writings are marked by force of style, clearness of arrangement, and homely yet felicitous illustration. Whately was appointed professor of political economy in 1830. The lectures he then delivered were afterward published under the title of 'Introductory Lectures on Political Economy.' In Oxford Whately stood in the front rank of those who held liberal views in ecclesiastical and social matters, and among these his earnest love of truth, his contempt for arguments resting solely on tradition, and the keenness of his logic, gave him great influence. By his theological and other writings, and by the part he had taken in political affairs, especially the support he had given to the Catholic Emancipation measure, his name and abilities became well known, and 1831 he was appointed archbishop of Dublin and bishop of Glendalough. The cause of national education in Ireland he warmly embraced, and for 20 years was an active and influential member of the board. But in 1853, Dr. Cullen and the Roman Catholic party having objected to a treatise on the 'Evidences of Christianity,' composed by Whately, and used in the schools, and having procured its withdrawal, the prelate resigned his seat at the board. Whately was distinguished by honesty, love of truth, and princely liberality. In manner he was somewhat rough and careless—the reaction, as he said, from the painful sensitiveness with which he had been troubled in his youth. His conversation was rich in joke, and pun, and witty repartee; and he was fond of trapping and puzzling his opponents by logical quibbles, though no man could be sharper in detecting a fallacy in another's reasoning. Consult 'Life and Correspondence of R. Whately, D.D.' by his daughter, E. J. Whately (1866).

Wheat. Wheat belongs to the Hordeæ tribe of the Gramineæ or grass family. There are four principal kinds or sub-races: common wheat (*Triticum sativum vulgare*), Egyptian and English wheat (*Triticum sativum turgidum*), flint wheat (*Triticum sativum durum*), to which the durum and macaroni varieties belong, and a dwarf variety (*Triticum sativum compactum*), supposed to have been the kind produced in ancient times. Each sub-race is in turn divided into many varieties. The wheat most generally cultivated and in most common use for bread purposes is *Triticum sativum vulgare*, although varieties of durum and spelt are extensively grown in some localities.

Wheat is of ancient origin and was cultivated by prehistoric races, as the Swiss Lake-Dwellers. In the earliest writings it is mentioned, and samples which are not materially different from similar modern varieties have been found in a fair state of preservation in ancient tombs. Attempts have been made to germinate this "mummy wheat," but without success. The Chinese claim that wheat was used by them as food 2,700 years before the Christian era and in Egypt its use as food appears even to ante-date this period. A number of varieties have been cultivated from early times, as spelt, durum, and winter and spring varieties of *Triticum sativum vulgare*. Wheats produced in different countries have been subject to different climatic and soil conditions as well as to different methods of cultivation until material changes have taken place and numerous hard and soft varieties have been produced. There

appears to be no authentic record of wheat growing wild and sowing itself without the help of man.

The world's wheat crop normally amounts to about 2,720,000,000 bushels, of which the European countries produce a little more than half. At present the United States is the greatest wheat growing country. In 1901 the yield was over 720,000,000 bushels. There are large wheat areas in the northwestern possessions of British North America which have not yet been brought under full cultivation. This will increase the wheat producing belt of North America by adding a strip about 1,500 miles long by 300 miles broad. There also are large undeveloped wheat regions in South America, particularly in the Argentine Republic, and it is claimed that some parts of Siberia are suitable for wheat production. Thus it is evident that there are vast areas of fertile virgin soil yet to be brought under wheat cultivation.

Wheat can be grown on a variety of soils. It thrives best, however, and produces largest yields upon rich alluvium, and soils formed from different kinds of rock thoroughly disintegrated and mixed with vegetable mold. The wheat soils of the northwestern wheat region of the United States are largely of glacial formation and composed of clay and silt with small amounts of fine sand and containing liberal amounts of alkaline matter, particularly disintegrated limestone. The best wheat soils are rich in humus (decaying vegetable matter), which through decay supplies nitrogen, one of the principal elements used by the wheat plant for the formation of gluten. The chemical composition of a wheat soil of high productiveness from the Red River Valley of the North is as follows:

	Surface per cent	Sub soil per cent
Insoluble matter	47.64	41.41
Soluble silica	15.43	8.37
Potash	0.54	0.25
Soda	0.45	0.48
Lime	8.44	7.45
Magnesia	1.85	4.48
Iron oxid	4.28	3.48
Alumina	7.89	10.72
Phosphoric anhydrid	0.38	0.17
Sulphuric anhydrid	0.11	0.10
Carbonic anhydrid	2.42	14.26
Volatile matter	15.55	6.22
Humus and volatile matter ..	5.34	0.89
Nitrogen in volatile matter ..	0.38	0.11

The tendency in wheat farming upon new soils has been to grow the crop for a number of years without practising rotation or using fertilizers. After a time this results in reduced yields and an inferior crop, due in part to the loss of nitrogen from the land. Wheat does not remove a large amount of gross fertility from the soil, but exclusive wheat culture on virgin soil causes a rapid decay of the humus and a consequent loss of nitrogen, one of the elements of which humus is composed. When wheat is grown along with other farm crops in a good rotation and manures are intelligently used the wheat does not have an exhausting effect upon the soil.

The yield of wheat ranges from 10 bushels and less to 30 bushels and more per acre. In countries where land is expensive, and intensified farming is practised, the yield per acre is

WHEAT

generally larger than in new regions where more land is available. The yield per acre of wheat in the United States is much less than the soils are capable of producing.

Formerly plowing was done with a bent stick or wooden plow, the wheat was sown broadcast by hand, the crop was cut with the cradle and bound in sheaves by hand, and finally thrashed with the flail or by the trampling of horses. Improvements in machinery, as steam and gang plows, seeders, reapers, self-binders, and thrashers, have greatly reduced the cost of production and increased the world's supply of wheat. Equally as great have been the advances in transportation, storage and milling facilities. Wheat is now transported in specially constructed freight cars and boats, and stored in large elevators in which 120,000 bushels are placed in one compartment, when formerly it was often transported on horse or mule back in bags, loaded and unloaded by hand and stored in small bins in granaries. The milling process has developed from crushing between two stones to reduction by steel rolls.

Wheat is subject to a number of diseases, as rusts, smut, and other vegetable parasitic diseases, many of which have been studied and are now in part capable of being controlled. The smuts are destroyed by treating the seed wheat with chemicals which kill the smut spores, while the rusts are held in check by destroying the host plants, as the barberry, upon which the parasite spends part of its cycle of life. There are a number of insect pests which often cause great destruction of the crop, as grasshoppers, frit flies, Hessian flies, and chinch bugs. Economic entomologists have done much to save the wheat crop from insect ravages.

The wheat kernel is surrounded by a seed pod composed of cellulose which constitutes the outer layer and is called the pericarp. The second covering or epispem, which is just within the pericarp, consists of the outer and inner integuments. The perisperm or third bran layer is a thin mass of collapsed cells. The aleurone layer—so-called gluten cells—is composed mainly of nitrogenous matter and lies within the three-bran layers. The endosperm or floury portion constitutes about 80 per cent of the wheat kernel and is within the three-bran layers and aleurone cells. The germ or embryo plant is stored in the lower part of the kernel where its outline can be traced by the indentations. The germ makes up about 6 per cent of the kernel, the bran layers about 10, while about 86 per cent is present in the aleurone and endosperm. The relation of the different parts, one to the other, as bran to endosperm, varies in different kinds and varieties of wheat, some producing a larger amount of flour than others and some more bran.

The character of the wheat, as starchy or glutinous, is determined largely by soil and climate. A short, forcing growing season and a fertile soil have a tendency to produce glutinous wheat, while the opposite conditions produce starchy wheat. When hard glutinous seed wheat is sown in regions which produce starchy soft wheats, the hard wheat gradually changes its character and in about two years becomes starchy. Whether a wheat is hard or soft depends upon the amount and character of its gluten. Hard wheats usually contain over 12 per cent gluten, of which 55 to 65 per cent is in

the form of gliadin, an alcohol soluble proteid, while soft wheats contain less gluten, but gluten of a higher gliadin content. See article on **BREAD AND BREAD MAKING** for influence of gluten on quality of bread.

Extensive experiments have been performed by Lawes and Gilbert of Rothamsted, England, to determine the influence which different kinds of fertilizers have upon the wheat crop. They have shown that fertilizers influence the yield more than the composition of wheats and that it is not possible by means of fertilizers alone to materially increase the amount of starch or gluten. Climatic conditions effect the composition to a greater extent than do fertilizers. Wheats grown upon the same soil in different years show greater variations in composition than wheats grown the same year but differently fertilized.

Different varieties of wheat when grown under the same conditions are fairly constant in composition. In protein content, wheats range from 8 to 18 per cent. The most nitrogenous wheats do not necessarily make the most glutenous flours, as frequently a large portion of the nitrogen is in the germ and offals.

The grading of wheat is based entirely upon the physical qualities as weight per bushel, color, and plumpness. Smut and blemishes, caused by unfavorable climatic conditions, are also considered in grading wheat. When new wheat is stored in elevators, a slight fermentation change takes place known as "sweating." If the wheat is sound this change is slightly beneficial for flour production, as it increases the keeping qualities of the flour. Unsound wheats, as those which are bleached, frosted, immature and sprouted, usually have a somewhat different composition from fully matured wheat. Such wheats usually contain a larger amount of soluble proteids, soluble carbohydrates, and organic acids than normal wheats. Damaged wheats generally yield a smaller amount of flour as well as flour of poor keeping qualities.

It is not possible to make accurate comparisons as to composition of wheats grown in different countries. It will frequently be found that wheats grown in different localities of the same country vary as much in composition as do wheats grown in different countries.

Wheat contains slightly more protein and less starch than corn, oats, rye, or barley. Oats from which the hulls have been removed contain more protein and fat than wheat. The difference in composition between wheat and the other cereals is not large and occasionally individual samples of corn or rye will be found containing more protein than individual samples of wheat. Wheat differs in composition from all other cereals in that its gluten is composed of the two proteids, gliadin and glutenin. This gives flour its bread-making value. No other cereal except rye contains a gluten that is capable of expanding and forming a light porous loaf. Because of its unique composition no other cereal can take the place of wheat for bread-making purposes.

Numerous experiments have been made to improve the quality of wheat by selection of seed, and by breeding and crossing of standard varieties. Wheat responds readily to such tests, but unless great care is taken it as readily reverts to its original condition. In the United States two main classes of wheat are produced,

BREEDING NEW WHEATS.

TESTING NEW WHEATS IN THE LABORATORY.

WHEATEAR—WHEAT INSECT PESTS

namely: winter and spring wheat, of which there are a number of varieties, as white and red winter wheat, Oregon Club, Blue Stem, Scotch Fife, etc. Minnesota, North and South Dakota, and northern Iowa constitute the main spring wheat region; spring wheat is, however, grown in other localities.

The wheat plant assimilates its mineral food and nitrogen from the soil at a rapid rate. In the case of spring wheat, by the time the crop is half grown, over three fourths of the mineral food and nitrogen needed for construction purposes have been taken from the soil. Wheat is not a strong feeding plant and taking its food from the soil in so comparatively short a time, the soil must be in a high state of productiveness in order to yield a good crop. The wheat plant needs greatest assistance in securing its nitrogen, hence fertilizers for wheat should be nitrogenous in character. Wheat also needs a good supply of available mineral food as phosphoric acid and potash, but is better able to secure these elements from the soil than it is nitrogen.

The flour yield of wheat is determined approximately from the size and weight of the kernels. According to Foster, the weight of 100 average kernels can be taken as the basis for estimating the flour yield:

WHEAT KERNELS	Weight troy grains	Contains per cent of flour
100	46	74.1
100	44	73.6
100	42	73.2
100	40	72.6
100	38	71.8
100	36	71.0
100	34	70.3
100	32	69.6
100	30	68.7
100	28	67.6
100	26	66.8
100	24	66.0

Because of its usually high price, wheat has never been extensively used as animal food, but at times when it has been cheap and abundant, it has been used for the feeding of all farm animals and has proven equally as valuable as other grains for the production of beef, pork, mutton, and milk. In the feeding of wheat to farm animals, the best results are secured by coarsely grinding or pulverizing the grain instead of feeding it whole. The main use of wheat, however, is to manufacture flour for human food. It is used more extensively as human food than any other cereal.

HARRY SNYDER,

Professor of Agricultural Chemistry, University of Minnesota.

Wheatear, or Fallow-chat (*Saxicola eximie*), an European terrestrial warbler, allied to the stonechat. Its average length is 6½ inches, and its color is gray above, the wings being tipped with black; a black streak encloses the eye and ear-coverts. The breast is brown and the under parts white. The wheatear is much sought after when in good condition as a table bird, its flesh being very delicate and is usually caught in traps. By the British peasants the wheatear's presence is regarded as a sign of ominous and unfavorable kind; and probably the fact of the nest being often found in collections of old stones in burial-places has tended to in-

crease the superstitious feeling. The nest is buried deeply among stones or in rock-clefts, the eggs being of pale-blue color, and numbering from four to six.

Wheat Insect Pests, insects injurious to growing wheat-crops. These number from 50 to 100 different kinds in the United States alone, many of which have been imported from the Old World; and they represent a wide variety of forms and classes. The most important, probably, are flies, more or less closely related to the house fly and mosquito; and of these the Hessian fly is the most dreaded and widespread. This is a small fly (*Cecidomyia destructor*) of the family *Cecidomyiidae*, the larva of which is very destructive to wheat, barley, and rye, but does not attack oats. It is named from the unfounded belief, that it was brought to America from Europe (where it is native, and has been a pest for centuries) in the baggage of the Hessian mercenaries employed against the Americans in the war of independence. The female fly is about a tenth of an inch in length. Its body is brown, with the upper parts, the thorax, and the head of a darker shade, approaching to black. The wings are dusky gray, and are surrounded with fringes. The male is somewhat smaller than the female, and has longer antennae. The female flies usually lay their eggs on the young plants twice in the year, in May and September, the maggots being hatched in from 4 to 14 days. These work themselves in between the leaf-sheath and the stem, and fix themselves near the lowest joints, often near the root, and suck the juices of the stem, so that the ear falls down at a sharp angle. These maggots turn to pupae ("flaxseed") from which the flies develop in about ten days; those of the fall brood hibernate in the pupa state, and are ready to begin their depredations with the early sprouting of the spring crop. In view of these habits, wherever the presence of these insects is known or suspected, the winter wheat should be planted as late as possible, or the early planting of a "trap" strip at one side of the field. In this the flies will lay their eggs, after which the strip may be plowed under and the young destroyed; volunteer wheat should be destroyed and stubble burned.

Other true flies attacking wheat and other grain-crops are mainly of the family *Osciidae* which contains a large number of species of variable habits, those of interest in the present connection mainly inhabiting the stems of grains and grasses. Here belongs the frit-fly of Europe, so terribly destructive both in Great Britain and on the Continent, and many species in this country whose depredations are insignificant or local or obscure. That one of most consequence, and most thoroughly studied is the "wheat bulb-worm" or "wheat stem-maggot" (*Meromyza americana*), which has been a constant evil ever since civilized agriculture began here. It is a native of the whole of North America, apparently, originally feeding on the wild grasses. In the middle latitudes of the United States three annual broods develop; there are more farther south, but only two in Canada. The life-cycle of this insect within the wheat-belt of the United States, according to Webster, is as follows: The winter is passed in the larval stage, and the short pupal stage coming in May brings the emerging of the adults

WHEAT STARCH

at the time when the female is able to place her eggs on the plants where the young, on hatching, will make their way to the tender and succulent stem just above the upper joint. By the time the straw has ripened the larvae have ceased to require food, and pass through the pupal stage, the adults of this brood appearing in July. Eggs are now deposited in volunteer wheat and grass, and, owing either to the retarding effects of meteorological influences or a diversity of food of the larvae or both, perhaps, the emerging of the adults is prolonged throughout a period extending from late August through September until late October. At this period the fall wheat offers a decidedly inviting plant to the female fly on which to place her eggs with a prospect of her progeny having an abundant food supply. It is the larvae from eggs deposited during this period that winter over in the plants and give rise to the May-June generation of flies. It is this last brood that is of more especial interest to the farmer, as it is very seldom that the pest does serious injury to grain except in fall and early spring. The effect on the plant is this: in young plants the central spindle-shaped enfolded leaf is killed, the detached portion turning first yellow and later brown, then shriveling up and dying, leaving the outer lower leaves uninjured. In Hessian-fly attacks this spindle-shaped leaf is absorbed and does not appear at all in young wheat in autumn, so that there need never be any confusion of the work of these two insects in fall wheat, and the effect on the full-grown straws is even more easily distinguishable. When attacked by the maggots of this species the fully grown straw withers at the upper joint, and all that portion of the stem including the head, the sheath excepted, changes to a whitish color, the remainder of the plant, including the upper sheath, continuing uninjured and of the usual green color. The Hessian fly never affects the full-grown straws in this manner and the lesser wheat stem-maggot (*Oscinis carbonaria*) does so but rarely, so that the presence of these maggots in the straw can be easily detected shortly prior to harvest by their whitened color from the upper joint upward. The larvae are within the stem and not outside and under the sheath, as with the Hessian fly; they are larger and of a more glassy green color than those of the lesser wheat stem-maggot, and it is only when still very young that the ordinary farmer need ever mistake them for any of the others mentioned in this article. The liability of attack from this insect is not sufficiently great to warrant expensive preventive measures. It occasionally comes in vast numbers, but no way is yet known of foretelling these epidemics. The same precautions and methods as those taken against the Hessian fly are recommended. Several other species of *Oscinis* are known, among which the American frit-fly (*O. soror*) may prove formidable hereafter, as it has already committed extensive depredations in Minnesota. The more careful and cleanly the method of farming, the less are these and other insect pests to be dreaded.

The chinch-bug is another far too prevalent plague of grain-fields; it is, indeed, regarded as the most destructive insect in the country. It is a small blackish plant-bug (*Blissus cucumeris*), with white wing-covers each marked with a dark line like a figure 6. Arising from her winter sleep in the old grass and rubbish of the

fields and fence-corners, the female lays several hundred eggs on the stems and roots of the sprouting grasses and grains near her. The young hatch quickly, and in a crowd of reddish dots suck out the juices of the growing plants, causing them to wither and die. There is another brood in the fall. Severe winters and wet and cold springs reduce the numbers of this pest, and certain diseases are known which spread among the bugs and destroy them. Infected bugs have been sent from diseased districts to other regions and imparted to the bugs there with good effect. There seems to be no preventive, however, except great care in burning stubble and rubbish, keeping the fields clean, and planting as late as possible.

Another group of highly injurious insects is found in the family *Chalcididae* (q.v.),—a family of gall-flies with one genus (*Isosoma*), whose species prey upon growing plants of this kind and are called "straw-worms" or "joint-worms," because their larvae attack the nodes or "joints" of the grain-stem. The species of special interest as affecting wheat is *I. grande* (or *I. tritici*). This gall-fly is about an eighth of an inch long and black, with a body shaped much like that of an ant and four dark wings. When, in the spring, the young wheat plants are only starting to throw the stem upward, the females (at that time minute and wingless) push their ovipositors through the stem until they penetrate the head of the embryo plant within and leave an egg there. The larva soon hatching devours this vital part of the plant and kills it, though the stem may continue to grow for some time. By the middle of June the young have developed and cut their way out to appear as the adult summer form, which wander widely. These mature, winged females now deposit eggs within the stems of wheat just above the uppermost joint, where a hardy woody gall forms about the larva, within which it transforms into the pupa stage and stays on, inert, through the winter. The best preventive measure is an annual rotation of crops; next to that the burning of the stubble, purposely left long, but this must be done not later than early September. Various other species of *Isosoma* attack other grains, especially barley and rye, and some others also injure wheat.

Purples, ear-cockle or peppercorn is a disease of British wheat, produced by a minute nematoid worm called "wheat-eel" (*Vibrio tritici*), which are placed by their parents in the germ of the seed, and cause the formation of the purplish-black galls or "cockles" which are a feature of the disease, and in which the worms are contained. When fully grown they may attain a length of a quarter of an inch.

The Department of Agriculture has issued a large number of special illustrated publications upon the insects injurious to wheat and other grains, which should be consulted. Prominent among them are Marlatt, 'The Principal Enemies of Growing Wheat' (1901); Webster, 'Insects Attacking the Stems of Growing Wheat,' etc. (1903); Osborn, 'The Hessian Fly in the United States' (1898); Webster, 'The Chinch-bug' (1898).

Wheat Starch. The history of wheat starch dates back to the ancient Greeks and Egyptians. They evidently understood its qualities and experimented with various kinds of

WHEAT STARCH

wheat. Pliny speaks of starch made by the inhabitants of the island of Chios with the remark that starch made from summer wheat was preferred. They used it for medicinal purposes and for food. In Continental Europe wheat constituted the principal source of starch for centuries. It was heard of in England as early as 1511, but not much used until about 1564. In Queen Elizabeth's time its use was made popular for stiffening those enormous ruffs so much worn at that time, and as a powder for the hair. According to Planché, "Mistress Bingham Vandt Plasse, a Fleming, came to London and publicly taught the art of starching"—Stubbs falls foul of this "liquid matter which they call starch, wherein the devil hath learned them to wash and dive their ruffs, which being dry will then stand stiff and inflexible about their necks." During the reigns of Queen Anne, and the Georges I., II. and III. and until 1833, to use any other substance was prohibited under severe penalties, restrictions and taxes. As the cotton factories of England and France were built, the demand for wheat starch accordingly grew.

In the United States small factories sprung up in different places about the beginning of the last century. In 1803 a patent was granted to J. Naylor, by which he made spirits from the wash-water obtained as a by-product in the manufacture of wheat starch. Another patent was granted in 1810 to E. Perkins of Shrewsbury, N. J., on a process for making starch from wheat, and spirits from the residuum. In 1829 Stephen Liversidge purchased a water power mill at Dorchester, Mass., and made wheat starch for the New England cotton mills. He was prosperous, and in 1841 added steam power. He continued until 1855, when his factory was destroyed by fire and was never rebuilt. Other factories were built at Roxbury and at Watertown, Mass. At the latter place it was made mostly for family use, and put up in boxes holding 48 pounds each. This is the only one of the early factories still in existence, and is conducted by the firm, H. Barker & Co., of Boston, Mass. In 1842 Thomas Kingsford was the superintendent of a wheat starch factory belonging to W. Colgate & Co. of Jersey City, N. J., and experimented with corn as a material for making starch. His success led to his establishing the first corn starch factory at Oswego, N. Y., in 1848. Up to this time wheat starch was the principal kind sold by grocers. At present the various brands sold for family use are all made from corn, although starch made from wheat is superior both for culinary and for laundry purposes. At normal conditions of the market wheat starch costs about twice as much as corn starch. Being considered expensive its use is therefore confined to doing the best quality of work, and is used by experts who understand its superior qualities. For the finishing of cotton and linen textiles and as a carrier of colors in printing cotton goods, the best results and the finest effects are obtained by its use.

When examined under a microscope the granules are small and are found to differ greatly in size, varying from 0.05 to 0.01 m.m. in diameter, actually showing two classes of granules both of them shaped like circular disks. It is characterized by certain qualities which do not belong to either corn or potato starch. It enters the fabric and forms a body within instead of a coating on the outside, thus mak-

ing it possible to get a better finish and show the clean, clear texture of the goods. It adds weight by filling the meshes, and is tough and flexible. It better resists moisture and perspiration. Being possessed of these qualities it is thoroughly adapted to doing fine laundry work, and is in fact indispensable to the manufacturers of collars, cuffs, and shirts in laundering their goods which is more difficult the first time. Many laundrymen try to cheapen the cost by using other starch. This is readily detected by observing that the collars and cuffs break to form joints and do not possess the qualities mentioned above. The modern laundry industry is a growing one and the foundation for its finest work is wheat starch. In 1891 the Crystal Springs Company of Watertown, Mass., discovered that the penetrating quality of starch could be increased by partially dextrinizing it. This was the first of the "thin boiling" starches, which have been in considerable demand since.

The consumption has gradually increased from year to year until the amount used in this country is about 18,000,000 pounds, requiring annually about 700,000 bushels of wheat for its production. None is exported. The factories are scattered through the East and Middle West.

In the manufacture of starch from wheat as well as from other cereals, it is necessary to loosen the particles of the grain by disintegration so as to break up the cellular tissues. When this is accomplished it is not difficult to separate most of the granules which are thus laid bare by simply washing them out with water and breaking them loose from the other substances. A part of the starch in wheat is in a very close mechanical combination with some of the gluten, and is not easily separated. This glutinous starch is considered to be a compound of the unripe or undeveloped starch and gluten substance. If the process is complete, the three principal products obtained are starch, gluten, and gluten starch. There are three processes in use in this country. By acidulous fermentation of the wheat, by the fermentation of flour and by treating flour mechanically, in which the gluten is separated without either chemicals or fermentation. Most manufacturers employ the old fermentation process, which is cheaper and enables them to use unsound or weak flour, which can be purchased at low prices. The gluten is washed away as it ferments, leaving the starch at the bottom of the tanks. By repeated washings it becomes freed from other substances and is allowed to settle. It is then cut into cakes and placed into drying chambers to crystallize and dry. For the past years the writer has been making wheat starch by a process in which all the products are saved. The flour is placed in machines which wash out the starch and gluten starch together under a constant flow of water leaving strong, elastic gluten (q.v.) by itself. This being perfectly fresh and sweet, is dried by a special process, ground into flour, and put on the market as Gum Gluten. An average of only 16 pounds of dry gluten is retained from a barrel of flour. The demand is mostly from those suffering from diabetes mellitus and such as are selecting a vegetable protein instead of too much meat. The dietetic value of gluten has been recognized by scientists for years, and it is to be regretted that a loss of such a valuable food

substance has been going on for centuries. The gluten starch together with the starch runs from the washing machinery as a milky liquid into wooden tanks, where it is allowed to settle. The heavy starch particles go to the bottom, while the gluten, having less specific gravity, forms a layer on top, and the water which forms the greatest bulk can be drawn off. In appearance the gluten starch is gelatinous and somewhat darker than the starch. It has not been considered of any great commercial value and has been allowed to run away with the water. In 1902 the writer took out patents for making it into a dry powder that turns to a wet adhesive paste by mixing with cold water. It is known on the market as "Jellitac," and is used for sticking on labels, for hanging wall-paper, for bill-posting and wherever wet paste is used. In thus making use of the by-products, especially when they have a superior value, is in a national economical sense, an attainment of the highest importance. For references read the United States Census Bulletin (198), published in 1902, United States Patent Reports and Histories of Manufacturers by Clapp and by Bishop. See STARCH.

ARTHUR S. HOYT,

Manufacturer of Wheat Starch, New York.

Wheatland, a famous estate and former residence of President James Buchanan, located a mile from Lancaster, Pa.

Wheatley, hwét'li, Francis, English painter: b. Wild Court, Covent Garden, London, 1747; d. London 28 June 1801. In early life he carried off several premiums given by the Society of Arts and was employed by Mortimer in decorating the ceilings at Brocket Hall. He set up as a portrait painter at Dublin, and was much employed on small whole-lengths, among his sitters numbering many members of the Irish House of Commons. Becoming involved in a scandal he left the Irish capital for London and between 1765 and 1783 exhibited many pictures classed as "domestic," but his works also included the 'Riots of 1780,' the original of which perished in a fire, although Heath's engraving of it gives a good idea of the work. As a contemporary of Morland he was superior to that painter in the refinement both of his subjects and his treatment of them, and was really masterly in his handling of equestrian portraits, such as 'The Second Duke of Newcastle and a Shooting Party.' He was elected R.A. in 1791. He is an important figure as being one of the founders of English rural genre, and painted pretty and graceful rustic figures of women and children, while his sense of landscape coloring was really exquisite.

Wheatley, Henry Benjamin, English philologist and bibliographer: b. Chelsea 2 May 1838. He was clerk to the Royal Society 1861-79, honorary secretary to the early English Text Society 1864-72 and its treasurer 1872-1901. Besides editing for the Text Society 'The Romance of Merlin' (1865-99) and other works he is the author of 'Anagrams' (1862); 'What is an Index?' (1879); 'Samuel Pepys and the World he Lived In' (1880); 'How to Form a Library' (1886); 'London Past and Present' (1891); 'Literary Blunders' (1893); 'Historical Portraits' (1897); etc.

Wheatley, Phillis, American-African verse writer: b. Africa about 1753; d. Boston 5 Dec.

1794. She was brought to Boston in 1761, was purchased by Mrs. Wheatley, and, exhibiting a fondness for books, was instructed by her mistress and her daughters, and acquired for the time a superior education, reading Latin with facility. At an early age she began to express her thoughts in verse, and some of her poems written at 14 give evidence of poetic ability. At 19 she visited England, where she attracted much attention. A volume of her poems dedicated to the countess of Huntington was published there, containing her portrait, and bearing the title, 'Poems on various Subjects, Religious and Moral, by Phillis Wheatley, Negro Servant to Mr. John Wheatley of Boston, in New England.' After her return from England she published several poems, among others an address to Gen. Washington. Her book was reprinted in Boston and passed through several editions. The family of Mr. Wheatley being broken up by death soon after her return, she married a negro named Peters, and her last days were spent in extreme want.

Wheatley, Richard, American Methodist clergyman: b. near York, England, 14 July 1831. He received an academic education, was ordained in the ministry and since his removal to the United States has been engaged extensively in literary work. His writings include: 'Cathedrals and Abbeys in Great Britain'; 'Biographic Encyclopedia of the New England States in the XIXth Century' (5 vols.); 'History of the World from the Middle Ages'; etc.

Wheaton, hwé'ton, Frank, American military officer: b. Providence, R. I., 8 May 1833; d. Washington, D. C., 18 June 1903. He was educated at Brown University, went to California in 1862, and studied law at Poitiers, France; lieutenant in the United States cavalry, subsequently participated in various Indian campaigns, and at the outbreak of the Civil War was promoted captain. He served with the Army of the Potomac through the war, was promoted brigadier-general of volunteers in 1862, commanded a division at Gettysburg and in the Shenandoah, and was engaged in other famous movements. He was made colonel in 1874, brigadier-general in 1892, and major-general in 1897. He was retired in the year last named.

Wheaton, Henry, American jurist: b. Providence, R. I., 27 Nov. 1785; d. Dorchester, Mass., 11 March 1848. He was graduated from Rhode Island College (now Brown University) in 1802, and studied law at Poitiers, France; he then took up the practice of law in Providence, and later (1812) moved to New York, where he was editor of the 'National Advocate,' until his increasing law practice caused him to give up that position in 1815. He was for a time one of the justices of the marine court in New York; and in 1816 became reporter for the United States Supreme Court; his reports, which were published in 12 volumes, are exceptionally complete and valuable. In 1821 he was a delegate to the New York State Constitutional Convention; and in 1825 was one of a commission for revising the statute law of New York. In 1827 he was appointed *chargé d'affaires* to Denmark, being the first regular diplomatic agent from the United States to that country, and resided at Copenhagen until 1835, when he was appointed minister resident to the court of Prussia. Two years later he was made minister

WHEATON—WHEEL AND AXLE

plenipotentiary by President Van Buren, which office he retained until 1846. His diplomatic work was most successful; in 1844 he negotiated a treaty with Germany, which, though rejected by the United States Senate, served as a basis for subsequent treaties. In 1843 he was elected a corresponding member of the French Institute, and in the following year a foreign member of the Royal Academy of Science of Berlin. He returned to the United States in 1847. His most important work is his 'Elements of International Law,' published in 1836, which has always been regarded as a standard authority on the subject; numerous editions have appeared in the United States, including one by Lawrence (1835), and one by Dana (1866); there is also an English edition and a French translation. His other writings include 'Digest of the Law of Maritime Captures or Prizes' (1815); 'Life of William Pinkney' (1826); 'History of the Northmen' (1831); 'Histoire du Droit du Gens en Europe, depuis la Paix de Westphalie jusqu'au Congrès de Vienne' (1841), translated into English in 1846; and 'An Inquiry into the British Claim of a Right of Search of American Vessels' (1842).

Wheaton, Lloyd, American military officer: b. Fairfield, Mich., 15 July 1838. He entered the Union army at the outbreak of the Civil War with rank as sergeant and served through the war, receiving promotion to captain of volunteers in 1862, major in 1863, and lieutenant-colonel in 1864. In 1866 he was appointed captain in the regular army, was subsequently employed on frontier duty, and on the outbreak of the Spanish-American war in 1898 he was appointed brigadier-general of volunteers, was assigned to duty in the Philippines in 1899, and in 1900 received rank as major-general of volunteers. He was engaged in all the important engagements in the Philippines, and in 1900-2 was in command of the departments of North Luzon and the Northern Philippines. He was promoted brigadier- and major-general in the regular army in 1901 and in 1908 was retired.

Wheaton, Ill., city, county-seat of Du Page County; on the Chicago & Northwestern Railroad; 25 miles west of Chicago. It is in an agricultural and stock-raising region. It has industrial establishments connected with farm and dairy products, and ships annually considerable hay, vegetables, wheat, flour, live-stock, and dairy products. The water-works plant cost originally \$60,000. The city has eight churches, Wheaton College (Congregationalist), a high school, opened in 1874, public and parish schools, a public library presented by J. Q. Adams, and a college library. Pop. (1890) 1,622; (1900) 2,345; (1910) 3,423.

Wheaton College, located at Wheaton, Ill., 25 miles from the centre of Chicago. It had its beginnings in Illinois Institute, founded by the Wesleyan Methodists in 1856. In 1860 the Institute was sold to a board of trustees affiliated with the Congregationalists, and was chartered under the name of Wheaton College. The organization includes in addition to the regular collegiate department, an Academy, a Business Department, a Conservatory of Music, and an Art Department. Women are admitted to all courses. There are four collegiate courses offered, the classical, the literary, the Latin sci-

tific, and the English scientific; the degree of A.B. is conferred for the completion of any of these courses; before 1903, the three degrees of A.B., B.L. and B.S. were conferred. Certain studies are required of all students; and each course has in addition other required studies, the rest of the work is elective, the scientific courses having the least elective work. The academy offers four corresponding courses, and a teachers' course. The Business Department offers a business course, a shorthand course, and a course combining the two. An arrangement has been made with the American Sunday School Union of the Northwestern district by which a three years' scholarship is given to a young man who will spend six months each year in college, and six months in the missionary work of the Union. The college has a campus of 13 acres on a slight elevation in the city; the buildings are the main buildings, the Woman's Building, and the gymnasium. The library in 1910 contained 6,000 volumes; the Adams Memorial Library, a short distance from the College, is also open to students. The students in 1910 numbered 271, of whom 61 were in the collegiate department, 76 in the Conservatory of Music, and 112 in the Academy.

Wheatstone, hwet'stón, Sir Charles, English physicist: b. Gloucester February 1802; d. Paris 19 Oct. 1875. He commenced business for himself in London as a maker of musical instruments, and in 1823 attracted the attention of scientists by the publication in 'Thomson's Annals of Philosophy' of a paper entitled 'New Experiments on Sound.' In 1834 he was appointed professor of experimental philosophy in King's College, London, and in 1836 exhibited at King's College experiments showing the velocity of electricity. For this purpose he used a circuit of four miles of copper wire. These experiments suggested to him the idea of applying his apparatus to telegraphing. In 1837 with W. F. Cooke, he took out the first patent for magnetic telegraph, but no practical application of this was made till after the Morse telegraph had been operated. Another subject that engaged much of his attention was vision, on which he published various papers, among them a memoir contributed to the 'Philosophical Transactions' in 1848, 'On some Remarkable and Hitherto Unobserved Phenomena of Binocular Vision.' He was knighted in 1868; was a fellow of the Royal Society from the year 1836, and was also a corresponding member of the French Institute and honorary member of the principal academies of science in Europe. He wrote no considerable work, but was the author of numerous papers chiefly contributed to the 'Philosophical Magazine' and the 'Journal of the Royal Institution.'

Wheatstone's Bridge, in electricity, a well known form of the electrical bridge or balance for testing electrical resistance.

Wheel, The, in the southwestern United States, an agricultural league or guild, similar to the Granger movement. The first Wheel was founded in Prairie County, Ark., in 1880, and for some years the order increased rapidly.

Wheel and Axle, one of the mechanical powers, which consists of a wheel round the circumference of which a string may be wound, having a small weight attached to its free end,

WHEEL — WHEEL-GEARING

and an axle whose circumference, being smaller than that of the wheel, will sustain a heavier weight at the end of a string which is wound upon it in the opposite direction to that of the string on the wheel. The wheel and axle is merely a case of the lever; the small weight in ounces or other measure of weight multiplied by the radius of the wheel is equal to the balancing weight on the axle multiplied by the radius of the axle. The wheel is grooved, and carries a coil of rope; another rope is secured to the axis; and when the power is in motion every revolution of the wheel raises the weight to a height equal to the circumference of the axis or cylinder. The power is increased by enlarging the wheel or diminishing the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. The common winch, the windlass, the capstan, and the tread-mill are so many applications of the wheel and axle; and the same principle may be adapted to a train of wheel-work wherein motion is regulated and power acquired.

Wheel, Breaking on the, a horrible mode of punishment formerly in use in Europe. The condemned criminal was first fastened to two pieces of wood, in the form of a Saint Andrew's cross, with his legs and arms extended, and had the bones of his shins and thighs, and of the fore and upper arms, broken by blows with a bar of iron. After that he was attached to a small carriage wheel balanced on a stake, and allowed to suffer in this position till he died, sometimes several days after the breaking of his limbs. Later the punishment was so far mitigated that the criminal was put to death by a final blow on the breast, spine, or neck, before being exposed on the wheel, and sometimes he was strangled before even the breaking of his limbs took place. This punishment was abolished in France at the Revolution, and is now disused everywhere.

Wheel-bug, any of several species of cone-nose (q.v.).

Wheel-Gearing, a general term applicable to all forms of mechanical devices by which motion is transmitted by means of toothed or cog wheels. The different parts of a machine may transmit motion to each other by "direct contact," or by means of an "intermediate connector," in the latter case the motion of the connecting part being usually of no importance since the desired object is simply the proper

nism consists of a series of such elementary combinations, the motion being transmitted to each piece from the one immediately preceding it,

Skew Gearing.

and so on throughout the entire series; therefore, in order to ascertain the action of a complete machine, the "velocity ratio," and the "directional relation," of each combination of the series has to be determined. These factors depend upon the mechanical connection of the two parts, forming the combination, and are

Screw or Worm Gearing.

Bevel Gearing.

relative motion of the two parts thus connected. In elementary combinations of either kind, the part receiving the motion from the source of power is termed the "driver," and the part to which that motion is transmitted by the driver is termed the "follower." A train of mecha-

absolutely independent of the true velocities or directions of the parts themselves, which may or may not be liable to continual variation. For example, in two circular wheels, in contact with each other, and rotating upon fixed axles, the velocity ratio is constant. If the diameter of one is twice that of the other, the angular velocity of the larger will be one half that of the

WHEEL-GEARING

smaller, but during any changes of velocity whatsoever since the length of the respective radii of the wheels remains unchanged, the velocity ratio at any instant is the same. As to the directional relation: if the wheels are in internal contact, they will rotate in the same direction, and if in external contact, in opposite directions; but in both cases the directional relations will remain unchanged regardless of any change of the absolute direction of the driver. On the other hand, if the wheels are elliptical,

while the larger is commonly known as the "wheel," When the teeth are formed on the inner side of the wheel, or convergent to its centre, it is called an "annular" or internal wheel. Wheels in external contact rotate in opposite directions, but wheels in internal contact rotate in the same direction. As the diameter of the pitch circle of a "wheel" is increased, its curvature decreases and finally becomes a straight line, and results in a "rack and pinion" combination.

Face Gearing.

while the directional relation will remain constant, the velocity ratio will be subject to variation according to varying lengths of the contact radii. All elementary combinations may be divided into four classes—rolling contact, sliding contact, link work, and wrapping connections. The first two are direct methods, while the two last named communicate the motion through intermediate connectors.

The theoretical forms required to transmit motion by rolling contact are cylinders, cones, and hyperboloids of revolution. In the various forms of "friction gearing," employed to drive light machinery, the rolling pieces are made of different materials, one of wood and the other of iron, or one of them is covered with leather or rubber, and the necessary amount of adhesive contact is secured by adjusting the bearings of the pieces, or by the application of weights or springs. It is, however, impossible to transmit motion against any considerable amount of resistance by means of smooth surfaces, and various methods are resorted to, in order to secure the necessary resistance to slipping. Of these, the one most extensively used consists in the employment of teeth constructed upon the contact surface of the rotating pieces, and known under the general term of "gearing," which may be conveniently divided into five classes, according to the form of the pitch or contact surfaces of the equivalent toothed wheels, and designated as "spur" gears, "bevel" gears, "skew" gears, "screw" or "worm" gears, and "face" gears.

In spur gearing the wheels act upon each other in the same plane; the pitch surfaces are cylinders, and the teeth engage along straight lines parallel to the sides of the cylinders. The smaller wheel is usually termed the "pinion,"

a

b

c

Spur Gearing.

- (a) External Contact.
- (b) Internal Contact (annular).
- (c) Rack and Pinion.

In bevel gearing the wheels act upon each other at an angle; the pitch surfaces are cones, and the teeth engage along straight lines which pass through the common vertex of the two cones. When the angle of contact is equal to 45° they are called "mitre gears." In skew gearing the axles are neither parallel nor intersecting, the pitch surfaces are hyperboloids of revolution, and the teeth engage in lines approximating to the general direction of the common

WHEEL WINDOW—WHEELER

element of the hyperboloid. Owing to the difficulty of constructing the teeth, this class of gearing is not much used, and where the conditions require their application, two pairs of cone wheels are generally employed.

In screw gearing the axes of the cylinders are neither parallel nor intersecting, and the pitch surfaces are in contact only at one point. In its practical form it is known as "endless screw" or "worm gear," and is commonly employed to convert rapid into slow motion. The mounting of the screw prevents any other motion except that of rotation, so that at each complete turn of the screw, a tooth of the engaging wheel passes across the line of centres, and there being no limit to this action, the wheel continues to rotate so long as the screw is turned around its axis.

In face gearing, the teeth consist of pins arranged in a circle, and fastened to a flat circular plate attached to an axis. The wheels act at right angles to each other, and the points of contact are situated only upon the surfaces of the pins. Prior to the introduction of bevel gears, it was the method usually employed to transmit motion between axes that were not parallel, but at the present time it is almost exclusively used in connection with wooden mill machinery.

There are a great many other forms of gearing which are adapted for various purposes. Of them the stepped, twisted, spiral, and differential gearing are the most important. The particular advantage of the last named over ordinary spur gearing being the almost entire absence of friction and the consequent wear of the teeth. Bevel gears of this type have been used with great advantage in mowing machines. By the substitution of epicycloidal and hypocycloidal curves and involutes for the circular arcs in the forms of the teeth, the rolling contact action of the circles, in its relation to the production of a constant velocity ratio, is replaced exactly by a sliding contact action. The teeth of all gear wheels are designed upon the principles of these curves, so that when running together their action is smooth and free from vibration and shock.

Bibliography.—For specific information relative to the application and design of gearing, consult Rankine, 'Machinery and Millwork'; Grant, 'Teeth of Gears'; Kent, 'Mechanical Engineer's Pocket Book' (1903); and Stahl and Woods, 'Elementary Mechanism' (1903).

W. MONSEY, JR.,
Consulting Civil Engineer.

Wheel Window, in architecture, a circular window with radiating mullions resembling the spokes of a wheel.

Wheeler, hwé'ler, Andrew Carpenter, American journalist and author: b. New York, July 1835; d. Monsey, Rockland County, N. Y., 10 March 1903. He began newspaper work on the New York Times, and later became city editor of the Milwaukee (Wis.) Sentinel. Soon after the outbreak of the Civil War, he went with the Federal army as correspondent for several eastern and western papers; and afterward, following two years of incidental writing for the Chicago press, joined the New York Leader staff, then numbering many prominent names. For a time he wrote for the Leader dramatic critiques over the signature "Trin-

cuio." Then he became dramatic and musical critic of the World, and began writing the articles signed "Nym Crinkle." Later still he was on the staff of the Sun. As "Nym Crinkle" he published 'The Chronicles of Milwaukee' (1861); 'The Toltec Cup'; 'The Primrose Path of Dalliance'; 'The Iron Trail,' and other books. Latterly, having withdrawn from journalistic work, he published under the new pseudonym "J. P. Mowbray" (or J. P. M.), two series of essays and two books of fiction—'A Journey to Nature' (1901); 'The Making of a Country Home' (1902); 'Tangled Up in Beulah' (1902), and 'The Conquering of Kate' (1903). His authorship of these later works was not known until after his death.

Wheeler, Benjamin Ide, American college president: b. Randolph, Mass., 15 July 1854. He was graduated from Brown University in 1875, and afterward studied for four years in Germany, traveling also in Greece. He was subsequently engaged as an instructor at Brown, Harvard, and Cornell, and in 1886 was appointed professor of philology at the last named university, receiving the chair of Greek in 1888. In 1896 he accepted the directorship of the American School of Classical Studies, at Athens, Greece, and since 1899 has been president of the University of California. He was editor of the department of philology in Johnson's 'Universal Cyclopaedia' and in Macmillan's 'Dictionary of Philosophy and Psychology,' and has written: 'The Greek-Noun Accent' (1885); 'Analogy and the Scope of its Influence in Language' (1887); 'Introduction to the History of Language,' joint author (1890); 'Organization of Higher Education in the United States' (1896); 'Life of Alexander the Great' (1900); etc.

Wheeler, Joseph, American soldier and statesman: b. Augusta, Ga., 10 Sept. 1836; d. Brooklyn, N. Y., 25 Jan. 1906. He was graduated from the United States Military Academy in 1859; served in several scouting expeditions against Indians in Kansas and New Mexico; in February, 1861, resigned his commission, and in April following was made a first lieutenant of artillery in the army of the Confederate States. In September he became colonel of the 19th Alabama infantry. He commanded a brigade at Shiloh (6-7 April 1862), distinguished himself by his services, and was selected to command the rear-guard when, at the end of the second day's fighting, the Confederates retired from the field. By reason of his success as commander of the rear guard when the Confederates withdrew from before Halleck's army (30 May 1862), and his equally successful command of the salient outpost at Corinth, led to his appointment as head of the cavalry of Bragg's army. As such he led the advance in every forward movement of the forces and commanded the rear guard with the exception of Hood's Nashville campaign (winter of 1864). In August and September 1862 he led Bragg's advance into Kentucky, and detained Buell until Bragg had captured Mumfordsville, with cannon, munitions and supplies. At Perryville (see PERRYVILLE, BATTLE OF, and THE KENTUCKY CAMPAIGN OF 1862), 8 Oct. 1862, Wheeler commanded the cavalry, and displayed great energy and skill. He led a brilliant charge and captured a battery. Ordered to cover the retreat of Bragg's

BENJAMIN IDE WHEELER.

army, he made possible that general's successful escape, with large supply trains, to Cumberland Gap. Rosecrans on 23 December moved forward to attack Bragg before Murfreesboro. Wheeler skillfully retarded Rosecrans' advance, and during the battle (31 Dec 1862 to 3 Jan. 1863) (see STONEMAN, or MURFREESBORO) was, in the words of Bragg's official report, "pre-eminently distinguished." He was commissioned major-general in January 1863, and in June and July took a prominent part in the battles attending Bragg's retreat to Chattanooga. At Chickamauga (19-20 September) he defeated the right flank of Rosecrans' army (20 September), penetrated to the rear, and defeated Watkins in a severe combat. On 20 September he crossed the Tennessee and captured substantially all of Rosecrans' ordnance and supply trains. He fought in the Knoxville campaign in November, and on the 27th, with Cleburne, defeated Hooker at Ringgold Gap. During the spring of 1864 he aided in opposing Sherman's advance from Dalton to Atlanta, commanding the cavalry of the Confederate right wing, under Johnston and Hood. He fought almost daily, his force frequently being dismounted. On 28-31 July he defeated a Federal raiding force under Gen. Stoneman, Garrard and McCook, capturing many prisoners and all the transportation and artillery. On 10 Aug. 1864 he was again in the rear of Sherman's army, capturing supplies, burning bridges and destroying railways. He went as far as the Kentucky line in eastern Tennessee, and then proceeded to northern Alabama. It was impossible, however, to arrest Sherman's advance or destroy his communications. Wheeler was then sent in advance of Sherman's army, keeping the Confederate government and commanders advised of the enemy's movements and preventing foraging parties from leaving the main force. He thus restricted the spoliation of Georgia to a comparatively narrow area. He defeated Macon, Augusta and Savannah, and defeated Kilpatrick at Aiken and Johnsonville. During the operations in North Carolina in 1865, he distinguished himself at Bentonville (19-21 March) by opening an avenue for Johnston's retreat. He was promoted lieutenant-general on 28 February, and commanded Johnston's cavalry until the surrender of the Confederate armies. Subsequent to the war he studied law, and followed that profession and the occupation of a planter until 1880, when he was elected a Democratic representative in the 47th Congress. He was unelected by W. M. Lowe in 1882, but on Lowe's death not long after was re-elected, and in 1884 was returned to the 49th. He was continually re-elected, and was serving at the outbreak of the Spanish-American war. In April 1898 he volunteered for duty, and on 4 May 1898 was commissioned major-general of United States volunteers. On 14 May he was assigned to command the cavalry division, U. S. A., about to leave for the invasion of Cuba. He planned, and commanded in, the battle of Las Guasimas, 24 June 1898, and participated in the battle of San Juan, 1-2 July 1898. He commanded the cavalry division of the Fifth corps in Cuba from 22 June to the surrender at Santiago, 17 July. Subsequently he was in command of the troops at Montauk Point, L. I., and from 7 October to 3 December was in command of the Fourth Army corps at Huntsville, Ala.

From August 1899 to January 1900 he commanded the 1st brigade, 2d division, Eighth corps, in Luzon, Philippine Islands. On 16 June 1900 he was commissioned brigadier-general, U. S. A., and in June-September commanded the Department of the Lakes. On 16 September he retired from the service. His publications include: 'Account of the Kentucky Campaign' (1862); 'History of the Santiago Campaign' (1898); a 'History of Cuba' (1899), and 8 volumes of Congressional speeches (1883-98).

Wheeler, Nathaniel, American inventor: b. Watertown, Conn., 7 Sept. 1820; d. Bridgeport, Conn., 31 Dec. 1893. He was engaged with his father in the manufacture of carriages, but about 1848 joined Allan B. Wilson in manufacturing sewing machines. In 1852, on the establishment of the Wheeler and Wilson Manufacturing Company, he became its president, and by his practical knowledge of machinery and ability as an organizer soon built up what was then the largest sewing machine factory in the world. Subsequently he served for six sessions in the Connecticut legislature; and invented and patented various improvements in sewing machines, railway cars, heating and ventilating apparatus, and wood finishing processes.

Wheeler, William Adolphus, American lexicographer: b. Leicester, Mass., 14 Nov. 1833; d. Roxbury, Mass., 28 Oct. 1874. He was graduated from Bowdoin in 1853, was engaged in teaching for several years, and subsequently assisted Joseph E. Worcester (q.v.) in the preparation of his 'Dictionary' (1856-9). He was afterward occupied with the revised edition of Webster's 'Dictionary' (1864) for which he compiled 'Explanatory and Pronouncing Vocabulary of the Names of Noted Fictitious Persons and Places, including Familiar Pseudonyms, Surnames, etc.,' which was issued separately in 1865. In 1867 he was appointed assistant superintendent of the Boston Public Library. He left unfinished an encyclopedia of Shakespearean literature and an index to anonymous literature entitled 'Who Wrote It?' The latter, completed by C. G. Wheeler, was published in 1881. He edited Hole's 'Brief Biographical Dictionary' (1866); a 'Dickens Dictionary' (1873); and also 'Familiar Allusions' (1882).

Wheeler, William Almon, American legislator: b. Malone, N. Y., 30 June 1819; d. there 4 June 1887. He was educated at the University of Vermont, and was admitted to the bar in 1845. He was United States district-attorney of Franklin county in 1847-9 and in 1849 was elected as a Whig to the State assembly, but in 1856 he joined the ranks of the then newly organized Republican party. He was a member of the New York assembly in 1858-9, in 1860 was elected to Congress; in 1867 was president of the State constitutional convention; was re-elected to Congress 1869 and served until 1877, taking a prominent part in the adjustment of Southern affairs under the Reconstruction act and settling the political difficulties in Louisiana by the well known "Wheeler Compromise." He was vice-president of the United States under Hayes in 1877-81.

Wheeling, hwe'ling, W. Va., city, county-seat of Ohio county; on the east bank of the Ohio River, in the northern pan-handle and in the same latitude as Philadelphia. It is on the

WHEELLOCK

Baltimore & Ohio Railroad, and its branch lines, including the Ohio River and Cleveland L. & W. railroads recently acquired; the Pittsburg W. & Ky. and Cleveland & P. Railroad of the Pennsylvania system; the Wheeling & L. E. Railroad of the Wabash system; the Ohio River & Western Railroad and the Wheeling Terminal Railway, a belt line connecting all the roads. It is the largest and most important city in West Virginia. The land area is 2,050 acres and it has an elevation of 660 feet above sea-level. Part of the city, a beautiful residential section, is on Wheeling Island, which is over a mile long and contains 400 acres. A historic suspension bridge over 1,000 feet long and a modern steel bridge connect the island (the Seventh Ward) with the main part of the city, and two other steel bridges span the west channel of the river from the island to the Ohio side. Eighty miles of trolley lines in Wheeling and suburbs, place a population of 75,000 in West Virginia, Eastern Ohio and Western Pennsylvania in connection with the city as a commercial centre. It has steamer connections with the Ohio and Kanawha River points and commands a large river trade. Among the features of interest are the Court House and City Hall combined (formerly the State Capitol), the new Government building, the site of old Fort Henry, the only sky-scraper in the state, the Henry Clay monument, Wheeling and Mozart parks.

Business Interests.—The excellent transportation facilities of the city, the large supply of natural gas piped from West Virginia and Pennsylvania fields, the extensive coal fields of the vicinity and the abundance of raw material nearby have served to make Wheeling an important manufacturing city. In 1906 Wheeling had 196 manufacturing establishments, capitalized for \$18,227,622, in which were employed 7,215 persons receiving annual wages of \$3,842,659. The yearly cost of raw material used was \$13,806,723 and the finished products were valued at \$23,297,475. The chief manufactures are iron and steel products, pottery, glass, tobacco products, leather, lumber products, canned goods, beer, wagons and carriages.

Churches, Schools, Charities, Etc.—Wheeling has 42 churches, embracing 13 denominations. It is the seat of the Roman Catholic diocese of Wheeling. Besides a modern public school system, including a high school, opened in 1897, there are the Linsly Institute, Mount de Chantal Academy (R. C.), Saint Joseph's Academy (R. C.), two business colleges, several parish schools, and a public library with 18,000 volumes. Bethany College and the West Liberty State Normal School are located a few miles to the north. The city has the North Wheeling and City hospitals, two private hospitals, several orphanages, a day nursery, and homes for the aged and friendless. There are four clubs occupying their own buildings, three theatres, five daily newspapers, a flourishing Y. M. C. A., which will soon erect a new building, an active Board of Trade, and numerous secret and fraternal organizations.

Banks and Finances.—There are 15 banks, including two trust companies and two National banks. The combined capital in 1906 was \$2,387,000 and the deposits \$17,000,000. The clearings for the year ending 31 Dec. 1905 were

\$41,335,368. The volume of banking business has doubled since 1899. The chief items of expense are for schools, \$130,115.65; gas works and electric light plant, \$125,811.89; water-works, \$97,467.20; fire department, \$58,786.20; police department, \$39,817.38; paying and street maintenance, \$59,901.08; health, \$13,866.50; salaries and miscellaneous, \$44,403.23; interest, \$21,113.39.

Government.—The Mayor, elected for two years, the Council, Chief of Police, City Clerk, Wharfmaster and Board of Education are chosen by popular vote. The Board of Public Works, Water and Gas Boards, Chief of Fire Department, Health Officer, City Collector and minor officials are chosen by the council.

History.—Wheeling was one of the first towns founded on the Ohio River and is supposed to have derived its name from the Wheeling or meandering character of Wheeling Creek. The first settlement was made 1769 by Ebenezer Zane. In 1774 a stockade fort—Fort Henry, named in honor of Patrick Henry—was built here as a defense against the Indians. On 1 Sept. 1777 this fort was attacked by an Indian force of 300, who were repulsed, but 15 of the settlers were killed. In 1781 another attack was made. On 11 Sept. 1782 the fort was again besieged by a force of 40 British soldiers and 260 Indians, who continued the attack for two days, but were forced to abandon the fight. In 1793 the town was laid out by Colonel Zane, and in 1806 was incorporated. In 1836 it was chartered as a city and became widely known as an important trading post on the great National road and the Ohio River. In 1861 Wheeling was made the capital of the "restored government of Virginia" by the people of Virginia opposed to secession. It was the state capital from 1863 to 1870, and again from 1875 to 1885. Pop. (1900) 38,078; (U. S. Census 1910) 41,641.

R. B. NAVLOS,

Secretary Board of Trade.

Wheelock, hwel'ok, Eleazar, American clergyman: b. Windham, Conn., 22 April 1711; d. Hanover, N. H., 24 April 1779. He was graduated at Yale in 1733, and from 1735 to 1770 was pastor of the 2d Congregational society in Lebanon, near Columbia, Conn. In 1754 he opened a missionary school for Indians, known from Joshua Moor, who gave for its use a building and two acres of ground, as Moor's Indian Charity School. This he removed in August 1770 to Dresden (now Hanover), N. H., founding Dartmouth College, to which a charter had been granted in 1769.

Wheelock, John, American educator: b. Lebanon, Conn., 28 Jan. 1754; d. Hanover, N. H., 4 April 1817. He was son of Eleazar Wheelock (q.v.). He entered Yale in 1767, but became a member of the new Dartmouth College at Hanover, N. H., and was graduated with the first class in 1771. In 1775 he was elected a member of the provincial assembly, in 1777 was appointed a major in the New York forces, and soon after lieutenant-colonel in the Continental army. In 1778 he led an expedition against the Indians. In 1779 he was elected president of Dartmouth College and remained there, except two years, till 1817. He bequeathed half his large estate to Princeton Theological

WHEELWORK—WHWELL

Seminary. He published 'Essay on the Beauties and Excellencies of Painting, Music, and Poetry' (1774) 'Sketches of the History of Dartmouth College' (1816); etc.

Wheelwork. See **Clockwork**.

Wheelwright, hwē'rit, John, American Puritan clergyman: b. Lincolnshire, England, about 1592; d. Salisbury, N. H., 15 Nov. 1679. He was a graduate of Cambridge, and vicar of Bilsby, near Alford, Lincolnshire; but in 1636, being driven from his church by Archbishop Laud, he emigrated to Boston, Mass., where the same year he was chosen pastor of a branch of the Boston church at Mount Wollaston, in what is now Quincy. The celebrated Anne Hutchinson (q.v.) was his sister-in-law, and he partook of her views. Differences of opinion led to personal animosities between him and John Wilson, the pastor of the Boston church; and the general court appointed a fast in January 1637, partly to heal these dissensions. On this occasion Wheelwright preached in Boston, and as his enemies asserted, denounced the ministers and magistrates. The general court pronounced him guilty of sedition and contempt, for which in November 1637 he was banished from the colony. In 1638 he formed a settlement on the banks of the Piscataqua, which he called Exeter. After a residence of five years here, the town was declared to be within the limits of Massachusetts, and he removed with a part of his church to Wells in the district of Maine. In 1644 his sentence of banishment was revoked, in consequence of some acknowledgments on his part, and he returned to that colony in 1646, and settled in Hampton. In 1654 he published his 'Vindication.' About 1657 he went to England, where Cromwell, who had been his college classmate, received him cordially; but he returned in 1660, and in 1662 settled as pastor in Salisbury, N. H. His 'Writings,' edited, with a memoir, by C. H. Bell, were published by the Prince Society in 1876.

Wheelwright, John Tyler, American author: b. Roxbury, Mass., 26 Feb. 1846. He was graduated at Harvard College in 1876, studied law and was admitted to the Suffolk bar in 1879. He was acting park commissioner of Boston in 1897. He has published 'Rollo's Journey to Cambridge' (1880, with F. J. Stimson); 'A Child of the Century' (1887); 'A Bad Penny' (1895); etc.

Whelan, hwē'lan, Richard Vincent, American Roman Catholic prelate: b. Baltimore, Md., 28 Jan. 1809; d. there 7 July 1874. He was educated at Mount Saint Mary's College, Emmitsburg, Md., and at the Seminary of Saint Sulpice, Paris, where he was graduated in 1831. He was ordained to the priesthood in 1832, returned to the United States, and in 1832-5 was a professor at Mount Saint Mary's. He was engaged in missionary work at Harper's Ferry and other towns in Virginia and Maryland in 1835-40, and in the latter year was consecrated bishop of Richmond. He built a theological seminary near Richmond, founded schools and academies, built a cathedral at Wheeling, and in various ways greatly improved the condition of his diocese. When the diocese was divided in 1850 he became bishop of Wheeling. The Wheeling diocese then contained but two churches and two priests, with no supplementary institutions of any kind. At his death it

possessed 48 churches, 40 stations for religious services, 29 priests, six academies, four convents, a hospital, an orphan asylum, and a college. He was present at the Vatican Council of 1869-70 and opposed the definition of the dogma of papal infallibility, considering the time inopportune for its definition, but upon its declaration he submitted promptly to the decision of the council.

Whelk, a gastropod mollusk of the genus *Buccinum* and order *Ctenobranchiata*. The large or common whelk (*B. undatum*) is of common occurrence on both sides of the North Atlantic, and is distinguished by the shell having its canal notched, and the mouth or aperture of large size. The whorls of the shell, which has a thick horny epidermis, are few and rounded. In England these animals are largely used for food and bait, and are caught in "creels" baited with garbage, but in America they are not eaten. The eggs are contained in egg-cases, bundles of which are common on the sea-coasts; each capsule contains several eggs, some of which develop and devour the others. The red whelk, or "roaring buckie" of the Scotch (*Fusus antiquus*), belongs to the family *Fusida* (q.v.). The tulip whelk (*Fasciolaria tulipa*) is very richly colored and inhabits the tropical seas. The purple whelk (*Purpura lapillus*) is so named from its affording a part of the dye which made Tyre of old so famous.

Wherry, hwē'ri, William Macky, American soldier: b. Saint Louis, Mo., 13 Sept. 1836. He was educated at the University of Missouri and studied law; served through the Civil War; and was present at the battles of Wilson's Creek, Dallas, Kenesaw Mountain, Atlanta, Jonesboro, Nashville, and at the surrender of Gen. J. E. Johnston. He was brevetted brigadier-general of volunteers in 1865, mustered out of the volunteer service in 1866, and appointed captain in the regular army and subsequently served on frontier duty. In the war with Spain in 1898 he took part in the battle of San Juan Hill, and in the capture of Santiago. He was promoted brigadier-general, U. S. A., 7 Jan. 1899, and was retired the same month. He has published 'Battles and Leaders of the Civil War' (1888-9).

Wherry, a light, shallow boat, for plying on rivers; also a light, half-decked fishing vessel, used in different parts of Great Britain and Ireland.

Whetstone, any stone used for sharpening tools. Sandstones and fine mica schists form the coarser kinds. Silicious clay rocks (lutites) and particularly the fine compact rocks made of quartz-mud (siliclutites), such as the Arkansas stone or novaculite, form the more desirable varieties for oil-stones and delicate hones. See **SEDIMENTARY ROCKS**; **SCHISTS**.

Whewell, hwē'el, William, English scholar: b. Lancaster 24 May 1794; d. Cambridge 6 March 1866. He was graduated from Trinity College, Cambridge, in 1816, and in due course became fellow and tutor of his college. He labored with Herschel, Babbage, and Peacock to raise the standard of mathematics in the university, and wrote text-books which were justly celebrated. From 1828 till 1832 he was professor of mineralogy, and in 1838 was elected

to the Knightbridge chair of moral philosophy, which he held till 1855. In 1841 he became master of Trinity and in this position labored earnestly and successfully to obtain for the natural and moral sciences a better recognized position among the studies of the university. He became fellow of the Royal Society in 1820, and was one of the first members of the British Association, of which he was president in 1841. Whewell was a strong, healthy, clear-headed man, possessed of a vigorous and capacious intellect, and endowed with extraordinary powers of acquiring and retaining knowledge. The extent and variety of his attainments were something wonderful. Yet there was nothing superficial about his learning, notwithstanding the well-known *wit* of Sydney Smith, that "science was his forte and omniscience his foible." Besides other gifts, he built at his own expense, and presented to his college, a *hætel*, or collection of chambers for undergraduates. His principal writings include: *The Bridgewater treatise 'Astronomy and General Physics, considered with reference to Natural Theology'* (1833); *'History of the Inductive Sciences'* (1837); *'Philosophy of the Inductive Sciences'* (1840); *'Novum Organum Renovatum'*; *'Indications of the Creator'*; *'History of Scientific Ideas'*; *'Elements of Morality, including Polity'*; *'Lectures on Systematic Morality'*; *'Architectural Notes on German Churches'*; *'On Liberal Education in General'*; *'Lectures on the History of Moral Philosophy in England'*; *'Philosophy of Discovery'*; *'History of Moral Philosophy'*; *'Platonic Dialogues for English Readers.'* He was the author of the well-known anonymous essay, *'The Plurality of Worlds.'* Consult: Toddhunter, *'Whewell an Account of His Writings'* (1876); *'Life'* by Mrs. Stair Douglas (1881); Clark, *'Old Friends at Cambridge and Elsewhere'* (1900).

Whichcote, hwich'köt, Benjamin, English Anglican clergyman: b. Stoke, Shropshire, 11 March 1610; d. Cambridge May 1683. He was educated at Emmanuel College, Cambridge, took orders in the English Church in 1636, held the living of North Cadbury, Somerset in 1641, and the next year was appointed provost of King's College, Cambridge. He was a leader of the latitudinarian school of English divines, a famous preacher, and one of the Cambridge Platonists. His works, published posthumously, include: *'Observations and Apophthegms'* (1688); *'Moral and Religious Aphorisms'* (1703); *'Sermons'* (1698-1707), etc. Consult: Tulloch, *'Rational Theology,'* Vol. II. (1892); Westcott, *'Essays in the History of Religious Thought'* (1891); Mulhunger, *'History of the University of Cambridge'* (1892).

Whigs, a word of British origin, used for many years to designate an American political party. It had previously been used in America in colonial and revolutionary times to indicate those who were opposed to the attempts of the British Crown to deprive the Americans of their political and commercial rights. It disappeared with the close of the Revolution, and did not appear again until the National Republicans, successors to the Federalists (q.v.), adopted the name of Whigs. Those Whigs who considered the slavery question settled by the compromise of 1850 were called in Massachusetts "Cotton

Whigs," and in New York "Silver Grays." The Whigs continued to exist as one of the two great parties until the election of 1852, which was followed by a division on the slavery issue, the anti-slavery Whigs joining the Republican party, and the others making common cause with the Democracy.

The term was prominent in British political history for nearly two centuries to designate the political party which advocates such changes in the constitution as tend in the direction of democracy. Defoe thus accounts for the origin of the name: "The use of it began then when the western men (the peasantry of the West Lowlands of Scotland), called Cameronians, took arms frequently for their religion. Whig is a word used in those parts for a liquor (whig, Scotch for *whisky*), which the men used to drink . . . and so became common to the people who drank it. It afterward became a denomination of the poor harassed people of that part of the country, who, being unmercifully persecuted by the government, against all law and justice, thought they had a civil right to their religious liberties, and therefore resisted the power of the prince (Charles II.)." Monmouth was sent to quell the insurrection, and "at his return he found himself ill-treated for having used the rebels too mercifully; and Lauderdale told Charles, with an oath, that the duke had been so civil to the Whigs because he was a Whig himself to his heart. This made it a court word, and in a little time the friends and followers of the duke began to be called Whigs."

A different origin is, however, assigned to the term. Sir James Balfour, in writing of an outbreak which occurred in 1648, in his own day, calls the enthusiasts "whiggamores," and Burnet, who was then five years old, offers the following explanation: "The southwest counties of Scotland have seldom corn enough to serve them throughout the year, and the northern parts producing more than they need, those in the west come in the summer to buy at Leith the stores that come from the north; and from a word, whiggan, used in driving their horses, all that drove were called the whiggamores, and shorter, the whiggs. After the news come of Duke Hamilton's defeat (in 1648), the ministers animated their people to rise and march to Edinburgh; and they came up, marching at the head of their parishes, with an unheeded fury, preaching and praying as they came. . . . This was called the whiggamores' inroad, and ever after that all that opposed the court came in derision to be called whiggs; and from Scotland the word passed to England." The Whigs brought about the revolution of 1688-9, and established the Protestant succession; they were chiefly instrumental in obtaining the abolition of the slave-trade and slavery, the repeal of the Test and Corporation Acts, Catholic emancipation, parliamentary and municipal reform, the repeal of the corn-laws, and similar measures. The term Liberals is now generally applied to the representatives of this party; the extreme section of the party, who agitate for sweeping innovations, usually have a more or less close connection with the Whigs, and have adopted the name of Radicals. See POLITICAL PARTIES.

Whin. See FUZZ.

Whin, **Whinstone**, a mining term for intruded igneous or basaltic rocks generally of a firm texture and resistant character. The great Whin Sill of Northumberland is a typical example.

Whin-chat, an European warbler (*Protonotus rubetra*), allied to the stonechat, and is named from its frequenting the neighborhood of whin and furze bushes. It possesses a long white streak, passing across the sides of the head, which, as well as all the upper parts of the body, is colored brown. The lower parts are yellowish. Its song is very sweet, and it has been known to imitate the song of other birds.

Whip or **Coach-whip Snake**, a light brown harmless snake (*Zamenis flagelliformis*) with whitish tail, closely related to the blacksnake. It is found in the southern United States and Mexico, and is especially abundant in Texas. Its name is given it on account of its general appearance; and the more ignorant Indians and negroes believe it will whip or lash its adversary with its tail. It runs with the utmost swiftness, and has the general habits of a blacksnake (q.v.). A group of very slender poisonous African and Asiatic tree-snakes, the *Dipsosaurus*, are called whip-snakes in some books. They are elapine and poisonous, and conceal themselves aided by their leaf-green color, in bushes where they dart upon birds, lizards, insects, etc., unsuspecting of their presence.

Whipping Post, a punishment inflicted by the law of England, and also in the State of Delaware, chiefly for minor offences. The criminal law in England enumerates several offences for which the punishment may be inflicted on males under 16. A subsequent act enacts that when the offender is under 14 the number of strokes is not to exceed 12. In Scotland no person above 16 is to be whipped for theft or crime committed against person or property. In Delaware robbery, theft, and other crimes are punished by whipping. See also **FLAGELLATION**.

Whipple, hwip'l, **Abraham**, American naval officer: b. Providence, R. I., 1733; d. near Marietta, Ohio, 29 May 1819. In the French and Indian war he commanded the privateer *Gamecock* and on one cruise alone captured 23 prizes. He was in charge of the expedition which on 8-9 June 1772 destroyed the British armed schooner *Gaspee*, commanded successively the *Columbus*, the schooner *Providence*, and the frigate *Providence*, and from 1775-9 with the schooner *Providence* took more prizes and destroyed more vessels than any other commander in the colonial service. With the frigate *Providence* he evaded British surveillance and succeeded in getting to sea with important despatches for France, and in 1779 performed the daring exploit of capturing 10 vessels from a merchant fleet of nearly 150 sail, eight of which reached Boston safely, and brought \$1,000,000. He commanded the naval forces at Charleston, S. C., in 1780, but was captured and held a prisoner until the close of the war. He commanded the vessel which in 1784 unfurled the first American flag on the river Thames.

Whipple, Edwin Percy, American author and critic: b. Gloucester, Mass., 8 March 1819; d. Boston 16 June 1886. After a secondary education, he began writing for newspapers, in

1837 became a clerk in a Boston brokerage office, and from 1837 to 1860 was superintendent of the reading-room of the Merchants' Exchange. In 1843 he first attracted attention by a critical panegyric on Macaulay in the Boston 'Miscellany,' and in October of that year entered upon his successful career as a lecturer, chiefly on literary topics. He contributed much to reviews and journals, publishing in 1848-9 two volumes of 'Essays and Reviews,' including discussions of 'English Poets of the 19th Century,' 'Byron,' 'Rufus Choate,' and 'Henry Fielding.' In 1872-3 he was literary editor of the Boston *Globe*, a newly-established daily. The greater part of his work is composed of essays on literature and authors, though he treated of other subjects with an almost equal discrimination. His 'Literature of the Age of Elizabeth' (1876) probably shows him to best advantage, though his estimates of the moderns are also painstaking and for the most part just. His characterizations were penetrative, and at times very effectively expressed. He lacked, however, to a large extent, originality and power, and Whittier's declaration that "with the possible exception of Lowell and Matthew Arnold, he was the ablest critical essayist of his time" cannot now be accepted. Among his further publications are: 'Literature and Life' (1849), a small volume of lectures; 'Character and Characteristic Men' (1866); 'Success and its Conditions' (1871). Three books appeared posthumously, 'Recollections of Eminent Men, with Other Papers' (1887), with an introduction by C. A. Bartol; 'American Literature and Other Papers' (1887), with a brief introduction by Whittier, and containing the centennial review of American literature written in 1876 for 'Harper's Magazine'; and 'Outlooks on Society, Literature and Politics' (1888). Consult papers by T. W. Higginson in the 'Atlantic,' Vol. lviii. 345, and by T. W. Hunt in the 'Bibliotheca Sacra,' l. 30.

Whipple, Henry Benjamin, American Protestant Episcopal bishop: b. Adama, Jefferson County, N. Y., 15 Feb. 1822; d. Faribault, Minn., 16 Sept. 1901. Ill health prevented his entering college, for which he had prepared, and he engaged in business for several years. In 1847 he began a theological course privately, took priest's orders in the Episcopal Church in 1850 and was rector of Zion Church, Rome, N. Y., 1850-7 and of the Church of the Holy Communion, Chicago, 1857-9. In October 1859 he was consecrated first bishop of Minnesota. He very soon afterward organized the Seabury Mission at Faribault, out of which have since been developed the cathedral of Our Merciful Saviour, Seabury Divinity School, the Shattuck School for boys, and Saint Mary's Hall, a school for girls. Bishop Whipple was widely known as "the apostle to the Indians" on account of his labors among them both for their material as well as spiritual welfare. By the Indians themselves he was called "Straight Tongue." He thoroughly understood the Indian character and at the time of the Sioux massacre in 1862 insisted that the trouble came directly from the false dealing of the whites with the Indians. In 1876 he secured the Sioux treaty, opening up the best portions of Dakota to white settlement, and his advice in regard to Indian affairs was sought by every President from Lincoln to McKinley. In his 'Lights and Shadows

of a Long Episcopate' (1899) the character of the Indian problem will be found very fully treated. Bishop Whipple traveled extensively and was well known and highly regarded in England, while in his own country he was beloved and respected by men of every creed.

Whipple, Squire, American civil engineer: b. Hardwick, Mass., 24 March 1804; d. Albany, N. Y., 15 March 1888. He was graduated from Union College in 1830 and engaged in canal and railway surveying. He patented in 1840 an iron bridge truss of the bowstring type, several of which were built over the Erie Canal. After 1852 he built several bridges known as the "Whipple trapezoidal type," and in 1872 took out a patent for a lift drawbridge, one of which was built over the Erie Canal at Utica. He wrote: 'The Way to Happiness' (1847); 'Treatise on Bridge Building' (1847); and 'The Doctrine of Central Forces' (1866).

Whipple, William, American soldier and politician: b. Kittery, Me., 14 Jan. 1730; d. Portsmouth 28 Nov. 1785. Before 1751 he was captain of a merchantman trading with the West Indies and making voyages to Africa for slaves. But in 1759 he set up as a merchant at Portsmouth, and in 1775 was chosen a delegate to the New Hampshire provincial congress. He was also made a member of the provincial council of safety. In January 1776 he was elected to the Continental Congress, continuing to hold his seat until September 1779, and signing the Declaration of Independence. As brigadier-general of New Hampshire troops, he commanded a brigade in the operations against Burgoyne in 1777, and assisted in negotiating the terms of the surrender of the British general. Commanding the New Hampshire forces, he co-operated with Sullivan in the campaign against the British in Rhode Island in 1778. From 1782 to 1784 he was superintendent of finance for New Hampshire, and from 1782 until his death a judge of the superior court. He was president of the commission for the adjustment of the dispute between Connecticut and Pennsylvania regarding the Wyoming Valley region.

Whippoorwill, a North American night-jar (*Antrostomus vociferus*). In this genus the rictal bristles are greatly developed and reach far beyond the tip of the small, weak bill, and sometimes they are fringed. The nostrils are not tubular as in *Nyctidromus*. The whippoorwill is 10 inches long with a spread of wings of about 18 inches, the rictal bristles are simple, the tail long and rounded, and the soft lax plumage closely and delicately mottled with gray, black, white, and yellowish brown, the female with the tips of the outer tail-feathers tawny, the same parts in the male white. These birds inhabit the United States and British provinces east of the plains, and breed, chiefly northward, throughout most of this area. Being migratory they reach the Middle and New England States in May. The whippoorwill is a strictly nocturnal bird, but usually becomes quiet by midnight except on moonlight nights when they continue active till dawn, but at all times they are most vociferous during the early evening. The song is a clear, energetic whistle, aptly syllabified in the name, strongly accented on the last syllable, and is repeated many

times; then, after a short pause, begins anew. They fly noiselessly in pursuit of flying insects, skimming low over stone walls and bushes or even alight on the ground to pick up a beetle or other insect. Large moths, night-flying beetles, and insects frequenting forest borders are their chief food. As they pass close to a person at night they are heard to utter a low murmuring sound. Unlike the great majority of birds they always perch along and not across a bough, a peculiarity which they share with other weak-footed birds. Whippoorwills do not fly abroad during cloudy days like the night hawk, and as a consequence their appearance is unknown to many persons to whom the song is quite familiar. No nest is made and the two elliptical creamy white eggs marked with brown and lavender are laid in a depression on the bare ground or a log. When danger threatens, the old birds often carry the eggs or young in their mouths to a place of safety. A much larger species of similar colors and habits, but more southern in its range, is the chuck-will's-widow (*A. carolinensis*) (q. v.). In this species the rictal bristles are provided with lateral filaments.

Whiptail Scorpion. See SCORPION.

Whirligig Beetle. See WATER-BEETLE.

Whirlpool, a circular eddy or current in a stream or the sea, produced by the configuration of the channel, by meeting currents, by winds meeting tides, etc. There are some very celebrated whirlpools, such as Charybdis, in the strait between Sicily and Italy; and the Malström, off the coast of Norway. When agitated by tides or winds they sometimes become dangerous to navigators. These are not, however, whirlpools in the strict sense, which are indeed very rare, but merely superficial commotions created by winds meeting tides, and in calm weather are free from all danger.

Whirlwind. See CYCLONE; SIMOON; WATER-SPOUT.

Whisky, the name applied to a well-known liquor distilled from barley, wheat, oats, and other grains; potatoes, beet, and other roots, and subsequently refined, colored and flavored by various processes. Whisky from malt alone is made in the Scotch distilleries as follows: The malt is bruised upon cylinders, and the quantity intended to be mashed is put into the mash pan, water at a temperature of about 170° F. being then added. After two or three hours' agitation the whole is left to repose for an hour and a half, and then the worts are drawn off to about one third of the water employed. About two thirds of the first quantity of water of a somewhat higher temperature is put into the pan, and the agitation is renewed for about half an hour. After a second period of repose these second worts are drawn off. Both infusions are now cooled down as quickly as possible to the temperature of 80° or 70° to prevent souring; the wort is cooled down by being exposed in shallow coolers to currents of air, or by being passed through serpentine tubes surrounded with cold water. More water may be let into the pan, and a third wort drawn off, which may be fixed with the other worts, or used instead of water for the first infusion of malt. The quantity of saccharine matter con-

WHISKY

verted into alcohol depends upon the proportion of ferment or yeast introduced into the worts; if too little be used, a portion of the sugar will remain undecomposed; if too much, the spirits will have an unpleasant taste. Generally the worts are let down at the specific gravity of 1.050 or 1.060, and at a temperature of 60° to 50°. For every 100 gallons a gallon of good porter yeast is added and thoroughly incorporated by agitation. An hour after the addition of the yeast fermentation begins to show itself by a ring of froth around the edges of the vat, and in about five hours frothy bubbles cover its whole surface. Large vats generally afford a better result than small ones, owing to the equality of the fermenting process. It is considered good worts when the specific gravity comes down to that of water and superior worts when it falls to 0.995. In about 48 to 60 hours the wash begins to get clear and comparatively tranquil, and is then ready for distillation. In its simplest form the still consists of a copper boiler into which the wash is poured. This vessel is furnished with a close head terminating in a bent tube which passes in a spiral form through a vessel filled with cold water. (See DISTILLATION.) On the application of heat to the still the spirit begins to rise in vapor at 175°, along with more or less steam. These vapors are condensed in passing through the spiral tube, and trickle in fluid form into a receiver. The product of this first distillation is called low wines. This is again distilled at a lower temperature, which gets rid of part of the water and of the fetid oils that had come over with the alcohol. Great purity and strength can only be obtained by repeated distillation. The casks or packages into which these spirits are put are never charred, as in America, but preference is given to empty wine or rum casks which impart both flavor and color, and when plain casks are used, flavoring and coloring is accomplished by means of blending wines. If nothing whatever is added to the spirits which are put in plain casks, the coloring and flavoring is attributable to the tannic acid extracted from the wood, and the oxidation of the aldehydes in combination with the ethyl alcohol.

In the United States, Kentucky, Maryland, and Pennsylvania whiskies, or those represented to be such, constitute the majority of those consumed for drinking purposes, either medicinal or otherwise. Kentucky whiskies are known as Sour Mash, Sweet Mash and Bourbons, and Pennsylvania and Maryland whiskies as Eastern Ryes. At the head of the various processes of distillation, for excellence of quality of the spirit produced thereby, stands that known as "fire copper," which is the method that originally established the high reputation of whisky in these States; those since employed, while giving a larger yield of spirit to the bushel of grain, procure it at the expense of the quality and flavor thereof. In this process the corn and rye meals are scalded or mashed with hot spent beer, which is the liquid residue of the previous distillation. The mash is then allowed to cool to the proper temperature, when malt is added, and the mash, diluted with a sufficient quantity of water, is left to ferment the time established by law. The diluted mash when fermented is called beer. The beer is distilled in three different ways. In the very smallest distilleries, it is

sometimes boiled in copper stills, over wood fires; the vapor, passing through a copper coil or worm, immersed in cold water, is condensed and delivered into a receiver. The condensed liquid is called low wines, or singlings. Singlings contain only a small amount of spirit. This manner of boiling the beer is seldom used, as the large quantity of grain contained in the beer makes it apt to cake in the still, and, becoming scorched, it gives the whisky a strong, smoky flavor, a very little of which, however, is not considered objectionable. The singlings are doubled or again distilled in small copper stills, or doublers, over wood fires, and the vapor again condensed in a copper worm, whence it is delivered into the receiving cistern. Another name for doublings is highwines. The usual way of distilling sour mash whisky is to boil the beer in a wooden still by admitting steam, the vapor being condensed into singlings; the singlings are doubled as above. In the third way, the beer is boiled in a copper still, by steam confined in a copper pipe, placed inside of the still. The singlings are doubled in small copper stills, over wood fires, in the same manner described. This latter way is considered a great improvement, as it avoids both the scorching of the grain in distilling the beer and the admission of live steam, while it preserves all the characteristics so highly prized in "sour-mash, fire copper" whiskies. The yield by the sour-mash process is from two to three gallons to the bushel of grain.

Most whisky is made by the process known as "steam." In this the corn and rye meals and malt are mixed with water in the mash-tub, where they are scalded with direct or live steam, introduced by means of a perforated pipe at the bottom of the tub. When fully scalded, the mash is cooled down and run into the fermenting tubs. Fresh yeast is used in fermenting, which gives the name of "sweet mash." The still is made of wood and divided into two or three compartments. When the still is charged, a certain amount of beer is placed in each compartment, live steam is admitted into the lower, which boils the beer, and the vapor from it ascends through a curved pipe into the compartment above, where its continued reception boils the charge therein contained; the vapor from this again ascends into the next compartment above, where the same process is repeated. The vapor then passes through a pipe into a wooden doubler, where it boils the low wines; and the vapor arising thence passes into a copper worm, where it is condensed and then run into the whisky cistern. Only one worm is used and one condensation made. Highwines, as well as whisky, are manufactured by this process. The yield is from three and a half to four and a half gallons. In making whisky by the "steam copper" process, the mash is made and fermented and the beer boiled, in the same manner as for the "steam" process. The same wooden still is used; but, instead of the vapor from the upper compartment passing directly into a wooden doubler, it is run through a worm and condensed into singlings, which are doubled in a copper still by live steam, or by steam confined in a jacket around the still, or sometimes by fire underneath.

In locating a distillery a full supply of clear, bright water, that contains the proper chemical

WHISKY

qualities, is the first consideration. It is well known to both chemists and practical distillers that water containing a large quantity of sulphate of lime, earthy carbonates, and no organic matter, is best adapted to distilling. The lime and carbonates being dissolved in the acid generated during the fermentation of the mash, mostly pass off in the form of carbonic acid gas, and leave the water soft and best suited for extracting the active properties of the malt and grain. Great care has to be taken in the selection of the grain to have it well developed and sound. Musty or unsound grain is fatal to the production of fine whisky, and its defects become more prominent as the whisky increases in age. Those distillers most careful to manufacture only fine goods use the grain that is grown in their own section of the country, in order to have both the grain and water spring from the same kind of soil. Successful fermentation requires of the distiller not only constant attention, but also extensive knowledge both of the principles of chemistry and of practical results. It is exceedingly injurious to allow the fermentation to be prematurely concluded or to proceed too long. As a general rule, the slower the fermentation and lower the heat at which the distillation is carried on, the finer and purer will be the spirit. The mash being made and fermented, and the beer distilled by whatever process, the whisky is collected in the cistern, and thence run into barrels, under the control of the United States inspector, and in the custody of the United States storekeeper, who has also charge of it while in the bonded warehouse, till the tax is paid. Barrels, and the cooperage thereof, require much attention, and must be made of well-seasoned oak. For high-wines they are not charred, but for whisky they should be well charred, as the char has some peculiar chemical effect on the character and ripening of the whisky that is very desirable.

The subsequent purity of the product depends largely upon the care exercised by the distiller in stopping the distillation when the temperature of the vapor rises above the boiling point of ethyl alcohol and water and certain flavoring bodies depending upon the material employed.

The process of fermentation which precedes that of distillation produces a number of alcohols radically different from ethyl alcohol (which, with water, is the body of whiskies) and which seriously serve to contaminate the product. These are usually referred to by the distiller in America as the "heads" and "tails," because the former have a lower boiling point than that of ethyl alcohol, and the latter a higher boiling point, as a result of which a careful distiller can separate them from the main body of the distillate which is to be preserved.

In England these heads and tails are called "feints." Among these is fusel oil, from which it is very desirable that the spirit should be freed as soon as possible. This may be partially accomplished by the action of charcoal and heat, which are the principles underlying the barrel-charring process of refinement and maturation. If, however, the fusel oil contents are too large to start with, they will never be sufficiently reduced by such process to make the product wholesome and palatable. In such case, they can only be removed or reduced by a subsequent process of rectification, including redis-

tilling and the passage of the spirits through leach tubs. It follows, therefore, from the process of manufacture, that the fusel oil contents or percentage of impurities is not fixed or constant, and this fact led to the process called blending. Under the present system of Internal Revenue Laws in the United States distilled spirits can be sold only by one who qualifies thereunder as a wholesale liquor dealer, and such person may also be a rectifier. A rectifier is one who rectifies, purifies, or refines distilled spirits, or who merely mixes without refining. Whenever it is found that whisky which has been subjected to the barrel-charring process still contains an excessive quantity of fusel oil, or has acquired an excessive quantity of tannic acid, it can only be corrected by redistillation or other rectifying processes or by the addition thereto of ethyl alcohol and water (termed for commercial purposes either "neutral spirits" or "cologne spirits") which contains no fusel oil and no tannic acid. One effect of charring a barrel is to produce a coating of a gummy, resinous substance beneath the char and next to the hard wood which is classed as caramel and which not only imparts a flavor, but produces about two thirds of the color usually obtained by spirits which have been stored in such a barrel for a length of time. The other one third of the color is imparted by the tannin or flavescin which the spirits extract from the wood.

Since neutral spirits are seldom put in charred barrels, they retain their original color, which is water white, and when they are mixed with the whisky which has been colored, it necessarily lightens the color which has to be restored by the addition of plain caramel. Harmless flavorings are sometimes added to modify or soften the effect of the tannin, which is a severe astringent. On account of their diminished toxicity, smoothness which sometimes results from the addition of sugar, and improved flavor which results from diluting or diminishing the tannic acid, acetic acid, and fusel oil, blends are considered by some more desirable than a simple whisky.

The bulk of the so-called straight or simple whiskies in America are made by adding water to the high wines or doublings in the receiving cistern until they are reduced to "100 proof" or "proof,"—approximately half ethyl alcohol and half water,—and then storing them in charred barrels.

High wines contain higher alcohols known as "impurities," created during the process of fermentation. If these impurities are removed from the high wines, the spirit is then termed "neutral," but that term is properly applied to it only so long as it is kept in its original condition, free from any coloring or flavoring matters. To insure this result, neutral spirits are stored in paraffined or waxed barrels. Neutral spirits when put into charred barrels are converted into whisky, but milder in flavor and less fiery than whisky produced from high wines. Being unsuitable for blending purposes, such whisky is seldom produced in America, although all foreign whiskies partake more of its characteristics than of whisky produced from high wines.

The recent custom of steam-heating warehouses in which whisky in charred barrels is

WHISKY FRAUDS--WHIST

stored, increases the proof very materially. If kept in damp storage, the proof would diminish. Whisky ranges in proof from 70 to 120, but all spirits that have been subjected to the process usually recognized as producing whisky, are considered whisky without reference to their "proof."

No standard for whisky is created by the Federal laws, but many of the states have adopted the standard laid down in the United States Pharmacopœia, which requires that whisky for medicinal purposes should be approximately from 88 to 110 proof, should contain no more than traces of fusel oil from grain and oak tannin from casks, a stated limit of free acid, and show a residue from 100 C. C. evaporated on a water bath and dried at 212 F. of not more than 0.5 Gm. Blended whiskies more nearly meet these requirements than straight whiskies.

Whisky, whether called "straight" or "blended" is composed of approximately half water and half ethyl alcohol, plus a color and a flavor, and the only substantial difference between the two consists in the percentage of fusel oil and tannic acid, which exist in straight whiskies in a larger amount than in blended whiskies.

According to the report of the Commissioner of Internal Revenue for the fiscal year ended 30 June 1910, grain to the amount of 29,327,437 bushels was consumed in the manufacture of whisky, the product of which for that year in the United States amounted to 156,237,526 gallons.

Whisky Frauds. The, in American civil history, a national internal revenue scandal, which reached its climax in 1874 through the efforts of Secretary of the Treasury D. H. Bristow. Statistics showed that for some years prior to 1874 the United States had, in St. Louis alone, lost at least \$1,000,000 of revenue which it should have received from whisky, yet special agents of the Treasury set to work from time to time had failed to do more than cause an occasional flurry among the thieves. The Whisky Ring was organized in St. Louis when the Liberal Republicans there achieved their first success. It occurred to certain politicians to have the revenue officers raise a campaign fund among the distillers. This idea the officers modified later, raising money in the same way for themselves, and in return conniving at the grossest thievery. As it became necessary to hide the frauds, newspapers and higher officials were hushed, till the ring assumed national dimensions. Its headquarters were at St. Louis, but it had branches at Milwaukee, Chicago, Peoria, Cincinnati, and New Orleans, and an agent at Washington. A huge corruption fund was distributed among gaugers, storekeepers, collectors, and other officials, according to a fixed schedule of prices. As a result of the investigation by Secretary Bristow arrests were made in nearly every leading city. Indictments were found against 152 liquor men and other private parties, and against 86 government officials, notably the chief clerk in the Treasury Department, and Gen. Grant's private secretary, Gen. O. E. Babcock.

Whisky Insurrection, a popular name given to a local outbreak in opposition to the

excise laws passed by Congress 3 March 1791. General objections were urged against the measure and in western Pennsylvania the inhabitants considered the tax an unfair discrimination against their particular region and raised an insurrection. It became necessary for President Washington to call out an army of 15,000 militia to subdue the rebels, who dispersed without bloodshed.

Whispering Gallery, a gallery or dome of an elliptical or circular form, in which faint sounds conveyed around the interior wall may be readily heard, while the same are inaudible elsewhere in the interior. Thus, in an elliptical chamber, if a person standing in one of the foci speak in a whisper, he will be heard distinctly by a person standing in the other focus, though the same sound would not be audible at the same distance under any other circumstances, or at any other place in the chamber. There is a whispering gallery in the Capitol at Washington, one at Saint Paul's Cathedral, London, and another at Gloucester Cathedral, England.

Whist, a well-known game at cards, first clearly described by Edmond Hoyle (q. v.) in his 'Short Treatise on the Game of Whist' (1743). The game is played with the full pack of 52 cards by four persons, two being partners against the other two, each player receiving 13 cards dealt out one by one in rotation. The last card dealt is turned face up, and is called the trump card; it gives a special power to the suit to which it belongs. The cards rank as follows: ace (highest), king, queen, knave, and the others according to their number of pips. Play is commenced by the person on the left hand of the dealer laying down a card face up on the table, the other players following in succession with cards of the same suit if they have them. When all have played the player who has the highest card takes the four cards laid down, which constitute a trick. The winner of the trick then leads, as the first of a new trick, the winner of which becomes the leader, and so on. When a player cannot play a card of the same suit, he may play one of the trump suit, and take the trick, or lay one of a different suit, which gives him no chance of winning the trick. When the hand is played out the score is taken as follows: the partners who conjointly gain the majority of tricks score one point for every trick taken above six. The ace, king, queen, and knave of the trump suit are called honors, and count one each for the side which holds them; if one side hold three honors, they count two by honors, as the opposite side can have but one; if one side hold all the honors, four by honors is counted; should the honors be equally divided neither side counts, the honors being then said to cancel each other. In long whist, an obsolescent form of the game, 10 of these points made a game. In short whist, the game now generally played, the number has been reduced to five, and in this form it is common to count by tricks alone. A rubber consists of a series of three games, and is won by the side that secures two of them. Should one party gain two games in succession, the third of the rubber is not played. In duplicate whist the hands played are preserved and replayed by the opposing side.

Whistle-wood, a North American maple-tree (*Acer pennsylvanicum*). It is a small tree, or sometimes only a shrub, common in the mountainous districts of the eastern United States and Canada. Generally it is found in thicket-like young woods, growing in damp rocky soil. The flowers are in long axillary racemes, and bloom late in spring, drooping under the branches. They are succeeded by strings of the two-celled winged fruit of a yellowish green tint. They dangle there all summer. The slender trunks are olive-green, when older becoming a reddish-brown in color, striped with short, delicate streaks of white pigment, which may be scraped off, and for this reason the tree is often called striped maple; it is, however, also known as moose-wood, since the deer are fond of the young shoots when the sugary sap is flowing. The bark is easily stripped off the young branches, leaving white withes from which country folk make whistles. Other whistles are made from the bass-wood (*Tilia americana*), and the name is given in Great Britain to the mountain-ash (*Pyrus*) and to the common and sycamore-maples.

Whistler, hwhs'lér, James Abbott McNeill, American artist: b. Lowell, Mass., 10 July 1834; d. London 17 July 1903. In 1851 he was appointed to the West Point Military Academy, which he left in 1854; and in 1854-5 was a draughtsman in the Coast and Geodetic Survey. This employment he soon quitted, going to England and thence to Paris, where in 1855-7 he was a pupil in the studio of C. G. Gleyre, an artist of Ingres' school who "never drew a line without having first assured himself how Raphael would have proceeded." Previous to the series generally styled the "French Set," Whistler is known to have etched three plates, and other early attempts were almost certainly made. The "French Set," renderings of figures, street scenes, and interiors, appeared in 1858 (published by Delâtre)—12 plates, with an etched title. But a few copies were printed. In 1863 Whistler went to London and settled in Chelsea. During his earlier days there he completed the 'Thames Set' of etchings, 16 in all, treating of the craft of that stream and the quaint buildings along its edge. Some rare prints of these, generally considered superior, were made before their publication in 1871. 'The Pool' and 'Black Lion Wharf' are among the best of them. He exhibited his paintings quite frequently at the Royal Academy, one of the earliest being 'At the Piano,' purchased by the Scottish painter John Phillip for 30 guineas. In 1872 the 'Arrangement in Gray and Black' ('The Painter's Mother'), now in the Luxembourg Gallery, was accepted by the Academy only on the insistence of Sir William Boxall. Whistler sent other pictures, such as 'The Last of Old Westminster,' and 'Symphony in White III,' but he could not agree with the management of that institution, long before his death ceased to exhibit there, and was never made A.R.A. Some of his best work was shown at the Grosvenor Gallery, opened by Sir Coutts Lindsay in 1877, including famous portraits, 'Irving as Philip II' and the 'Arrangements,' 'Harmonies,' and 'Nocturnes,' novel in title and character. It was in 1877 that Ruskin wrote of the 'Nocturne, Black and Gold' ('The Falling Rocket'), then at the Grosvenor: "I have seen and heard much of cockney impudence be-

fore now, but never expected to hear a concomb ask 200 guineas for flinging a pot of paint in the public's face" ('Fors Clavigera'). Then ensued the diverting Ruskin suit, brought for libel by the artist and heard in November 1878. The verdict was for the plaintiff, and the farthing assessed for damages Whistler afterward wore on his watch chain. The costs against Ruskin, £306 12s. 4d., were met by a public subscription. Whistler followed up the affair by his pamphlet, 'Art vs. Art-Critics,' in which he first proved his cleverness in controversial satire. He preferred to exhibit his works under conditions which he could himself direct, and gave a special exhibition in 1874. Others, of either prints or paintings, were held in the rooms of the Fine Arts Society in 1880, 1881, 1883, 1884, and 1886. At the International Society, Knightsbridge, he always had chief place. He became a member of the Royal Society of British Artists in 1884, and in 1886 some "revolutionary members" made him its president. His administration improved the artistic quality of the exhibitions, but was not commercially successful; and in 1889 he failed of re-election and many of his following resigned. His explanation was characteristic: "It is all very simple. The Royal Society of British Artists has disintegrated—the 'artists' have come out, the 'British' remain." He failed for a long time of the recognition he merited, but latterly many distinctions were conferred upon him. He was a member of the Legion of Honor and the Bavarian Order of Saint Michael, member of the Munich, Rome, Dresden, and other academies, in 1900 received the unusual award at the Paris exposition of the gold medal for etching and also for painting, and in 1902 the gold medal of honor from the Pennsylvania Academy of Fine Arts. By many Whistler's etchings have been ranked as the consummate product of his art, classed with those of Rembrandt, and even said to surpass the world's greatest etcher in the process of selecting essentials and a certain subtlety in execution. He did not keep a set of proofs or memoranda of his work, and it is as yet impossible to make a complete list of his etchings. The first catalogue of them appeared in 1874. Wedmore gave 214 in 1886, 268 in 1889; a supplement to Wedmore increased the number to 372. It is probable that with the search certain to be made the list will be brought up to more than 400 prints. It has been said, and probably with much justice, that while Rembrandt chose greater subjects, only a comparatively small part of the total number of his plates is sought by collectors, but all of Whistler's are highly esteemed by connoisseurs. "There are no failures," declares one writer; some are sketchier than others, but all are genuine expressions of Whistler's art. Whistler used an increasing economy of means; the 'First Venice Set,' published by the Fine Arts Society in 1880 (12 plates), and the 'Twenty-six Etchings' (1886), principally of Venetian subjects, though including some English also, show in this respect great difference from the 'French' and 'Thames' sets. The unflinching characteristics of the etchings are precision and flexibility of line, and remarkable picturesqueness in the rendering of shade and light. Their observation and their technical skill are alike noteworthy. Of the single plates may be men-

tioned 'Joe,' 'Little Putney,' 'Battersea Bridge,' 'Old Chelsea,' and 'Speke Hall.' Examples are to be seen in many important public collections, including the Venice Academy, Bibliothèque Nationale, British Museum, the New York Public Library, and the Dresden Gallery. In dry-point and lithography, too, Whistler was very successful. His first lithographs he made in 1877, and he greatly perfected the art. His London exhibition of 1883 contained, besides etchings, a number of dry-points; in 1896 about 70 lithographs were shown at the Fine Arts Society. The Way catalogue, no longer in print, and claiming to include all those printed down to 1897, gave 130, to which at least eight must further be added. The list of nearly 400 etchings and dry-points and 138 lithographs, known to be in existence, reveals a large amount of work, even supposing that the artist had done nothing else. In pastel and water-colors Whistler wrought sparingly, although some of the Venetian pastels are the equals of anything yet attempted in that medium. His creed as a painter he stated in two series of 'Propositions,' and the lecture 'Ten O'Clock' first given in London 20 Feb. 1885. One of the propositions was that a painting had "no mission to fulfil," but was a "joy to the artist, a delusion to the philanthropist, a puzzle to the botanist . . ." Critics he thought a herd of ignoramuses; but they had their utility — "they keep one always busy, always up to the mark, either fighting or proving them idiots." For a long time in London he was better known for his pugnacity than for his art. His arrogance, his mordant wit, his sparkling bon-mots, his striking individuality — these were sooner recognized than his genius. He had in oils a broad range of subjects. There are the numerous portraits; marines ('Valparaiso Harbor'; 'Blue Wave — Biarritz'; 'The Ocean'); and landscapes of many sorts, especially those interpretative of night. His method was to apply many coats of thin color instead of one or a few of greater consistency; this guarantees to his work a superior permanence. He was above all the colorist, and in pure line and color harmonies has been called one of the supreme artists. His work has repeatedly been compared to that of Velasquez, but study shows very important dissimilarities, and Whistler must remain unique. He borrowed somewhat from Oriental art, though always subordinating these elements to his own ends. Among portraits not referred to is that of Carlyle, now in the Glasgow Museum, of which the philosopher observed, "Weel, man, you have given me a clean collar, and that is more than Meester Watts has done", and Sarasate (Pittsburg Academy). Whistler did also some work in interior decoration, such as the music-room of Sarasate (Paris) and the "Peacock-room" for Mr. Leyland (London). Many fine examples of his paintings are in American galleries, public and private. His place in the history of art cannot yet be estimated, but he may safely be put among the greatest painters of the 19th century. No 'Life' has as yet (1904) appeared, and recourse must be had to his own writings, to the extensive periodical literature concerning him, and to the discursive but interesting 'Recollections and Impressions' by Eddy (1903) and Menpes' 'Whistler as I Knew Him' (1904).

Whistlewing, or Whistler, a duck. See **GOLDEN-EYE.**

Whiston, hwis'ton, William, English mathematician and Anglican clergyman: b. Norton, Leicestershire, 9 Dec. 1667; d. London 22 Aug. 1753. He took his degree at Clare Hall, Cambridge, in 1690, and in 1691 was elected to a fellowship there. He was ordained a deacon in 1693, was appointed chaplain to the Bishop of Norwich, and in 1698 became vicar of Lowestoft, Suffolk. He was appointed deputy professor of mathematics to Newton at Cambridge in 1701, and in 1703, upon Newton's resignation, succeeded to the Lucasian professorship. He continued to preach, but having given expression to Arian views, was in 1710 summarily expelled from his professorship and the university. He removed to London where he published 'An Historical Preface to Primitive Christianity Revived' (1711). He was thereupon prosecuted for heresy, but after proceedings lasting five years, was permitted to remain in the English Church. He subsequently engaged in lecturing upon scientific subjects, being among the first to introduce lectures with experiments in London. He founded in 1715 a society for the promotion of Primitive Christianity, the meetings of which were held in his home, and afterward became a Baptist. He made a translation of Josephus (1737) which ran through many editions and wrote: 'New Theory of the Earth' (1696); 'The Accomplishment of Scripture Prophecies' (1708); 'A New Method of Discovering the Longitude' (1714); 'The True Origin of the Sabellian and Athanasian Doctrines of the Trinity' (1720); 'The Testimony of Philegon Vindicated' (1732); 'The Longitudes Found by the Ellipsis of Jupiter's Planets' (1738); 'Memoirs' (1749); etc.

Whitaker, hwit'a-ker, Alexander, American clergyman: b. Cambridge, England, 1585; d. Henrico County, Va., after 1613. He was graduated from Cambridge, was for some years rector of a north of England parish, settled in Henrico County, Va., in 1611, and was active in missionary work. He baptized Pocahontas, and officiated at her wedding. He wrote 'Good News from Virginia,' one of the first books written in the colonies (1613).

Whitaker, John, English Anglican divine: b. Manchester about 1735; d. Ruan-Longhorne, Cornwall, 30 Oct. 1808. He was educated at Oxford. In 1771 he published a 'History of Manchester,' and in refutation of Macpherson's theory that the modern highlanders were descendants of the Caledonians of Tacitus, wrote his 'Genuine History of the Britons' (1772), maintaining that they were descended from an Irish colonization which followed the Roman invasion. In 1778 he was presented by his college to the rectory of Ruan-Longhorne. His most important works are: 'Sermons upon Death, Judgment, Heaven, and Hell' (1783); 'Mary, Queen of Scots, Vindicated' (1787); 'The Origin of Arianism Disclosed' (1791); 'The Course of Hannibal over the Alps Ascertained' (1794); 'Life of Saint Neot' (1809).

Whitaker, Joseph, English publisher: b. London 4 May 1820; d. Enfield, Middlesex, 15 May 1895. In 1849 he started a church monthly called 'The Penny Post,' soon after established a theological publishing business of his own in

Fall Mall, and in 1856-59 was editor of 'The Gentleman's Magazine.' He founded 'The Bookseller' in 1858, but his name is remembered principally in the title of 'Whitaker's Almanac,' which first appeared in 1868. The 'Reference Catalogue of Current Literature' was started by him in 1874.

Whitaker, Nathaniel, American Presbyterian clergyman: b. Long Island, N. Y., 20 Feb. 1732; d. Woodbridge, Va., 21 Jan. 1795. He was graduated from Princeton in 1752, entered the ministry and became pastor of a church at Chelsea, Conn., and visited England in 1765-6, accompanied by Samson Occom, an educated Indian, for the purpose of soliciting funds for the establishment of an institution of learning in America for the use of the Indians. His mission resulted in the foundation of Dartmouth College. He was subsequently engaged in pastoral duties in Massachusetts and in Maine, finally removing to Virginia. He was a staunch Whig and ardently supported the cause of the Colonies during the Revolution. Several of his sermons were published.

Whitaker, Osi William, American Protestant Episcopal bishop: b. New Salem, Mass., 10 May 1830. He was graduated from Middlebury College, Vt., in 1856 and from the General Theological Seminary in 1863. He took priest's orders in the last named year, was rector of Saint John's, Gold Hill, Nev., 1863-5, of Saint Paul's, Englewood, N. J., 1865-7, and of Saint Paul's, Virginia City, Nev., 1867-9. In 1869 he was consecrated missionary bishop of Nevada, was translated to the diocese of Pennsylvania as assistant bishop in 1886, and upon the death of Bishop Stevens in 1887 became bishop of Pennsylvania. Died 9 Feb. 1911.

Whitbread, hwt'bréd, Samuel, English politician: b. Cardington, Bedfordshire, 1758; d. 6 July 1815. He was educated at Oxford and Cambridge and entered the House of Commons in 1790 as Whig member for Bedford. He at once made his mark in Parliament as an able advocate of parliamentary reform, religious and civil liberty, the abolition of slavery, and similar liberal causes, and as a strong opponent of Pitt's war policy. He took a leading part in the impeachment of Viscount Melville in 1805-6, and against Lord Chatham for his mismanagement of the Walcheren expedition in 1809. Consult 'The Creevy Papers' (1903).

Whitby, hwt'bi, Canada, capital of Ontario county, a town and port of entry on Lake Ontario, at the southern terminus of the Whitby and Port Perry Railway, and on the Grand Trunk Railway, 30 miles east of Toronto. It has iron foundries, tanneries, manufactures of agricultural implements, mill machinery, and musical instruments, and carries on an active agricultural trade.

Whitby, England, seaport in the North Riding of Yorkshire, 48 miles north-northeast of York, at the mouth of the Esk, which divides it into two parts. The houses are ranged on bold acclivities, and an ancient restored cruciform church stands on the verge of a lofty cliff; there are several modern churches and Nonconformist chapels; a town hall, court house, museum, temperance hall, seamen's hospital, etc. The harbor is spacious and commodious, having wet and dry docks, etc. The manufacture

of jet ornaments is carried on, this substance being abundant in the neighborhood. There are also yards for ship and boat building, and productive sea fisheries. In 657 Saint Hilda founded her famous priory on the site of Whitby, then called Streoneshalh, and in it was held the important Synod of Whitby in 664, at which the Roman usage as regarded Easter was adopted (see EASTER). The poet Cadmon (q.v.) was a resident in this monastery, of which nothing now remains, though the choir, north transept, and part of the nave of an abbey erected on the site in the 11th century are still standing. These ruins are in early English style, and extremely beautiful. The neighborhood is rich in picturesque scenery and interesting features. Pop. about 13,000. Consult: Kitchin, 'Whitby Abbey and Other Essays' (1904).

Whitcher, hwich'er, Frances Miriam Berry, American humorist: b. Whites town, N. Y., 1 Nov. 1811; d. there 4 Jan. 1852. She was married in 1847 to Rev. B. W. Whitcher, an Episcopal clergyman of Elmira, N. Y. Her 'Widow Bedott's Table-Talk' first appeared in 'Neal's Saturday Gazette,' published by J. C. Neal, author of 'Charcoal Sketches.' After her death these and other humorous articles of the journalistic type, once very popular, were collected in 'The Widow Bedott Papers' (1855), and 'Widow Sprigg, Mary Elmer, and Other Sketches' (1867).

White, Andrew Dickson, American diplomat, educator and author: b. Homer, N. Y., 7 Nov. 1832. He was graduated from Yale in 1853, and studied at the College of France, Paris, and at the University of Berlin. He was attaché of the American legation at Saint Petersburg in 1854-5 at the time of the Crimean War, and in 1857, shortly after his return to the United States, became professor of history and English literature at the University of Michigan. In 1863 he returned to Syracuse and was elected to the New York State senate, where he was especially interested in educational legislation, obtaining the passage of bills organizing the State normal system, and providing for the codifying of the educational laws. He also had an important part in the founding and organization of Cornell University, and in procuring for that institution the national land grant for agricultural colleges; in 1867 he became president of the university, and was also professor of history. He maintained his connection with Cornell until 1885, when he resigned both presidency and professorship. He gave to the university his excellent historical library of about 30,000 volumes, and on the acceptance of this gift the departments of history and economics were reorganized as the White School of History and Political Science. While president of Cornell, he was also active in public affairs; in 1871 was one of a commission to study and report on the desirability of annexing Santo Domingo; in 1878 was honorary commissioner to the Paris exposition, and in 1879-81 minister to Germany, during which time he had leave of absence from the university. In 1892-4 he was minister to Russia; in 1896 was one of the commissioners to investigate the Venezuela boundary question; and in 1897-1902 was ambassador to Germany, holding that position longer than any other American minister. Before his

WHITE

retirement from the German ambassadorship he was elected a member of the Berlin Academy of Sciences. In 1899 he was president of the United States delegation to the Hague Peace Conference. He has written 'History of the Warfare of Science against Theology' (1898), an enlargement of his 'Warfare of Science' (1876); 'Studies in General History'; 'The New Germany'; 'European Schools of History'; 'Paper Money Inflation in France' (1876); 'Chapters from My Diplomatic Life' (Century Mag., 1903); 'Autobiography' (1905).

White, Arnold, English author. He has published 'The Modern Jew' (1899); 'Problems of a Great City'; 'English Democracy'; 'Efficiency and Empire'.

White, Arthur Silva, English publicist: b. London 1 Feb. 1859. He was secretary to the Royal Scottish Geographical Society and editor of the 'Scottish Geographical Magazine' in 1884-92, and for 15 years was engaged in foreign travel. In 1898 he explored the oasis of Siwa, and in 1900 traveled in the Sudan. His publications include: 'Development of Africa' (1890); Report to the Paris Geographical International Congress (1898); 'From Sphinx to Oracle' (1899); 'The Expansion of Egypt' (1899); etc.

White, Charles Abiathar, American geologist: b. North Dighton, Mass., 26 Jan. 1826. He was State geologist of Iowa in 1866-70, occupied the chair of natural history at the Iowa State University in 1867-73, and in 1873-5 held that chair at Bowdoin College, Maine. In 1874-98 he was engaged as geologist and paleontologist on different United States government surveys, and since 1876 has been connected honorarily with the Smithsonian Institution and the United States National Museum, where he is now associate in paleontology. He has published 'Report on the Geological Survey of Iowa' (1870); 'Report on Invertebrate Fossils and Surveys West of the 100th Meridian' (1875); 'Review of the Fossil Osteidae of North America' (1881); 'The Relation of Biology to Geological Investigation' (1894); etc. A complete list of his writings, including 211 titles (1860-85) was catalogued by J. B. Marcott (1885).

White, Edward Douglass, American jurist: b. parish of Lafourche, La., 3 Nov. 1845. He was educated at Mount Saint Mary's College, Md., and at the Jesuit College in New Orleans and during the Civil War served in the Confederate army. He subsequently studied law and was admitted to the Louisiana bar. He was State Senator in 1874; associate justice of the Supreme Court in Louisiana in 1878; and United States Senator in 1899-04. While still a member of the Senate he was appointed an associate justice of the United States Supreme Court.

White, Edwin, American naval officer: b. Ohio 1843; d. Brooklyn, N. Y., 23 Dec. 1903. He was graduated from the United States Naval Academy in 1864; was promoted lieutenant-commander in 1869, commander in 1886, was on duty at the Naval Academy as commander of cadets in 1895-98, received rank as captain in 1898 and was assigned to command the 'Philadelphia,' flagship at the Pacific station. He returned from Samoa in 1899 with broken health

and was retired from active duty with rank of rear-admiral.

White, Eliza Orne, American author: b. Keene, N. H., 2 Aug. 1836. Her publications include: 'Miss Brooks' (1890); 'Winter-borough' (1892); 'When Molly Was Six' (1894); 'The Coming of Theodora' (1895); 'A Little Girl of Long Ago' (1896); 'A Browning Courtship and Other Stories' (1897); 'A Lover of Truth' (1898); 'Edna and Her Brothers' (1900); 'John Forsyth's Aunts' (1901).

White, Frank, American politician: b. Stillman Valley, Ill., 12 Dec. 1856. He was graduated in civil engineering from the University of Illinois in 1880. A few years later he moved to North Dakota, where he became active in politics as a Republican; in 1891-3 he was a member of the lower house of State legislature, and in 1893-9 a member of the senate. During the Spanish-American war he joined the army, was major of the 1st North Dakota regiment and served in the Philippines. In 1901 he was elected governor of the State for a term of four years.

White, Sir George Stuart, English soldier: b. 6 July 1835. He was educated at Sandhurst, entered the army in 1853, served in the Indian mutiny and the Afghan war, became military secretary to the viceroy of India, and in 1881 lieutenant-colonel of the Gordon Highlanders. His subsequent promotions were colonel (1885), lieutenant-general (1895), major-general, and field marshal. From 1893 to 1898 he was commander-in-chief of the forces in India, in 1898-99 quartermaster-general to the forces, and in 1899-1900 was general on staff to command troops at Ladysmith. He defended Ladysmith 118 days (2 Nov. 1899-18 Feb. 1900) against the Boers, being relieved by Lord Dundonald after a disastrous siege. In 1900 he was made governor of Gibraltar. See SOUTH AFRICAN WAR.

White, Gilbert, English naturalist: b. Selborne, Hampshire, 18 July 1720; d. there 26 June 1793. He was graduated from Oriel College, Oxford, in 1743, and having taken deacon's orders in 1747, acted as curate to an uncle at Swarraton. After being ordained priest he was for a short period in 1751 curate to the vicar of Selborne. Appointed dean of his college in 1752 he soon after became curate of Durlay, Hampshire. He failed to secure the provostship of Oriel in 1757, but in the same year obtained the vicarage of Morton Pinkney, in Northamptonshire, which was in the gift of his college. He never resided on his Northamptonshire living, but throughout his whole life remained closely associated with the Hampshire parish which he has made famous. About 1758 he gave up the Durlay curacy for that of Faringdon, near to his home, though for a time he acted as curate of West Deane, Wiltshire. White's great English classic 'The Natural History and Antiquities of Selborne,' the only work of the kind in the language to attain that rank, was published at the end of 1783, with the date 1789 on the title page. It consists of letters to his two friends, Thomas Pennant, author of the 'British Zoology,' and James Barrington, who devised the form of 'Naturalist's Journal' which White kept from 1767, when he

discontinued the 'Garden Kalendar' begun in 1751. In the preparation of the part on antiquities, compiled only when he had been induced to publish, he was greatly assisted by Richard Chandler, the classical antiquary and traveler. His 'Natural History of Selborne' has won the enthusiastic admiration of men of widely different tastes, and has gone through a very large number of editions. Professor Newton says that such was White's keenness of observation, his undoubted errors are scarce worthy of notice. In America, where most of the plants and animals mentioned are, save to a few experts, known only by name, the popularity of the work has been great. The most important editions after the first are the following: the so-called Markwick's or Aikin's (1802), including 'The Naturalist's Calendar,' which Dr. Aikin had compiled from White's papers and published in 1795, but excluding the 'Antiquities'; the 1813 octavo, including his poems for the first time; Mitford's (1813); Rennie's (1833); Bennett's (1837), based upon the preceding; Jardine and Jesse's (1851); Jardine's (1853); Harting's (1875), one of the best, based upon Bennett's; Buckland's (1875), with a chapter on the 'Antiquities' by the Earl of Selborne; Bell's (1877), which superseded all previous ones, and may still be regarded as the best (see BELL, THOMAS); Grant Allen's (1899), without the 'Antiquities'; and Bowdler Sharpe's (1900-1901), including the 'Antiquities' and the 'Garden Kalendar.' There is a bibliography (1897) by E. A. Martin. Consult further: Jesse, 'Gleanings in Natural History' 2d series (1834); Gordon, 'Gilbert White in Sussex' (1893); and the considerable amount of magazine literature.

White, Greenough, American educator and Episcopal clergyman: b. Cambridge, Mass., 26 July 1863, d. Sewanee, Tenn., 3 July 1901. He was graduated from Harvard in 1884, was professor of English language and literature at the University of the South, Sewanee, Tenn., in 1885-7, occupied that chair at Kenyon College in 1888-9, and in 1893 became a deacon in the Episcopal Church. He served as minister at Saint James' Church, West Hartford, Conn., in 1893-4, at the same time occupying the chair of history and political economy at Trinity College, Hartford. In 1894 he returned to his position at the University of the South, which he occupied until his death. He was ordained to the priesthood in 1896, and in 1897 became acting professor of the history of art at the university. He wrote: 'Sketch of the Philosophy of American Literature' (1890); 'A Saint of the Southern Church' (1897); 'An Apostle of the Western Church' (1899); 'Outline of the Philosophy of English Literature'; 'The Rise of Papal Supremacy'; etc.

White, Henry Kirke, English poet: b. Nottingham 21 March 1785; d. Cambridge 19 Oct. 1866. The son of a butcher, he was apprenticed to a stocking weaver, and later to an attorney, in whose office he devoted his spare time to the study of Latin and Greek. At 14 he wrote verse which was published in different magazines, and in 1803 published 'Clifton Grove, a Sketch in Verse, with Other Poems,' a venture which won for him the attention and friendship of Southey and other literary men.

He obtained a starship at Saint John's College, Cambridge, in 1804, and entered upon his studies with such close application that his health broke under the strain, resulting in his death from consumption. After his death his manuscripts were placed in charge of Southey, who edited his poems, letters, etc., and published them under the title 'Remains, etc., with an Account of his Life' (1807). He will be longest remembered by his hymn beginning

"When marshalled on the nightly plain
The glittering host bated the sky."

White, Harvey, American author: b. New London, Iowa, 26 Nov. 1866. He was graduated from Harvard in 1894 and was reference librarian in the John Crerar library 1896-99. He has published 'Differences' (1899); 'Quicksand' (1900); 'When Eve was not Created, and Other Stories' (1900); 'Noll and the Fairies' (1902).

White, Horace, American journalist and editor: b. Colebrook, N. H., 10 Aug. 1834. He was graduated from Beloit College in 1853, removed to Chicago, and there became city editor of the *Evening Journal* in 1854. He was later connected with the *Chicago Tribune*, and accompanied Lincoln during his campaign against Stephen A. Douglas in 1858, his narrative of the famous debates being given in Herndon's life of Lincoln. He was editor of the *Chicago Tribune* in 1865-74 and in 1887 removed to New York, where he became associated with Carl Schurz and E. L. Godkin in editing the *Evening Post*. He was editor-in-chief of that publication from 1899 to 1903, when he retired, though still remaining connected with the paper. Among his publications are: 'The Silver Question'; 'Money and Banking Illustrated by American History' (1895, 2d ed. 1902); 'The Gold Standard'; etc. He edited Luigi Corra's 'Scienza delle Finanze' (1889); and translated Appian's 'Roman History' (1899).

White, Hugh Lawson, American jurist and legislator: b. Iredell County, N. C., 30 Oct. 1773; d. Knoxville, Tenn., 10 April 1840. He served as a volunteer against the Cherokees in 1792, studied law and began practice at Knoxville in 1796. He was judge of the supreme court of Tennessee, 1801-7 and 1809-15, became United States district attorney in 1807, in 1809 was elected to the State senate, was president of the Bank of Tennessee in 1815-27, State senator in 1817-25, United States commissioner in 1821-4 for the adjustment of claims against Spain, and in 1825 was elected to the United States Senate to succeed General Jackson. He was opposed to the making of internal improvements by the Federal government and led in the movement which resulted in the abolishment of the National Bank. He was an earnest advocate of the removal of the Indians west of the Mississippi, and by his support of the bill to limit executive patronage incurred the enmity of Jackson. In 1835 he was nominated for the presidency and received 25 votes in the electoral college. He became a declared Whig in 1838 and in 1839 resigned his seat in the Senate because of his unwillingness to vote for the Sub-Treasury Bill, as he had been instructed to do by the Tennessee legislature. Consult Nancy N. Scott, 'Memoir of Judge White' (1836).

WHITE

White, John Blake, American artist and author: b. Eutaw Springs, S. C., 2 Sept. 1781; d. Charleston, S. C., 24 Aug. 1859. He studied under Benjamin West in London in 1800-04. Returning to the United States, he established himself in Boston, but on account of the lack of practice went to Charleston, S. C., and became a lawyer, was successful in that profession, and was several times a member of the South Carolina legislature. His best known picture, 'The Unfurling of the United States Flag in the City of Mexico,' was destroyed during the Civil War. His other paintings include: 'Battle of Eutaw Springs' (1804); 'Battle of Fort Moultrie' (1806); 'Battle of New Orleans'; 'Mrs. Motte Presenting the Arrows'; and 'Marion Inviting the British Officer to Dinner' (1836). He also wrote the dramas 'Foscari, or the Venetian Exile' (1805); 'Mysteries of the Castle' (1806); 'Modern Honor' (1812); 'Triumph of Liberty, or Louisiana Preserved' (1819); and 'Intemperance' (1839).

White, John Hazen, American Protestant Episcopal bishop: b. Cincinnati, Ohio, 10 March 1849. He was graduated from Kenyon College in 1872 and Berkeley Divinity School, Middletown, Conn., in 1875. He was ordained priest in 1876, was rector of Grace Church, Old Saybrook, Conn., 1878-81; of Christ Church, Joliet, Ill., 1881-89; St. John's Church, St. Paul, 1889-91, and warden of Seabury Divinity School, Fairbault, Minn., 1891-95. In the last named year he was consecrated bishop of Indiana, and on the division of the diocese in 1899 chose the northern portion with the title of bishop of Michigan City.

White, John Williams, American classical scholar: b. Cincinnati, Ohio, 5 March 1840. He was graduated from the Ohio Wesleyan University in 1868, and studied at Harvard and at Berlin. He occupied the chair of Latin and Greek at Willoughby College in 1868-9, at Baldwin College in 1869-71, continuing there as professor of Greek alone in 1871-4. He was tutor of Greek at Harvard in 1874-7, assistant professor there in 1877-84, and since then has been full professor. His publications include: 'Edipus Tyrannus of Sophocles' (1873); 'First Lessons in Greek' (1876); 'Realia of Greek Literature' (1882); 'The Old Scholia on the Aves of Aristophanes' (1903); etc. He was senior editor of 'The College Series of Greek Authors' (30 vols., 1879).

White, Joseph Blanco, English clergyman and author: b. Seville, Spain, 11 July 1775; d. Liverpool 30 May 1841. After study in Seville University, he was ordained sub-deacon (1796) and priest (1800) in the Roman Catholic Church, in 1802 was appointed to a chaplaincy in the Chapel Royal of Saint Ferdinand at Seville, but, having abandoned his belief in Christianity, withdrew from the priesthood, and went to England in 1810. There he became editor of 'Español,' a monthly periodical, circulated in Spain (partly by the English government) in aid of the national cause; in 1812 again became a Christian; and in 1814 qualified as an English clergyman. He began contributing in 1820 to the 'New Monthly,' edited by Thomas Campbell (q.v.), and in 1825 published 'Evidences against Catholicism.' In 1826 he settled at Oxford as a member of Oriel,

and there Newman, Pusey, and other leaders of the Oxford movement learned much from him respecting Catholic theology. He finally became an acknowledged Unitarian, and from 1835 lived at Liverpool, doing some desultory literary work. Many of his books had a real interest in their time, but he is best known to literature by his sonnet 'Night and Death,' which Coleridge, in a letter of 1827, declared to be the finest in the English language. Among his further publications are 'Letters from Spain by Don Leucadio Doblado' (1822), 'Second Travels of an Irish Gentleman in Search of a Religion' (1833; in answer to Thomas Moore's 'Travels'), and 'Observations on Heresy and Orthodoxy' (1835).

White, Octavius Augustus, American physician: b. Charleston, S. C., 8 Feb. 1826; d. New York 25 May 1903. Graduated from the College of Charleston in 1846, and from the South Carolina Medical College in 1848, he practised with success until the outbreak of the Civil War, when he was made surgeon in the Confederate army. He became an expert on yellow fever, during the war was sent within the Union lines at Goldsborough, N. C., for medical services connected with the fever, and wrote much on the subject, as well as on general topics of medicine and surgery. Several professional inventions are to be credited to him.

White, Percy, English novelist: b. London 1852. He taught English literature and language in a French college for some years, entered journalism in 1880 and for ten years edited 'Public Opinion.' He has published several brilliant novels, strongly satirical in character, among them being: 'Mr. Bailey-Martin' (1893); 'Andria' (1896); 'A Millionaire's Daughter' (1898); 'The Heart of the Dancer' (1900); 'The New Christians' (1902).

White, Peregrine, the first child born in New England of English parents: b. on board the Mayflower, in the harbor of Cape Cod 20 Nov. 1620; d. Marshfield, Mass., 22 July 1704. He was the son of William and Susanna White, and on account of his birth received 200 acres of land from the general court. He filled various civil and military offices, and "was vigorous and of a comely aspect to the last." His father died during the colonists' first winter at Plymouth, and the marriage of his mother to Gov. Edward Winslow was the first wedding in New England.

White, Richard Grant, American author and critic: b. New York 22 May 1821; d. there 8 April 1885. He was graduated from the New York University in 1839, studied medicine and then law, and became a contributor of musical, art, and dramatic critiques to the New York *Courier and Enquirer*. From 1854 to 1859 he was an editor of this journal; and of the *World* 1860-1. His 'Yankee Letters,' contributed in 1863-7 to the London 'Spectator,' were interesting narratives of contemporary events and of considerable service to the national cause. In 1867-78 he was chief clerk of the United States revenue marine bureau for the district of New York. White was particularly known as a Shakespearean scholar. He contributed articles on Shakespeare, to 'Putnam's Magazine' in 1853, in 1854 published 'Shakespeare's Scholar,' and in 1857-63 a critical edition of the

WHITE—WHITE BRETHREN

poet's works. Other volumes on this general subject were, 'Essay on the Authorship of the Three Parts of Henry the Sixth' (1859); 'Memoirs of William Shakespeare, with an Essay toward the Expression of his Genius' (1865), and the posthumous 'Studies in Shakespeare' (1885). White's 'Riverside edition' of Shakespeare (1883) was one of the most popular prepared by an American. He was also one of the leading American critics of his time, dogmatic at times and over-hasty in generalization, but vigorous, acute, and frequently brilliant. Philological studies were represented by his 'Words and their Uses: A Study of the English Language' (1870, rev. ed. 1872), and 'Every-Day English' (1881). The most widely circulated of his writings was the anonymous satire 'The New Gospel of Peace' (1863-6). He also wrote a novel, 'The Fate of Mansfield Humphreys' (1884), and edited 'Illustrated Record of the New York Exhibition of the Industry of All Nations' (1854), and 'Poetry, Lyrical, Narrative, and Satirical of the Civil War' (1866). His scholarship was considerable, his style readable and often marked by satire, and his authority in his day decided. An interesting article regarding him by F. P. Church appeared in the 'Atlantic' for March 1891 (vol. 67).

White, Stanford, American architect: b. New York 9 Nov. 1853; d. New York City 25 June 1906. He was graduated from the University of New York and received his professional training under Charles D. Gambrill and H. H. Richardson, and was the chief assistant of the latter in the construction of Trinity Church, Boston. In 1881 he became a member of the firm of McKim, Mead & White. He was the designer of Madison Square Garden, the Washington Arch, and other important structures.

White, Stewart Edward, American novelist: b. Grand Rapids, Mich., 12 March 1873. He was graduated from the University of Michigan in 1895 and studied law at the Columbia Law School 1896-7. He has published stories of Western life, including 'The Westerners' (1901); 'The Claim Jumpers' (1901); 'The Blazed Trail' (1902); 'Conjuror's House' (1903); 'The Forest' (1903).

White, William, American Protestant Episcopal bishop: b. Philadelphia, Pa., 4 April 1748; d. there 17 July 1836. He was graduated at the College of Philadelphia in 1765, completed his theological studies in 1770, and going to England to obtain holy orders, was admitted to the diaconate by the bishop of London in 1770, and to the priesthood by the bishop of Norwich in 1772. Returning to Philadelphia, he became assistant minister and afterward rector of Christ Church and St. Peter's Church, being at one period the only Episcopal clergyman in Philadelphia, and in 1777 was chaplain to Congress. The degree of D.D., the first honorary degree of the University of Pennsylvania, was conferred on him in 1782. The meeting which issued the summons for a convention preparatory to organizing the Protestant Episcopal Church, was held at his house in 1784 and he presided over the 1st General Convention in 1789. In 1786 he was elected bishop of Pennsylvania and was consecrated in Lambeth palace, England, 1787. He wrote 'Memoirs of the Protestant Episcopal Church' (1820); 'Lectures on the Cate-

chism' (1813); etc. Consult: 'Memoir,' by Bird Wilson (1839); McConnell, 'History of the American Episcopal Church' (1890).

White, William Allen, American author: b. Emporia, Kan., 1868. He was educated at the University of Kansas and in 1890 became editor of the *Eldorado Daily Republican*. He afterward was engaged on the editorial staffs of the *Kansas City Journal* and of the *Star*, and in 1894 purchased the *Emporia Gazette*. His editorial, 'What's the Matter with Kansas?' published in that paper in August 1896 was read and reprinted throughout the country. He has published 'The Real Issue' (1896); 'The Court of Boyville' (1899); 'Stratagems and Spoils' (1901); etc.

White, William Hale, 'MARK RUTHERFORD', English author. Under the pseudonym 'Mark Rutherford' he has published such notable books as 'The Autobiography of Mark Rutherford'; 'Mark Rutherford's Deliverance' (1885); 'Miriam's Schooling' (1890); 'The Revolution in Tanner's Lane' (1887); 'Pages from a Journal' (1900); etc.

White, Sir William Henry, English naval constructor: b. Devonport 2 Feb. 1845. He was educated at the Royal School of Naval Architecture, served in the constructive department of the Admiralty, 1867-83, becoming chief constructor, and from 1870 to 1881 was professor of naval architecture at the Royal School of Naval Architecture and at the Royal Naval College. In 1883-5 he organized and directed the warship building department of Armstrong & Company, Newcastle. From 1885 to 1902 he was director of naval construction and assistant controller of the navy, and during that period was the responsible designer of all British ships of war. Upon his resignation, due to failing health, he received from Parliament a special money grant in recognition of his services to the navy. He has published: 'A Manual of Naval Architecture'; 'Architecture and Public Buildings'; 'A Treatise on Shipbuilding'; and numerous professional papers.

White Ants. See **TERMITES**.

White Bass. See **BASS**.

White Book, a government publication in Germany and Portugal, corresponding to the British Blue Book and the Yellow Book of France. See **BLUE BOOKS**.

White Boys, an illegal association formed in Ireland in 1760, composed of starving day-laborers, evicted farmers, and others in a like condition, who used to assemble at nights to destroy the property of landlords or their agents, the Protestant clergy, the tithe collectors, or any others that had made themselves obnoxious in the locality. In many cases they did not confine their acts of aggression merely to plunder and destruction, but even went the length of murder.

White Brethren, a sect which caused a commotion in Europe about the beginning of the 15th century. A priest whose origin is unknown, his nationality being variously alleged as Spanish, French and Scotch, made his appearance in Lombardy, and said that he was the prophet Elias, and had come back from heaven to give notice of the coming destruction of the world. He had thousands of followers, who were arrayed in white, and carried large cruci-

WHITE CAMELIA, KNIGHTS OF— WHITE CROSS SOCIETY

foxes, as they marched from the Ligurian Alps into central Italy. Pope Boniface IX. caused him to be apprehended, and he was burned as an impostor. The White Brethren then dispersed.

White Camelia, The Knights of the, formed in May 1867 at New Orleans, was the largest of the revolutionary orders called into existence by the misgovernment of Reconstruction. Its principal strength was in the Gulf States, farther south than the Ku Klux Klan. The organization was as follows: a Supreme Council for the United States; a Grand Council in each State; a Central Council in each congressional district; and Councils in each county. Each council was divided into circles and groups. The officers of the council were known as commander, lieutenant-commander, sentinel, secretary and treasurer; with the prefixed adjectives, supreme, grand, or eminent, for the officials of the three higher ranks of councils. The members were called "brothers." The objects of the order were, to nullify radical legislation, to reduce the influence of the blacks in politics, to prevent amalgamation of the races, and to defend the white race against radical encroachment. The members swore to vote for no black for office, to observe always a marked distinction between the races, to maintain the social and political superiority of the white race, at the same time protecting the blacks in the privileges rightfully theirs. The constitution forbade the endorsement of any political party by the order. Each member was free to vote as he pleased, subject to his oath always to oppose negroes for office, or those favorable to negro political rights. The order operated also as a body of regulators using such methods as were usually attributed to the Ku Klux Klan. The membership was of a higher order than that of the Klan; the discipline was good and the order never degenerated so badly as the Ku Klux. The effect of its operations was to control the lawless negroes, intimidate and drive from the country the carpetbaggers, and to secure again to the whites control of the State and county governments. These objects accomplished, the order gradually disbanded. Its secrets were well kept and not until recent years was anything definite known of the order. The White Brotherhood and the White League were closely related orders that existed in the same territory a few years after the White Camelia had disintegrated.

WALTER L. FLEMING,
West Virginia University.

White Caps, in American history, a name applied to lawless bands in southern Indiana, who, from 1880, undertook the regulation of the manners and morals of that section. During the Civil War the Knights of the Golden Circle (q.v.) flourished in the same parts. The white caps dressed differently in different parts of the country which they terrorized. Where they were regularly organized and did the most mischief they generally had nearly a full uniform or regalia. They wore white paper foolscaps, with paper masks, and coats of coffee sacking. To make the coats they merely cut arm or sleeve

holes in the sides of coffee sacks close to the bottoms and holes in the bottoms to put their heads through. The whole White Cap movement was borrowed from English outlawry.

White Cattle (of Chillingham), certain cattle preserved in a semi-wild state in Chillingham Park, England. They are pure white, except the muzzle, which is black, and the horns which are tipped with black. The white color on the body, however, is artificially produced, the owner causing all spotted calves to be killed. They are now generally believed to be the descendants of the mountain bull or urus (see Ox), which was wild in Gaul at the time of Caesar's invasion, and the stock whence modern breeds of domestic English cattle have been partly derived. Dawkins, however, considers them the last surviving representatives of a still more primitive race, the gigantic ox, known by its remains in caves to have occupied Great Britain in the Pleistocene Period. He considers them much modified in every respect by their small range and their contact with man.

White Clover, Oak, Pine, etc. See CLOVER; OAK; etc.

White Colors, in painting, white pigment or white lead. Baryta yields several commercial varieties of white color, largely used for adulterating white lead. The substances used are heavy spar, the native sulphate, and witherite, the native carbonate, of baryta. An artificial sulphate of baryta is also used in permanent white. Zinc white or Chinese white is a hydrated oxide of zinc, and pearl white is yielded by the nitrate of bismuth. A fine chalk yields Spanish white, and whiting is ordinary ground chalk. Quilime is a sanitary white for external walls, etc.

White Cross, a self-supporting American organization, with a large membership throughout the Union, having for its motto, "Truth, Charity and Philanthropy," and for its emblem cross bandages of white on a field of red. It was founded in 1898 by Mrs. Jane Creighton, of Portland, Oregon, and its object is the care of wounded and sick American soldiers and sailors, and aid to the widows and orphans of those who have fallen in battle, or died of disease or accident.

White Cross Society, an association founded in England, in 1883, by the Bishop of Durham, and introduced in the United States in that year by the Rev. B. F. De Costa, rector of the Protestant Episcopal Church of Saint John the Evangelist, New York, who became a Roman Catholic in 1899. The objects of the society are "to urge upon men the obligation of personal purity; to raise the tone of public opinion upon the subject of morality; to secure proper legislation in connection with morality." Those who become members of the society promise "by the help of God," to treat all women with respect, and endeavor to protect them from wrong and degradation; to endeavor to put down all indecent language and coarse jests; to maintain the law of purity as equally binding on men and women; to endeavor to spread these principles, and try to uplift younger brothers, and to use every possible means to fulfil the command, "Keep thyself pure." The society seeks to forward its objects "by the full presentation of those spiritual truths which form distinguishing characteristics of Christianity, and demonstrate its

WHITE-CROWNED SPARROW — WHITE LEAD

unalterable hostility to every form of impurity.³ The society has been established also in Canada.

White-crowned Sparrow. See SPARROW.

White Eagle, Order of. See ORDERS, ROYAL.

White Elephant, an elephant affected with albinism. Such animals, always rare, are highly esteemed by some Eastern potentates, and are considered sacred in Siam, where the animal has become a national symbol, so that Siam is called "the land of the white elephant," and one of the highest decorations conferred by its rulers is that of the Order of the White Elephant. A specimen purchased by the late P. T. Barnum from King Theebaw, of Burma, was brought to the United States in 1884. It stood seven feet and a half high, and the face, ears, front of trunk, fore feet, and part of breast were of a light ash color.

Figuratively, a present which does one much more harm than good, or more generally any nominal advantage which has this effect. It is reported that when in old times the ruler of Siam desired to ruin any one, he made him a present of a white elephant. The sacred elephant has an enormous appetite, and, being sacred, it would be a crime to let it die, so that the gift generally entailed ruin on the recipient.

White-eyes, one of the numerous small insectivorous birds of the New Zealand region, called blight-birds there, because they feed so largely upon the plant-lice which torment garden plants and orchard trees. They belong to the genus *Zosterops*, which is variously classified by ornithologists, but seems most nearly related to the titmice. Other species are scattered elsewhere throughout the Old World tropics. All are neatly but not gaudily dressed, have in most cases a conspicuous ring of white feathers around the eye, and build pretty nests. The genus is interesting, further, from the fact that many of its species are confined to small islands, apparently affording examples of the effect of isolation (q.v.).

White Feather, a symbol of cowardice; a term introduced in the days when cock fighting was in vogue. As a thoroughbred game cock has no white feathers, a white feather was a proof that the bird was not game.

White Fly, a minute insect of the family *Aleyrodidae*, closely allied to the aphids and coccids, which infest the leaves of plants, usually on the lower side, and are pests in greenhouses. (See GREENHOUSE INSECTS.) They are covered with a whitish mealy secretion, and when young also secrete wax. The group is not a large one, and does not do much harm to fruit or forest trees, except that one species (*Aleyrododes citri*) has been prevalent in Florida orange groves since about 1890. The evil they do results not only from their sucking the nutritive juices of the plants, but from the spread of smut-fungus which is promoted by their presence. Consult Howard, 'The Insect-book' (New York 1901).

White Friars, a name formerly given to the friars of Our Lady of Mount Carmel, because they wore a white scapular and cloak over their brown habit. See CARMELITES.

White Goat. See ROCKY MOUNTAIN GOAT.

White Hats, a badge of the Democratic party in Flanders in the 14th century. White

hats were used in England to denote radical proclivities, because Orator Hunt (1773-1835), the great demagogue, during the Wellington and Peel administration, used to wear a white hat.

White Hellebore, a liliaceous plant of the genus *Veratrum*, a source of insect-poison, the principle of which is the alkaloid veratrin. See also HELLEBORE.

White House, the official residence of the President of the United States, in Washington, D. C. The name arose from the fact that the building is constructed of freestone and painted white. It is 170 feet long, 86 feet deep, and two stories in height. It has an Ionic portico, the main entrance faces north. Reception rooms are on the first floor and the private apartments of the President are on the second floor. Among the reception rooms are the Blue Room used for diplomatic functions, the East Room used for public receptions, and the Red and Green rooms. The original official residence for the President was begun in 1792; it was first occupied by Adams, in 1800. In 1814 it was burned by the British, and four years later was rebuilt. In 1903 executive offices connected with the main building were built on the grounds. Presidents Harrison and McKinley used for the official name, "Executive Mansion"; President Roosevelt changed to the old name, White House.

White Lady, an apparition which figures in the legends and traditions of various countries, as presenting itself to give warning of death and other momentous events in royal and titled households. The White Lady is supposed to be an ancestress of the family she visits, and the association of such a legend with a family name is regarded as a guarantee of noble and ancient lineage. The imperial house of Hohenzollern has its White Lady, and Hampton Court, England, is said to be invaded at times by a supernatural visitor, although there seems to be some doubt whether it is a White Lady or the ghost of Henry VIII.

The earliest historical instance of the apparition is recorded as having occurred in the 15th century, and is celebrated under the name of Bertha of Rosenberg, in Bohemia. Similar appearances are said to have been witnessed in the Schloss at Berlin, one as recent as 1879.

As a considerable number of estates of European titled personages are passing into new and plebeian ownership the question has arisen whether the White Lady is transferred with the property, or follows the old family into poorer quarters in some city tenement.

White Lead, a white pigment very largely used in painting. Many processes have been devised for its manufacture, but only the important ones will be described here. The old Dutch method was to expose sheet lead in coils, placed in earthenware jars partly filled with vinegar, to the combined action of air, moisture, and carbonic acid gas. This was done by immersing the jars with their contents in decomposing horse manure which furnished the heat and carbonic acid gas necessary for the process. The English process, which is the one by which most of the white lead is made, differs from the Dutch process by the use of fermenting tan bark instead of manure. The pots containing the lead and dilute acetic acid or vinegar are piled in rows in the so-called stacks and surrounded with the fermenting tan bark. After about three

WHITE LEAGUE — WHITE PLAINS

months the lead is removed and purified. The process is slow and the methods of purification dangerous to the workmen, but the resulting white lead is of the best quality. In the French method a solution of basic lead acetate is first prepared by the action of an impure acetic acid on litharge or lead oxide. Carbonic acid gas is then passed through this solution and the white lead precipitated.

White lead is a basic carbonate of lead of somewhat variable composition. That formed by the Dutch and English processes may be represented by the formula $2PbCO_3 \cdot Pb(OH)_2$.

White League, The, in American history, a popular name for a semi-military organization, gathered to repress the negroes of the State of Louisiana, who, it was asserted, were meditating insurrection. The organization had its inception in New Orleans, in 1874, and on the refusal of the city authorities to allow the landing of a cargo of firearms, which the league had imported from New York, a riot ensued which resulted in more than 100 deaths. The league afterward became a powerful factor in Louisiana politics.

White Metal, a term used for an alloy of lead, antimony, and tin used for bearings in machinery. Also applied to many other alloys that have a white color.

White Monks. See *Bernardines* under *Orders, Religious*.

White Mountains, a group of peaks and hills, or a range of mountains, principally in New Hampshire, in the northern part; but which extend into Maine on the east, and on the west are connected with the Green Mountains in Vermont. They belong to the Appalachian system. Mount Katahdin, in Maine, is the highest elevation on the eastern rim; and in New Hampshire there are about 20 peaks, with deep narrow valleys and long lines of rounded foot-hills. The peaks are in two groups; the eastern or White Mountain group proper and the Franconia group, separated by a tableland varying from 10 to 20 miles in width. The principal summits of the eastern group are, beginning at the Notch and passing around to Gorham, Mounts Webster, Clinton, Pleasant, Franklin, Monroe, Washington, Clay, Jefferson, Adams, and Madison. Of these Mount Washington is the highest, and is indeed the highest mountain summit in New England, being 6,293 feet above the level of the sea. The principal peaks of the Franconia group are Pleasant, Lafayette, Liberty, Cherry, and Moosehillock. Near the southern border of the plateau are Whiteface, Chocoma, Red Hill, and Osagee, and in the southeast, Kearsarge. North of the plateau, and near the upper waters of the Connecticut, are several elevations, among which are the twin mountains known as Stratford peaks. The plateau is deeply furrowed by several streams. The geological formation of the White Mountains is almost entirely of the ancient metamorphic rocks. In many of the peaks the upper portion is composed of huge masses of naked granite or gneiss; and the debris which in the course of ages has clothed the lower portion with a coarse gravelly soil, possesses only enough of the constituents of vegetable life to support those trees and shrubs which will grow in the hardest and poorest soil. Land slides, not the result of a glacier movement, but of dislodgment of boulders and loosely adherent soil after heavy rains, are not infrequent. One of these,

occurred in the notch of the White Mountain group in August 1826, and destroyed a whole family named Willey, consisting of nine persons. The most noteworthy of many waterfalls among the mountains are: the Artist's fall in North Conway; the Silver Cascade, a beautiful thread of water descending from far up the side of Mount Webster; Ripley's falls, on a tributary of the Saco, below the Willey house, the lower one, Sylvan Glade cataract, falling, at an angle of 45°, 156 feet, in a stream from 50 to 75 feet in width; the falls of the Ammonoosuc, which in a course of 30 miles descends over 5,000 feet; the Berlin falls on the Androscoggin, descending over 200 feet in the course of a mile; and the Crystal Cascade and Glen Ellis Fall, near the Glen house, on a tributary of the Androscoggin. Of the "notches," or passages rent through the solid granite of the mountains, apparently by some violent convulsion of nature, there are five; the White Mountain Notch, two miles in length, and at its narrowest point only 22 feet wide, through which the Saco River passes; the Franconia Notch, which permits the passage of the Pemigewasset; the Pinkham Notch, through which a branch of the Saco and one of the Androscoggin find their way; and the Grafton and Dixville notches, through which flow the Androscoggin and one of its tributaries. The first two of these are those best known. "The Flume" at Franconia Notch is the most noted of those narrow waterways excavated through the rock, though there are others hardly inferior to it in attractiveness. Among the other objects of interest in the Franconia group is the "Old Man of the Mountain," a well defined profile of the human face formed by three projecting rocks. (See *FRANCONIA*.) At the base of the mountain lies a beautiful lakelet one fourth of a mile long and one eighth wide, called "Profile lake," or the "Old Man's Washbowl." Five miles south of the notch is the "Basin," a circular bowl-like cavity 45 feet in diameter and 28 in depth, produced by the whirling of large stones in a natural hollow in the rock by the current. It is filled with clear sparkling water, which flows down the mountains in a succession of beautiful clear cascades. The "Pool," in the same vicinity, is a natural well in the solid rock 60 feet in diameter and 190 feet deep, of which 40 feet is water. The White Mountains were first visited by a white man, Darby Field of Pascataqua, in 1642, when with two Indians he ascended Mount Washington. Later in the same year Thomas Gorges and companions traveled up the Saco and explored the mountains and the plateau, and discovered the sources of the Saco, Connecticut, Androscoggin, and Kennebec rivers. The White Mountains are a famous summer resort. Several railroads enter the mountains, and in the seasons special trains carry passengers direct from many of the large cities.

White Oak Swamp, Battle of. See *GLAXDAL, BATTLE OF*.

White Plains, N. Y., village, county-seat of Westchester County; on the Harlem Division of the New York Central & Hudson River Railroad; about 20 miles from the central part of New York city. It is in an agricultural section, and has several manufactories. It has a high school, opened in 1894, graded elementary public and parish schools, Saint John's Academy for

WHITE QUAKERS—WHITE SULPHUR SPRINGS

Boys, Good Counsel Training School, several private schools, and a public library. Bloomingdale Asylum for the Insane occupies a prominent position overlooking the village. The village owns and operates the water-works. The government is vested in a president and board of trustees. Pop. (1910) 15,949.

White Plains and vicinity were the scenes of many battles and skirmishes during the Revolution. Fortifications or their ruins were to be seen on all sides. On 21 October Washington established his headquarters at White Plains. On the evening of 27 October Haslett with about 1,600 American troops had taken possession of Chatterton Hill, a commanding eminence on the west side of the Bronx; and on the morning of the 28th, reinforced by a small additional force under McDougall and two pieces of cannon under command of Alexander Hamilton, he fortified his position as well as time would allow. On the morning of that day Howe advanced with his forces in two columns (numbering about 13,000 men) upon the American army posted along the Bronx. Perceiving the importance of the position on Chatterton Hill, and regarding it as the only assailable point of the American army, Leslie was sent with a strong detachment to cross the Bronx and attack it in front, while Rall with a Hessian regiment was ordered to cross the river a quarter of a mile below and attack Haslett in flank. The hill was carried with great difficulty, the Americans retreating in good order and without being pursued. The British troops rested that night on Chatterton Hill. The next day, 29 October, a skirmish took place between the two armies; but Howe, finding the Americans still too strongly posted to be attacked with safety, waited for reinforcements. These arrived on the evening of the 30th, but a storm coming on, the Americans took advantage of it and withdrew to the still stronger position of Newcastle, two miles above, which they had previously fortified. Afraid to attack them in this position, Howe fell back to the junction of the Harlem and Hudson rivers, and encamped on Fordham Heights; and Washington withdrew his army leisurely into New Jersey and made his headquarters at Hackensack. The loss of the Americans in the battle of White Plains and the skirmish of the succeeding day was nearly 300 in killed, wounded, and prisoners, and that of the British about the same.

White Quakers, a small community of Quakers in Dublin, Ireland, so-called from dressing in white. They are seceders from the main body, and are said to be Antinomian in their belief.

White Ribbon Gospel Army, a Christian society which originated in England in 1884, and has since extended to the United States. It gives special attention to inculcating moral purity.

White River, in Arkansas, has its rise in the Ozark Mountains, in the northwestern part of the State, flows northeast into Missouri, forming a large curve, and entering Arkansas again in Marion County, then flows southeast to the Mississippi River. It enters the Mississippi through several channels, some of which pass through the mouth-channels of the Arkansas River. Except in the highlands of the

Ozark Mountains, the greater part of the course of the river is through marshy forest land. It is navigable to Batesville, about 380 miles. The total length is 800 miles.

White River, in Indiana, the chief branch of the Wabash in the State, is formed by the confluence, in Pike County, of the East and West Fork, which have their rise near the eastern boundary of the State. From the junction of the two forks to the mouth of the White, where it enters the Wabash, is 50 miles; total length from the source of the West Fork is 350 miles. The river is navigable to Martinsville on the West Fork and to Reekford on the East Fork.

White River Junction, Vt., village in Windsor County; on the Connecticut River at the mouth of the White River, and on the Central V., the Boston & M., and the Woodstock R.R.'s; about 65 miles south by east of Montpelier and 14 miles east by north of Woodstock. It is a commercial centre for a large agricultural region in both Vermont and New Hampshire. The National bank has a capital of \$100,000 and deposits amounting to over \$1,275,000; the savings bank has deposits amounting to \$481,150. White River Junction is in the town of Hartford, and the Government Census does not give the population of the village separate. Pop. of town (1890) 2,740; (1900) 3,817; (1910) 4,170.

White Sage. See EUBOTIA; GOOSEFOOT.

White Sea, Northern Russia, a large gulf opening into the government of Archangel, between the Kola peninsula on the west and the Kamin peninsula on the east. Near its mouth, and on the eastern side, is a branch of it called the Gulf of Mezen, which receives the waters of the river Mezen, and the inner part of the sea sends off three large arms, namely, the Gulf of Kandalak, penetrating northwest into Lapland, the Gulf of Onega, receiving the river Onega, and the Gulf of Archangel, into which flows the Northern Dvina. Of the islands in the sea Solovetskii is the largest. The White Sea is comparatively shallow, and is frozen over from October to May. Archangel, at the mouth of the Northern Dvina, is the leading port of northern Russia, and other ports on the shores of the sea are Onega and Kem. Canals connect the White Sea basin with the basins of the Caspian, Baltic, and Black Sea.

White Sulphur Springs, Mont., city, county-seat of Meagher County; about 65 miles east by south of Helena. It is reached by stage from the Northern Pacific Railroad, a distance of about 40 miles. It is the commercial centre of a large agricultural, stock-raising, and mining region, and is noted for its thermal springs. The National bank has a capital of \$100,000. Pop. (1910) 417, which includes only those within the limits and not the number who transact business in the city.

White Sulphur Springs, W. Va., a district in Greenbrier County; on the Chesapeake & Ohio Railroad; about 230 miles west by north of Richmond and 90 miles west of Staunton. The locality has long been noted for its medicinal springs. The temperature of the water is 62° F. It is a famous health-resort. Pop. (1910) 338.

WHITE-SWELLING—WHITEFISHES

White-swelling, any severe disease of the joints resulting from chronic inflammation in the bones, cartilages, or membranes. The knee, ankle, wrist, and elbow are the joints most subject to this form of disease. It is distinguished from simple inflammation of the synovial membrane (synovitis) by the fact that the synovial membrane passes into pulpy degeneration. Amputation is frequently necessary. The disease may be local or constitutional in origin, being in the latter case due to rheumatism, gout, syphilis, pyæmia, etc.

White Whale. See **WHALE**.

Whitebait, the young fry of herring, the sprat and other small marine fishes, 2 to 4 inches long, caught in England as a delicate food. Whitebait, so much celebrated as figuring in the list of dainties of London epicures, has given rise to a great deal of controversy, but it is no longer considered a separate kind of fish, peculiar to the Thames. Its fame was no doubt attained, not so much from the simple quality of its flesh, as from the modes in which it was cooked at Greenwich; and doubtless the fact that it formed a feature in the annual dinner of her majesty's ministers at Greenwich also tended to enhance its reputation. Epicures advise its being cooked as soon as caught. Whitebait are sold in London in June and July.

Whitechapel, London, England, a parish and parliamentary district, east of the nucleus city of London, one of the poorest portions of the metropolis, and formerly notorious for its criminal population. From 1888 to 1891 it was the scene of the atrocities of the mysterious Jack the Ripper. Within its boundaries are the Tower of London, and London Hospital, and it is intersected by Whitechapel Road. The name is derived from a former medieval chapel, whence all distances east of London were calculated.

Whitefield, hwi't'fild, George, English evangelist, founder of the Calvinist Methodists: b. Gloucester 16 Dec. 1714; d. Newburyport, Mass., 30 Sept. 1770. He was sent to the grammar school of Saint Mary de Crypt at Gloucester, and at 18 entered as servitor at Pembroke College, Oxford, where he became acquainted with the Wesleys, and joined the small society which procured them the name of Methodists. Hearing of his devotional tendencies, Dr. Benson, bishop of Gloucester, made him an offer of ordination at 21, which he accepted; and he was ordained a deacon in 1736. Such was his powerful and exciting preaching, that, after his first sermon at Gloucester, a complaint was made to the bishop that he had driven several people mad; on which the prelate observed that he hoped the madness would not be forgotten before the next Sunday. He for some time supplied a curacy at Dummer, in Hampshire but the next account sent him by the Wesleys of their progress in Georgia excited in him a desire to assist in their labors, and he arrived at Savannah in May 1737. Observing the deplorable want of education in the colony, he projected an orphan-house, for which he determined to raise contributions in England, where he arrived in the beginning of 1739. Although disheartened by many of the clergy, Bishop Benson did not scruple to confer on him priest's orders; and on going to London the churches in which he preached were incap-

ble of holding the crowds assembled to hear him. He now adopted the practice of preaching in the open air, which he seems first to have carried out at Kingswood, near Bristol, among the colliers, on whom his discourses produced a surprising effect, and whose vicious manners and habits he visibly improved. He afterward preached in the open air in Bristol, and in Moorfields, Kennington, and other places in the neighborhood of London, to vast assemblages of people. In August 1739, he again embarked for America, and made a tour through several of the provinces, where he preached to immense audiences, with an effect vividly portrayed in the autobiography of Benjamin Franklin. He arrived at Savannah in January 1740, where he laid the foundation of the orphan-house, and after making another extensive tour, returned to England, in March 1741. During his absence his cause had been declining at home, and the differences between him and Wesley on the doctrines of election and reprobation deprived him of many followers. After visiting many parts of England, Scotland, and Wales, where he married in 1741, he again returned to America (1744), and remained there nearly four years. His preaching met with great opposition in New England at this time and Harvard College put forth a "testimony" against him. Returning to England in July 1748 he was soon after introduced to the Countess of Huntingdon, who made him one of her chaplains. A visit to Ireland and two more voyages to America followed, and for several years his labors were unceasing. He preached at Exeter, N. H., the day before his death, and also at Newburyport. He is buried beneath the pulpit of the Federal Street Church at Newburyport. His works were published in 1771-2. Consult Gillies, 'Memoirs' (1772); Gledstone, 'Life and Travels of Whitefield' (1871); Tyerman, 'Life of Whitefield' (1876-7).

Whitefishes, a name given in the United States to various species of salmonoid fishes of the genus *Coregonus* and sometimes to those of *Argyrosomus*, more properly designated ciscoes. *Coregonus* has a comparatively small and nearly toothless mouth, the premaxillary bones broad and with the edge nearly vertical, and the lower jaw short. The thin cycloid scales are much larger than in the salmon and trout, and the caudal fin is deeply forked. Internally, the stomach is horse-shoe shaped and provided with very numerous pyloric caeca, and the swim-bladder is very large. The species, about 15 in number, though some ichthyologists recognize many more, are confined to the clear lakes of the northern portions of the northern hemisphere often extending into the Arctic regions and sometimes there becoming anadromous. Wherever found they are highly valued for food. North America has about eight species. The common whitefish (*C. clupeiformis*) has its centre of distribution in the Great Lakes, but extends into the various lake systems of New York and southern Canada. It reaches a length of two feet and may be distinguished from the related species by its numerous and long gill-rakers, the toothless tongue and the elevated but not compressed back. As generally in the whitefishes, the color is olivaceous above and white below. It receives various local names from the fishermen, such as buffalo-back; and the variety landlocked in Otsego Lake at the

WHITEHALL

head of the Susquehanna River is known as the Otago bass. During the greater part of the year the whitefish remains in the deeper waters of the lake, moving about in schools which change their feeding grounds with considerable regularity. Being toothless they feed only upon small animals, such as crustaceans, snails and insect larvae, the first being by far the most important part of their diet. During the late fall and early winter the schools congregate on the shallows to spawn; in the act of spawning the female rises to the surface and is immediately followed by a male which mingles the sperm with the stream of eggs issuing from her vent. The eggs are about one eighth of an inch in diameter and sink to the bottom, where most of them are eaten by the small fishes and mud-puppies which swarm on the spawning grounds. They develop slowly and require several weeks to hatch, the exact time depending upon the temperature of the water. Each female produces from 10,000 to 75,000 eggs, depending upon her size.

Besides the enemies affecting the eggs and young the adult whitefish are preyed upon by the large pike and lake-trout which follow the schools, and to a less extent by smaller predaceous fishes. The extensive development of the fisheries, which are prosecuted most vigorously at the very season when the spawning fish are most accessible on the shallows, has so depleted the numbers of the whitefish that the fisheries are now dependent upon artificial propagation for their maintenance. The methods are essentially the same as those employed in the artificial propagation of the shad, though many modifications in detail have been found necessary. Hundreds of millions of eggs are now annually taken and hatched under the auspices of the United States and State commissions of fisheries. Such extensive and even greater operations are required to bring these fisheries back to their former importance; for the catch in all of the Great Lakes has steadily fallen from 21,463,900 pounds in 1880 to 12,401,335 pounds in 1890 and 5,094,014 pounds in 1899. The value of the latter was \$297,023. But as the common whitefish has decreased in abundance, other and less esteemed species have assumed an increasing importance so that if the catch of all these in 1899 be taken into consideration the total becomes 78,640,364 pounds, valued at \$1,280,852. Of this 59,913,576 pounds, valued at \$941,067 were lake herring or cisco (*Argyrosomus arcti*). These figures represent the American catch alone and during the same year the Canadian fisheries probably yielded about 40,000,000 pounds more. Whitefish are sold fresh or are frozen immediately after capture and placed in cold storage at a temperature several degrees below freezing and in this condition shipped, especially during the winter, to all parts of the country. Relatively small quantities are also pickled or smoked.

Other species of *Coregonus* are found in the Great Lakes as well as in other lakes particularly northward and westward, but at the present time none are so highly valued as the common whitefish. An important one is the shad-waiver or round whitefish (*C. quadrilateralis*). The genus *Argyrosomus*, however, includes two species of great and increasing importance though inferior in quality to the common whitefish. The genus differs from *Coregonus* chiefly in the projecting lower jaw, larger mouth and

horizontal premaxillary bones. The numerous species are similarly distributed in North America, which has 8, Europe and Asia, and except for their great activity predatory mode of life their habits in general resemble those of the true whitefishes. The cisco whitening or lake herring (*A. arcti*) is about a foot long, bluish or greenish above, with dark, speckled silvery sides. It abounds in shallow waters of the Great Lakes and, as indicated above, is of great commercial value. The moon-eye cisco (*A. hoy*) has a very large eye and the sides are brilliantly silvery. It is about a foot long and is the object of a considerable fishery in the western part of Lake Michigan. It spawns in November in relatively deep water. A third important species of this genus is the blue-fin whitefish (*A. nigripinnis*), distinguished from all of the preceding which have pale fins by the blue-black color of its pectorals, anals and ventral. It attains a length of 18 inches and is plentiful in the deep waters of Lake Michigan and the small lakes of Minnesota and Wisconsin.

Whitefishes seldom take the hook, but are captured by means of pound, trap, and gill nets and to a smaller extent with seines. The pound and trap nets are arranged in lines which sometimes reach to a distance of 10 or 12 miles from shore, while the gill nets are set much farther out in deep water and are weighted to the bottom.

Consult Brown Goode, 'Natural History of Aquatic Animals,' (Washington 1884) and Townsend, 'Statistics of the Fisheries of the Great Lakes,' Report U. S. Fish Com. for 1901.

Whitehall, London, England, a street leading from Parliament Square to Trafalgar Square, containing several public offices, and named after a palace that once stood here. The building known as the Horse Guards, the office of the commander-in-chief of the army, is so called in consequence of being the station where that part of the troops usually do duty. The treasury, near the Horse Guards, is built on the site of part of the old palace; the First Lord of the Treasury, however, has his official residence in Downing Street, where also the cabinet meets. The Admiralty Office contains the offices connected with the administration of the naval affairs of the country. The original Whitehall succeeded a mansion built by Hubert de Burgh before the middle of the 13th century. It afterward came into the possession of the archbishops of York, was inhabited by Wolsey (under the name of York Place), then passed to Henry VIII., and was called Whitehall. Charles I. was executed in front of Whitehall, and he was led to the scaffold out of one of the windows. Oliver Cromwell died in Whitehall. In 1697 the building was destroyed by fire, except the banqueting hall, which had been added by James I., according to a design of Inigo Jones, in 1619. This portion still remains, and chiefly consists of one room, of an oblong form and 40 feet high. The ceiling, representing the apotheosis of James I., was painted by Rubens, and was retouched by Cipriani. This building was long a royal chapel, but it now contains the museum of the Royal United Service Institution.

Whitehall, Ill., city in Greene County; on the Chicago & A., and the Chicago, B. & Q.

WHITEHALL—WHITELOCKE

R.R.'s; about 25 miles southwest of Jacksonville and 63 miles north of Saint Louis. It is in an agricultural and stock-raising region, and in the vicinity are deposits of fire clay. The chief manufactures are flour, sewer-pipe, tiles, stoneware, and machinery. Its shipping trade is chiefly in farm and dairy products, live-stock and clay products. There are six churches, a high school, and library. The two banks have a combined capital of \$100,000. Pop. (1910) 2,854.

Whitehall, N. Y., village in Washington County; on Lake Champlain, Poultney River, the Champlain Canal, and the Delaware and Hudson Railroad; about 75 miles north by east of Albany. It is at the foot of Skene's Mountain, in a narrow valley. It has railroad shops, silk and knitting mills, grist mills, lumber mills, and machine shops. It has a high school and a library. The bank has a capital of \$50,000 and deposits (1903) of nearly \$700,000. The village owns and operates the water-works. The government is vested in a board of trustees and a president chosen annually by popular vote.

In 1761 Whitehall was settled by Major Philip Skene and a colony of about 30 families; in November 1763 it was incorporated. When differences arose between America and England, which culminated in the Revolution, Skene joined the British and the Americans took possession of his property. An American garrison was stationed at Whitehall in 1776; but fearing capture by Burgoyne, they destroyed the fort, and the houses, and abandoned the place. At the close of the war nearly all the people returned and claimed their former holdings. The whole of the Skene property was sold at auction, and the highest bidder gave £11 10s. In 1812, when the Lake Champlain towns and villages were again near the centre of danger, a fort and block house was built. In 1819 the Champlain Canal was built from Whitehall to Fort Edward, and five years later it was extended to Troy. Pop. (1890) 4,434; (1900) 4,377; (1910) 4,917.

Whitehaven, England, a seaport and important coal-mining centre in Cumberland, situated on a bay of the Irish Sea, 40 miles southwest of Carlisle. It is well built, and has a townhall, custom-house, market-house, public library, public baths, with swimming-pond; a theatre, etc., a good harbor and a deepwater floating-dock. There is a considerable shipping trade, coals, iron-ore, pig-iron, steel rails, etc., being exported and American and other produce imported. The manufactures comprise sail-cloth, cordage, anchors, nails, cement, alabaster, earthenware, candles, and soap. Iron ship-building also is carried on, and there are blast-furnaces, iron- and brass-foundries, engineering works, flour- and saw-mills, breweries, a tannery, etc. There are here extensive coal and iron mines, in which a large number of the inhabitants are employed. The coal-mines, which have been worked since the 17th century, extend some miles under the sea, and coal is wrought beneath the town.

Whitehead, Charles, English poet: b. London 1804; d. Melbourne, Australia, 5 July 1862. He was engaged in a London mercantile house until 1857 when he went to Australia and entered journalism. He was the author of numerous poems, plays, and sketches, among

which are: 'The Solitary' (1831); 'The Autobiography of Jack Ketch' (1834); 'The Cavalier,' drama (1836); 'Richard Savage' (1842) subsequently dramatized; 'Smiles and Tears, or the Romance of Life' (3 vols. 1847); 'Life and Times of Sir Walter Raleigh' (1854); etc. Consult Mackenzie Bell, 'Charles Whitehead, a Forgotten Genius' (1884).

Whitehead, Cortlandt, American Protestant Episcopal bishop: b. New York 30 Oct. 1842. He was graduated from Yale in 1863 and from the Philadelphia Divinity School in 1867. Ordained to the priesthood in 1868 he was engaged in pastoral work in Colorado for three years and was rector of the Church of the Nativity, South Bethlehem, Pa., 1870-82. In January 1882, he was consecrated bishop of Pittsburgh.

Whitehead, William, English poet: b. Cambridge 1715; d. London 14 April 1785. He was educated at Winchester and Clare Hall, Cambridge, was appointed secretary and registrar of the order of the Bath in 1755, and in 1757 was appointed poet-laureate, in succession to Colley Cibber (q.v.). His identity is frequently confused with that of the satirist Paul Whitehead. He was the author of the tragedies: 'The Roman Father' (1750); and 'Creusa, Queen of Athens' (1754); the comedy 'The School for Lovers' (1762); a farce 'The Trip to Scotland' (1770); and numerous minor poems. His collected works were edited and published with a memoir by William Mason (1788).

Whitehouse, Henry Remsen, American diplomat: b. New York 17 Aug. 1857. He was educated in the United States and in Europe, was engaged in the United States diplomatic service in 1882-96, and has written: 'Sacrifice of a Throne' (1897); 'Collapse of the Kingdom of Naples' (1899-1902); etc.

Whiteing, Richard, English journalist and novelist: b. London 27 July 1840. He was educated privately and began his career in journalism in 1866 with a series of satirical sketches on social and political topics afterward republished as 'Mr. Sprouts—his Opinions' (1867). He was subsequently engaged on the *Morning Star* as leader-writer, and was afterward Paris correspondent for various New York, London, and Manchester papers, but returned to London to join the editorial staff of the *London Daily News*, a position he resigned in 1899. He has written: 'The Democracy' (1876); 'The Island' (1888); 'No. 5 John St.' (1899); 'The Life of Paris' (1900); 'The Yellow Van' (1903); etc.

Whitelocke, hwt'lsk, Bulstrode, English statesman: b. London 2 Aug. 1605; d. Chilton Park, Wiltshire, 28 Jan. 1676. Educated at Oxford he studied law at the Middle Temple, was called to the bar in 1626, and entered Parliament as member for Stafford. He was elected to the Long Parliament of 1640 from Great Marlow, was chairman of the committee for drawing up Stafford's charges of impeachment, and one of the commissioners appointed to treat with the king at Oxford. As a member of the Westminster Assembly (1643) he opposed the adoption of Presbyterianism, and as a commissioner of the Great Seal (1649) withheld consent to the king's death. In 1623 he was

WHITESTONE—WHITING

ambassador to Sweden, where he concluded a treaty with Queen Christina, and on his return was speaker of the House of Commons (1656), and one of Cromwell's lords (1657). From his MSS. have been published 'Memorials of English Affairs from the Beginning of the Reign of Charles I. to the Restoration' (1682, new ed. 1852); 'Memorials of English Affairs from Brute to the End of the Reign of James I.' (1709); 'Journal of the Swedish Embassy' (1772, new ed. 1845), and other works.

Whitestone, N. Y., in New York city, borough of Queens. The village was a place of importance, on account of its good harbor, and its position near the eastern entrance to New York Harbor. It is near the United States military post at Willett's Point, and Fort Schuyler, on Throgg's Neck. Pop. (1910) 3,000.

White-throat, a bird, either of two species of Old World warblers—*Curruca cinerea*, the greater, and *C. sylvicola*, the lesser whitethroat; or a hummingbird (*Leucochloris albicollis*) of Brazil; or a white-throated sparrow (*Zonotrichia albicollis*), commonly known in the eastern United States, where it is a migrant, as Peabody-bird.

Whitewash, a milky fluid produced by mixing good slaked lime with water. Used as a cheap coating for walls, fences, etc. When mixed with a little size and sometimes colored it is used on interior walls under the name of calcimine.

White-water, Wis., city in Walworth County; on the Whitewater River, and on the Chicago, Milwaukee & Saint Paul Railroad; about 46 miles southeast of Madison and 50 miles southwest of Milwaukee. It is in an agricultural and stock-raising region and has creameries, paper mill, wagon works, sash and door factories, flour mill, machine shops, and furniture factory. It has a State normal school, a high school, opened in 1886, public and parish schools, and a public library. The two banks have a capital of \$150,000 and deposits amounting to \$1,118,740. Pop. (1890) 4,359; (1900) 3,405; (1910) 3,700.

Whitewood. See **LINDEN**.

Whitfield, hwt'feld, or **Whitfield**, Henry, English clergyman: d. Winchester, England, about 1658. Of the date of his birth and his early life nothing is definitely known. He appears to have been appointed to the living of Ockley, Surrey, in 1616, but having protected several Puritan clergymen during the Laudian persecution incurred the displeasure of Laud, which was further increased by his refusal to read to his parishioners from the 'Book of Sports.' He therefore emigrated to New England in 1637 with many followers and was one of the founders of Guilford, Conn. In 1650 he returned to England and was minister at Winchester. His writings include: 'Some Helpe to Sturre up to Christian Duties' (3d ed. 1636); 'The Light Appearing more and more toward the Perfect Day, or a Farther Discovery of the Present State of the Indians of New England concerning the Progress of the Gospel amongst them' (1641); and 'Strength out of Weakness' (1652).

Whitfield, Robert Parr, American geologist: b. New Hartford, N. Y., 27 May 1828. He

studied natural history and geology unaided, was assistant on the New York State geological survey in 1856-76, and in 1872 was attached to the United States Geological Survey. He was instructor in geology at the Rensselaer Polytechnic Institute in 1872-5, professor in 1875-8 and since 1887 has been curator of the American Museum of Natural History in New York.

Whitgift, John, English prelate: b. Great Grimsby, Lincolnshire, about 1530; d. Lambeth 20 Feb. 1604. He was educated at Pembroke Hall, Cambridge, and after the accession of Elizabeth took holy orders (1560), and was made chaplain to Cox, bishop of Ely. In 1563 he was appointed Lady Margaret professor of divinity at Cambridge, in which office he gained a high reputation by his lectures on the book of Revelations and the Epistle to the Hebrews, and in 1567 was elected master of Pembroke Hall. Soon after the queen made him her chaplain and master of Trinity College, Cambridge, and the same year he also became regius professor of divinity. He was made dean of Lincoln in 1571, and in 1576 bishop of Worcester, and, being also vicepresident of the marches of Wales, made constant use of both the temporal and spiritual powers to put down Roman Catholicism and Puritanism within the limits of his jurisdiction. In 1583 he became archbishop of Canterbury, and soon exacted from every clergyman in the church a subscription to the three points of the queen's supremacy, the lawfulness of the common prayer and ordination service, and the truth of the whole 39 articles. Making use of the court of high commission he removed from positions in the church all non-conformists. In 1585 the star chamber, at his instigation passed ordinances for the regulation of the press, by which no one was allowed to print except in London, Oxford, and Cambridge; the number of printers was to be determined by the ecclesiastical commissioners; and none but a few special printers were to be suffered to print any book, matter, or thing whatsoever until it should be perused and allowed by the archbishop of Canterbury and the bishop of London; and every one selling books contrary to the intent of the ordinance was to be imprisoned for three months. In 1586 he was sworn of the privy council, and framed the statutes of cathedral churches. The hospital and grammar school at Croydon were founded by Whitgift. Consult *Lives* by Strype (1718) and by Sir George Paule (1612).

Whiting, hwi'ting, Arthur Butts, American musician: b. Cambridge, Mass., 20 June 1861. He is well known as a pianist and as a composer of orchestral and chamber music as well as of numerous songs and pianoforte pieces.

Whiting, George Elbridge, American musician and composer: b. Holliston, Mass., 14 Sept. 1842. He early displayed musical talent; and was engaged as an organist successively at Hartford, Conn., Boston, and at Albany. He studied in Europe in 1863 and in 1872, was organist at the Church of the Immaculate Conception, Boston, in 1876-78, and has occupied that position since 1883. In 1878-83 he was organist at the Cincinnati Music Hall and professor of organ and composition at the Cincinnati College of Music. He was engaged as a

WHITING—WHITLOCK

teacher in the New England Conservatory of Music for several years but resigned in 1897. His compositions include: 'Grand Sonata'; 'Tale of the Viking'; 'Dream Pictures, Cantata'; 'Midnight, Cantata'; a one-act opera in Italian, 'Lenora' (1893); and numerous pre-udes, symphonies, etc.

Whiting, Lillian, American author: b. Niagara Falls, N. Y., 3 Oct. 1857. She engaged in journalism in Saint Louis, Mo., in 1876, in 1880-90 was literary editor of the Boston 'Traveler' and was editor of the Boston 'Budget' in 1890-93. Her published books include: 'From Dreamland Sent' verse; 'The World Beautiful' (3 vols., 1894-6-8); 'A Study of the Life and Poetry of Elizabeth Barrett Browning' (1899); 'Kate Field: a Record' (1899); 'The World Beautiful in Books' (1901); 'Boston Days' (1902); etc.

Whiting, Ind., town in Lake County; on Lake Michigan, and on the Pennsylvania Railroad; about 16 miles southeast of Chicago. It has a good harbor and steamer connections with the Lake Michigan ports. It has a large oil refinery, machine shops, and several industrial establishments connected with refining and shipping petroleum and with shipping farm products. In 1900 (government census) the manufacturing establishments, though small in number, were capitalized for \$12,701,598, and the value of the annual products was \$16,674,285. The two banks have a capital of \$100,000. Pop. (1910) 6,587.

Whiting, a name applied to several quite unrelated fishes probably in allusion to the noteworthy whiteness of their flesh, or, in some cases, of the skin of the lower parts. In the United States, and more especially in the South, several species of *Menticirrhus*, a genus of *Sciaenidae*, are known as whiting, but more widely as kingfishes (q.v.). The common whiting (*M. americanus*) reaches a length of about a foot; the body is elongated and slender with a high spinous dorsal and a long low soft dorsal fin, an undulate caudal fin, and is completely covered with ctenoid scales; the outer row of teeth of the upper jaw are enlarged and strong and the color silvery gray with faint oblique dusky bars. It is very common along sandy shores of the entire Gulf coast and on the Atlantic coast northward to about the mouth of Chesapeake Bay and southward to Brazil. Though remaining on these coasts throughout the year they are most plentiful in summer when they frequent the bays and estuaries, but prefer strong currents and the deeper waters. They feed upon crabs, shrimps and other crustaceans and being vigorous biters and gamy fighters, afford splendid angling. Great numbers are caught on lines for the market and the flesh is unusually firm, delicate, and well-flavored. Spawning is said to occur in May. The surf whiting (*M. littoralis*) is so called because, unlike the last, it frequents shallow waters along sandy shores and is captured in large quantities by means of seines. The outer teeth of the upper jaw are not enlarged; the gill-rakers are better developed than in the common whiting; and the black tip of the caudal fin is another mark of distinction. The common northern kingfish (*M. saxatilis*) also extends into southern waters, and is there con-

fused with the above species under the name of whiting. It may be recognized by its dusky color and the distinct, dark bands which cross the sides obliquely. Other species occur on the Pacific coast. By the New England fisherman the name of whiting or silver hake is given to a common species of the cod family (*Gadidae*), the *Merluccius bilinearis* of American ichthyologists, though many European authorities fail to distinguish it from the Old World *M. vulgaris*. From the great majority of the cods the whiting is distinguished by the total absence of a chin-barbel and by the peculiar excavated area of the top of the skull; the second dorsal and the anal fin are long and each divided nearly in two by a deep notch. The body is elongated and covered with small scales; the color grayish silvery white below. This whiting is common in waters of moderate depth along the shores of New England and somewhat northward, and extends southward in deep water to Virginia and even to the Bahamas. Unlike most of the *Gadidae*, which are essentially bottom-feeders, it is an active, roving species, which comes to the surface to pursue and feed upon herring and other fishes. Sometimes large schools appear on our coasts and many are captured in purse-seines and pound-nets. Spawning takes place at the bottom on the edge of the continental slope. Owing to its comparatively small size and the softness of its flesh it is one of the least important economically of the family.

The European whiting (*M. vulgaris*) is scarcely distinguishable from ours, but has much smaller scales, fewer spines in the first dorsal fin and larger teeth. It frequents shallower water and is very abundant along the northern coasts of Europe. It makes its appearance in vast shoals, keeping at a short distance from the shore, and is taken by the line in great numbers. It is considered the most delicate and most wholesome of all the species of cod; but it does not attain a large size, usually not exceeding a foot in length and under a pounds in weight. The food of the adults consists chiefly of fishes and of the young of shrimps and other crustaceans. Spawning occurs in, and the young frequent, the shore waters. As long as the young feed chiefly on the bottom they retain a chin-barbel, but as their habits change this degenerates and finally disappears. Other fishes sometimes called whiting are the hog-fish, har-vest-fish, and a whitefish (qq.v.).

Whiting, a preparation of white chalk from which the grosser impurities have been removed. It is extensively used in the arts, also for cleaning silver and making putty.

Whitlock, hwt18k, Elizabeth Kemble, English actress, fifth child of Roger Kemble (q.v.), b. Warrington, Lancashire, 2 April 1761; d. 27 Feb. 1836. She first appeared at Drury Lane theatre in February 1783, as Portia. In 1785 she was married to Charles Edward Whitlock, a provincial manager and actor, and seven years later accompanied her husband to this country, where they performed for many years in the principal cities. Mrs. Whitlock became the most popular actress of the day in America, and in Philadelphia frequently performed before President Washington and other distinguished persons. She returned to England in 1807 with a competency, and thenceforth retired from the

WHITMAN

stage. In personal appearance and voice she is said to have strongly resembled her sister, Mrs. Siddons.

Whitman, Charles Otis, American zoologist: b. Woodstock, Maine, 14 Dec. 1842. He was graduated from Bowdoin in 1868, studied at Leipsic, and in 1880-1 was professor of zoology at the Imperial University, Tokio, Japan. He was engaged in further studies at the Naples Zoological Station in 1882, and in 1883-5 was assistant in zoology at Harvard. He was director of the Allis Lake Laboratory, Milwaukee, in 1886-9, and in 1889-92 professor of zoology at Clark University, Worcester, Mass. He became director of the Marine Biological Laboratory at Woods Hole, Mass., upon its foundation in 1888, and since 1892 has been at the head of the department of zoology at the University of Chicago. He was elected to the National Academy of Sciences in 1895. He founded the *'Journal of Morphology'* in 1887, and since 1883 has been editor of the microscopical department of the *'American Naturalist'*. He has made a specialty of the development of the vertebrates and of the structure and development of worms. His writings include: *'Methods of Research in Microscopical Anatomy and Embryology'* (1885); *'Biological Lectures'* (1890-5); *'The Inadequacy of the Cell Theory of Development'* (1893); *'Animal Behavior'* (1898); etc.

Whitman, Marcus, American missionary and pioneer: b. Rushville, N. Y., 4 Sept. 1802; d. near Walla Walla, Or., 29 Nov. 1847. After studying medicine at the Berkshire Medical Institution, Pittsfield, Mass., he practised in Canada for four years. He offered his services as a missionary (1834) to the American Board of Commissioners for Foreign Missions, and in 1835 went with Samuel Parker to explore the region of the Oregon, but did not go beyond Green River. In 1836, having married, with his wife and three fellow missionaries he set out to work among the Indians of the upper Columbia. The party crossed the plains by wagon, being the first persons to reach the Pacific coast by this means. On 1 May they reached the Columbia River, and located themselves near the site of the present Walla Walla, Wash. They were soon followed by a large number of emigrants, who settled in what was then known as Oregon, and now forms the States of Oregon, Washington, and Idaho. At this time the Hudson Bay Company was using every possible means to secure this territory to the English. When this plan became evident to Whitman he decided to take every precaution to forestall it. The Ashburton Treaty was then before Congress, and was expected to settle the Oregon question. In 1842-3 Whitman traveled over 3,000 miles to the East on horseback, enduring all the hardships of a Western winter in the mountains, and according to the statement of H. H. Spalding, one of his missionary companions, he reached Washington (3 March 1843) only to find that the treaty had been signed, but that the Oregon question had not been included. Whitman, as Spalding's version represents, at once went to work to show the government the value of the land it had deemed worthless, demonstrated to the people the fertility of the soil of Oregon, and the fact that it could be reached by wagon, and then returned

at the head of a large body of emigrants. By his daring ride and earnest endeavors Whitman, in this view of the matter, won this great section for the United States, and the results of his work were secured by the treaty of 1846. This claim, however, has been the subject of much controversy, and to the satisfaction of some students has been disproved. Whatever its merits, there is no doubt that Whitman's ride (he reached Boston 30 March 1843) resulted in the reversal of the missionary board's purpose to discontinue the southern branch of the mission in which he was engaged; and his work and that of his companions has a historical relation to the American settlement of the Oregon country. Whitman, his wife, and 12 of their companions were massacred by the Cayuse Indians. Consult: Nixon, *'Life of Marcus Whitman'* (1895); Mowry, *'Marcus Whitman'* (1901); and Bourne, *'Essays in Historical Criticism'* (1901), in which the Whitman claims are examined and discredited. See OREGON; OREGON QUESTION, THE.

Whitman, Sarah Helen Power, American poet: b. Providence, R. I., 1803; d. there 27 June 1878. She was married to John W. Whitman, a Boston lawyer; was once engaged to Edgar Allan Poe, afterward writing a defense of him entitled *'Edgar A. Poe and His Critics'* (1866); contributed numerous critical articles and poems to periodicals, and was noted for her conversational powers. Her verse was in part collected in the volume *'Hours of Life, and Other Poems'* (1853), and fully in the posthumous *'Poems'* (1879). *'Fairly Ballads'* and some other works were written with her sister, Anna M. Power. Her finest poem, *'A Still Day in Autumn'*, has much melody and beauty of expression and retains an honored place in anthologies.

Whitman, Walt (originally WALTER), American poet: b. West Hills, Long Island, New York, 31 May 1819; d. Camden, N. J., 26 March 1892. He was educated in the public schools of Brooklyn, and learned the printer's trade, teaching also in several country schools in Long Island. For a brief period he edited several newspapers, until in 1847-8 he made an extensive pedestrian tour as a workman through the United States and Canada, subsequently employing himself as a carpenter and builder. His first and chief work, *'Leaves of Grass'*, was published by himself at New York in 1855. This thin volume of 94 pages was received, for the most part, with abuse, mainly because of its unconventional metrical style, and the freedom with which the poet dealt with moral and social subjects. During the American Civil War, Whitman's brother was wounded on the battlefield, and the poet, who hastened to his aid, remained afterward as a volunteer army nurse at Washington and in Virginia for the years 1862-5. One result of this experience was the small volume *'Drum Taps'* (1865), subsequently included with *'Leaves of Grass'*. After the war he held a government clerkship in Washington, but the fatigue and mental strain of his labors in the hospitals brought about a severe attack of paralysis in 1873. He was recovering from this when the sudden death of his mother in his presence caused a serious relapse. From this time he resided at Camden, N. J., remaining more or less of an invalid until

WHITMAN — WHITMAN COLLEGE

his death. During all these years Whitman continued to write with the old vigor and freedom of rhythm, but with less of the early crudeness of expression. Though Whitman, like Carlyle and Browning, may be a dangerous and dangerously easy model for imitation, he undoubtedly worked out for himself a style of distinction as notable as theirs. This in itself is a title to fame, or at least a charm against oblivion, even though his style, like that of Lyly, runs to extremes and vices. This style or form is a rhythmic recitative or irregular chant, precursors of which may be found in the English translation of the Psalms and other Biblical poems, in Macpherson's 'Osaiian,' and in the later poems of William Blake. These chants vary in movement and seem governed by laws rhythmic rather than metric, which (like the grammar of an unwritten tongue) have never been formulated even by the inventor himself. They have a peculiar, wild, stirring charm, which is apt, for a time, to make regular verses seem tame and insipid after them. As to subject, Whitman set himself the Atlantean task of uplifting into the sphere or dominion of poetry the whole of modern life and man, omitting nothing, concealing nothing. His thesis is that of Saint Peter's vision: "There is nothing common or unclean." Hence the logical necessity with Whitman to include the treatment of subjects which in modern society are tabooed as obscene and unmentionable; hence, too, the accusations of indecency, so just and pertinent from the accuser's point of view, but so futile and irrelevant from that of the accused. Whitman is in fact an idealist who has bound himself by a solemn vow to be a thorough-going realist; and his resolute and often successful endeavor to secure this union gives his work its exceptional artistic quality. He is a prince of impressionists in literature. But so hard and high is the task that he sets himself that it is no matter of surprise that he sometimes, if not often, fails, and from heights where he was approaching the sublime falls seriously near the ridiculous. This is the fate of all artists who strive for the highest things, that their failures—often only apparent—are more easily detected than their solid achievements; hence the contumely and ridicule that a Turner or a Wordsworth, Keats, or Shelley suffers at the hands of a clever but uninitiated criticism. So largely with Whitman; but it is better to approach him in the same spirit that he has shown toward man and nature, that of for ever seeking for what is great and good, while outfacing steadily and bravely every stern and refractory reality. Besides the two books already mentioned, he published 'Drum-Taps' (1865); 'Memoranda During the War' (1867); 'Democratic Vistas' (1870); 'Passage to India' (1870); 'After All, Not to Create Only' (1871); 'As Strong as a Bird on Pinions Free' (1872); 'Two Rivulets' (1873); 'Specimen Days and Collect' (1883); 'November Boughs' (1885); 'Sands at Seventy' (1888); and 'Good-bye, My Fancy' (1892).

The 'Conservator,' of Philadelphia, is the organ of Whitman study. Consult: 'Autobiographia,' selected from the poet's writings (1892); Burroughs, 'Whitman as Poet and Person' (1866); Bucke, authorized 'Life' (1883); Burroughs, 'Whitman: A Study' (1896);

O'Connor, 'The Good, Gray Poet' (1866); Dowden, 'Studies in Literature' (1878); Symonds, 'Essays, Speculative and Suggestive,' Vol. II. (1890).

Whitman, Mass., town in Plymouth County; on the New York, New Haven & Hartford R.R.; about 15 miles northwest of Plymouth and 20 miles south by east of Boston. The chief manufacturing establishments are boot and shoe factories, paper and wood box factories, tack and nail works, and steel shank factory. In 1900 (government census) Whitman had 65 manufacturing establishments which were capitalized for \$2,054,815, and in which were 2,161 employees to whom were paid annually \$1,192,401. The value of the annual finished products was \$5,009,786. It has seven churches, public schools, and a public library. There are two banks, one national and one savings bank. The government is administered by annual town meetings.

The town was originally a part of Abington, but was set off in 1875 and incorporated as South Abington. In 1886 the present name was adopted. Pop. (1910) 7,292.

L. B. SLATCH,
Editor of 'Whitman Times.'

Whitman College, located at Walla Walla, Wash. It was founded by Cushing Ellis as a memorial to Marcus Whitman (q.v.); it was chartered in 1859 as Whitman Seminary, but was not open to students till 1866; in 1882 the courses were extended, the standard raised, and a new charter obtained in 1883 by which the name was changed to Whitman College. For several years the college was aided by the American College and Education Society of Boston, in 1893 Dr. D. K. Pearsons of Chicago offered to give \$50,000 if the college would raise \$150,000 for the same purpose. The conditions were met, and in 1902 Dr. Pearsons added another \$50,000 to the endowment. Women are admitted on equal terms. The organization includes in addition to the College Department, the Conservatory of Music and the Academy. The college confers the degrees of bachelor of arts, bachelor of letters, bachelor of science, and bachelor of music. Certain studies, including Biblical literature, are required for all courses; Greek is required for the H.B. degree, French or German for the B.L. and B.S. degrees, and one year's work in theory of music, history of music, harmony, and counterpoint for the music degree. Each student by the end of the Freshman year must elect a major study in which three years' work must be done; the major for the B.S. degree must be in mathematics or a science. The rest of the required number of hours are free electives. Courses in pedagogy are included in the curriculum. Practical music work does not count toward a degree in the above mentioned courses; but in the Conservatory the degree of bachelor of music is conferred on students who hold a bachelor's degree and complete the regular music course. There are 20 scholarships, and one loan fund; students are also aided in securing employment. The students maintain Christian Associations, literary societies, and an oratorical association; glee clubs, athletic associations, and a general organization known as the 'Associate Students'; the college is affiliated with the Inter-Collegiate Debating Association, and the Inter-

WHITMARSH — WHITNEY

Collegiate Athletic Association. The campus consists of 27 acres near the centre of the city and includes a small lake. The buildings include the Whitman Memorial, Billings Hall (men's dormitory), Reynolds Hall and Prentiss Hall (women's dormitories), Association Hall, the Conservatory, and the gymnasium; plans for a new gymnasium were constructed during 1904 and 1905. The library in 1910 contained 18,000 volumes; the students numbered 240, of whom 78 were in the College Department, and 162 in the Conservatory of Music.

Whitmarsh, Hubert Phelps, American journalist: b. Madoc, P. O., 10 Aug. 1863. He was a druggist in New York and Boston in 1887-1900, and in the latter year became the representative of the 'Century' in Cuba. He subsequently went to the Philippines for the 'Outlook' and in 1900-01 was governor of Benguet, P. I., resigning in the last named year. He has published: 'The World's Rough Hand'; 'The Golden Talisman'; 'Mysterious Voyage of the Daphne'; 'The Young Pearl Divers'; etc.

Whitney, hwit'n'l, Adeline Dutton Train, American author: b. Boston, Mass., 15 Sept. 1824, d. Milton, Mass., 21 March 1906. She was married to Seth D. Whitney of Milton, Mass., in 1843. Although a frequent contributor to different periodicals during her earlier years, her real literary career did not begin until 1850, and her best work was done in the two following decades. Her writings, which are chiefly for young people, are wholesome in tone and entertaining in style, and include, among many others: 'Footsteps on the Seas, a Poem' (1857); 'Boys at Chequasset' (1862); 'Faith Gartney's Girlhood,' which first brought her into general notice (1863); 'A Summer in Leslie Goldthwaite's Life' (1866); 'Patience Strong's Outings' (1868); 'Hitherto: A Story of Yesterdays' (1869); 'Real Folks' (1871); 'Pansies,' verse (1872); 'Sights and Insights' (1876); 'Bonnyborough' (1885); 'Bird Talk,' verse (1887); 'A Golden Gossip' (1890); 'Friendly Letters to Girl Friends' (1897); etc.

Whitney, Anna, American sculptor and poet: b. Watertown, Mass., September 1821. She contributed to magazines and newspapers considerable verse of high quality collected in 1859 in a volume of 'Poems.' In 1860 she began work as a professional sculptor, opening a studio at Watertown, whence, after four years of study abroad, it was transferred in 1872 to Boston. Among her works are the statue of Samuel Adams for the Capitol at Washington, a bronze replica of which stands in Adams square, Boston; one of Lief Erikson in Boston (replica in Milwaukee, Wis.); and many designs and studies, including 'Roma,' an enlarged copy of which was exhibited at the Columbian exposition.

Whitney, Asa, American inventor and manufacturer: b. Townsend, Mass., 1 Dec. 1791; d. Philadelphia 4 June 1874. As a boy he worked at the blacksmith's trade, also became a machinist, and afterward manufactured machinery in Vermont and at Brownsville, N. Y. In 1830 he was appointed master machinist of the Mohawk & Hudson railroad shops, and three years later became superintendent of the road. In 1839-41 he was a State canal commis-

sioner in New York, and in 1842 removed to Philadelphia, where he entered into partnership with Matthew Baldwin in the building of locomotives. In 1847 he perfected a process for annealing cast-iron carwheels, and began to manufacture them extensively. By his further improvements in carwheels, etc., he did much to increase the convenience and safety of railroad service, and travel. He left \$50,000 to the University of Pennsylvania to found a chair of dynamical engineering.

Whitney, Casper, American journalist and author: b. Baltimore, Md., 2 Sept. 1861. He was graduated from Saint Mathew's College, California, spent several years in traveling and hunting, acting as correspondent for 'Harper's Weekly' during much of the time and writing on outdoor sports. He is now (1904) editor of 'Outing.' His writings include: 'A Sporting Pilgrimage'; 'On Snowshoes to the Barren Grounds'; 'Hawaiian America'; etc.

Whitney, Eli, American inventor: b. Westboro, Mass., 8 Dec. 1765; d. New Haven, Conn., 8 Jan. 1825. He was graduated at Yale in 1792; while there having paid his expenses partly by teaching, partly by mechanical labor. He went to Georgia as a teacher, but finding a patron in the widow of General Nathaniel Greene, of the Revolutionary army, he resided on her estate and studied law. The cotton culture at this period, especially that of the best kind, the green-seed cotton, was limited by the slow and difficult work of separating the cotton from the seed by hand. Whitney set to work to remedy this by inventing a machine, but worked under great disadvantages, for he had to make his own tools. Reports of his success prompted some lawless people to break into his workshop and steal his machine, and get others made before he could secure a patent. He, however, formed a partnership with one Miller in 1793, and went to Connecticut to manufacture cotton gins; but the lawsuits in defense of his rights carried off all his profits and \$30,000 voted him by the State of South Carolina. Finally in 1798 he got a government contract for the manufacture of firearms, and was the first to effect the division of labor by which each part was made separately. He made a fortune by this manufacture, carried out with ingenious machinery at Whitneyville, Conn.; while he received little credit for the perfection of the gin, one of the most important of the whole series of inventions connected with the cotton manufacture. See COTTON; COTTON-GINNING MACHINERY.

Whitney, Henry Howard, American military officer: b. Glen Hope, Pa., 25 Dec. 1866. He was graduated from West Point in 1892, and was on special duty at the War Department in 1896-8. In the last named year, under orders from the secretary of war, he disguised himself as an English sailor, communicated with General Gomez, and made a military reconnaissance of the island of Porto Rico, thereby gaining the information upon which General Miles based the campaign on that island. He was captain of volunteers in 1898-9, served through the Spanish War as captain and assistant adjutant-general on the staff of General Miles, and in 1899 was appointed lieutenant. He accompanied General Miles in his tour around the world in 1902-03.

Whitney, Josiah Dwight, American geologist, brother of W. D. Whitney (q.v.): b.

Eli Whitney

Northampton, Mass., 23 Nov. 1819; d. Lake Umbagog, N. H., 18 Aug. 1896. He was graduated at Yale in 1839, and spent the years 1842-7 in study in Europe, and then explored, with J. W. Foster, the Lake Superior region. Their 'Synopsis' of the explorations was published in 1849 and their 'Report' on the geology 1850-1. He was appointed State chemist and professor in the Iowa State University in 1855 and State geologist of California in 1856. He labored on the survey of that State till 1874, publishing his 'Geological Survey of California' (1864-70). In 1865 he was appointed to the chair of geology at Harvard. Among his publications not already named are: 'The Metallic Wealth of the United States' (1854); 'Yosemite Guidebook' (1869); 'Contributions to American Geology' (1880); 'Studies in Geographical and Topographical Nomenclature' (1888). The highest peak of the Sierra Nevada was named Mount Whitney in his honor.

Whitney, William Collins, American capitalist and politician: b. Conway, Mass., 15 July 1841; d. New York 2 Feb. 1904. He was graduated at Yale in 1863, and at the Harvard Law School in 1865; studied law with Abraham R. Lawrence in New York, and was admitted to the bar in that city. He took an active part in the organization of the Young Men's Democratic Club, and in the proceedings against the "Tweed Ring"; served as corporation counsel of the city in 1875-82, thoroughly reorganizing the Law Department; and was secretary of the navy in the Cabinet of President Cleveland from 1885 to 1889. In this position he accomplished much in the development of plans for strengthening the naval service, and the "new navy" owes its subsequent increase in considerable part to his progressive policy. He did effective work for the election of Grover Cleveland as governor of New York in 1882, and as President in 1884, and again in 1892, when he was manager of the Democratic campaign. He, however, declined to enter the Cabinet again, preferring to pursue his business career, in which his interests had grown to great proportions. One of his largest enterprises was that which resulted in the consolidation of the various street railway lines in New York city. The Metropolitan Street Railway system was mainly organized by him, and he was a director in many corporations and societies. He was also a man of recreations, was especially interested in the breeding and training of horses, and became the recognized leader of the American turf, for the elevation of which to higher levels of sportsmanship he successfully strove. At the time of his death he was one of the largest landowners in the East, his holdings being in several States, and including a game preserve of 16,000 acres in the Adirondacks. While his main residence was in New York, he also maintained others on his various estates, North and South, as well as a house in London.

Whitney, William Dwight, American philologist, brother of J. D. Whitney (qv.): b. Northampton, Mass., 9 Feb. 1827; d. New Haven 9 June 1894. He was graduated from Williams College in 1845, studied at Yale in 1849-50, and then went to Germany, where he continued his philological and Sanskrit studies under Bopp at Berlin and Roth at Tübingen. He was appointed to the professorship of San-

skrit at Yale in 1854, and in 1870 he received in addition the chair of comparative philology, posts which he retained till his death. In 1856 he published, with Roth, an edition of the Atharva-Veda Samhita, and in 1862 issued at New Haven an edition, with translation and notes, of the 'Atharva-Veda Prātiśākhya.' His 'Language and the Study of Language' (1867) was an admirable exposition of the main principles of comparative philology. His other published works include: 'A Compendious German Grammar' (1869); 'A German Reader' (1869); an edition of the 'Taittiriya-Prātiśākhya' (1872), for which he was awarded the Bopp medal of the Berlin Academy; 'Oriental and Linguistic Studies' (1878); 'The Life and Growth of Language' (1875); 'Essentials of English Grammar' (1877); 'A Sanskrit Grammar' (1879); 'The Roots, Verb Forms, and Primary Derivatives of the Sanskrit Language' (1885), a supplement to the grammar; 'A Practical French Grammar' (1886); etc. He was a contributor to Böhtlingk and Roth's great 'Sanskrit Dictionary' (1853-75) and editor-in-chief of 'The Century Dictionary of the English Language' (1880-91). He was elected a member of the American Oriental Society in 1850 and wrote more than half of the contents of Vols. 6-12 of the 'Journal' of that society. For a complete bibliography of his work, consult the 19th volume of the 'Journal of the American Oriental Society' (1897).

Whitney, Mount, a peak of the Sierra Nevada, in the southeastern part of California; altitude, 14,522 feet. It is the highest elevation in the United States, outside of Alaska. On the east side the slope is precipitous, rising abruptly from Owens Valley about 11,000 feet. In 1881 Professor S. P. Langley remained for some time on the summit, making daily observations on the solar heat.

Whitneyite, a metallic mineral, containing 88.4 per cent of copper and 11.6 per cent of arsenic and having the formula $Cu_{10}As_2$. It is known only massive, its structure being very fine-granular. It is malleable, has a hardness of 3.5 and specific gravity of about 8.5. Its color is pale reddish-white, tarnishing quickly to a bronze or nearly black. It has been regarded as a rare mineral until the recent discovery of large quantities associated with domykite in the Mohawk mine, Michigan, where it is now a valuable ore of copper.

Whiton, hwit'ōn, James Morris, American Congregational clergyman: b. Boston, Mass., 11 April 1813. He was graduated from Yale in 1833, and in 1854-64 was rector of Hopkins Grammar School, New Haven, Conn. He was principal of Williston Seminary, East Hampton, Mass., in 1876-8, and subsequently was in charge of Congregational churches in Lynn, Mass., Newark, N. J., New York, and Haworth, N. J. Since 1896 he has been a member of the editorial staff of the 'Outlook.' He has published several volumes of sermons, text-books, an edition of selected orations from Lysias (1875), and 'Is "Eternal" Punishment Endless?' (1876); 'Gloria Patria' (1892); 'Miracles and Supernatural Religion' (1903); etc.

Whitside, hwit'sid, Samuel Marmaduke, American military officer: b. Toronto, Canada, 9 Jan. 1839. He entered the United States army

in 1858; served through the Civil War, was brevetted major in 1865 and in 1866 was appointed captain. He was afterward engaged for more than 25 years in the Indian wars on the Western frontier, where he captured Big Foot and his 400 Sioux warriors in December 1890; and commanded his regiment at the battle of Wounded Knee on the following day. He was promoted lieutenant-colonel in 1895; was in command of the 5th United States cavalry during the Spanish-American War, and was placed at the head of the Department of Santiago and Puerto Principe, Cuba, in January 1900. He was promoted brigadier-general of volunteers in 1901, receiving that rank in the regular army in 1902, and in the same year was retired from active service.

Whitsitt, hwit'sit, **William Heth**, American Baptist clergyman and educator: b. Nashville, Tenn., 25 Nov. 1841. He was graduated from Union University, Murfreesboro, Tenn., in 1861, served in the Confederate army 1862-3, and was pastor of Mill Creek church, Nashville, 1865-6. He subsequently studied at the University of Virginia, the Southern Baptist Theological Seminary, Louisville, Ky., and at Leipzig, and became pastor of a Baptist church in Albany, Ga., in 1872. He was professor in the Southern Baptist Theological Seminary 1872-95, president of that institution 1895-9, and has been professor of philosophy at Richmond College, Va., from 1901. He has published: 'History of the Origin of Infant Baptism'; 'Origin of the Disciples of Christ'; 'A Question in Baptist History' (1897).

Whitson, John Harvey, American novelist: b. Seymour, Ind., 26 Dec. 1854. He was admitted to the Indiana bar in 1876, but after practising his profession for a time turned to journalism. He has published: 'The Young Ditch Rider and Other Stories' (1899); 'Barbara, a Woman of the West' (1903); 'With Fremont the Pathfinder' (1903); 'The Rainbow Chasers' (1904); 'Justin Wingate, Ranchman' (1905).

Whitsunday, the seventh Sunday after Easter; a religious festival in commemoration of the descent of the Holy Spirit on the day of Pentecost. The name was derived from the white garments worn on that day by candidates for ordination and children presented for baptism. The older name was Pentecost. See **PENTECOST**.

Whittemore, hwit't-môr, **Amos**, American inventor: b. Cambridge, Mass., 19 April 1759; d. West Cambridge (now Arlington), Mass., April 1828. He worked for some years as a gunsmith, and finally formed a copartnership with one of his brothers and several other persons for the manufacture of cotton and wool cards. He had not been long engaged in this business before he invented a machine for puncturing the leather and setting the wires, a work previously performed by hand. In experimenting for this invention he met with great difficulty in bending the wires to a given angle after they were finally fastened in the leather, and was on the point of giving up the attempt when in a dream he discovered a method of effecting it. The invention was patented in the United States in 1797, and Whittemore went to England to secure his rights there, but was unsuccessful.

In the United States the patent was sold for \$150,000; but afterward his brother Samuel Whittemore repurchased it, and carried on the business. Amos Whittemore devoted his last years to the invention of an orrery, in which every planet was to describe its own orbit, but did not live to complete it.

Whittemore, Thomas, American Universalist clergyman: b. Boston 1 Jan. 1800; d. Cambridge, Mass., 21 March 1861. He studied for the ministry under the Rev. Hosea Ballou, in April 1821; was settled as the Universalist minister at Milford, Mass., and the next year removed to a church in Cambridgeport, Mass. He resigned in 1833 but resided in Cambridge for the remainder of his life. Early in his ministry he was joint editor of the 'Universalist Magazine,' and in 1828 commenced the publication of the 'Trumpet,' a Universalist newspaper in Boston, of which he was sole editor and proprietor for nearly 30 years. He was also president of the Cambridge bank and of the Vermont and Massachusetts railroad, and represented Cambridge repeatedly in the State legislature. He published: 'A History of Universalism' (1830, enlarged 1860); 'Notes and Illustrations of the Parables' (1832); 'Songs of Zion' (1836); 'Plain Guide to Universalism' (1839); 'Life of Hosea Ballou' (1854-5); etc. Consult his 'Autobiography' (1859).

Whittier, hwit't-ër, **John Greenleaf**, American poet: b. Haverhill, Mass., 17 Dec. 1807; d. Hampton Falls, N. H., 7 Sept. 1892. A Quaker, he labored in boyhood on the farm made celebrated by 'Snowbound,' and received but little formal education, though he contrived by working at shoemaking and teaching to pay for two periods of six months at Haverhill Academy in 1827-8. The acceptance of a poem from him in 1826 for the Newburyport 'Free Press' led to a lifelong friendship with its editor, William Lloyd Garrison (q.v.). He edited the 'American Manufacturer,' a weekly concerned chiefly with mechanics, the industries, and agriculture, in Boston in 1829, and in the following year the 'Haverhill Gazette.' During 1830-2 he conducted the 'New England Review,' which G. D. Prentice (q.v.) had brought into some prominence, at Hartford, Conn., and to this time belong his first independent publications, 'Legends of New England' (1831), and 'Moll Pitcher' (1832). In 1833 he issued 'Justice and Expediency,' an anti-slavery pamphlet and acted as a secretary of the anti-slavery convention at Philadelphia, and a member of the committee which drafted the 'declaration of principles.' He sat in the Massachusetts legislature in 1835, and in the following year sold his farm and removed to Amesbury, some eight miles northeast of Haverhill, where he chiefly resided for the rest of his life. In 1836 he became a secretary of the Anti-Slavery Society, and in 1837 there appeared a volume of 'Poems Written During the Progress of the Abolition Cause in the United States.' With that cause he was now thoroughly identified. At Concord, N. H., he was mobbed with George Thompson (q.v.), during the latter's lecturing tour. Whittier edited the 'Pennsylvania Freeman' in Philadelphia during 1838-40, and in the first of these years his office was sacked and burned by a mob. In 1844-5 he edited the 'Middlesex Standard' in Lowell, and during

WHITTINGHAM—WHITTINGTON

1847-60 was corresponding editor of the 'National Era,' a Washington paper, sometimes writing half-a-dozen columns weekly of general articles and reviews. He also contributed to the 'Atlantic Monthly' from its foundation in 1857. His poem, 'A Word for the Hour' (January 1861), shows that he shrank from the Civil War and was prepared to let the Southern States secede. He hailed the end of the war and of slavery with delight, and did his utmost to induce the North to welcome back the South in the most generous spirit. His publications, after those above mentioned, include the following: 'Mogg Megone' (1836); 'Poems' (1838); 'Lays of My Home, and Other Poems' (1843); 'The Stranger in Lowell' (1845); 'Supernaturalism in New England' (1847); 'Leaves from Margaret Smith's Journal' (1849), an imaginative description of early New England, and 'Old Portraits and Modern Sketches' (1850), all four collected from the 'Era'; 'Voices of Freedom' (1846); 'Songs of Labor, and Other Poems' (1850); 'The Chapel of the Hermits, and Other Poems' (1853); 'Literary Recreations and Miscellanies,' also gathered from the 'Era' (1854); 'The Panorama, and Other Poems' (1856); 'Home Ballads and Poems' (1860); 'In War Time, and Other Poems' (1864); 'National Lyrics' (1865); 'Snowbound: a Winter Idyl' (1866); 'The Tent on the Beach, and Other Poems' (1867); 'Among the Hills, and Other Poems' (1869); 'Miriam, and Other Poems' (1871); 'The Pennsylvania Pilgrim, and Other Poems' (1872); 'Hazel Blossoms' (1875); 'Mabel Martin: a Harvest Idyl' (1875); 'The Vision of Echard, and Other Poems' (1878); 'The King's Misave, and Other Poems' (1881); 'The Bay of Seven Islands, and Other Poems' (1883); 'St. Gregory's Guest, and Recent Poems' (1886); and 'At Sundown' (1892), a posthumous volume. The Riverside edition of his works, both in prose and in verse, carefully revised and annotated by himself, appeared at Boston in 1888-9. The most complete edition of the poems is the one-volume Cambridge edition (1895). Whittier was long interested in politics, though his active part in it largely ceased with the development of anti-slavery opinion in the North. His services to the cause of anti-slavery were important. He wrote numerous occasional poems celebrating or denouncing incidents and events of the conflict, the best-known being the 'Ichabod' verses, "the most powerful that he ever wrote," rebuking the defection of Webster from the anti-slavery principles in the 'Seventh of March' speech. Opposed to the Civil War, he insisted, when it was begun, that slavery was the vital question; and during its progress contributed largely to the small quantity of valuable poetry that it evoked. Subsequently he devoted himself to presenting in narrative and ballad poems the legends, traditions, and history of colonial America, particularly New England; to describing, as he did notably in 'Snow-Bound,' rural scenes and conditions, the latter of which have passed into history; and to writing several hymns which appear in the collections of many denominations. His work had been criticised for its inequality and faulty rimes, and also somewhat for its moralizing tendency. Much of his verse does reveal a certain want of com-

pression and verbal selection, due principally to the fact that it was written with a readiness approaching improvisation. To object to his moralizing tendency is simply to object to the point of view of one who was originally and strongly a reformer. His leading characteristics are a fine simplicity, a convincing quality, and what Lowell styled as his "genial piety." He was less cosmopolitan than Longfellow, but by many critics has been ranked as not greatly inferior to that poet. Consult the biographies by Underwood (1875; new ed. 1883); Kennedy (1882); Linton (1893); Pickard (1894; the authoritative 'Life and Letters'); Barton (1900; 'Beacon Biographies'); and Carpenter (1903; 'American Men of Letters'). Also Fields, 'Whittier. Notes of His Life and His Friendships' (1893); Claffin, 'Personal Recollections of John G. Whittier' (1893); Pickard, 'Whittier as a Politician' (1900) and 'Whittier Land' (1904); and Stedman, 'Poets of America' (1886).

Whittingham, hwit'ing-ham, William Robinson, American Protestant bishop: b. New York 2 Dec. 1805; d. Boston 17 Oct. 1879. He was graduated at the General Theological Seminary, New York, in 1825, ordained deacon in 1827, and priest 1829, and was in charge of St. Mark's Church, Orange, N. J., until 1831. He then became rector of St. Luke's, New York, and in 1835 he became professor of ecclesiastical history in the General Seminary, which position he held until his consecration as bishop of Maryland in 1840. In this office he commanded universal respect by the fullness and breadth of his scholarly attainments. He was generally recognized, especially in the historical field, as the most learned prelate in his communion. A convinced but fair and chivalrous controversialist, he advocated the principles of his faith in such a way as to win adherence to them in all parts of the country. The written evidence of his learning is, however, preserved principally in the pages of various periodical publications, such as 'The Churchman,' of which one time he was editor. During the Civil War, in opposition to many of the people in Maryland, he was unflinching in his advocacy of loyalty to the Federal government.

Whittington, hwit'ing-tôn, Richard, English magistrate: b. Pauntley, Gloucestershire, about 1359; d. London March 1423. He became a mercer in London, a member of the common council in 1385 and 1387, subsequently alderman and sheriff, and mayor in 1397-8, 1406-7, and 1419-20. He was very liberal in charitable gifts. The legend which represents him as making his fortune by sending a cat in an outgoing ship to Barbary, where it was sold for a large sum, and as returning to London, which he had just quitted, on hearing Bow bells sounding what seemed to be

Turn again, Whittington,
Lord Mayor of London,

is without foundation; though it is treated as fact in the uncritical 'Lives' by Lysons (1860) and Besant and Rice (1881; 2d ed. 1894). Consult Clonston, 'Popular Tales and Fictions' (1887) and Wheatley's edition (for the Villon Society) of the 'History of Sir Richard Whittington' by T. H. (1885).

WHITTLESBY — WHYDAH-BIRD

Whittlesby, hwit'l-sī, Charles, American geologist: b. Southington, Conn., 4 Oct. 1808; d. Cleveland, Ohio, 1886. He was graduated from West Point in 1831, served in the Black Hawk war of 1832 and resigned from the army in that year. He was admitted to the bar and engaged in law practice at Cleveland, where he was on the editorial staff of the 'Herald' in 1836-7, and in 1837-8 was engaged in the Ohio State geological survey. He was occupied in making a mineralogical and geological survey of the Lake Superior and upper Mississippi regions for the United States government in 1847-51, and in 1858-60 was attached to the Wisconsin geological survey. On 17 April 1861 he was appointed assistant quartermaster-general on the staff of the governor of Ohio, and in the western Virginia campaign served as chief engineer of the Ohio troops. He was appointed colonel in August 1861 and was subsequently chief engineer of the Department of the Ohio. He led his regiment at the battle of Fort Donelson and at the battle of Shiloh was in command of a division. Failing health compelled his resignation in 1862 and he resumed his surveys in the Lake Superior and upper Mississippi regions. He was one of the founders in 1867 of the Western Reserve Historical Society of Cleveland, and was for many years its president. His writings include more than 200 titles. Among them are: 'Description of Ancient Works in Ohio' (1851); 'Ancient Mining on the Shores of Lake Superior' (1863); 'Early History of Cleveland and Vicinity' (1867); etc.

Whittrodge, hwit'rēj, Worthington, American artist: b. Springfield, Ohio, 23 May 1820. He studied art in Cincinnati, worked there as a portrait-painter 1842-9, later went to Europe, and studied under Andreas Achenbach at Düsseldorf, also in Paris, Belgium, Holland, and Rome, returning to the United States in 1859, to become noted as a landscape painter, his chief subjects being drawn from American scenery. Accompanying Gen. Pope on a tour of inspection at the West in 1874, he sketched many Rocky Mountain views. He was president of the National Academy of Design in 1875-6. His chief works include: 'House on the Hudson River' (1863); 'Old Hunting Ground' (1864); 'View of the Rocky Mountains from the River Platte' (1868); 'Trout Brook' (1875); etc.

Whitworth, hwit'wérth, Sir Joseph, English mechanical engineer: b. Stockport 21 Dec. 1803; d. Monte Carlo, Italy, 22 Jan. 1887. He worked as a mechanic in Manchester and London, discovered the method of making a truly plane surface, and in 1833 established himself as a tool-maker at Manchester. Between 1840 and 1850 he developed his measuring-machine, by means of which he elaborated his standard system of measures and gauges which was found by engineers to be of great usefulness. One of his devices which proved to be of much immediate service was that of a uniform system of screw-threads. He made many experiments in connection with rifles, and in 1857 perfected a hexagonal-barreled rifle of great range, accuracy, and penetrative power, highly excelling the Enfield, then largely in use. It was not accepted at the time by the War Department, as being of a calibre too small (.45) for a military weapon: though in 1869 the War Of-

fice declared that a weapon of such calibre would appear to be the most suitable. He was equally successful in the building of cannon, but his rifled gun with a 250-pound shell and a six-mile range, was rejected by the ordnance board in 1865, greatly to the detriment of British ordnance. His invention of compressed cast steel for ordnance was an important one, and came into general use. His works at Manchester were converted into a limited liability company in 1874, and in 1897 united with the Elswick works, established by Sir William Armstrong (q.v.). His fortune was devoted to the endowment of 30 scholarships in mechanics, and to the furthering of charitable and educational work. He was made a baronet in 1869. Among his writings were: 'The Industry of the United States in Machinery, Manufactures, and Useful and Ornamental Arts' (1854) and 'Miscellaneous Papers on Mechanical Subjects' (1858). Consult the memoir in the 'Proceedings' of the Institution of Civil Engineers, Vol. XCI. (1887-8). See ORDNANCE.

Whitworth Gun. See ORDNANCE.

Whitworth Scholarships, a name given certain scholarships established in England in 1869 by Sir Joseph Whitworth, to encourage the cultivation of combined theoretical and practical skill in the industrial arts of mechanics and engineering. They were placed by the founder under the charge of the English council of education, and are open to be competed for by any young man not 26 years complete, and who has been engaged in handicraft in the workshop of a mechanical engineer for at least three years. There are now four scholarships annually competed for of the value of \$500, tenable for three years, besides exhibitions tenable for one year, value \$250 and \$400.

Whooper, the whooping swan. See SWAN.

Whooping-cough. See HOOPING-COUGH.

Whooping Crane. See CRANE.

Whortle-berry. See VACCINIACEÆ.

Whydah, hwid'ā, French West Africa, a seaport town of Dahomey, on a lagoon communicating with the Bight of Benin, about 70 miles south of Abomey. It has a considerable trade in palm-oil. Pop. est. 15,000.

Whydah-bird, or **Widow-bird**, a weaver-bird (q.v.) of the West African subfamily *Vidua*, in which the tail-feathers are greatly prolonged and modified. The paradise whydah-bird is brownish-black, the head, chin, and throat being black, and the neck encircled by a brown collar. The under parts are pale brown. The tail is long and the two central feathers are elongated and possess broad webs at the tip and a slender shaft, while the two next feathers are about 11 inches long and are broadly webbed. The other tail feathers are set vertically. This species attains a length of five or six inches, exclusive of the tail feathers. The nest is said to be ingeniously made of cotton fibres, and to be divided into two compartments, in one of which the female sits on the eggs, the other being occupied by the male bird. The shaft-tailed whydah-bird (*V. regia*) is colored a rusty red on the head and neck, the back of the head and crown being black. The average length of this species is eight or nine inches; and the four central feathers are elongated, but consist each of the bare shaft

WHYMPER—WICHITA

or quill only, a slight web existing at their tips. Consult Newton, 'Dictionary of Birds' (New York, 1896).

Whympér, hwím'pér, Edward, English author and traveler: b. London 27 April 1840. He was educated privately, and in 1860 was sent by a London firm to make sketches of Alpine peaks. He ascended Mount Pelvoux in the French Alps in 1861, the Pointe des Ecrins in 1864, and in 1865 the Matterhorn. He visited northern Greenland in 1867 and in 1872, making valuable discoveries in evidences of a previous abundant, rich vegetation there, his collection of specimens being now a part of the collection of the British Museum. In 1879-80 he explored the Andes in Ecuador, discovered the Andean glaciers, and succeeded in ascending Chimborazo, a feat which Humboldt attempted and had failed to accomplish. In 1901 he made an exploring tour of Canada, ascending mountains and making investigations in the region of the "Great Divide." His publications include: 'Scrambles Among the Alps in the Years 1860-9' (1871); 'Travels Among the Great Andes in the Equator' (1892); 'Zermatt and the Matterhorn' (1897); etc.

Whyte-Melville, hwít'mél'vél, George John, British novelist: b. Fifeshire, Scotland, 19 June 1821; d. Vale of Aylesbury, Berkshire, 5 Dec. 1878. He was educated at Eton and at 18 joined the 93d Highlanders, from which he exchanged in 1846 into the Coldstream Guards. He retired in 1849 with the rank of major, but volunteered for active service in the Crimean war and was appointed major of the Turkish irregular cavalry. The rest of his life was chiefly devoted to fox-hunting and other field sports, and to the writing of novels of fashionable and sporting life. He was killed by the fall of his horse while hunting. The following are among his novels: 'Kate Coventry' (1856); 'Holmby House' (1860); 'The Queen's Maries' (1862); 'Bones and I' (1868); 'Contraband' (1870); 'Sarchedon' (1871); 'Satanella' (1873); 'Rosine' (1875); 'Roy's Wife' (1878); 'Black but Comely' (1879). He also published some volumes of verse.

Wiard, Norman, American inventor: b. Normandale, Ont., 1826; d. Reading, Pa., 11 Sept. 1896. In early life he was foreman in a foundry at Bradford, Ont., where he began experiments in founding ordnance. During the Civil War he was employed by the United States government in the manufacture of ordnance and projectiles, and was frequently called into consultation by the President and Secretary Stanton. After the war he applied himself to experiments and inventions in his special lines; patented a device for preventing the explosion of steam-boilers, which he sold to the United States and Japanese governments; spent two years in Japan in government employ; was for some time a military engineer in that country; and on his return to the United States conducted, near Boston, a series of experiments in gunnery which attracted wide attention.

Wiborg, ví'börg, or Viborg, Russia, (1) A town in Finland, capital of the government of its own name, on a bay in the Gulf of Finland, 72 miles northwest of Saint Petersburg, with which and with Helsingfors it is connected by railway. It is regularly built in spacious streets;

and has the ruins of a fine old castle, situated on an isolated rock in an arm of the sea. It carries on some iron-founding and other industries, and has a considerable trade in timber, deals, tar, tallow, and fish. The canal that connects the Gulf of Finland with Lake Saima starts at Wiborg. Pop. about 35,000. (2) The government forming the southeastern region of Finland, has an area of 13,530 square miles. Pop. about 400,000.

Wicas'set, Maine, town, port of entry, county-seat of Lincoln County; on the Sheepscot River, and on the Maine Central Railroad; about 48 miles northeast of Portland and 20 miles from the Atlantic. In 1760 the town was incorporated under the name of Pownalboro, and in 1802 it was reincorporated under the present name. Wicasset is a popular summer resort. It is in an agricultural region and has some manufacturing interests. It has two banks. Pop. (1910) 1,287.

Wichern, ví'čérn, Johann Heinrich, German philanthropist: b. Hamburg 21 April 1808; d. there 7 April 1881. He studied theology at Göttingen and Berlin, and then returning to his native town gave himself up to endeavors to improve the condition of the poor and suffering. In the Rauhes Haus (founded 1 Nov. 1833) he established an institution for neglected children, with a training seminary for teachers connected with it, and similar institutions were shortly afterward formed throughout Germany. In 1856 he was appointed councillor of the Prussian ministry of the interior, and in 1858 superintendent of all penal and reformatory institutions in the kingdom. His writings include: 'Die Innere Mission der Deutschen Evangelischen Kirche' (1849); 'Die Behandlung der Verbrecher und Entlassenen Sträflinge' (1853); 'Der Dienst der Frauen in der Kirche' (1858). Consult Lives by Oldenburg (1881-6); Krummacher (1882).

Wichita, wích'í-tá, Kan., city, county-seat of Sedgwick County; on the Arkansas River, and on the Missouri P., the Atchison, T. & S. F., the Wichita & C., the Wichita & W., the Chicago, R. I. & P., and the St. Louis & San Francisco R.R.'s; about 230 miles southwest of Kansas City. It is in a fertile agricultural region, and is the commercial and industrial centre of southern Kansas. The chief products of this section are wheat, corn, hogs, and cattle. The city is on a rolling prairie; it has broad, well-shaded streets, and a good system of water-works and sewerage. The principal parks are Linwood, Riverside, and Griswold.

Business Interest.—In 1909 (Government census) the city had 225 manufacturing establishments, capitalized for \$9,849,000, and employing 718 persons, to whom were paid annually in salaries and wages \$2,211,000. The raw material used each year cost \$16,985,000, and the value of the finished products was \$22,564,000. The chief manufactures were 7 confectionery, whose products brought annually \$171,613; 10 flour and grist mills, annual products \$457,275; 11 saddlery and harness works, products \$168,565; and 18 men's clothing establishments, products \$102,452. The estimated number of employees in manufactories in 1904 was 4,000. Other manufactures were foundry and machine-shop products, furniture, lumber products, brick, tile, books and papers, tobacco products, brooms,

WICHITA FALLS—WICLIFF

brushes, and wood and paper boxes. The city has large meat-packing houses, and a number of wholesale and jobbing houses.

Public Buildings, Churches, and Schools.—The principal buildings are the Government building, the county court-house, city-hall, three commercial blocks, opera houses, and hotels. The Scottish Rite Masonic Cathedral is a noteworthy building. There are 37 churches, representing 18 different denominations. It is the episcopal see of a Roman Catholic bishop. There are a city hospital, Saint Francis Hospital, Saint Joseph's Orphan Asylum, The Martha Washington Home, Children's Home, and a city orphanage. The educational institutions are the Friends' University (1898), Fairmount College (Cong.), opened in 1892; the Albert Magnus College (R. C.), opened in 1900; Kansas College of Osteopathy, All Hallows Academy (R. C.), Lewis Academy (Presb.), Wichita Business College, Wichita Commercial College, a public high school, opened in 1877, public and parish schools, and a public library which contains about 8,000 volumes.

Banks.—There are eight banks, four national, three state, and one private. They have a combined capital of \$500,000 and deposits amounting to about \$4,500,000.

Government.—The government was administered under a charter of 1886, which provided for a mayor, who held office two years, and a city council of 12 members from six wards. The government is conducted on the commission plan.

History.—Wichita was settled in 1869 by Indian traders. In 1870 it was incorporated, and in 1872 was chartered as a city of the second class. Pop. (1900) 24,671; (1910) 32,450, an increase of 112.6 per cent.

M. M. Mumock,

Editor of 'Wichita Daily Eagle.'

Wichita Falls, Texas, county-seat of Wichita County; on the Wichita River, and on the Wichita Valley railroad; about 115 miles northwest of Fort Worth. It is in an agricultural and stock-raising region. It has two national banks with a combined capital of \$150,000 and deposits (1903) amounting to \$385,000. Pop. (1910) 8,200.

Wichita Indians. One of the southern tribes of the Caddoan linguistic stock of North American Indians whose traditional home was the Wichita Mountains of Oklahoma, near which their reservation now lies. In the first half of the 19th century their principal village was on the north fork of Red River, a short distance below the mouth of Elm Creek, in Oklahoma, but three centuries ago (in 1541) Coronado found them in Kansas, between the Arkansas and Kansas rivers, in what the Spaniards designated the province of Quivira (q.v.). The typical house of the Wichitas is the grass lodge; they were always agriculturists, and formerly practised tattooing, from which custom and from their resemblance to their congeners, the Pawnees, they were called by the French *Pani Piqués*. They are now under the Kiowa agency in Oklahoma, where, with their subtribes, the Tawakoni and Waco, they number more than 300.

Wicklow, wík'lô, Ireland, a maritime county of Leinster Province, on the Irish Sea, with an area of 782 square miles. Chief town, Wicklow. The county generally is mountain-

ous, but has fertile lowlands where oats and potatoes are cultivated, and much pasture land devoted to stock-raising. Copper, lead, and iron are mined.

Wicksteed, Philip Henry, English Unitarian clergyman and Dante scholar: b. Leeds, Yorkshire, 25 Oct. 1844. He was educated at University College, entered the Unitarian ministry in 1867, and was minister of Little Portland Street Chapel, London, 1874-97. Since 1887 he has been prominent as a university extension lecturer, especially on Dante, Ibsen, and economics. He has published: 'Dante: Six Sermons' (1880); 'Alphabet of Economic Science' (1888); 'Henrik Ibsen' (1892); and the translation and notes of the Temple edition of Dante's 'Paradiso.'

Wiclif, wík'lif (Wicliffe, Wiclef, Wicliff, or Wychliff), John, English reformer: b. Spreswell, Yorkshire, probably about 1330; d. Lutterworth 31 Dec. 1384. He studied at Balliol College, Oxford, of which he became master at some date between 1356 and 1361, in which latter year he was appointed by his college to the living of Fillingham, in Lincolnshire. About the same time the pope bestowed upon him a prebend in the collegiate church of Westbury-on-Trym, near Bristol, in which he was confirmed by the king. In 1368 he gave up Fillingham and accepted the living of Ludgershall, in Buckinghamshire, and four years later qualified as doctor of theology. He was presented by the crown in 1374 to the benefice of Lutterworth, in the south of Leicestershire, which he held till his death. A Latin tract 'Determinatio quaedam Magistri Johannis Wycliff de Dominio contra unum Monachum,' has been regarded as belonging to the controversy raised by the refusal of the parliament of 1366 to pay a tribute demanded by the Pope Urban V., in virtue of the homage paid by King John to Innocent III., but some authorities refer it to a date about ten years later, when similar circumstances arose. At the time of writing the tract Wiclif was a kind of royal chaplain, for he calls himself *peculiaris regis clericus*, and in 1374 was named second on a commission which went to Bruges to try to settle disputes concerning ecclesiastical jurisdiction with the representatives of the Pope Gregory XI. He had shortly before been appointed a canon of Lincoln, but never actually obtained a prebend in that cathedral. The development of his views on the relation between the ecclesiastical hierarchy and the secular authorities brought him into close association with John of Gaunt, duke of Lancaster, and his party, and in 1377 the anti-Lancastrians sought to strike at their political opponents through Wiclif. He was summoned in that year before Archbishop Sudbury and his suffragans at St. Paul's, and attended, accompanied by Lancaster, Lord Percy, and other powerful Lancastrians. A violent altercation between the duke and William Courtenay, bishop of London, caused the break-up of the meeting, and the infuriated populace plundered Gaunt's palace and attacked Percy's house. Soon afterwards Pope Gregory sent several bulls to the University of Oxford, the Archbishop of Canterbury, and the bishop of London, in which he accused Wiclif of teaching the condemned doctrines of Marsilius of Padua and John of Jandun, and ordered him to be arrested and exam-

ined. The parties were reluctant to move in view of Wiclif's great popularity and influence, and even after the bulls had arrived he was consulted by the government as to whether they might legally prevent money from going abroad to absentee holders of benefices. He eventually appeared before the prelates at Lambeth in 1378, but the king's mother sent a message forbidding them to interfere with him, and a popular demonstration in his favor put an end to the proceedings. In the Gloucester parliament of 1378 he made a defence of John of Gaunt, who had grossly violated the Westminster right of sanctuary.

This year, 1378, was an important date in Wiclif's religious career. While continuing to inveigh against certain abuses, he now began to question the whole basis of sacerdotalism and its authority, and by 1381 had attained to a substantially Lutheran position in regard to transubstantiation and the mass. About this time also he began to make his appeal to the common people and to present religion as a popular force rather than a dogmatic system or an organized institution. This appeal assumed two forms, the sending out of his "poor preachers" and the translation of the Bible from the Vulgate into the English of his day. His itinerant evangelists spread his doctrines throughout the land and soon made the Lollard movement one of great strength and importance. In his translation of the Bible he had the assistance of Nicholas Hereford, who was responsible for most of the Old Testament, and the whole work was revised by his assistant at Lutterworth, John Purvey, who finished it soon after Wiclif's death. Wiclif's views on the eucharist were promptly condemned at Oxford and forbidden to be taught there, and in 1382 Courtenay, archbishop of Canterbury, summoned a council in the Blackfriars' convent hall, at which Wiclif's teaching was condemned and some of his followers excommunicated. This council, known as the "earthquake council" because a violent earthquake occurred during the meeting, ordered the Carmelite Dr. Stokes to publish the condemnation at Oxford. The chancellor of Oxford University at that time, Robert Rygge, was a supporter of Wiclif and evaded the duty of carrying out the council's mandate until absolutely compelled to do so. Wiclif himself remained untouched, but he retired to Lutterworth, where he occupied himself in preaching and writing. It is said that Urban VI. summoned him to Rome in 1384, but this is doubtful. He had a paralytic stroke in 1382 or 1383, and again in 1384, from which he died. He was buried at Lutterworth, but in 1428, in accordance with a decree of the council of Constance in 1415, his body was exhumed and burned, and his ashes thrown into the river Swift.

Of the 24 Wiclifite propositions condemned by the earthquake council ten were described as heretical and 14 as erroneous. The most important of the ten were: that transubstantiation is philosophically false, since the substance cannot be changed while the accidents remain; that transubstantiation is not taught in the Gospels; that confession is not necessary to salvation; that no one after Urban VI. should be recognized as pope; and that it is unscriptural for ecclesiastics to hold temporal possessions. Of the erroneous doctrines, several seriously limited the right of excommunication in a distinctly

Protestant sense, one asserted the right of unlicensed preaching, another declared that dominion, whether civil or ecclesiastical, could not belong to one in mortal sin, and another distinctly asserted the authority of the temporal power over the ecclesiastical in temporal affairs. Wiclif unmistakably made his appeal to Scripture as of higher authority than Church tradition or decrees, and had a strong sense of the individualistic basis of religion. He never reached the Lutheran doctrine of justification by faith, but from denunciation of abuses in the Church rapidly advanced to his three main positions: that all dominion was of divine origin and was forfeited by anyone in mortal sin; that transubstantiation was a doctrine both unphilosophical and unscriptural; and that monasticism in every form was a corrupt institution.

At first he attacked only the luxurious and corrupt orders of monks and was on friendly terms with the friars, but from about 1379 the friars were also included in his condemnation. He was one of the last of the realists in philosophy, and he tried to reconcile predestination with the freedom of the human will. Not only was Wiclif one of the chief forerunners of the Reformation, but he was also a pioneer in English prose literature. He wrote many learned works in Latin, but the nature of his message and the necessities of his position led him to appeal to the people in works in their own tongue. His chief Latin works are: 'De Dominio Divino'; 'De Dominio Civili'; 'De Officio Pastoralis'; and 'Trialogus.' All, except the 'Trialogus' and the 'De Officio Pastoralis,' and also volumes of Latin sermons and a volume of Polemical Works, have been edited by English and foreign scholars for the Wiclif Society. The excepted works were edited by Lechler (1869 and 1863 respectively). His translation of the Bible was edited by Forshall and Madden (1850); and his English works are to be found in the three collections: 'Three Treatises of John Wycliffe' (1851), by Todd; 'Select English Works of Wycliffe' (1869-71), by T. Arnold; and 'The English Works of Wycliffe' hitherto unprinted (1880, Early English Text Society), by F. D. Matthew.

Consult: 'Wicliffe' in the Dictionary of National Biography; Lechler, 'Johann von Wicliffe und die Vorgeschichte der Reformation' (1873); Poole, 'Wycliffe and Movements for Reform' (1889), and 'History of Mediæval Thought' (1884); Burrows, 'Wicliffe's Place in History' (1881); Buddensieg, 'Johann Wicliffe und seine Zeit' (1885); Jos. Stevenson, 'The Truth About John Wicliffe'; Parson, 'Studies in Church History' (Vol. 2); F. A. Gasquet, 'The Eve of the Reformation.'

Widdin, vid'In, or Vidin, Bulgaria, a town on the right bank of the Danube, near the Servian frontier, consisting of three parts, the town on the Danube, the walled city, and the citadel. The principal buildings are the palace, several mosques with lofty minarets, and a range of bazaars lining the main street. Ships can reach the town at high-water. There is a considerable trade, chiefly in corn, wine, and salt, and the chief manufacturers are gold and silver filigree work and jewelry. Widdin was formerly strongly fortified and during Russo-Turkish wars was important strategically, but the treaty of Berlin (1878), which erected Bul-

WIDE AWAKES—WIDOW

garia into a hereditary principality tributary to the Porte, decreed that its fortifications should be dismantled.

Wide Awakes, in American political history, a name adopted by numerous Republican campaign clubs organized for the purpose of aiding in the election of Abraham Lincoln during the presidential campaign of 1860. The first club was organized in Hartford, Conn. It is stated that in New York city there were on one occasion 20,000 Wide Awakes marching in procession.

Wide, Wide World, The, a tale by Susan Warner, published in 1851 under the pen name of "Elizabeth Wetherell." It reached a sale of over 300,000 copies. The life of the heroine, Ellen Montgomery, is followed from early childhood to her marriage with a fulness of particulars which leaves nothing to the reader's imagination. The scenes and episodes are those of a homely every-day existence, described with a close fidelity to detail. Ellen's spiritual experience is minutely unfolded, and the book was long regarded as one of those which are "good for the young." The criticism of a later generation, however, pronounces it mawkish in sentiment and unreal in conduct. It stands among the fading fancies of an earlier and less exacting literary taste.

Wide'ner, Peter A. Brown, American capitalist: b. Philadelphia, Pa., 13 Nov. 1834. He acquired a large fortune in the meat business, entered politics, was appointed city treasurer of Philadelphia in 1873 and in 1874 was re-elected to that office. He is largely interested in street railway corporations. In 1897 he presented to the city of Philadelphia his private residence, valued at \$600,000, for a branch of the Free Lending Library, and in the following year gave to the library a collection of 500 rare books valued at \$25,000. In 1899 he endowed at Philadelphia the Widener Memorial Training School for Crippled Children, a combined home, hospital, and school. The school site consists of a tract of 36 acres at Logan, a Philadelphia suburb.

Widgeon, or **Wigeon**, a river-duck of the genus *Mareca*. Widgeons have a short bill, much rounded at the tip, with a strong, broad nail, and the upper lamellae prominent; wings long and pointed; tail moderate and wedge-shaped. There are about 10 species in various parts of the world. They are found on the seashore and on the margins of lakes and rivers, feeding chiefly on vegetable substances, and performing periodical migrations at night in vast flocks. The American widgeon or baldpate (*M. americana*) is about 20 inches long and 35 in alar extent; the bill is blue, black at the base and tip; upper parts finely waved transversely with dark lines; lower parts mostly white; top of head nearly white, with a broad green patch around and behind the eyes; rest of head and neck grayish, spotted and banded with black; wing-coverts white, the greater tipped with black; speculum green, encircled by black. The baldpate is found throughout North America, breeding chiefly north of the United States and wintering in Central America. It is an active bird, with a swift and well sustained flight, in ranks of various and irregular forms; and it associates during the winter with teal and other ducks. The flesh is highly esteemed,

especially when they have fed in the rice fields of the south, or along with the canvas-back on the water-celery of the Chesapeake. They do not dive, but feed with the head and neck immersed, swimming very near together. The food consists of aquatic seeds, roots, insects, worms, small fry, leeches, nuts, and grain, especially rice in the rainy season; being very fond of the tender aquatic plants on which the canvas-back feeds, and no diver itself, it watches the latter and snatches the morsels as it emerges and before it has had time to open its eyes. They are among the most difficult ducks to shoot, owing to their shyness and swift, irregular flight. The nest is built on the ground, often far from water, and usually of leaves lined with down. The eggs number 8 or 10, are pure ivory white, and about 2 inches long by nearly 1½ in diameter. The European widgeon (*M. penelope*) is rather smaller, and not uncommon all along the Atlantic coast of the United States, as well as on the Pacific. It differs chiefly in having the head and neck reddish brown or cinnamon, the top of the head cream-colored. Consult Grinnell, 'American Duck Shooting' (New York, 1902).

Widmann, vid'n-män, Max, German sculptor: b. Eichstätt, Bavaria, 13 Oct. 1812; d. Munich, Bavaria, 3 March 1895. He was educated at Munich and at Rome, executing while at the latter city his "Shield of Hercules," considered one of his masterpieces, and in 1849 became professor of sculpture at the academy of Art at Munich. Several of the public monuments in that city are by him, but his best work is considered to be shown in his busts and statuettes, which, however, are fewer in number. His statues include those of Orlando de Lasso (1848); Schiller (1863); Goethe (1868); Castor and Pollux (1877). Specimens of his workmanship are to be found at Bamberg, Ratisbon, Würzburg, and other cities.

Wid'nes, England, a manufacturing town in Lancashire, on the Mersey, opposite Runcorn, 13 miles east-southeast of Liverpool by rail. There are extensive chemical, alkali, and soda works; soap, candle, grease, and manure works; copper-smelting works and rolling-mills, and iron-foundries. The town has a considerable carrying trade, which has been further developed by the construction of large docks in 1866, extended in 1884.

Widow, a married woman who becomes bereft of her husband; a grass-widow is a divorced woman. In 1900 there were 2,720,000 widows in the United States, of which 320,000 were in New York State, 120,000 in Massachusetts and 88,000 in Indiana. There were but 8,000 in Utah. New York city contains 105,000 widows and Chicago but 23,097. Among the ancients was practised a form of funeral sacrifice, in which the widow was slain or induced to commit suicide so that she might be buried with her husband and accompany him to the world of spirits. This practice is mentioned as existing among the Greeks by Euripides and Pausanias, and from Caesar it may be inferred that it existed also in Gaul. Widow sacrifice is still the custom in many African tribes; traces of it may be found in China; it lingered till late in the first half of the 19th century in Fiji, and though abolished by law in British India in 1829, is not yet abandoned.

WIDOW BEDOTT PAPERS — WIESSADEN

Widow Bedott (bē-dōt') **Papers**, The, a collection of broadly humorous sketches by Frances Miriam Whitcher, which appeared first in Neal's 'Saturday Gazette' of Philadelphia, about 1847, and in book form in 1855. They were extremely popular in their day and are still read and quoted from, though they have been followed by many works in a similar vein, such as Marietta Holley's 'My Opinions and Betsey Bobbett's' (1873), to mention one of the best known.

Widow Bird. See WHYDAH-BIRD.

Wieland, vē'lānt, Christoph Martin, German author. b. Oberholzhelm, near Biberach, 5 Sept. 1733, d. Weimar 20 Jan. 1813. Having received a thorough preparation, he went in 1750 to the University of Tübingen to study law, but most of his time was devoted to belles-lettres. In 1751 appeared his 'Zwölf Moralische Briefe,' which met with very favorable reception. He also wrote at this time the didactic poem, 'Anti Ovid.' In 1752 he went to Zurich as a literary companion to J. J. Bodmer (q.v.). He was inspired by the deeds of Frederick the Great to write a poem exhibiting the ideal of a hero, for which purpose he chose the story of Cyrus. The first five cantos appeared in 1759, but the poem remained unfinished. About this time he published 'Araspe and Panthea,' an episode from the 'Cyropaedia' of Xenophon. In 1754 he left Bodmer's house, became a tutor, and in 1760 returned to Biberach, where he translated 28 of Shakespeare's plays (1762-8). In 1762 he went to live with Count Stadion, an accomplished scholar, but a thorough man of the world, averse to all religious enthusiasm. Wieland had been formerly prone to religious mysticism, but the gay pleasure-seeking life of the society with which he now came in contact, and the sceptical and cynical kind of literature now most at his command, produced an entire change of sentiment. The first production of his bearing the stamp of his new philosophy of life was the tale of 'Nadine,' which he called a composition in Prior's manner. This was followed in 1764 by 'Die Abenteurer des Don Sylvio de Rosalva' ('The Adventures of Don Sylvio de Rosalva'), a work in which he took Don Quixote as a model. In 1766-7 appeared his 'Agathon,' which established his reputation. His chief work devoted to the subject of love, which at this time occupied much of his attention, is 'Musarion' (1768), a production distinguished for grace, ease, and harmony. In 1770 he wrote 'Die Grazien' ('The Graces'); and the 'New Amadis' in 1771, a poem which celebrates the triumph of intellectual over mere physical beauty. In 1769 he was appointed professor primarius of philosophy at the University of Erfurt. In his 'Verklagter Amor' ('Cupid Accused') he defended amatory poetry; and in the 'Dialogen des Diogenes von Sinope' (1770) gave a general vindication of his philosophical views. In 1772 he was invited to Weimar by the Duchess Anna Amalia as tutor to her two sons, and now turned his attention to dramatic poetry, and wrote his 'Wahl des Hercules' ('Choice of Hercules'), and his 'Alceste.' He also edited the 'Deutscher Mercur,' a monthly, which he conducted till near the close of his life. His views, as exhibited therein, showed too much of the narrow conventional spirit of ranch criticism, and he was therefore attacked

by Goethe, who wrote a satire against him under the title of 'Götter, Helden, und Wieland' (Gods, Heroes, and Wieland), which Wieland answered with great good nature, recommending it to all who were fond of wit and sarcasm. Goethe and Herder were soon drawn to Weimar, where the Duchess Anna Amalia formed a circle of talent and genius. Schiller afterward joined the circle. In 1773 appeared his 'Geschichte der Abderiten.' 'Oberon' (1780), a romantic epic, is the most successful of his larger works. Wieland also prepared translations of Horace, Lucian, and the 'Letters' of Cicero. He superintended (1794-1802) an edition of his 'Works' in 45 volumes. These were also edited by Gruber (1818-28 and 1867-75), and there are many editions of selections, some of which have been translated into English. Consult: Loebell, 'Entwicklung der Deutschen Poesie' (1858); Ranke, 'Zur Beurtheilung Wielands' (1885); Hirzel, 'Wieland und Martin und Regula Künzli' (1891); and Gruber's biography, with his editions.

Wiener, vē'nēr, Leo, American author and educator. b. Russia 27 July 1866. He was educated at the gymnasium of Minsk and Warsaw, at the University of Warsaw and the Polytechnic of Berlin. From the latter city he went to New Orleans, worked in a cotton factory, and later sold fruit in Kansas City, Mo. He then obtained a position as teacher in Odessa, Mo., and afterwards a professorship in the University of Missouri, and was next appointed to his present position as assistant professor of Slavonic languages at Harvard. Among his publications are: 'History of Yiddish Literature in the 19th Century'; 'Anthology of Russian Literature'; 'Slavic Anthology'; and he has edited Rosenfeld's 'Songs from the Ghetto.'

Wiener-Neustadt, vē'nēr-noi'stāt, Austria. See NEUSTADT.

Wiertz, vērts, Anton Joseph, Belgian painter: b. Dinant 22 Feb. 1806; d. Brussels 18 June 1865. He studied art in the Antwerp Academy, where he gained, in 1832, a prize which enabled him to continue his studies in Rome. On his return to Belgium he lived at Liège for a time, and from 1848 at Brussels, where the Belgian government erected a large studio for him in 1850. Wiertz was a painter of great, though eccentric, genius, with a strange predilection for horrible and fantastic subjects, and invented a method of painting, called by himself *peinture mixte*, in which the characteristics of fresco and oil painting are combined. His principal pictures are: 'Greeks and Trojans contending for the Body of Patroclus'; 'The Flight into Egypt'; 'Death of Dionysius'; 'The Triumph of Christ' (1848), his masterpiece; 'The Things of To-day in the Eyes of the Men of the Future'; 'The Beacon of Golgotha'; 'The Last Cannon'; 'Napoleon in Hell'; 'A Second after Death.' He did not sell any of his chief paintings, which he bequeathed to the state, but supported himself by painting portraits. His Brussels studio, fitted up after his death as the Musée Wiertz, contains his large pictures. He wrote 'Eloge de Rubens' (1840); and 'Caractères Constitutifs de la Peinture Flamande' (1863). Consult Labarre, 'Antoine Wiertz' (1866).

Wiesbaden, vē'sbā-dēn, Prussia, (1) A town in the province of Hesse-Nassau, capital

of the government of Wiesbaden, and formerly capital of the Duchy of Nassau, beautifully situated among vineyards and orchards on the southern slopes of the Taunus range, about three miles north of the Rhine and 20 miles west of Frankfurt. It annually attracts about 80,000 visitors from all parts of Europe by its baths. Among notable buildings are the royal palace, the ducal palace, the town-house, the government buildings, the court-house, the museum and picture-gallery, the library (100,000 vols.), the royal court theatre, the Trinkhalle, and the Kurhaus, consisting chiefly of a large and splendid saloon, forming the east side of a square, while the north and south sides are lined by colonnades, filled with gay shops, and uniting a promenade and a bazaar. The springs, all of which except one are alkaline and among the most powerful of their class, are very numerous, and have temperatures varying from 100° to 153° F. The springs of Wiesbaden are spoken of by Pliny as the "Fontes Mattiaci," and on the Heidenberg, north of the town, traces of a Roman fortress were discovered in 1838, which seems to have been connected with the town by a wall, the Heidenmauer ("heathen's wall"), in the ruins of which votive tablets and inscriptions have been discovered. Pop. about 90,000.

(2) The government of Wiesbaden comprises almost the whole of the former Duchy of Nassau, most of the territory which belonged to the city of Frankfurt, etc. Area, 2,108 square miles; pop. about 1,200,000.

Wife. See **LAW OF HUSBAND AND WIFE.**

Wig, an artificial hair covering for the head to conceal baldness. The use of wigs is traced back to the ancients. They were used especially by the women. The fashion is said to have been copied by the Greek ladies from those of Egypt. Under the Roman emperors it became common even for men to wear wigs, and several of the emperors themselves used this ornament. In the latter half of the 16th century the fashion became much in vogue in France, Italy, and England. In 1560 no lady appeared at the French court without a blonde wig. Louis XIV. was at first averse to wigs; but in the latter part of his reign, when he began to lose his own hair, he reintroduced the fashion, which went to a greater extreme than ever. About 1660 they began to be worn by the clergy, who had at first shown themselves hostile to the practice. The practice of powdering these wigs was adopted about the year 1700. About 1720 the great wig began to give place to the queue, which remained the fashion till early in the 19th century. Modern refinement has abolished the wig as an ornament except in Great Britain for the lord-chancellor, judges, and barristers.

Wigan, England, a town of Lancashire, on the Douglas, 21 miles northeast of Liverpool. Wigan stands in the centre of an extensive coal field, and its manufactures, which are important, consist chiefly of calicoes, fustians, and other cotton goods, linens, checks, cotton twist, etc., besides iron foundries, iron forges, railway car works, iron rolling mills, large breweries, chemical works, and corn and paper mills. Pop. about 65,000.

Wiggin, wig'jin, Kate Douglas Smith, American author: b. Philadelphia, Pa., 28 Sept. 1857. She was educated at Abbott Academy, Andover, Mass., and in 1876 went to California,

where she studied the kindergarten system in Los Angeles, and later at San Francisco organized the first free kindergarten in the West. In 1880 she was married to S. B. Wiggin, a lawyer (d. 1889), and removed to New York. In 1895 Mrs. Wiggin was married to George C. Riggs. She published, with her sister, Nora A. Smith: 'Froebel's Gifts' (1895); 'Kindergarten Principles and Practice' (1896); etc. Her other works, several of which have attained great favor in this country and England include: 'The Bird's Christmas Carol' (1888); 'The Story of Patsy' (1889); 'A Cathedral Courtship' (1893); 'Mann Lisa' (1896); 'Penelope's Progress' (1898); 'Penelope's Experience in Ireland' (1901); 'Diary of a Goosegirl' (1902); 'Rebecca of Sunnybrook Farm' (1903); etc.

Wigglesworth, wig'lz-werth, Michael, American Puritan clergyman: b. Yorkshire, England, 1631; d. Malden, Mass., 10 June 1705. In 1638 he was brought to Charlestown, Mass., by his father and accompanied him in the same year to New Haven, Conn. He was graduated from Harvard in 1651, subsequently becoming a tutor there. He then studied theology and was settled as pastor of the Church of Malden in 1656. He was accounted skilful in medicine, and was offered the presidency of Harvard in 1684, but on account of ill health declined the honor. His best-known work, 'The Day of Doom' (1662), was a popular poem in New England for a long period. Two editions were printed in England and the 6th edition in New England appeared in 1715. The savage Calvinism of the poem is unsurpassed in literature save perhaps in Jonathan Edwards' sermon, 'Sinners in the Hands of an Angry God,' but the work contains not a little dramatic force and here and there passages of dignity and beauty. He also wrote: 'God's Controversy with New England' and 'Meat out of the Eater,' in verse; and 'A Discourse on Eternity.' Consult. Tyler's 'History of American Literature' (1878); and Dean, 'Memoir of Michael Wigglesworth' (1863, new ed., 1871).

Wight, wīt, Orlando Williams, American physician and translator: b. Centerville, N. Y., 19 Feb. 1824; d. Detroit, Mich., 19 Oct. 1888. He was educated at the Rochester Collegiate Institute, removed to New York in 1847, studied theology and was ordained to the Universalist ministry. He subsequently studied medicine, being graduated from the Long Island College Hospital in 1865. He engaged as a medical practitioner in Wisconsin, and was appointed state geologist and surgeon-general in 1874. He was health commissioner of Milwaukee in 1878-80, and health officer of Detroit in 1882-8. He was a noted translator and throughout his life devoted a large share of his time to literary work. He wrote: 'Maxims of Public Health' (1884); 'Peoples and Countries Visited' (1888); etc. His translations include: 'History of Modern Philosophy,' with F. W. Ricord (1852); 'Lives and Letters of Abélard and Héloïse' (new ed., 1861); Martin's 'History of France,' with Mary L. Booth (1863); etc. He also edited 'Standard French Classics' (14 vols., 1858-60); 'The Household Library' (18 vols., 1859, et seq.); etc.

Wight, Peter Bonnett, American architect: b. New York 1 Aug. 1838. He was graduated from the College of the City of New York

WIGHT, ISLE OF—WILBERFORCE

In 1855, practised as an architect in New York in 1861-71, and since 1871 in Chicago. He has been secretary of the Illinois State board of architects since 1897, was elected to the American Institute of Architects in 1866, and since 1900 has been secretary of the Municipal Art League of Chicago.

Wight, Isle of, England, off the south coast, in the county and opposite to the mainland portion of Hants, is separated from the mainland by the roadstead or channel of Spithead on the east, and by the Solent or continuation of this on the west. It is about 23 miles in length from east to west, by 15 miles broad; circuit about 70 miles; area, 140 square miles. The general appearance of the island is exceedingly diversified; the air is remarkably healthful. Only a small portion of the surface is waste. The downs, which cross the island from east to west and form excellent sheep-walks, separate it into two districts, which in their general character contrast with each other, the soil on the north side being generally a stiff, cold clay, and on the south side a fertile sandy loam. Excellent cement is manufactured at the works on the west side of the Medina, and largely exported. The chief imports are cattle, coal, timber, and building material. The island is well defended, being protected on the east side by Sandown Fort, Bembridge Fort and Battery, and by other forts which lie between the island and the mainland. The western approach is guarded by Hurst Castle and other forts.

The chief towns are Newport (the capital), Ryde, Cowes, Ventnor, Brading, Yarmouth, and the fashionable health-resorts of Sandown and Shanklin on the southeast coast. Osborne, near Cowes, was a residence of Queen Victoria, and with its beautiful grounds is now a national memorial, the gift of Edward VII.

Among the antiquities of the Isle of Wight the most interesting is Carisbrooke Castle, which stands a little southwest of Newport, and consists of extensive and well-preserved picturesque ruins. It has many historical associations: it is supposed to have originally been a fortress of the Britons, was afterward repaired and enlarged by the Romans, was considerably strengthened under Cerdic, who founded the kingdom of Wessex, and rebuilt in the reign of Henry I. During the Parliamentary war it became the asylum of King Charles I. on his escape from Hampton Court, and afterward his prison. Another interesting remain is Quarr Abbey, about 2½ miles from Ryde, which was built in 1132, and is now a farmhouse. Pop. about 85,000.

Wigwam, among the American Indians a name applied to a hut or cabin, generally of a conical shape, formed of bark or mats laid over stakes planted in the ground, and converging toward the top, where there is an opening for the escape of the smoke. The word has also been applied to a large temporary structure for public gatherings.

Wilars de Honacourt, vè-lâr dê hôn-koor, French architect of the 13th century. He is one of the earliest recorded experimenters with the perpetual motion theory, his rude drawings of his plans being still preserved in his sketch book at the Ecole des Chartes at Paris.

Wilber, wil'ber, Neb., village, county-seat of Saline County; on the Big Blue River and

on Chicago, Burlington & Quincy railroad; 30 miles southwest of Lincoln. It is in a rich agricultural region, in which the chief products are wheat and corn. It has flour mills, grain elevators, machine shop, creameries, and cigar factories. There are six churches, a high school, and a county court-house. The two banks have a combined capital of \$75,000.

Wilberforce, wil'ber-fôrs, **Robert Isaac**, English clergyman, 2d son of William Wilberforce (q.v.); b. Clapham, Surrey, 19 Dec. 1802; d. Albano, Italy, 4 Feb. 1857. He was graduated from Oriel College, Oxford, in 1823, and was subsequently chosen fellow of his college, associating in that capacity with Pusey and Newman, Hurrell Froude and other leaders of the high church party. In 1830 he left Oxford to take charge of a parish, and became vicar in 1840 of Burton Agnes, Yorkshire. He published 'Church Courts and Discipline' (1843); 'Lucius, or Stories of the Third Age' (1842); 'Doctrine of the Incarnation' (1848); and 'Doctrine of Holy Baptism' (1849), the two last attracting great attention by the very positive doctrines they enunciated. He also published a 'History of Erastianism' (1851); 'Doctrine of the Eucharist' (1852); 'Inquiry into the Principles of Church Authority' (1854); etc. Finding that he could no longer consistently hold his position in the Church of England, he was received into the Roman Catholic Church in Paris in October 1854.

Wilberforce, Samuel, English prelate, 3d son of William Wilberforce (q.v.); b. Clapham, Surrey, 7 Sept. 1805; d. near Dorking, Surrey, 19 July 1873. He was graduated from Oriel College, Oxford, in 1826, ordained deacon in 1828, and appointed curate of Checkendon, Oxfordshire, the same year. He was rector of Brightstone, in the Isle of Wight, 1830-40, in 1839 became archdeacon of Surrey, and in 1840 a canon of Westminster. In the last named year also he became rector of Alverstoke, Hampshire. He received the deanery of Westminster in March 1845, but before the close of that year was promoted to the bishopric of Winchester. He was the leader of the High Church party, though much opposed to ritualism, and was both witty and eloquent as well as a skilful debater in the House of Lords. His readiness in argument and his versatile qualities gained him the title of "Soapy Sam." He published 'Notebook of a Country Clergyman' (1833); 'Eucharistica' (1839); 'A History of the Protestant Episcopal Church in America' (1844); 'University Sermons'; etc. Consult the 'Life' by his son, R. G. Wilberforce (1888); Daniell, 'Bishop Wilberforce' (1891).

Wilberforce, William, English philanthropist; b. Hull, Yorkshire, 24 Aug. 1759; d. London 29 July 1833. Educated at Cambridge, he was in 1780 elected member of parliament for his native town; and in 1784 was returned both by his former constituency and by that of the county of York. He chose to represent the latter. In 1786 he made the acquaintance of Clarkson, who gained his sympathies on behalf of the agitation against the slave-trade, to which he henceforth devoted all his energies in parliament till the agitation proved successful. He first called the attention of the house to the subject in 1787, and in 1791 moved for leave to bring in a bill to prevent further importation of

African negroes into the British colonies. Year after year he pressed this measure, but was always defeated till 1807, when it was passed during the short administration of Fox. But his exertions in the cause of the slave were not over. Having secured the abolition of the slave-trade in the British colonies, he next addressed himself to the task of obtaining emancipation for those already reduced to or born in slavery. In 1812, after having sat for Yorkshire in six parliaments, he withdrew from the representation, and until 1825, when he retired from parliament, sat for the borough of Bramber. He died shortly after the government plan for the total abolition of slavery in the British colonies had passed in the House of Commons. His remains were interred in Westminster Abbey, and his funeral was attended by distinguished men of all parties. Wilberforce was the author of a treatise entitled 'A Practical View of the Prevailing Religious Systems of Professed Christians in the Higher and Middle Classes contrasted with Real Christianity' (1797). Consult: 'Life of William Wilberforce' by his sons (1838); his 'Correspondence' (edited 1840); and 'Private Papers of William Wilberforce' (edited 1897).

Wilberforce University, an institution for the education of the colored race located at Wilberforce, a suburb of Xenia, Ohio. It was founded in 1856 under the auspices of the African Methodist Episcopal Church. It includes the Collegiate Department, the Normal Department, the Payne Theological Seminary, a Law Department, the Academic Department, and Music and Commercial departments, and a Nurses' Training School. Women are admitted to all departments. The Collegiate Department offers two four years' courses, the classical and the scientific leading to the degrees of A.B. and B.S. The Theological Seminary offers a three years' course and confers the degree of B.D. A practice school is connected with the work of the Normal Department. Industrial training is not included in the curriculum; students, however, care for their own rooms. Emphasis is placed upon the development of moral character; there are few rules for behavior and government, but these are strictly enforced. The income in 1910 amounted to \$65,000; the grounds and buildings were valued at over \$380,000; a new dormitory was built in 1900-1; the library contained 10,000 volumes. The students numbered 340 and the faculty 27.

Wilbrandt, wī'brānt, Adolf, German dramatist, novelist, and biographer: b. Rostock 24 Aug. 1837. He was educated in Berlin and in Munich, traveled in Italy and France, and in 1871 became director of the Hofburg theatre in Vienna. He resigned his position in 1889, returned to Rostock, and has since occupied himself in literary pursuits. He wrote biographies of Heinrich von Kleist (1863), Hölderlin, and Fritz Reuter, the two last published in 'Fahr-ende Geister.' His dramas have met with great success, and among them may be mentioned: 'Der Graf von Hammarstein' (1870); 'Gracchus' (1872); 'Giordano Bruno' (1874); 'Kriemhild' (1877); etc. His novels treat with skill the social and literary problems of the day. They include: 'Adams Söhne' (1890); 'Der Dornenweg' (1894); 'Feuerblumen' (1900); 'Villa Maria' (1902); etc.

Wilbur, wīl'bər, John, American preacher of the Society of Friends: b. Hopkinton, R. I., 17 July 1774; d. there 1 May 1856. He was a teacher and surveyor, who was a strongly conservative member of the Society of Friends and opposed innovations which he believed to be at variance with the original doctrine of the society. For his alleged statements reflecting on J. J. Gurney (q.v.), the English Quaker, he was denounced by several members of the Rhode Island yearly meeting of 1838. He was sustained by a large majority of his own (South Kingstown) monthly meeting; but that meeting was dissolved and its members added to the Greenwich meeting, by which he was formally disowned in 1843. This action was confirmed by the quarterly meeting and the Rhode Island yearly meeting. Wilbur's adherents then withdrew from the orthodox society in such numbers as to form an independent conservative yearly meeting whose members were styled Wilburites (q.v.). Among Wilbur's writings, largely polemical, was 'A Narrative and Exposition' (1845). His 'Journal and Correspondence' appeared in 1859.

Wilburites, a branch of the Society of Friends, or Quakers, who adopted the principles of the Rev. John Wilbur, and maintain an independent yearly meeting. Wilbur became a preacher of the Society of Friends, and took a strongly conservative stand against what he regarded as innovations antagonistic to the original doctrines of the society. He was also accused of making unjust charges against Joseph John Gurney, the noted English philanthropist and preacher of the Society of Friends, when Gurney visited the United States. Wilbur was sustained by his own monthly meeting of South Kingstown, but that meeting was dissolved and its members added to the Greenwich meeting. The latter disowned Wilbur, and its action was confirmed, after an earnest controversy, by the quarterly meeting and the Rhode Island yearly meeting. Wilbur's followers thereupon formed an independent meeting, which in 1902 included 38 ministers, 53 churches, and 4,468 communicants. See FRIENDS, THE RELIGIOUS SOCIETY OF.

Wilcox, wīl'kōks, Cadmus Marcellus, American soldier: b. Wayne County, N. C., 19 May 1826; d. Washington, D. C., 2 Dec. 1890. He was graduated from West Point in 1846, served in the Mexican War, and in 1860 was promoted captain. In 1861 he resigned from the army and entered the service of the Confederacy. He participated in the first battle of Bull Run, was promoted brigadier-general in October, and in 1863 became major-general. He was engaged in the second battle of Bull Run, at Fredericksburg, Chancellorsville, Salem Heights, Gettysburg, and other important battles, and was present at the surrender at Appomattox Court-house. He was offered a commission as brigadier-general in the Egyptian army after the close of the Civil War, but declined it. In 1886-9 he was chief of the division of railroads at the general land-office in Washington. He wrote 'Rifles and Rifle Practice' (1859); translation 'Austrian Infantry Evolutions of the Line' (1860); and an excellent 'History of the Mexican War,' the manuscript of which was completed and published by his niece, M. R. Wilcox (1892).

WILCOX — WILDBAD-GASTEIN

Wilcox, Ella Wheeler, American poet: b. Johnstown Centre, Wis., 1855. She was educated at the University of Wisconsin and in 1884 began her literary career by contributing to the periodical press, and her work has been widely read and extensively reprinted. 'Poems of Passion' (1883) is perhaps her best known work. Among her other publications, in verse, are: 'Drops of Water' (1872), 'Maurine and Other Poems' (1876); 'Poems of Pleasure' (1887); 'The Beautiful Land of Nod' (1892); etc. She has also written the novels: 'Mal Moulée' (1885); 'A Double Life' (1890); 'An Erring Woman's Love' (1892); 'The Story of a Literary Career' (1904).

Wilcox, Marston, American author: b. Augusta, Ga., 3 April 1858. He was graduated from Yale in 1878, studied in Germany, and was subsequently admitted to the New York bar. He has acted as instructor at Yale, was associate editor of the 'New Englander' and the 'Yale Review,' and since 1893 has been engaged in editorial and other literary work in New York. He has published: 'Real People' (1886); 'A Short History of the War with Spain' (1898); 'Harper's History of the War with the Philippines' (1900); etc.

Wilcox, Robert William, American legislator: b. Kūhū, Honolulu, Hawaii, 15 Feb. 1855; d. Honolulu, Hawaii, 24 Oct. 1903. He was educated in Hawaii and at the Royal Military Academy, Turin, Italy. He was a member of the native legislature, led the revolution to restore the old constitution in 1889, and in 1895 again commanded a revolution, on this occasion for the purpose of restoring Queen Liliuokalani to the throne. He was captured and sentenced to death, but through the mediation of the United States Congress the sentence was commuted to 35 years' imprisonment and \$10,000 fine. He was pardoned, conditionally in 1896, and fully in 1898, by President Dole. He was elected a delegate to the United States Congress in 1901 and served one term.

Wild, Heinrich, hin'rin vilt, Swiss meteorologist: b. Uster 17 Dec. 1833; d. Zürich 5 Sept. 1902. His education was obtained at Zürich, Königsberg, and Heidelberg, and from 1863 to 1865 he was director of the central meteorological bureau at Bern. He was called to St. Petersburg, and was director of the Russian meteorological service 1868-95, when he retired. He invented the polaristrobometer, a polarization pluviometer, a magnetic theodolite, and other optical instruments, edited the Russian 'Neues Repertorium für Meteorologie,' and published 'Temperatur-Verhältnisse des russischen Reichs' (1876); and technical papers.

Wild, wîld, Jonathan, English thief and informer: b. Wolverhampton, England, about 1682; d. London 24 May 1725. He was a Birmingham buckle-maker who in 1706 went to London intending to engage in his trade, but becoming involved in debt was imprisoned for four years, after which he became a receiver of stolen goods and an informer against such criminals as were not in his employ. He was hanged at Tyburn. He was the subject of Fielding's satire, 'History of the Life of the Late Mr. Jonathan Wild the Great' (1743) and also appears in Ainsworth's novel, 'Jack Shepherd,' as well as in various other tales and pretended biographies.

Wild Hunt (Ger. *Wilde Jagd*; also *Wäthener*), in German folk-lore, a fancied noise in the air at night, most usually supposed to be heard between Christmas and Epiphany. The sound is compared to that of a spirit host rushing along, accompanied by the shouting of huntsmen and the baying of dogs. The root of the notion is thought to lie in the Christian degradation of the old heathen gods. Like Odin, the lord of all atmospheric and weather phenomena, and consequently of storms, the wild huntsman also appears on horseback, in hat and cloak, accompanied by a train of spirits—by the ghosts of drunkards, suicides, and other malefactors, often without heads, or otherwise mutilated. When he comes to a crossroad, he falls, and gets up on the other side. Generally he brings hurt or destruction, especially to any one rash enough to address him or join in the hunting cry, as many persons valiant in their drink have done. Whoever remains standing in the middle of the highway, or steps aside into a tilled field, or throws himself in silence on the earth, escapes the danger. In many districts heroes of the older or of the more modern legends take the place of Odin: thus, in Lusatia, Dietrich of Bern; in Swabia, Berchthold; in Sleswick, King Abel; in Lower Hesse, Charles the Great; in England, King Arthur; in Denmark, King Waldemar. The legend has also in recent times attached itself to individual sportsmen, who, as a punishment for their immoderateness or cruelty in sport, or for hunting on Sunday, were condemned henceforth to follow the chase by night. In Lower Germany there are many such stories current of one Hakkelerend, whose tomb even is shown in several places.

Another version of the wild hunt is to be found in the legend prevalent in Thuringia. There the procession, formed partly of children who had died unbaptized, and headed by Frau Holle or Holda, passed yearly through the country on Holy Thursday, and the assembled people waited its arrival, as if a mighty king were approaching. An old man with white hair, the faithful Eckhart, preceded the spirit-host to warn the people out of the way. In one form or other the legend of the wild hunt is spread over all German countries, and is found also in France, and even in Spain. In England we meet substantially the same notion in folk-lore—phantom dogs, like the black Shuck-dog of Norfolk and the Mauthe hound of Peel in Man, the 'Wisht Hounds' of Dartmoor, headless horses, a ghostly coach, and horses swept along in a storm of wind. Such tales, with innumerable variants, are in fact found in the mythical and legendary records of all the older peoples.

Wild Irish Girl, *The*, a novel by Lady Morgan, published in 1806. It instantly became a favorite, in England went through seven editions in less than two years, and in 1807 reached its fourth American edition. The story is in the form of letters, and suffers from the consequent limitations; but the sketches of Irish life are curious and picturesque.

Wildbad-Gastein, vîlt'bâd gâs'tîn, Austria, a watering-place in Gastein valley, 3,000 feet above the sea, 48 miles south of Salzburg, with thermal springs varying from 64° to 100°, and containing some salt and carbonates of magnesium and lime. The place gives the name to a

WILDCAT

treaty signed here in 1865 by the emperor of Austria and the king of Prussia, the non-observance of the terms of which led to the German war of 1866.

Wildcat, any of the smaller species of feline animals (family *Felidae*, q.v.) in its feral condition; a lynx. The term is a general one applying to all the smaller felines; but locally has usually some specific application. Thus in European books and speech the "wildcat" properly and ordinarily means *Felis catus*, formerly well-known in all forested districts from the British Isles to Siberia, and still to be found in the less settled districts of the continent south of Sweden, though extinct in Great Britain, France, and Italy; it is also numerous in northern Scotland. The wildcat is larger, heavier, and more strongly built than the domestic cat (to which it has contributed little, if anything; see CAT), has a stouter head and shorter and thicker tail, which does not taper; besides other peculiarities. Its body is yellowish gray, with a dark stripe along the spine, and with numerous darkish stripes descending more or less vertically down the sides, marking the limbs transversely and forming rings around the tail. It is noted for its savagery, and thoroughly tamed examples are very rare, if any ever existed. Like most of the wild felines the female makes her nest in a hollow tree, or cleft of rocks, in an abandoned crow's nest, or some similarly convenient place, and brings forth there in early summer an annual litter of young, which show the ferocity of their native disposition from the start.

Lynxes.—The other European wildcat, and the North American wildcats, are lynxes, formerly set apart in a separate genus (*Lynx*); but most modern zoologists do not do so. "The lynxes," says Mivart, "are animals which present a markedly different aspect from that of other cats. Their legs are long, and their tail is, with one exception (that of the caracal), very short. Their ears also are tufted at the tip. The pupil is linear when contracted. The orbits are incompletely surrounded by bone. They have no tooth representing the common cat's first upper premolar, while that answering to its second upper premolar is largely developed. The intestines are also very short. . . . Still the above given characters are variable in the cat group. In some cats other than lynxes the tail is short, and some have the ears more or less penciled. Some, as we have seen, have long legs, and in many the upper premolar is wanting. The lynxes, therefore, cannot be separated off as a nominally distinct group or genus. The lynxes are very variable in their color and markings, and the Northern lynx also varies greatly in the abundance of its hair, according to the season,—the animal having a very different aspect in winter from that which it presents in summer. The Northern lynxes are generally reckoned as forming two species, one belonging to the Old World (*F. borealis*), and at least one species belonging to the New (*F. canadensis*). The American forms are often also described as alone constituting three species—namely, *F. canadensis*, *F. rufa*, and *F. maculata*. After a careful examination . . . I am, however, not only quite unable to regard the American varieties as anything more than varieties, but I am inclined to the opinion that

there can be no real specific distinctness between the Northern lynxes of the two hemispheres, their skulls as well as their skins being so much alike."

The European lynx is still found in northern Scandinavia, Russia, and eastward, and in some of the wilder mountain chains of central Europe. It is reddish gray, as a rule, indistinctly spotted or not at all, most prominently when young. A large one will measure 40 inches from the snout to the root of the short, thick tail. The lynx of northern America is very similar, the color grading from nearly uniform grizzly gray in far northern specimens which are the largest in average size, toward the reddish and yellowish, more or less spotted southern specimens, which run much smaller: these colors are always brighter in summer than in winter. The long hair depending from the cheeks is characteristic of the group, especially in old males, and gives a very grim aspect to the countenance. These variations, which are local in some of their manifestations, have led the more recent school of American zoologists, led by Merriam, to name several species and subspecies. Thus the Canadian lynx (*F. canadensis*) is not regarded as findable south of Canada, and is characterized by its long gray unspotted coat. The lynxes or "bobcats" of the United States generally are *F. rufa*, yellowish brown spotted on the sides, with dark brown, and having other markings; a subspecies (*maculata*), more profusely spotted, extends the range of the cat to the Pacific coast; and various other subspecies, distinguished by color, are found in the Gulf States and westward to Central America. All have substantially the same rapacious qualities and habits, varying with the character of the country and climate in which each variety lives, and the kind of small animals upon which they must depend for food. They are chiefly solitary and nocturnal; and soon disappear from all well-settled regions.

African and Asiatic Wildcats.—The Egyptian or gloved cat (*F. caligata*) is most interesting of the Old World wildcats, because it is the source, or main source, of our domestic races (see CAT). It inhabits northern Africa, and is about a third smaller than the European wildcat; it is yellowish, growing nearly white on the belly, and has obscure stripings on the body, limbs, and tail, which is rather long, slender, and tipped with black, while the feet are usually blackish. Another well known African cat is the large, long-legged serval (*P. serval*) which is to be found throughout the whole continent. It becomes as much as 40 inches long from nose to root of tail, and the tail may be 16 inches in length. In color it is tawny, with black spots, forming two irregular bands along the back, and black rings on the tail; its fur is a valuable commodity. Three or four other species dwell along the West African coast, as the rare red-brown "golden-haired" cat (*F. rufila*), the smaller gray, spotted, *P. neglecta*, and the more yellowish *F. servalina*, but none is well known.

Asia and the Malayan archipelago have a large number of wildcats, some of which when better known may prove to be mere local varieties of other species. The most familiar are the common Indian wildcat (*F. torquata*), which has much resemblance to the European

one, but is more slender, a brighter fulvous in tint, and less striped. Another wide-ranging species in India is the chaus, or jungle-cat (*F. chaus*), about 26 inches long to the tail, which measures 9 to 10 inches and drops to the heels. It is yellowish gray, more or less dark and unspotted, more reddish on the sides, where it unites with the lower parts; a dark stripe extends from the muzzle to the eye, and there are faint bars on limbs and tail. A very similar species, restricted to the arid plains of northern India, is the "ornate" jungle-cat (*F. ornata*). Another large East Indian cat, known from Nepal to Borneo, but nowhere numerous, is called the baycat (*F. aurata*), in reference to its bay-red color, which is unspotted and becomes whitish on the under surfaces. India also has several spotted cats, of which the best known is the widely distributed fishing-cat (*F. viverrina*), which may be 30 to 32 inches long in body, with a tail 9 to 10 inches long; it feeds mainly on fish, snails, and other mollusks, yet is noted for its ferocity, and has even been known to seize and carry away small native children. This cat is dark gray in general color, profusely spotted and striped with blackish like a civet. Smaller, more yellowish, and much spotted, is the Indian leopard-cat (*F. bengalensis*) which occurs in all parts of India and eastward to Java. Resembling it, but smaller, is the rare wagati; but more distinct and richly ornamented is the tiger-cat (*F. marmorata*), whose tawny coat is marbled or clouded with elongate wavy black lines and commingling spots. It is of small size, but has a very long spotted tail. In the jungles of southern India the sportsman encounters about grassy places a small handsome species, with slender body and head, and rather short legs and long tail, called the rusty-spotted cat (*F. rubiginosa*), which is greenish gray with white under parts, and has dark stripes and lines of small spots extending from nose to rump, and pretty white marks about the face. A similar species (*F. chinensis*) occurs in southern China and Formosa; and several others in the Malayan region. It is quite likely that future increase of knowledge and connecting specimens will bring them all under one name. In Borneo, however, occurs a very distinct little cat (*F. badia*), tinted bright chestnut, white on the breast and belly, and without markings, except a few on the face, and a streak on the long tapering tail. The flat-headed cat (*F. planiceps*) of Malacca, Sumatra, and Borneo, is another distinct form. It is about the size of a domestic cat, but the body is unusually long, the neck short and thick, the head globular and flat on top, the legs remarkably short, and the tail short and thick. Its fur is dark-brown above, each hair tipped with white, and it is spotted white on the lower parts, with yellow lines forming a V on the face. Central Asia has several notable wildcats, as the manul (*F. manul*), the steppe cat (*F. caudatus*), and Tibetan tiger-cat (*F. scripta*), all of which are handsomely striped or spotted, or both.

American Tropical Cats.—South and Central America are the home of a large variety of small felines, as well as of the puma and jaguar. Of these the most notable are the eyra, ocelot, and jaguarondi (qq.v.) elsewhere described. In addition to these are several of much local interest. The margay or chati (*F. tigrina*) is a widespread and variable species,

which is met with from Mexico to Paraguay, in warm and well-wooded lowland regions. Its fur may be a grizzly gray, or vary from that to a fox-red, profusely marked with black spots and rings, which extend along the tail, but do not form rings. There are three upright bars upon each cheek. The margay measures about two feet in length of body, and its tail about 11 inches. Geoffroy's cat (*F. guigna*) is a little known species of southern Brazil; and may turn out a variety of the colocola (*F. colocola*) of the same region, which is whitish gray with elongated spots on the face, and along the sides. The Pampas cat or straw-cat (*F. pajeros*) is a well-marked form. It is much larger and more robust than a house-cat, with short thick legs, a short, club-shaped tail, thick neck, and small head, with great round eyes and very small ears. This appearance of weight and size is largely due to the unusual length of the hair, which is yellowish gray, marked with transverse brownish bands on the body, patches on the face and rings around the tail. It inhabits the open plains of Argentina, and with similar habits has become a curious counterpart of the manul of the Asiatic steppes.

Wilde, wild, George Francis Faxon, American naval officer: b. Braintree, Mass., 23 Feb. 1845. He was graduated from the United States Naval Academy in 1864 and in 1864-6 was attached to the Brazil squadron. He received promotion to lieutenant-commander in 1869, to commander in 1885, and while commanding the despatch boat Dolphin in 1885-8 made a trip around the world, the Dolphin being the first steel vessel in the United States navy to accomplish that feat. He became captain in 1898, commanded the ram Katahdin in the Spanish-American War, and later, in command of the Boston, he landed the first marine troops ever landed in China, sending them to guard the legation at Peking. He captured Iloilo in the Philippine Islands in 1899, and was placed in command of the Oregon in that year. In 1900 he captured Vigan in the Philippines, and he was in command of the Oregon when she was grounded on an uncharted ledge of rock in the Pechili Gulf. In 1901-2 he was in command of the navy yard at Portsmouth, N. H., and since 1902 has been in charge of that at Boston.

Wilde, Jane Francesca Elgee, LADY ("SPERANZA"), Irish poet: b. Wexford, Ireland, 1826; d. Chelsea, England, 3 Feb. 1896. She was married to Sir William Robert Wills Wilde in 1851. Her literary career began in 1845 with her contributions in prose and verse to the 'Nation.' The publication of her essay 'Jacta alea est,' under her pen-name 'Speranza,' was made the basis of the unsuccessful prosecution of the editor after the suppression of the 'Nation' in 1848. Among her writings are: 'Ugo Bassi' (1857); 'Poems by Speranza' (1871); 'An

WILDE — WILDERNESS, THE BATTLE OF THE

cient Legends, Mystic Charms, and Superstitions of Ireland' (1887); 'Notes on Men, Women, and Books' (1891); 'Social Studies' (1893); etc.

Wilde, Oscar (Fingal O'Flahertie Wills), Irish poet: b. Dublin, Ireland, 1856; d. Paris 30 Nov. 1900. His father was Sir William Wilde, a noted surgeon, and his mother was Lady Jane Wilde (q.v.). He was graduated from Oxford in 1878, winning the Newdigate prize for English verse. In 1879 he went to live in London, where he soon became the leader of the so-called aesthetic movement and was satirized by Du Maurier as 'Postlethwaite' in 'Punch,' and by Gilbert in the opera of 'Patience.' He visited this country in 1882, lecturing extensively on art topics, and later lectured similarly in his own country and in Paris. In 1895 he was convicted of a serious moral offense and condemned to penal servitude for two years. During his imprisonment he wrote 'A Ballad of Reading Gaol,' a poem of great force, and 'De Profundis,' published in 1905. His other published works include: 'Poems' (1880); 'The Picture of Dorian Gray,' a novel; 'The Happy Prince and Other Tales' (1888); the tragedies 'Guido Ferranti' (1890), and 'The Duchess of Padua'; 'Intentions,' essays (1891); 'Lord Arthur Savile's Crimes, and Other Stories' (1891); 'Lady Windermere's Fan,' 'A Woman of No Importance,' and 'The Importance of Being Earnest'; etc. His comedies are extremely clever, and his poems are characterized by melody of movement and beauty of thought. A complete edition of his poems appeared in 1903.

Wilde, Richard Henry, American scholar: b. Dublin, Ireland, 24 Sept. 1789; d. New Orleans, La., 10 Sept. 1847. He came with his parents to the United States in 1797 and settled in Georgia, where he studied law, and in 1809 was admitted to the bar. He was elected attorney-general of his State and in 1815-17, 1824-5, and in 1827-35 was a member of Congress. He spent the years 1835-40 in Europe, made a special study of Dante and Tasso, and was instrumental in the discovery of a portrait of Dante by Giotto on the wall of the chapel of Bargello. He subsequently removed to New Orleans, re-engaged in law practice, and in 1844 accepted the chair of constitutional law at the Louisiana State University. He wrote the widely popular poem, 'My Life is Like the Summer Rose,' and also published: 'Conjectures and Researches Concerning the Love, Madness, and Imprisonment of Torquato Dante' (1842). His poem 'Hesperia,' edited by his son, was published in 1867.

Wilde, Thomas. See **TRURO, THOMAS WILDE, BARON.**

Wilder, wil'der, Alexander, American physician and author: b. Verona, N. Y., 14 May 1823; d. 19 Sept. 1908. He was graduated at Syracuse Medical College in 1850 and in 1852 began an editorial career on the Syracuse 'Star,' being subsequently connected with the Syracuse 'Journal' (1853), New York 'Teacher' (1856), and New York Evening Post (1858-71). He was an anti-Tweed alderman in New York in 1872, inspector of schools in 1873, and from 1875 to 1895 secretary of the National Eclectic Medical Association, editing 19 volumes of 'Transactions.' He was president

of the New York School of Philosophy. Among his published works are: 'Secret of Immortality Revealed' (1846); 'Neo-Platonism and Alchemy' (1869); 'Our Darwinian Cousins' (1873); 'Eleusinian and Bacchic Mysteries' (1874); 'Ancient Symbol Worship' (1874); 'Serpent and Siva Worship' (1875); 'Vaccination, a Fallacy' (1879); 'Psychology as a Science' (1884); 'The Soul' (1884); 'Higher Sources of Knowledge' (1884); 'Ethics and Philosophy of the Zoroastrians' (1885); 'Ancient Symbolism and Serpent Worship' (1886); 'Later Platonists' (1887); 'Antecedent Life' (1895); 'The Ganglionic Nervous System' (1900); 'Perennial Life' (1902); 'History of Medicine' (1902). He translated and edited 'Iamblichus on Egyptian Mysteries.'

Wilder, Burt Green, American physiologist: b. Boston, Mass., 11 Aug. 1841. He was graduated from the Lawrence Scientific School at Harvard in 1862, was assistant surgeon in the Union army in 1863-5, and in 1866 was graduated from the medical department at Harvard. He was assistant in comparative anatomy at the Harvard Museum of Comparative Zoology in 1866-7, and in 1867 accepted the chair of zoology, which he still occupies, at Cornell. In 1874-84 he was lecturer in physiology at the Summer Medical School of Maine. He has made many interesting researches concerning the habits of the spider, and since 1880 has spent much time in an endeavor to secure a simple anatomic nomenclature. In 1885-6 he was president of the American Neurological Association. He has written numerous professional papers, and has published in book form: 'What Young People Should Know' (1875); 'Health Notes for Students' (1883); 'Physiology Practicum' (1895); etc.

Wilder, Marshall Pinckney, American horticulturist: b. Rindge, N. H., 22 Sept. 1798; d. Boston, Mass., 16 Dec. 1886. He was engaged as a merchant in the West India trade at Boston after 1825, in 1839 was chosen to the State legislature, was president of the State senate in 1850, and in 1849 served as member of the Executive Council. He was prominent in the organization of the Constitutional Union Party, was a delegate to the convention which nominated Bell and Everett in 1860, and throughout the Civil War was a firm supporter of the Union. He founded the Massachusetts Agricultural Society, the Massachusetts Agricultural College, and was active in the movement which resulted in the establishment of the Massachusetts Institute of Technology. He was author of numerous articles on horticulture, and lectured extensively on the subject. Among his published addresses may be mentioned 'The Hybridization of the Camellia and Its Varieties' (1847).

Wilder, Marshall Pinckney, American professional entertainer: b. Geneva, N. Y., 19 Sept. 1859. His occupation was at first that of a stenographer, but he abandoned it in order to become a drawing-room entertainer, in which capacity he has been widely popular. He has published 'People I've Smiled With.'

Wilderness, The Battle of the. On 9 March 1864 President Lincoln handed to Gen. Grant his commission as lieutenant-general, and two days later placed him in command of all the

WILDERNESS, THE BATTLE OF THE

armies of the United States. Grant made immediate preparations for an early campaign to be conducted simultaneously, east and west. He made his headquarters with the Army of the Potomac. Before coming to the East he had expressed himself as favoring a coast movement, south of James River, and an advance on Richmond on that line. After his arrival at Washington and a study of the problem he proposed to act with the Army of the Potomac on what was known as the overland route from the Rapidan to the James, while Gen. Butler, with 30,000 men, should ascend James River from Fort Monroe, and establish himself in an entrenched position near City Point, whence he could operate against Richmond and its communications with the south, and at a proper time form a junction with the Army of the Potomac, moving down from the north. At the same time Gen. Sigel, commanding troops in West Virginia and the Shenandoah Valley, was instructed to form two columns, one of 10,000 men, under Gen. Crook, to move from the Kanawha and operate against the Virginia and East Tennessee Railroad, the other 7,000 strong, under Sigel, in person, to advance, as far as possible, up the Shenandoah Valley, to draw detachments from Lee. Grant's main reliance, however, was the Army of the Potomac, which, 30 April 1864, was composed of the Second, Fifth and Sixth corps of infantry and a cavalry corps, commanded respectively by Gens. W. S. Hancock, G. K. Warren, John Sedgwick, and P. H. Sheridan. The Ninth corps, Gen. A. E. Burnside, united with the Army of the Potomac on 6 May, but acted under the immediate orders of Gen. Grant, until the 24th, when it became a part of the Army of the Potomac. The strength of the army, including the Ninth corps, 30 April, was 118,769 officers and men, with 316 guns. The army was commanded by Gen. George G. Meade. Formed in battle line, two ranks deep, with one third in reserve, it would cover a front of 21 miles. Its train of 4,000 wagons was 65 miles long. The assigned duty of this army was to attack the Army of Northern Virginia, and by constant hammering destroy it and take Richmond. The Army of Northern Virginia, commanded by Gen. R. E. Lee, was composed of the First, Second and Third infantry corps, commanded by Gens. J. Longstreet, R. S. Ewell, and A. P. Hill. A cavalry corps of two divisions (Wade Hampton's and Fitzhugh Lee's) was commanded by Gen. J. E. B. Stuart. The most reliable estimate gives Lee's strength, present for duty, on 1 May 1864, as 48,700 infantry, 4,854 artillery, and 8,399 cavalry, an aggregate of 61,953 officers and men, with 224 guns. On 1 May the Army of the Potomac was encamped in the vicinity of Culpeper Court House, between the Rapidan and the Rappahannock, and the Ninth corps on the railroad from Manassas Junction to the Rappahannock. Lee's army lay south of the Rapidan, Ewell's corps above Mine Run, and A. P. Hill's on Ewell's left, higher up the Rapidan. Longstreet's corps was near Gordonsville. Stuart's cavalry lay along the lower Rappahannock. Lee's headquarters were near Orange Court House, 70 miles from Richmond. Lee's army being the first objective, it was finally determined to cross the Rapidan, turn his right and compel him to fall back toward Richmond or come out of his intrenchments and give battle on open ground.

The principal objection to this movement was the difficulty presented by the Wilderness, a forest of unusually dense growth, with an almost impenetrable undergrowth, where infantry could pass with great difficulty, and where cavalry and artillery could not be used. It was thought to avoid this difficulty by moving at night, crossing the Rapidan and getting through the Wilderness before Lee could discover the movement and intercept it by moving on the Orange turnpike and Orange plank road. These two roads lead from Orange Court House down the Rapidan toward Fredericksburg. They follow the general direction of the river and are almost parallel to each other; the turnpike nearest the river and the plank road a short distance south of it. Grant's proposed route lay directly across these two roads along the western borders of the Wilderness. The movement began at midnight of 3 May. Hancock's Second corps, preceded by Gregg's cavalry division, crossed the Rapidan at Ely's Ford and moved to Chancellorsville, where the entire corps with its trains had arrived by noon of the 4th. Warren's corps, preceded by Wilson's cavalry division, crossed the river at Germanna Ford and marched to Wilderness Tavern, at the intersection of the Germanna road by the Orange turnpike. It reached its position by 3 p.m. of the 4th. Wilson's cavalry was thrown forward to Parker's Store on the Orange plank road. Sedgwick's Sixth corps followed Warren's across the Germanna Ford and halted a short distance beyond it. The crossing of the river was very gratifying to Grant who regarded it as a great success, and it removed from his mind the most serious apprehension he had entertained "that of crossing the river in the face of an active, large, well-appointed and ably commanded army, and how so large a train was to be carried through a hostile country and protected." At noon of the 4th Grant knew that Lee was aware of his movement, upon which he sent a despatch to Burnside to make a forced march from beyond the Rappahannock to Germanna Ford, and by the morning of the 5th his advance was crossing the Rapidan. The orders for the 5th were for Sheridan, with two divisions of cavalry, to move against the Confederate cavalry, near Hamilton's crossing, and at 5 a.m. Wilson's cavalry division was to move to Craig's Meeting House, and reconnoitre the Orange pike and plank roads, and other roads on his right and left. Hancock's Second corps was to march from Chancellorsville to Shady Grove Church and extend its right toward Parker's Store, on the Orange plank road, to which point Warren's corps was ordered to advance from Wilderness Tavern. Warren, in turn, was to extend his right toward Sedgwick's Sixth corps, which was ordered to Wilderness Tavern. Gen. Lee interfered with the full execution of these orders. He had been expecting Grant to move on his right and when he saw on the morning of the 4th that the movement was being made, determined to attack him before he could get out of the Wilderness and ordered Ewell to march by the Orange pike and A. P. Hill down the plank road, and that night Ewell bivouacked within five miles of Wilderness Tavern, and Hill's advance division halted for the night at Mine Run, seven miles from Parker's Store, on the plank road, and about ten from the intersection of the Brock road. Longstreet moved from near Gordonsville at 4 p.m. Stuart's cavalry was

WILDERNESS, THE BATTLE OF THE

drawn in and ordered to cover the Confederate right. On the morning of the 5th Ewell continued his march on the Orange pike, under instructions to regulate his march with that of A. P. Hill, on the plank road, and both informed that it was not desired to bring on a general engagement before Longstreet came up, who was under orders to follow Hill on the plank road. When Ewell was two miles from the Wilderness Tavern, he halted, as he was three or four miles farther advanced than Hill. Warren had discovered that the Confederates, under Ewell, were in force two miles beyond Wilderness Tavern and before 7 A.M. had informed Meade of the fact, who ordered Warren to make an attack with his whole force. Sedgwick was directed to move up by a cross road, attack the enemy and connect with Warren on the turnpike, and a despatch was sent to Hancock, informing him of what had become known and directing him to halt at Todd's Tavern, until further developments. Warren had started early in the morning for Parker's Store, on the Orange plank road, and when near it Crawford's division had been ordered to halt in a good position on high ground, and finding that Wilson's cavalry at Parker's Store needed assistance Crawford threw forward a skirmish line that encountered the flankers of A. P. Hill's corps. Soon after 8 A.M. Crawford was informed by Warren that Griffin's and Wadsworth's divisions would attack Ewell on the turnpike and he was ordered to join in it with one of his brigades. Between 9 and 10 A.M. Hancock was ordered to move up the Brock Road to the Orange plank road and be prepared to move out that road toward Parker's Store, and about the same hour three brigades of Gen. Getty's division of Sedgwick's corps were ordered from the Wilderness Tavern to the intersection of the Brock road with the Orange plank road, and directed to move out the latter road and attack the enemy, and, if they could, drive them back beyond Parker's Store. As described by Humphreys, "The Brock road begins on the Orange pike about a mile east of the old Wilderness Tavern, and runs in a southeast direction to Spotsylvania Court House, intersecting the Germanna plank, the Orange plank, the Furnace, the Catharpin and other roads running in a southwest and south direction." Ewell had formed for battle across the Orange pike when about noon Warren opened the attack. Griffin's division advancing on both sides of the pike struck Johnson's division, broke it and drove it back. Rode's division was thrown in on Johnson's right, south of the pike, and supported by Early, who was formed across the pike, the line was re-established. After a severe and bloody fight Griffin was driven back, losing many prisoners and two guns. Wadsworth's division which had advanced on the left of Griffin, lost direction, exposed its left, and was thrown back in confusion. McCandless' brigade of Crawford's division, attempting to unite with Wadsworth's left, was nearly surrounded by Ewell's right and fell back with heavy losses, and Crawford's entire division had to be drawn in. Thus all the ground gained by Warren was given up and he assumed a new line somewhat in rear, but still in front of Wilderness Tavern, with his right on the Orange pike. He had lost more than 3,000 men. On his right Gen. Wright's division of Sedgwick's corps came up early in the afternoon, and with Neill's brigade

of Getty's division formed within 300 yards of Ewell's front, and repulsed one of his attacks. Soon after this Seymour's brigade of Rickett's division came up on the right of Neill, and about 5 P.M. two brigades of Sedgwick attacked Ewell's left and were repulsed. Meanwhile Gen. Getty, who had arrived at the crossing of the Brock road and the plank road, had been ordered to attack. Heth's Confederate division was in his front supported by Wilcox's. Hancock, who had been ordered from Todd's Tavern, 10 miles distant, by the Brock road, was instructed to support Getty, drive A. P. Hill beyond Parker's Store and connect with Warren's left. It was 3.15 P.M. when Getty received his order to attack. Meanwhile Hancock's advance had arrived and began intrenching on the Brock road. At 4.15 Getty advanced to the attack through the thick woods, and had gone less than 400 yards beyond the Brock road, when he became hotly engaged with Heth's division. Although Hancock had not completed his dispositions he moved forward to Getty's support and the fight became fierce and deadly at very close quarters, and continued until near 8 P.M., when darkness put an end to the fierce contest. Hancock had not gained much ground, but Hill's lines had been broken, and his right driven back by two brigades of Barlow's division. While Hancock and Getty were engaged, Wadsworth's division had been ordered in a southeast direction to strike the flank of the Confederates engaging them, but did not become seriously engaged and was halted by darkness, about a half mile from the Brock road. The Union army had fought in detachments, with no connection of its corps or divisions. Grant said that he had never seen such hard fighting, but prepared to renew it next day, and Hancock, Warren and Sedgwick were ordered to attack at 5 o'clock next morning, and Burnside was ordered to have two divisions in position between Warren and Hancock so as to advance with them. Each corps commander was advised of the instructions given to the others. To note briefly the action of the cavalry on the 5th, Wilson's division, after leaving 500 men at Parker's Store had proceeded toward Craig's Meeting House, on the Catharpin road, and was driven back on that road as far as Todd's Tavern. Gen. Gregg had found nothing at Fredericksburg, but had discovered two brigades of cavalry falling back from Hamilton's Crossing to Lee's right flank, and fell back to Todd's Tavern before 3 P.M. to check the enemy pursuing Wilson, and drove them back beyond Corbin's bridge.

During the night of the 5th Ewell's and Hill's corps strengthened their intrenchments and put artillery in position, and a few minutes before 5 A.M. of the 6th opened the second day's fight by an attack upon the Union right, which was promptly met by the advance of Wright's division of the Sixth corps, which made two vigorous assaults against the Confederate left, which were repulsed with severe loss. Warren made several attacks on Ewell's right which were repulsed. These persistent and unsuccessful attacks were continued until after 10 o'clock, when Sedgwick and Warren were directed to suspend them, to strengthen their intrenchments and throw up new works, in order that a part of their troops might be available for an attacking force to move from the vicinity of Hancock's right, which had been desperately en-

WILDERNESS, THE BATTLE OF THE

aged. Hancock had disposed Gibbon's and Barlow's divisions, both under command of Gen. Gibbon, to defend his left flank against an apprehended attack by Longstreet, and at 5 A.M. launched Birney's, Mott's and Getty's divisions, all under Gen. Birney, along the Orange plank road, Wadsworth's division of Warren's corps at the same time advancing on Birney's right. They fell upon Heth's and Wilcox's divisions of Hill's corps with great fury and after a desperate contest broke them and drove them a mile and a half, through the dense woods, under heavy loss, and back on the trains and artillery, and Gen. Lee's headquarters. Just before Hill's troops gave way the head of Longstreet's corps, which had marched nearly all night, came upon the field at Parker's Store, and was hastened along the plank road to relieve the divisions of Heth and Wilcox. Kershaw's division was in the lead and began to form on the right of the road. Humphreys says: "The advance through the forest, undergrowth, and swamps more than a mile, in a hot contest, had separated and disordered Hancock's corps, and Birney's left, met in this condition by Kershaw's division, was not only brought to a standstill, but at some points swayed back and forward, until at length Kershaw, himself leading his division, forced Birney's left back as far as his centre. Wadsworth's advance had crowded many of Birney's troops to the south side of the plank road, so that the greater part of his, Birney's, command was on the left of that road. Field's division of Longstreet's corps following close on Kershaw's division, some of it coming on the ground at double-quick, was formed on the Confederate left of the plank road, and, advancing, at once became hotly engaged with Birney's right and Wadsworth's troops, Gregg's Texans and Benning's Georgians in the lead, bearing the brunt of the fight and losing heavily in killed and wounded. R. H. Anderson's division of Hill's corps, following Field's division, formed on the same part of the line, one portion uniting with Field's troops in the attack, the other portion supporting. It was when Hancock's troops were partially checked by the fresh troops of Longstreet that the necessity of readjusting his formation became imperative. Regiments were separated from their brigades and mixed with others, and the line of battle was very irregular, and commanders were in this way losing the control of their troops. This was about half past six o'clock." At 9 A.M. Hancock again attacked with the divisions of Birney, Mott, Wadsworth, Stevenson's of Burnside's corps, and three brigades of Gibbon's division and though fighting furiously made no headway, and at 11 o'clock the firing on his front died away. Meanwhile Longstreet had discovered that Hancock's left extended but a short distance from the plank road and he moved a part of his command to the right to attack Hancock's left and rear, the flank movement to be followed by a general advance of his entire corps. The attack first fell on the left of the advanced line held by Frank's brigade, partly across the Brock road, which was fairly overrun and brushed away; it then struck the left of Mott's division, which in turn was driven back in confusion to the Brock road, and the confusion spread to the troops on the right, and Hancock was compelled to withdraw his entire corps to the Brock road from which

they had advanced in the morning, where they were re-formed in two lines behind their intrenchments. Wadsworth, on the right of Hancock, made heroic efforts, but his troops broke, and while striving to rally them he was mortally wounded and died within the Confederate lines next day. When this movement had succeeded Longstreet ordered a general advance, and while riding at the head of column, moving by the flank down the plank road, when opposite the force that had made the flank movement, which were drawn up parallel with the road, about 60 yards from it, a volley was fired which killed Gen. Jenkins, commanding the leading brigade of Field's division, and severely wounded Gen. Longstreet. Gen. Lee soon came up, postponed the attack to a later hour and extended his line so that its right rested on the unfinished Orange Railroad. Meanwhile a brigade of the Ninth corps, which had been sent to the left, under Gibbon, swept down in front of Hancock's line from left to right and cleared it of the enemy. In the action of the previous day there had existed an interval between Warren on the turnpike and Hancock on the plank road, through which Burnside was expected to advance and attack Hill and Longstreet in flank, but in advancing through the woods the enemy was encountered on a wooded crest near the plank road. An attack was not deemed advisable and Burnside's troops were moved farther to the left. It was not till afternoon and after Hancock's repulse that they became engaged, without accomplishing much, and toward evening they fell back and intrenched. The lull that had followed the successful attack of Longstreet gave Hancock time to re-establish his position, now strengthened by fresh troops sent by Gen. Meade, and Hancock was directed to renew the fight at 6 P.M. But again Lee anticipated the Union commander, and at 4.15 P.M., having gotten well in hand the troops of Longstreet and Hill, he advanced in force against Hancock's intrenched lines, until he came within 100 yards of the front one, when he opened a severe fire, which was heaviest on Hancock's left, and at the end of half an hour a portion of Mott's division and of a brigade of Birney's gave way in disorder. The moment this break occurred the Confederates pushed forward and Anderson's brigade of Field's division took possession of that part of the first line of intrenchments and planted their colors on them. Near the point where the line was broken through a fire had, during the afternoon, sprung up in the woods, and at the time of Lee's attack had communicated to the log breastworks on that part of the line. At the critical moment they became a mass of flames, which could not be extinguished and which extended for many hundred yards to the right and left. The heat and smoke were driven by the wind into the faces of the Union troops, preventing them on portions of the line from firing over the parapet, and at some points obliged them to abandon it. It was this condition of affairs that permitted Anderson's brigade to seize a part of the breastworks, from which they were quickly driven by Carroll's brigade, which was near at hand and which rushed upon them at the double-quick. By 5 P.M. Lee's troops had been completely repulsed in Hancock's front, and fell back with heavy losses in killed and wounded. Just before dark Ewell moved two brigades of Early's division around

the right of Sedgwick's corps, held by Ricketts' division, and in co-operation with the rest of Early's division, succeeded in forcing Ricketts back in some confusion, capturing Gens. Shaler and Seymour, brigade commanders, and a large number of their men. Wright's division, also, was thrown into some disorder but Wright restored order and Early drew back and formed a new line in front of his old one. During the night an entirely new line was taken up by the Sixth corps, its front and right thrown back, a change which was conformed to by the right of the Fifth corps. On the left Sheridan's and Stuart's cavalry had some severe fighting at and near Todd's Tavern (q.v.) in which Sheridan had the advantage. On the morning of the 7th reconnaissances were made of the Confederate position which was found well intrenched, neither commander showed any disposition to renew the fight on that field, and Grant decided to continue the movement by the left flank, and when darkness came the Union columns began their march for Spottsylvania Court House (q.v.). The Union troops engaged numbered about 101,000; the Confederates numbered about 60,000. The Union losses, as officially reported, were 2,246 killed, 12,037 wounded, and 3,383 missing, an aggregate of 17,666. The Confederate reports are very incomplete; the most reliable estimate places their entire loss at 7,750.

Meade'; Long, 'Life of Gen. Lee'; Gordon, 'Reminiscences of the Civil War.'

E. A. CARMAN.

Wilderness Route, in American history, a famous emigrant road or trail from the Atlantic seaboard to Ohio through Cumberland Gap. Thousands of emigrants passed over this road to Ohio and Kentucky. The "Wilderness Road" was marked out by Daniel Boone. In 1775 the Transylvania Company, with Colonel Richard Henderson as head, engaged Boone to mark out a road from Fort Wautaga, on a branch of the Holston, to the Kentucky River, where the company's newly-purchased lands lay. "This I accepted," wrote Boone, "and undertook to mark out a road in the best passage through the wilderness to Kentucky with such assistance as I thought necessary to employ for such an important undertaking."

Wildea, Frank, American naval officer: b. Boston, Mass., 17 June 1843; d. on steamer China, off San Francisco, Cal., 6 Feb. 1903. He was graduated from the United States Naval Academy in 1863, served in the West Gulf Squadron, and later on the monitor Chickasaw. He was promoted master in 1866, became commander in 1880, was in charge of the Portsmouth, N. H., navy yard in 1885-8, and in 1894 was commissioned captain. He commanded the cruiser Boston at the Asiatic Station in 1895-8, and served under Dewey at the battle of Manila, 1 May 1898. In 1901 he was advanced to the grade of rear-admiral, was assigned to the Asiatic Station as junior squadron commander, and in 1903 was ordered home on sick-leave, but died on the way.

Wildfowl, in modern usage water-birds, as ducks, geese, and swans, pursued by gunners for sport or for market. American methods of wild fowling will be found given where these birds are described (see Duck, etc.) An interesting method in Europe, still extensively pursued in some parts of England, at the Fens, is by decoying wild ducks in large trap-ponds. The pond is constructed in a secluded place, well sheltered by trees, and with a plentiful supply of reeds and sedges. From this pond pipes or narrow passages are led, 60 to 80 yards, gradually narrowing toward the termination. Above, the pipe is bridged and covered by a light network, and at its termination it ends in a tunnel net, which is, as a rule, carried out on to the land. Decoy ducks, which come to be fed at the call of the attendants, are used to entice their wild neighbors into the pipe; but the decoy dog is perhaps a more valuable ally of the fowler. This dog is named a "piper." It is of a small breed, and indulges in playful gambols by the side of the pipe, appearing now and then in advance of the fowl, which, led by curiosity, swims onward toward the dog, and is thus drawn toward the terminal net. The dog preserves a perfect silence during its maneuvers. Devices of the same character are used in the Orient, especially in Japan. Another Old World method is by employing the stalking horse, still used in some parts of England; the body of the horse—which requires special training for its work—being used to conceal the sportsman from the game. Consult: Sanford and Van Dyke, 'Water Fowl,' American Sportsman's Library (New York 1903); Grinnell, 'American Duck-shooting' (New York 1901); Elliot, 'The Wild Fowl of the United States, Etc.' (New York 1898); Mayer, 'Sport with Rod and Gun' (New York 1892); Afalo, 'Sport in Europe' (London 1901).

Wiley, Harvey Washington, American chemist: b. Kent, Ind., 18 Oct. 1847. He was graduated from Hanover College in 1867; from the Indiana Medical College in 1872; from Harvard in 1873; and in 1878-9 studied abroad, chiefly at the University of Berlin. He was professor of chemistry at Purdue University in 1874-83, and in 1881-3 was also State chemist of Indiana. Since 1883 he has been chief chemist of the United States department of agriculture, occupying also the position of professor of agricultural chemistry at the graduate school of Columbia University since 1895. He has been secretary of the Association of Official Agricultural Chemists since 1889; was president of the American Chemical Society in 1893-5; and is connected with various other scientific organizations. He has made a specialty of sugar and glucose investigations and has been interested in the prevention of food adulteration. He has published: 'Songs of Agricultural Chemists' (1892); 'Principles and Practice of Agricultural Chemistry' (3 vols., 1894-7); etc.

Wiley University, an institution for the education of the colored race, located in Marshall, Texas. It was founded in 1873 by the Freedmen's Aid and Southern Educational Society of the Methodist Episcopal Church, by which it is now chiefly supported. It is open to both men and women. It has elementary, secondary, and collegiate departments, and normal,

commercial, and industrial courses. The Collegiate Department confers the degrees of A.B. and B.L. Industrial work and instruction is given in carpentry, bricklaying, printing, and sewing and cooking. The grounds and buildings in 1909 were valued at \$60,000; a building for general purposes was erected in 1900-1. The income in 1910 amounted to \$16,000; the library contained 6,000 volumes; the students numbered 623, and the faculty 28.

Wilfrid, or **Wilfrith**, **Saint**, Anglo-Saxon prelate: b. about 634; d. Oundle, Northamptonshire, 709. He studied at Lindisfarne, became a monk and in 653 accompanied Benedict Bishop to Rome in order to obtain an authoritative answer to the question of the proper time for celebrating Easter. On his return he obtained from Alchfrid, king of Northumbria, a grant of land and a monastery at Ripon, and here he was ordained priest in 664. In this same year he took a leading part in the conference at Wharfedale, where he persuaded the king to decree that, in the celebration of Easter, the Roman usage should be substituted for that of the Scottish Church, which had hitherto prevailed in Northumbria. At this time also the king appointed him archbishop of York, but having gone to France to be consecrated by a bishop holding orthodox views on the Easter question, he found on his return that his see was occupied by one of the opposite party, and he did not get possession till 669. Becoming obnoxious to King Egfrid (who had succeeded Alchfrid in 670), the king, to reduce his influence, divided his diocese into three, and when Wilfrid opposed this proceeding, deprived him of his see altogether (678). Wilfrid thereupon set out for Rome to obtain from the pope a reversal of the king's act of deposition. Having been driven by a storm on the coast of Friesland, he preached to the people (who had no difficulty in understanding the Anglo-Saxon) with such effect that all the princes and many thousands of the people offered themselves for baptism. Having reached Rome he easily obtained from the pope the desired decision, but during the reign of Egfrid remained under persecution or in exile; in 687, however, Aldfrid, who had succeeded Egfrid, reinstated him. But Aldfrid also in course of time was offended by his devotion to Rome, and Wilfrid was again deposed in 691. He then made another journey to Rome, and did not return till 705. Consult: Eddis, 'Vita Wilfridi,' in 'Historians of York,' Vol. I. 'Rolls Series'; Bright, 'Early English Church History' (3d ed. 1897); Hunt, 'The English Church from its Foundation to the Norman Conquest' (1899).

Wilhelm Meisters (vī'hēlm mī's'tērz) **Apprenticeship**, a novel by Goethe. The first part was published in 1796, after having occupied Goethe's attention for 20 years; its sequel, 'Wilhelm Meisters Wanderjahre' (travels) appeared 1821-9. The central idea of this great work is the development of the individual by means of the most varied experiences of life. There is no plot proper, but in a series of brilliant episodes the different stages of the hero's spiritual growth are brought before the reader. Wilhelm Meister is a young man with many admirable qualities of character, but passionate and emotional, somewhat unstable, lacking reflection and proper knowledge of the world.

The book gives a richly colored picture of the life of Goethe's time.

Wilhelmina I. vī'hēl-mē'nā (**Wilhelmina Helene Pauline Marie**), queen of the Netherlands. b. The Hague 31 Aug. 1880. She is the daughter of King William III. of the Netherlands by his second wife, Emma of Waldeck. She became queen on the death of her father in 1890, but as she had not attained her majority her mother ruled as queen-regent; Wilhelmina meanwhile was carefully educated under the best tutors. Shortly after her 18th birthday, on 6 Sept. 1898, she was crowned queen at Amsterdam. Her charming personality and strength of character have made her very popular with her people; she has also been strongly influenced by her mother, who is equally well loved by the people. In February 1901 she was married to Henry Frederick, Duke of Mecklenburg-Schwerin.

Wilhelmshaven, vī'hēlma-hā-fēn, Germany, town and naval station, on the northern coast of the duchy of Oldenburg, at the west entrance of the Bay of Jade; 40 miles northwest of Bremen, with which it is connected by rail. In 1853 the land was bought from Oldenburg by Prussia, and the town laid out in 1856; it was first used as a naval station in the Franco-Prussian war, and since then has been made a fortress of the first rank. The harbor and fortifications have been built at great cost, as the ground is soft and marshy, and without natural advantages. The harbor basin, which is artificially constructed and walled with granite, is connected with the bay by a canal, and contains three large dry docks; it is defended by forts and provided with a torpedo station. The naval workshops are located here and naval stores are kept here. There is also a commercial harbor connected with the naval harbor, but the town has not yet attained any commercial importance. Pop. about 25,000.

Willibrord, wīl't-brōrd, or **Willibrod**, **Saint**, English missionary, called the apostle of the Frisians: b. Northumbria about 657; d. about 738. He was brought up in St. Wilfred's monastery at Ripon, spent 13 years in Ireland, and at 33 with several associates embarked as a missionary for Friesland, where he was warmly welcomed by the Franconian prince Pepin. Willibrord made two visits to Rome (698 and 699), and on the latter occasion was made bishop by Pope Sergius over all the converted Frisians. In that part of Friesland under the rule of the Franks, he founded many Christian churches, some of which were destroyed a few years later in consequence of the successes of the pagan Frisians. He was buried in the monastery of Echternach, near Treves, and is commemorated in the Roman Catholic Church on 7 November.

Wilkes, wīlks, Charles, American naval officer and explorer: b. New York 1798; d. Washington 8 Feb. 1877. He entered the navy as a midshipman in 1818, served on the Mediterranean Station in 1819-20, in the Pacific, 1821-3, and was then selected for separate command. In 1826 he was promoted lieutenant, and in 1830 was appointed to take charge of the government charts and instruments. In 1838 he was put in command of an expedition for exploring and surveying the Southern seas, the first sci-

tific expedition ever fitted out by the United States government. During the next five years the expedition visited Madeira, Rio de Janeiro, Terra del Fuego, Chile, Peru, the Paumotu group, Tahiti, Tutuila and the Samoan group, New South Wales, the Antarctic regions, New Zealand, the Fiji group, the Sandwich (Hawaiian) Islands, the Columbia River, Willamette Valley, the coast of California, the Philippine Islands, Sulu archipelago, Saint Helena, Singapore, and the Polynesian Islands. The results of the expedition were published in 19 Volumes, those on 'Hydrography' and 'Meteorology' being written by Wilkes himself, who also wrote the 'Narrative of the United States Exploring Expedition' (1845). Wilkes claimed to have discovered an Antarctic continent, but the claim has been disputed. In 1843 he was made commander, in 1855 a captain, and at the beginning of the Civil War in 1861 was placed in command of the San Jacinto, in which he went to the West Indies in search of the Confederate vessel Sumter. On 8 November of that year he took the Confederate commissioners Mason and Slidell from the British mail steamer Trent. (See TRENT AFFAIR, TRE.) In 1862 Wilkes was in command of the Potomac flotilla, and afterward of the flying squadron that operated against blockade-runners. In July 1862 he was promoted commodore, in 1864 was placed on the retired list, and thereon in July 1866 became rear-admiral. Besides those above mentioned his publications are: 'Western America, Including California and Oregon' (1849); and 'The Theory of the Wind' (1855).

Wilkes, John, English politician: b. London 1727; d. December 1797. He was the son of a wealthy distiller, and was educated at the University of Leyden. In 1757 he was returned to Parliament as member for Aylesbury and in 1762 attained considerable reputation by the publication of a paper entitled the 'North Briton,' in which the administration of Lord Bute was severely attacked. These papers hastened the resignation of Lord Bute, April 1763, and the same month the 'North Briton' commented on the king's speech in such caustic terms that a prosecution was determined upon. Wilkes, among others, was apprehended; but he asserted the illegality of the warrant, and refusing to answer interrogatories, was committed to the Tower. Some days after, he was brought by writ of habeas corpus before the court, and was ordered discharged on the ground that his privilege as a member of Parliament had been violated. On the next meeting of Parliament, however, a special law was passed to sanction Wilkes' prosecution, and in January 1764 he was expelled from the House of Commons. A second charge was also brought against him for printing an obscene poem, entitled an 'Essay on Woman,' and he was found guilty of blasphemy as well as libel. As he had by this time withdrawn to France and did not appear to receive sentence, he was outlawed. He made vain attempts to procure the reversal of his outlawry; but trusting to his popularity ventured to return on a change of ministry (1768). He was elected to Parliament for Middlesex, but before he could take his seat was committed to prison to fulfil the sentences previously passed upon him, and not long after was expelled from the House for an alleged libel upon the secretary of state and

secretary at war. Three times after this he was re-elected within a few months, but the House of Commons persisted in keeping him out, and after the third election the other candidate, although he had got but a small minority of the votes, was declared duly returned. In 1770 he was released from his imprisonment. He was now more than ever the idol of the people. He was elected alderman of London, sheriff of Middlesex, and finally mayor (1774). In 1774 he was again elected to Parliament for Middlesex, and allowed to take his seat, which he held till 1790. His last triumph was obtained in 1782, when the resolutions respecting the disputed Middlesex election were ordered to be expunged from the journal of the House of Commons. From the year 1779 he was chamberlain of the city of London. Wilkes, as a writer and speaker, did not reach beyond mediocrity. His private character was very licentious, but he possessed elegant manners, fine taste, ready wit, and pleasing conversation. His 'Letters and Speeches' were published by himself in 1786; and much light is thrown upon his conduct by the 'Letters from the Year 1774 to the Year 1796 to His Daughter' (1894). His correspondence was also published (1895), with a memoir by Almon. Consult: Fitzgerald, 'The Life and Times of John Wilkes, M.P.' (1888).

Wilkes-Barré, Pa., county-seat of Luzerne County, and regarded as the most beautiful town in the State; on the north branch of the Susquehanna River, and on the Central railroad of New Jersey, the Wilkes-Barré and Eastern, the Delaware and Hudson, the Wilkes-Barré and Hazleton, the Delaware, Lackawanna and Western, the Lehigh Valley, the Lackawanna and Wyoming Valley, and the Pennsylvania railroads; 145 miles northwest of Philadelphia, and 176 miles northwest of New York city. It was first settled in 1769 by New England people, mainly from Connecticut, under the auspices of The Susquehanna Company, and was named in honor of John Wilkes and Isaac Barré (q.v.), members of the British Parliament. During the Revolutionary War the settlers were, with few exceptions, loyal to the patriot cause. July 3, 1778, the male inhabitants of Wyoming Valley, who were assembled at Forty Fort to repel an invading foe, were attacked near the fort (on Abraham's Plains, some seven miles from Wilkes-Barré) by a battalion of British Rangers with their Indian allies, and were badly defeated. The Wyoming Monument, erected near the field of battle, commemorates the valor of the Americans who fought on this bloody field. Following the surrender of Forty Fort, on July 4, 1778, Wilkes-Barré was almost wholly destroyed by the enemy. Wilkes-Barré was, in the period of 1769 to 1784, the center of the controversy between Connecticut and Pennsylvania, each State claiming territorial jurisdiction over the Wyoming region (see Pennsylvania: History), and was the scene of several conflicts during that controversy, being almost entirely destroyed by fire at one time in 1784. It was gradually rebuilt and was incorporated as a borough in 1806; its growth has been rapid since the Civil War; and in 1871 it was incorporated as a city. It is situated near the center of Wyoming Valley (q.v.), in the midst of picturesque scenery. Wilkes-Barré is the birth-place of the anthracite coal-mining industry. It was here the dis-

covery was made that there existed on this continent such a mineral as anthracite (or "stone coal" as it was early called). Here anthracite was first used for fires in naileries and blacksmiths' shops; and was thus used for upward of 20 years before the existence of anthracite in any part of Pennsylvania save Wyoming Valley was known. Here anthracite first came into use as a fuel for domestic purposes. Wilkes-Barré lies in the Seventh Anthracite Mining District of Pennsylvania, and from the 37 mines and washeries in operation in the district in 1903 there were produced 4,926,473 long tons of coal. The manufacturing and mechanical industries of the city are also large; the census for 1900 reported 438 establishments, with a combined invested capital of \$10,501,537. Among these, silk and lace mills, axle-works, foundries and machine shops, and wire-rope works are the most important. The city also contains breweries, manufactories of cotton goods, and the Lehigh Valley railroad shops. There are three national banks, and six savings banks and trust companies working under State charters. The city is well built and has a public square containing four acres and a park ("The River Common") containing 35 acres along the river front. In the vicinity of the city are the Wyoming Monument, already mentioned, the old Forty Fort Church, Harvey's Lake (the largest lake in Pennsylvania) and other points of historic interest. The notable public buildings are the city hall, courthouse, jail, post-office, armory of the Ninth Regiment, N. G. P., and Memorial Hall. The city has a number of charitable institutions, including two hospitals—one the City Hospital, and the other Mercy Hospital (under the management of the Roman Catholics); a Home for Friendless Children, and a Home for Homeless Women. It has 20 public school buildings, including the high-school building erected in 1890, in which, in addition to the usual studies, instruction in manual training is given. It has also six Roman Catholic parish schools, and is the seat of Harry Hillman Academy (for boys), the Wilkes-Barré Institute (for girls), the Wilkes-Barré Business College, the New Century School of Correspondence and two Roman Catholic academies for girls—Saint Mary's, connected with Saint Mary's Convent, and Saint Ann's, connected with Malinckrodt Convent. There are two large public libraries—The Osterhout Free Library (having reference and circulating departments), and the reference library of the Wyoming Historical and Geological Society. In addition, the Law and Library Association, the Young Men's Christian Association and other organizations have library collections. The government of the city is vested in a mayor, a select council and a common council; the appointing power rests largely with the mayor. Pop. (1890) 37,718; (1900) 51,721; (1910) 67,105. But, elbowing the city on all its boundaries are boroughs and hamlets, so that, within a radius of nine miles from the center of Wilkes-Barré, there is a population of approximately 200,000.

OSCAR J. HARVEY.

Wilkie, wil'ki, Sir David, Scottish painter: b. Culter, Fifeshire, 18 Nov. 1785; d. at sea, off Gibraltar, 1 June 1841. In 1799 he entered the Trustees' Academy, Edinburgh, where he studied for several years. In 1804 he returned home and painted 'Pittlessie Fair,' the first of that class of works for which he became famous.

In 1805 he went to London, taking with him the 'Village Recruit,' which at length found a purchaser for £6. The Earl of Mansfield purchased his 'Village Politicians,' which at the Royal Academy (1806) excited universal admiration. It was succeeded by the 'Blind Fiddler,' and among the works painted between this period and 1821 may be mentioned the 'Rent Day' (1807); 'Blindman's Buff' (1813); 'Distraint for Rent' (1814); 'The Penny Wedding' (1818); the 'Reading of the Will' (1820); and the 'Chelsea Pensioners,' begun in 1817 and finished in 1821, for the Duke of Wellington. Among the most noted of his later pictures are the 'Entrance of George IV. into Holyrood'; the 'Spanish Council of War'; and the 'Maid of Saragossa.' In 1836 William IV. created him a knight. In 1840 he made a journey to the East, and on the way home was attacked by fever at Malta, and died at sea.

Wilkins, wil'kinz, Mary Eleanor. See FREEMAN, MARY ELEANOR WILKINS.

Wilkinsburg, wil'kinz-bërg, Pa., borough, Allegheny County; on the Pennsylvania Railroad; five miles east of Pittsburgh. It was formerly called McNairville, and Rippeyville, and was given its present name in honor of William Wilkins, secretary of war in 1843-5; it was incorporated as a borough in 1887. Its business interests are identified with those of Pittsburgh, and it is almost entirely a residential town; it contains a national bank with a capital of \$50,000. It is the seat of a home for aged women (Protestant) and of the United Presbyterian Home for the Aged; and there is a high school, established in 1898. Pop. (1910) 18,924.

Wilkinson, wil'kin-son, Henry Spencer, English author: b. Manchester, England, 1 May 1853. He was educated at Owens College, Manchester, and at Merton College, Oxford, and in 1880 was called to the bar. He was on the staff of the *Manchester Guardian*, 1883-92, and since 1895 has been on the staff of the *London Morning Post*. His writings include: 'Essays Toward the Improvement of the Volunteer Forces' (1886); 'The Brain of an Army' (1890); 'The Great Alternative, a Plea for a National Policy' (1894); 'The Nation's Awakening' (1896); 'British Policy in South Africa' (1899); 'War and Policy' (1900); 'The Nation's Need, Chapters on Education' (edited, 1903); etc.

Wilkinson, James, American soldier: b. Benedict, Md., 1757; d. near City of Mexico 28 Dec. 1825. He studied medicine in Philadelphia, and in 1775 enlisted in Washington's army. He became intimate with Benedict Arnold and Aaron Burr, and, having received a captain's commission, joined Arnold's expedition to Canada. He was later appointed to the staff of Gen. Gates, was promoted colonel, and subsequently became deputy adjutant-general of the Army of the Northern Department. In the Saratoga campaign he appropriated as his own the information of the British position and strength which had been secured by Col. John Hardin, and after the surrender of Burgoyne was commissioned to bear the news to Congress, carrying with him also the recommendation of Gates that he be appointed brigadier-general. He was 16 days in making the journey, and the news was a week old when he delivered his

WILKINSON

message. Congress refused to grant his promotion at that time, but a few weeks later, through the influence of Gates, he was brevetted brigadier-general and subsequently was appointed secretary of the Board of War, of which Gates was also a member. He was deeply implicated in the Conway Cabal (q.v.), which his indiscretion betrayed, and was then forced to resign his brevet rank, though retaining his colonelcy. He took no further active share in the war until 1779, when he was appointed clothier-general, an office which he resigned in 1781. He removed to Kentucky in 1784, and in 1786 founded Frankfort. He gained considerable political influence there, intrigued with the Spanish government, with the hope of forming of the Western country a separate republic under the protection of Spain. His reward for this betrayal of his country was to be the exclusive control of commerce on the Mississippi and a yearly pension from the Spanish government. The plot was to be consummated at the convention which met in 1788 for the purpose of forming a constitution for the new State of Kentucky. Wilkinson's influence, however, proved insufficient, and the plot, becoming known to other leaders, fell through. The part of Wilkinson remained a secret, and though he continued to receive his pension from the Spanish government until 1800, he applied in 1791 for service in the army. His treasonable act not being known, he was appointed lieutenant-colonel, served in the Indian wars of the West, and was prominent in Anthony Wayne's campaign. He was promoted brigadier-general in 1792, and in 1796 succeeded Wayne in the command of the army. After the acquisition of Louisiana he was appointed in 1805 governor of the Territory of Louisiana and in this position engaged with Aaron Burr (q.v.) in the latter's scheme for founding an empire in Mexico. In 1806 Wilkinson, perceiving an opportunity to drive a double bargain, betrayed the scheme to the President, and at the same time demanded from the viceroy of Mexico a reward for saving that kingdom to Spain. The assertions of Burr as to Wilkinson's complicity in the plot were generally believed, but at that time no proof of his guilt was obtainable, though he barely escaped indictment on the same charge with Burr in 1807. Inquiry concerning his pension from the Spanish government was made in that year upon a resolution of John Randolph, but he was exonerated. Charges were again made against him in 1810 on the score of complicity with Burr and of receiving pay from the Spanish government, but he was finally acquitted in December 1811, and resumed command in the army. He was promoted major-general during the War of 1812, and commanded the Canada Expedition, but proved incompetent and in 1814 was superseded. He was court-martialed in that year on several serious charges—neglect of duty, conduct unbecoming an officer, drunkenness, etc.—but in 1815 was acquitted and honorably discharged from the army. He then removed to the City of Mexico, where he spent the remainder of his life. He published: 'The Aaron Burr Conspiracy Exposed' (1808); and 'Memoirs of My Own Times' (1816). Consult: Clark, 'Proofs of the Corruption of Gen. James Wilkinson' (1809); Gayarré, 'Spanish Dominion in Louisiana' (1854); Gilmore, 'Advance-Guard of

Western Civilization' (1887); Roosevelt, 'Winning of the West,' Vol. III. (1894); Green, 'The Spanish Conspiracy' (1891); McCaleb, 'The Aaron Burr Conspiracy' (1903).

Wilkinson, *Jemima*, American religious visionary. b. Cumberland, R. I., 1753; d. Jerusalem, Yates County, N. Y., 1 July 1819. She was educated as a Quaker and at 20, after a severe attack of fever, she professed that she had been raised from the dead, that her carnal life was ended, and that henceforth her body was reanimated by the spirit and power of Christ. She pretended to work miracles, and, though entirely illiterate, induced many intelligent people to become her followers, her attractive person and extraordinary tact and shrewdness aiding her in maintaining the imposture. In 1786, at a meeting of her disciples, it was resolved to found a colony in Yates County, N. Y., in the present town of Torrey. The next year 25 of her followers went to the new purchase, and prepared the land for wheat. In 1789 two of the number purchased 14,000 acres of land in that vicinity, to which was afterward added the township of Jerusalem. The same year Jemima and a large number of her followers came, and a house was erected for her. She had taken the name of the "universal friend," and assumed a costume which belonged about equally to either sex, as she asserted that in her spiritual body there was no sex. She was accompanied by two "witnesses," Sarah Richards and Rachael Miller. She exacted from her followers the most complete submission and the most menial services, her influence over them being practically supreme. A farm of 1,000 acres was set apart for her special use, and cultivated freely by her followers. She insisted on the Shaker doctrine of celibacy, and the exercises at her religious meetings resembled those of that sect. She never relinquished her pretensions, but after some years her influence waned, and the latter part of her life was embittered by jealousies and annoyances which she bore with no great fortitude. After her death the sect was entirely broken up. Consult: Hudson, 'Jemima Wilkinson, a Preacheress of the 18th Century' (1841); 'Memoir of Jemima Wilkinson' (Bath, N. Y., 1844).

Wilkinson, *Sir John Gardner*, English archaeologist: b. Haxendale, Westmoreland, 5 Oct. 1797; d. Llandover, Caermarthenshire, 29 Oct. 1875. He was educated at Harrow and Oxford, and after leaving Oxford lived in Egypt 1821-33, during his stay making a thorough study of the ancient monuments of that country as well as of the languages and manners of the modern inhabitants. The most important fruit of his labors was a work entitled 'Manners and Customs of the Ancient Egyptians Derived from a Comparison of the Painting, Sculpture, and Monuments Still Existing, with the Accounts of Ancient Authors' (1837-41), which still remains a standard authority on all that relates to Egyptian art. His later works about Egypt are of a more popular character. Among them are 'Modern Egypt and Thebes' (1833), afterward abridged and published as a 'Handbook for Travelers in Modern Egypt' (1847); 'A Popular Account of the Ancient Egyptians' (1853); and 'The Egyptians under the Pharaohs' (1851), forming a supplement to the previous work. His principal other

works are 'Dalmatia and Montenegro' (1848); and 'Color, and the Necessity of a General Diffusion of Taste Among All Classes' (1858). He was knighted in 1839. The collections made by him were given in part to the British Museum, but a considerable proportion of them was presented to Harrow.

Wilkinson, William Cleaver, American educator: b. Westford, Vt., 19 Oct. 1833. He was graduated from the University of Rochester in 1857, was ordained in the Baptist ministry in 1859, and in 1859-61 was pastor of the Second Baptist Church, New Haven, Conn. He was professor *ad interim* of modern languages at the University of Rochester in 1863-4, and was engaged in pastoral work at Cincinnati, 1863-6. He was professor of homiletics and pastoral theology at the Rochester Theological Seminary in 1872-81, was engaged in literary work in 1873-92, and has since been professor of poetry and criticism at the University of Chicago. He is counsellor of the Chautauque Literary and Scientific Circle and has published: 'The Dance of Modern Society' (1866); 'A Free Lance in the Field of Life and Letters' (1874); 'The Baptist Principle' (1881); 'Poema' (1883); 'Edwin Arnold as Poetizer and Paganizer' (1885); 'Classic German Course in English' (1887); 'The Epic of Saul' (1891); 'The Epic of Paul' (1898); 'The Epic of Moses' (1903); etc.

Wilkinsoniana. See **Religious Sects**.

Will. It has been usual to classify mental phenomena under the three headings of cognition, feeling, and will or conation. In the last class are included all those processes in which the mind is regarded as effecting some change in its own states, or in the physical environment by means of bodily movements. These changes may take place in a more or less clearly conscious way: that is, in producing changes by means of inner or outer acts of will, we may be more or less explicitly aware of the nature of the result to be attained, and of other possible lines of action. It is an essential characteristic of the states that we name impulses or instincts that they are not deliberative. These processes, however, as expressions of the appetitive or active powers of the mind, are conative in character. Automatic or reflex acts, on the other hand, being brought about without any mediation of consciousness, cannot be regarded as belonging to will at all. In impulse the act is initiated by a feeling of uneasiness or craving which has a tendency to discharge immediately in some movement to relieve this feeling. It is from such immediate and impulsive reactions of consciousness that those more explicit and conscious processes that we call voluntary acts develop. We are not born with the power of performing voluntary acts, but this is a progressive acquirement that presupposes an experience of the results of involuntary acts, and the means of obtaining or avoiding these results. The development of will, in the true sense in which it is an endowment that belongs only to rational beings, as it passes from the stage of impulse and instinct, involves a growing consciousness of the relative value of various ends, and also of the means that may be used for the realization of these ends. The development of will is thus only possible through the development of the mind as a whole. Moreover,

it is to be noted that this development implies further the systematic integration and union of the rational and emotional sides of mind with its active or conative aspect. As mind develops, all of its functions become more closely and organically connected.

What has just been said may serve to show the fallacy in the view of the older psychology which regarded will as a distinct faculty, opposed, as if it were a separate department, to feeling and cognition. It was too often forgotten in making this division that these faculties were not each *sui generis*, and that the so-called "faculty" is only an abstraction if thought of as a kind of entity apart from the concrete processes of consciousness. Moreover, the emotional and cognitive states of mind do not exist in separation from the conative aspect, but the latter is necessarily implicated and involved in them. It has been one of the most important achievements of recent psychological analysis to exhibit the presence of will in various intellectual processes, like perception, association, and thinking, in the form of the selective activity of attention. The true view then is that cognition, feeling, and conation are "moments" or "aspects" of mind that can be distinguished by analysis, but which exist and function concretely only in relation to each other. At the present time, psychologists are not agreed as to whether it is possible to discover by analysis any definite conative process as a structural element in conscious life, corresponding to the elementary sensations or feelings. The reality and functional efficiency of the will is not really at stake in this question, however, as has been too hastily assumed by certain representatives of both parties to the dispute. Even if it is found that the processes of will cannot be isolated as separate and distinct states of mind, there will be no ground for denying the real activity of the subject. The truth seems to the present writer to be that will cannot properly be represented in the form of one particular kind of mental content, just because it is the expression of the attitude of the self toward all mental content.

We have seen that those processes of fully explicit will that we term voluntary acts are always accompanied by a somewhat clear consciousness of the end to be realized, and of the relation of means to this end. Moreover, in a fully deliberative act of will, there is also a recognition of various competing possibilities and a conscious selection of one to the exclusion of the others. Instead of allowing an impulse to pass at once into action in accordance with the immediate demands of some single want or uneasiness, in voluntary states consciousness takes control, looking before and after and comparing the consequences of different lines of action. In many cases its efficiency and control are shown by checking or inhibiting the immediate impulse by the thought of some more valuable end with which it conflicts.

How are such volitions to be described psychologically? What actually goes on when a decision is voluntarily made? If we leave out of account the various sensations of muscular strain that accompany volitions, we may say that the essence of the act consists in fixing one alternative and holding it fast before us by means of selective attention. This attention is not passively determined by the greater intensity or immediate attractiveness of one object, but is

the result of the fullest activity of the subject, and is at once a psychological fact and a moving force in the external world. As Prof. James remarks: "We do not first have a sensation or thought, and then have to add something to it to get a movement. Movement is the natural immediate effect of feeling, irrespective of what the quality of the feeling may be. It is so in reflex action, it is so in emotional expression, it is so in voluntary life."

The Freedom of the Will—The vexed problem of the freedom of the will arises from the fact that there seems to be an antagonism between the demands of our intellect and those of our moral nature. On the one hand, there is the requirement that all phenomena of the inner life, like those of external nature, shall be capable of explanation according to the law of cause and effect. On the other hand, it is maintained that if morality is to have any meaning, the individual must be free and thus responsible for his acts. In favor of determinism, it is argued that the mental life is composed of a series of states or processes that are related to each other causally just as are events in the external world; this is the necessary assumption of psychology and of all the sciences that attempt to explain the mental life. "Whenever determination by necessary laws ceases, there ceases also the possibility of any explanation." Moreover, determinists point out that the individual is moved to act by certain motives, and that these motives are the resultant of certain external influences as modified by his character. This character again is the product of previous acts, either of his own or of his ancestors, so that at any time the act performed is the necessary reaction of the individual in the given circumstances. Furthermore, it is maintained that there is an unbroken line between acts that are performed from instinct or impulse, and where consequently there can be no claim made for freedom, and the most complicated and deliberate acts of will. On the other side, those who contend for freedom argue that we have no right to consider the mind of man as simply a part of nature and subject like it to necessary laws of causation. They urge in support of their position that personality, the principle of intelligence itself, cannot properly be represented as one factor on a level with others, but that it is the centre from which the very conception of law springs, and on another side is the determining ground of all motives, and furnishes the standard by which they are evaluated. Appeal is also made to the immediate conviction of freedom that is present in all genuine cases of willing. Further, it is said that it is only on the assumption of freedom that such terms as "responsibility," "duty," "obligation," and "remorse" have any meaning. He who denies freedom, then, declares the experiences denoted by these words to be illusory.

It is impossible to give in the present article a detailed examination of these arguments. A few remarks may, however, be added regarding the general nature of the problem and the lines along which a reconciliation may be effected. In the first place, it is obvious that this controversy is a special phase of the general problem of mechanism (q.v.) and teleology (q.v.). Is everything to be explained according to necessary laws of cause and effect, or is it possible without doing violence to this principle to main-

tain a determination according to ends? If it is possible for the individual to set before himself the ends of his life, and to work for their realization, he is free in the only sense in which the word has any meaning. If, however, his acts are determined by some force that acts independently of him, he cannot be held responsible. Again, determinism is the only standpoint from which psychology as a natural science can proceed. For this science views the mental life as made up of a series of processes or mental phenomena. Its task, therefore, is to discover how these various elements are linked together according to causal laws. From the very nature of its postulates it is impossible to admit that there is any break in the line of causes and effects: every "state of mind" must be explained by showing that it stands in necessary relations to some other phenomena belonging to the same series. But this is to look at the mind from the outside, as composed of a number of phenomena, or mere occurrences in time. It is, however, possible to describe mind in a way that is truer to the direct experience of life, as a system of conscious functions or acts in which purposes are being realized and ends attained through the self-directed activity of the subject. As soon as this point of view is taken the causal and deterministic position is left behind, and the only possible assumption is that of self-determination or freedom. The conclusion we have reached then is that, so long as we regard mind from the standpoint of psychology as a science, everything must be explained causally, and that there is no possibility of introducing here the conception of freedom. But we have also seen that this standpoint is not final, but that experience can be more adequately interpreted as a process in which a conscious subject realizes ends that he himself sets, and that this view necessarily regards mind as something more than a series of causally determined phenomena.

J. E. CRIGHTON,

Professor of Philosophy, Cornell University.

Will, in law, is a disposition made by a competent person known as the testator in a form prescribed by law, of property over which he has legal power of disposition, to take effect at death. Technically, the term "Will" is used to describe an instrument which disposes of real property, while "Testament" is used to describe one that disposes of personal property, "Will and Testament" including both. Broadly, and by common use, the term "Will" covers both meanings and is accepted as describing an instrument that disposes of both realty and personalty. Any person of legal age, being of sound mind and memory and not under duress, may make a will disposing of whatever interest he has at his death in either real or personal property. All wills to be valid, with the exception of a favored class known as "Nuncupative

Wills which are oral, must be written and signed by the testator and witnessed by at least two persons who must sign in the presence of the testator and of each other, and are not beneficiaries under the will. Oral wills are permitted in the case of soldiers and sailors in actual service, and these "nuncupative" wills are definite statements of the will of the maker with two or more witnesses, who shall within a reasonable time thereafter reduce the statement to writing and sign as witnesses. A beneficiary cannot be a competent witness to a nuncupative will. A will may be altered or amended by the addition of the further wish of the testator, the amendment being known as a "Codicil," which must be signed by the testator and witnessed with the same formality as the original will. A will may be revoked by the testator by destroying it, such as by canceling, tearing, burning, or otherwise mutilating it, or by making a new will, which later will invalidates all preceding wills. The destruction of a later will revives a former will, which will then have full effect. In some States the subsequent marriage of the testator invalidates a will. The laws of the different States vary as to the provisions for the heirs and next of kin.

A will may be written in any language that expresses the intention of the testator. It need not be written in any prescribed form, but must show the intention. It may be written in any form of writing material or on several pieces of paper if their sense shows them to be connected each to the other. Separate documents may be included in the will if the will speaks of their incorporation in the will as a part of it, and in such a way as to identify the documents. Publication is the act of making known in the presence of witnesses that the instrument executed is the will of the testator. It is not necessary for the witnesses to know the contents of the will, but the fact that it is the will. Publication is not necessary in all States. A will usually names one or more persons who shall carry out the will of the testator. This person is known as the executor. When no person is named in the will the court appoints such person, who is known as the administrator. At the death of the testator the will is placed on file for probate in the probate or surrogate court. A will is construed liberally, the words taken in their plain and usual sense, and the intention of the testator allowed to prevail wherever possible to understand such intention. Effect is given to every part of a will. Rules of construction are valuable only in case the will is contested. Favor is shown in case of contest to natural heirs and next of kin. Conditions may be made, and trust estates created, and whatever interest the testator may have at death may be disposed of by will during his lifetime to take effect at death. When a testator has a large estate it is customary to have his will drawn up by an attorney who is familiar with rules of construction and of evidence. This is not necessary to the validity of a will, which may be written by any one so long as it is properly signed and witnessed.

Will-o'-the-wisp. See **LOUIS FATOUS**.

Willamette, wil-lá'mét, a river in Oregon which has its rise in Lane County, flows nearly north and enters the Columbia River in Columbia County, in the northwestern part of the

State. The total length is about 200 miles. It is navigable for large steamers to Portland (q.v.), 15 miles from its mouth.

Willard, will'ard, Ashton Rollins, American art critic: b. Montpelier, Vt., 14 April 1858. He was graduated from Dartmouth in 1879, removed to Boston in 1887, and has since spent much time in Europe. In 1902 was made chevalier of the Order of the Crown of Italy. His writings include: 'Life and Work of Painter Domenico Morelli' (1895); 'History of Modern Italian Art' (1898); 'Land of the Latins' (1902); etc.

Willard, Edward S., English actor: b. Brighton, Sussex, 1853. His first appearance on the stage was made at Weymouth in 1869, but his London debut was not made until 1881. He became manager of the Shaftesbury Theatre in 1889 and in 1890 came to the United States, where he played successfully for three years. He leased the Comedy and Garrick Theatres in London in 1894 and has since made several tours of the United States, playing various leading parts under his own management.

Willard, Emma Hart, American educator: b. Berlin, Conn., 23 Feb. 1787; d. Troy, N. Y., 15 April 1870. She began her career as a teacher in 1803, subsequently became principal of a girls' academy at Middlebury, Vt., and in 1809 was married to Dr. John Willard. She opened at her home in Middlebury, Vt., in 1814, a boarding school for girls in which she introduced various improvements in methods of instruction and also taught subjects hitherto not included in the curriculum of girls' schools. Desiring a broader field for the development of her ideas of education she addressed to the New York Legislature in 1819 a treatise entitled 'A Plan for Improving Female Education'. It was an able exposition of excellent ideas and found favor with Gov. John Clinton, resulting in the establishment in that year of a seminary for girls at Waterford, N. Y., which was incorporated and was partially supported by the State. She removed to Troy in 1823 where she was presented by the city with a suitable building for her school, henceforth known as the Troy Female Seminary. After the death of her husband in 1825 she conducted the business management of the school in addition to her other work until 1838, when she resigned her duties into the hands of her son. She traveled in Europe in 1830, assisted in founding a school for girls in Athens, Greece, and afterward published 'Journal and Letters from France and Great Britain' (1833), the proceeds of which she presented to the school. She was married to Dr. Christopher C. Yates in 1838, but in 1843 she secured a divorce from him and resumed her former name. She traveled 8,000 miles through the Southern States in 1846 engaged in lecturing before conventions of teachers, and in 1854 was present at the World's Educational Convention in London. Mrs. Willard is one of the most prominent figures in the history of higher education for women in the United States. She was not only an advocate of advancement but a practical worker for it, and brought to her task great earnestness of purpose, coupled with high abilities and executive capacity. Her school-books were widely used and were translated into European and Asiatic languages. They include: 'The Wood-

bridge and Willard Geographies and Atlases' (1823); 'History of the United States' (1828); 'Treatise on the Circulation of the Blood' (1846); 'Last Leaves of American History' (1849); 'Astronomy' (1853); 'Morals for the Young' (1857); etc. She also wrote some excellent verse, which includes the famous 'Rocked in the Cradle of the Deep.' A statue was unveiled to her memory at Troy in 1895. Consult John Lord, 'Life of Emma Willard' (1874).

Willard, Frances Elizabeth, American educator and temperance reformer. b. Churchville, N. Y., 28 Sept. 1839, d. New York 18 Feb. 1898. She was graduated from the Northwestern Female College, Evanston, Ill., in 1859, engaged in teaching, was appointed professor of esthetics in the Northwestern University in 1869, and became dean of the Women's College of that institution in 1871. In 1874 she resigned this position, was elected secretary of the Woman's Christian Temperance Union in that year, and in 1879 she became its president, an office she held until her death. In her management of the association she displayed great executive ability and a remarkable genius for organization. She founded in 1883 the World's Christian Temperance Union, and in 1888 became its president. She declared herself in favor of woman's suffrage in 1876 and thereafter lectured occasionally upon the subject, deeming the ballot a protection to women from the miseries caused by drink. In 1892 she visited England, where she was the guest of Lady Henry Somerset, the temperance reformer, and while there addressed a mass meeting at Exeter Hall, said to have been one of the largest assemblages ever held there. In her work Miss Willard displayed an untiring energy, and for 10 years she averaged a meeting a day, meanwhile continuing her literary labors. She was editor of the *Chicago Post and Mail* for a short time after 1878, and from 1892-8 editor-in-chief of the 'Union Signal,' the official organ of the temperance movement. Her publications include: 'Nineteen Beautiful Years' (1868); 'Woman and Temperance' (1883); 'Glimpses of Fifty Years' (1889); 'A Great Mother' (1894); etc. She also edited with Mary A. Livermore, 'A Woman of the Century' (1893).

Willard, Josiah Flynt, American author and sociologist: b. Appleton, Wis., 23 Jan. 1869; d. Chicago, Ill., 20 Jan. 1907. While studying at the University of Berlin in 1890-5 he became interested in sociological problems, and was impressed with the danger impending to the United States through its being a haven of refuge for European criminals when their own country would no longer suffer their being at liberty. In order thoroughly to understand the situation and the actual conditions and feelings governing the tramp world he led for several years the life of a vagrant, publishing the results of his observations in 'Tramping with Tramps' (1899). His other writings include: 'Powers that Prey' with F. Walton (1900); 'Notes of an Itinerant Policeman' (1900); 'The World of Graft' (1901); 'The Little Brother' (1902); 'The Rise of Roderick Cloud' (1903); etc.

Willard, Samuel, American clergyman, scholar, and educator: b. Concord, Mass., 31 Jan. 1640; d. Boston, Mass., 12 Sept. 1707. Graduated from Harvard in 1659, he studied

theology, and in 1663 was ordained minister at Groton, Mass. This village having been destroyed by the Indians (1676) during King Philip's war, he removed to Boston, where he was made colleague of Thomas Thacher, pastor of Old South, and upon the latter's death (15 Oct. 1678) succeeded to the pastorate, which he held until his death. In 1700 he became vice-president of Harvard, and in 1701, upon the resignation of President Increase Mather (q.v.) (6 Sept.), assumed the direction of the institution. He retained the active pastorate of the South Church, however, and by order of the General Court was debarred from the title of president. He was opposed to the persecutions for witchcraft, and wrote and spoke against the delusion. In 1688 he began to give a series of Tuesday afternoon lectures on theology, and these he continued for the rest of his life. The lectures were printed in 1726 in a folio of 914 double-columned pages. 'The thought and expression of this literary mammoth,' says Tyler, "are lucid, firm, and close." Willard published numerous sermons and other writings.

Willard School, The Emma. The Emma Willard School, which in 1904 entered on its 91st year, is one of the oldest institutions for the higher education of women in the United States. It is the outgrowth of an institution founded by Mrs. Emma Willard in Middlebury, Vt., in 1814.

In 1819, the patrons of Waterford, N. Y., urged removal of the school to that place, believing the richer State of New York would grant it an appropriation. The legislature did not grant an endowment, but the application led to the allowing of a portion of the literature fund for girls' schools, to be given to the school, the first legislative appropriation of money for the education of girls.

In 1821, Mrs. Willard accepted an invitation from the citizens of Troy to remove the seminary to that city, where the school became known as the Troy Female Seminary. From the establishment of the seminary in Troy in 1821, to 1875, more than 15,000 pupils were connected with the school. In 1892, a complete reorganization of the course of study was made, the art department was introduced, the boarding department was opened in Russell Sage Hall, and the old name gave way to that of Emma Willard School, thus bringing the school into close touch with its famous past and associating it in name with its illustrious founder.

The school is situated in Troy, N. Y., on the Hudson River, a city of about 80,000 inhabitants. Troy has a healthful climate, being surrounded with attractive open country which can be reached easily. It is within a few hours' journey of many noted health resorts, and places of natural and historic interest; among which are the Green Mountains, the Catskills, the Berkshires, Lake George, Bennington, and Saratoga. Excursions to some of these places can be taken in the spring and autumn if desired. Troy is an important railway centre, and is easily accessible from many directions, by various lines of railroad. Advantages of New York are available during vacations, for students, if desired by parents or guardians.

The school now occupies, in addition to the former residence of Mrs. Emma Willard, three new beautiful buildings erected for its use.

Russell Sage Hall, the gift of the Hon. Rus-

sell Sage, whose wife is the efficient president of the Emma Willard Association, is the residence for members of the faculty and for boarding pupils. The building consists of five stories above the basement. It is fire-proof in construction, all floors having steel beams with a filling of fire-proof material, and all dividing walls and partitions being of brick or hollow tiles.

The Gurley Memorial Hall contains the assembly room, recitation rooms, gymnasium, laboratories, library, and offices. It is a two-story basement structure, having a central section and two wings, built of granite with Long Meadow brown-stone trimmings, and has a handsome appearance from every point of view. This building is also fire-proof, all of the floors are laid upon brick, supported by iron beams, and the plastering and ceiling are applied directly to the brick without lath. The rooms are spacious, with high ceilings, are well lighted and are handsomely furnished.

The library contains over 2,000 volumes, and is open daily for the use of faculty and students. The Troy Public Library, with more than 40,000 volumes, is situated directly opposite the school.

The Anna M. Plum Memorial building, the gift of Mrs. G. V. S. Quackenbush, in memory of her daughter, Miss Anna M. Plum, a graduate of the school, contains the studios and offices for the departments of music and art. It has three stories, and is built of granite with brown-stone trimmings.

The government of the school, and its underlying idea, is mutual good, understanding and sympathy between teacher and pupil. There are few regulations to be enforced, for it is taken for granted that girls entering the school are ladies and mean to do right. The design is to combine thorough scholarship with culture, and the oversight and care exerted are given as a help and guidance in developing self-respect and self-control.

The school is undenominational, but positively Christian in its influence. Regular attendance at church is expected, and students are permitted, under charge of some teacher, to attend any church preferred by their parents.

W. F. GURLEY,

President Board of Trustees.

Willcox, wil'kōks, Orlando Bolivar, American soldier. b. Detroit, Mich., 16 April 1823; d. Coburg, Ont., 10 May 1907. He graduated from West Point in 1847, served in the Mexican war and later in the Seminole war, and other Indian campaigns. He was promoted lieutenant in 1850 and in 1857 resigned from the army, thereafter engaging in law practice at Detroit until the outbreak of the Civil War, when he re-entered the army as colonel of volunteers. He was engaged at the capture of Alexandria, and at the first battle of Bull Run was wounded and taken prisoner. He was exchanged in 1862 and afterward participated in the battles at South Mountain, Antietam, and Fredericksburg, led a division at the battle of the Wilderness and in the Richmond campaign, and in 1864 was brevetted major-general of volunteers. He was the first to enter Petersburg, receiving its surrender, and in 1866 was mustered out of service. He re-entered the regular army with rank as colonel in 1866, was bre-

vetted brigadier-general and major-general in the regular army in 1867 for services at Petersburg and Spotsylvania, and was voted a Congressional medal of honor for gallantry at Bull Run in 1861. He received full rank as brigadier-general in 1886 and in the following year was retired. He wrote: 'Shoepac Recollections by Walter March' (1856); and 'Facts An Army Memoir, by Major March' (1857).

Willemite, an important ore of zinc and a mineral of much mineralogical interest. It is essentially a zinc orthosilicate, Zn_2SiO_4 , but all of the many varieties from Franklin Furnace and Ogdensburg, N. J., its two most prolific localities, contain considerable manganese. The colors of the New Jersey willemite are very varied, white, green, yellow, flesh-red, brown and gray, the last three being characteristic of the variety troostite which occurs in crystals up to six inches in length. The crystallization of willemite is rhombohedral, the common form being a hexagonal prism, either stout or much elongated, terminated by obtuse rhombohedrons. It occurs in small crystals of prismatic or obtuse rhombohedral habit in New Mexico. A granular form is also found in New Jersey in large quantities, intimately mixed with franklinite. Crystals from Belgium have an easy basal cleavage, but this cleavage is difficult in New Jersey crystals, which have eminent prismatic cleavage. The mineral has a hardness of 5.5 and a specific gravity of 3.9 to 4.2. Transparent crystals and masses have been found in New Jersey which yield gems whose beauty is much enhanced by the strong double refraction of the mineral, though the inferior hardness precludes their use as jewels. Ordinarily willemite is opaque, but with transparent portions scattered through the mass. The green phosphorescence of willemite when struck with a hammer has been known for many years. During exposure to the Röntgen rays and to the ultra-violet and other rays of the Piffard lamp a gorgeous green fluorescence is observed in the New Jersey mineral and some specimens are also highly phosphorescent, but these properties are not possessed by willemite from other localities. Radium salts excite instant luminescence in the New Jersey mineral. These observations have attracted widespread interest.

Willems, vil'lēmz, Florent, Belgian artist: b. Liège, Belgium, 9 Jan. 1823; d. Neuilly, France, 22 Oct. 1905. He studied at the Academy of Mechlin and formed his style upon that of the old Dutch masters. He removed to Paris in 1844 and was awarded first-class medals in 1855, 1867, and 1878. His work has been well received in the United States and examples of it are included in many private collections. Especially good canvases by him may be seen at the Metropolitan Museum of Art in New York, and at the Art Institute of Chicago.

Willems, Jan Frans, Flemish philologist: b. Bouchout, near Antwerp, Belgium, 11 March 1793; d. Ghent 14 June 1846. In 1809 he was placed in the office of an Antwerp notary, and in 1811 won a prize for the best poem on the battle of Friedland and peace of Tilsit (1811). His ode, 'Aen de Belgen' ('To the Belgians,' 1818), hailing the revival of Belgian nationality under Holland's protection, brought him a position under the Dutch government and a series of masterly philological works, including

'Over de Nederduitsche Taal en Letterkunde' (1819-20), procured him admission to the Academy of Antwerp. On the formal separation of Belgium from Holland in 1830 he was removed from office and settling at Enclou, he labored there on the Flemish version of 'Reynard the Fox,' in his edition of it (1834) calling on Flemings to help to preserve their ancient tongue. As archivist of Ghent from 1835 he edited the 'Rymkronyk van Fan van Helu' (1837), 'Brabantsche Yeesten' (1839-43), etc., and after his death appeared his collection of old Flemish songs, and his 'Mengelingen van Vaderlandschen Inhoud.' Consult lives by Snellaert (1847); Rooses (1874); and Rooses, Buytende, and Bergmann, 'Jan Frans Willem's' (1893).

Willet, an American snipe of the genus *Symphemia*. The bill is thick, compressed, straight, longer than the head; wings long, legs long and strong; tail short and nearly even. The *S. semipalmata* is about 15 inches long and 31 in alar extent, the bill $2\frac{1}{4}$; it is darkly speckled above; rump, upper tail coverts, and under parts white; tail ashy white, the two middle feathers spotted; secondaries white, with brownish black spots. The young are spotted and transversely banded with brownish black. It is found throughout eastern temperate North America, and in South America, rarely going far from shore; on the Pacific it is represented by a distinct subspecies. It goes south in winter as far as the Gulf States where it also breeds sparingly; and is often found in company with the godwits. It breeds in both fresh and salt marshes on the ground and remain in separate flocks during the fall and winter. The eggs and the flesh, especially of the young birds, are excellent eating. The food consists of small crustaceans, and aquatic worms and insects. They are rather shy, rapid and strong fliers, and good swimmers if necessary, though they cannot dive. They are noisy while breeding, the shrill cry being reiterated as long as an intruder remains in sight. The name is derived from the resemblance of their notes to the "will-willet." Owing to their shyness, the keen sight which enables them to detect the sham of decoys, and their swift, often elevated flight they are difficult to shoot, and offer fine sport to the skilful sportsman. For these reasons, and because of their large size and excellent table qualities, they are much sought. Consult Eliot, 'North American Shorebirds' (New York 1895).

Willett, Marinus, American soldier: b. Jamaica, N. Y., 31 July 1740; d. New York 22 Aug. 1830. He served in the French war with rank as lieutenant, was especially prominent in the expedition against Ticonderoga in 1758, and in the capture of Fort Frontenac. He was active in the movements of the Sons of Liberty and on 6 June 1775 took measures to prevent the forwarding of arms from New York to the British troops in Boston Harbor. He served as captain under Montgomery in his expedition against Canada in 1775, remaining in command of the post at Saint John's until January 1776; was second in command at Fort Stanwix in 1777, led and held the fort until relieved by Arnold. In June 1794 accepted a mission to the Creek Indians present at Monmouth, and in 1779 joined the expedition of General Sullivan against the Six

Nations. He commanded the forces in the Mohawk Valley from 1780 until the close of the war, conducting in 1783 the attempted surprise of the garrison at Oswego, which was the last hostile movement against the British. In 1784-92 he was sheriff of New York, and in 1794 accepted a mission to the Creek Indians and succeeded in concluding with them a treaty of peace. He was appointed mayor of New York to succeed De Witt Clinton in 1807, and in 1812 was secretary of a mass meeting which favored military preparations against the British. He left several manuscript journals from which his son, W. M. Willett, prepared 'A Narrative of the Military Actions of Col. Marinus Willett' (1831).

Willett's Point, N. Y., national military reservation on the south shore of East River at its entrance to Long Island Sound. The reservation comprises 136 acres, purchased partially in 1857 and partially in 1863; the construction of a fort was begun here in 1862, but the work was suspended and the fort remains unfinished. After the war, an engineer battalion was ordered here to establish a depot for stores, a station for torpedo experiments, and a school of practice. The post which constitutes one of the defenses of New York harbor is also known as Fort Totten (q.v.).

William I., surnamed the Conqueror, king of England and duke of Normandy: b. Falaise, Normandy, 1027 or 1028; d. Rouen 9 Sept. 1087. He was the natural son of Robert, duke of Normandy, by Arletta, the daughter of a tanner of Falaise, and his father, having no legitimate son, when about to set out on a pilgrimage to Jerusalem, nominated him as his heir. Robert died in 1035, while returning from Palestine; and Normandy fell for time into a condition of anarchy. When William succeeded to the dukedom his vigor and ability soon restored order, and his power increased so much as to excite the jealousy not only of the surrounding nobles, but of his suzerain the king of France. Two combinations were formed against him, and twice his territory was invaded; but he repelled these aggressions, and reduced the French king to the necessity of peace. The opportunity of gaining a wider dominion presented itself on the death of his second cousin, Edward the Confessor, king of England. When this event took place he laid claim to the English crown, alleging that Edward had bequeathed it to him. To enforce his claim he invaded England, and the victory of Senlac or Hastings, in which his rival Harold was killed, ensured his success (1066). On the following Christmas Day William was crowned, after tumultuary election on the part of the English nobles, and took the customary coronation oath. His first measures were mild: he sought to ingratiate himself with his new subjects, preserved his army in strict discipline, confirmed the liberties of London and other cities, and administered justice impartially. On his return to Normandy, however, the English, being treated by the Norman leaders like a conquered people, revolted and a conspiracy was planned for the massacre of all the Normans in the country. On this intelligence William returned, and began with a show of justice by repressing the encroachment of his followers; but on reviving the Danegelt, which had been abolished by Edward the Confessor, the discon-

WILLIAM

ments were renewed. These he repressed with his usual vigor, and a temporary calm succeeded. The resistance of two powerful Saxon nobles, Edwin and Morcar, who had formed an alliance with the kings of Scotland and Denmark, and with the prince of North Wales, soon after drew William to the north, where he obliged Malcolm, king of Scotland, to do homage for Cumberland. From this time he treated the English like a conquered people, multiplied confiscations in every quarter, and forced the native nobility to desert the country in great numbers. In 1069 another formidable insurrection broke out in the north, and at the same time the English resumed arms in the eastern and southern counties. William first opposed the storm in the north, and executed such merciless vengeance in his progress that the whole country between York and Durham was turned into a desert; and above 100,000 of both sexes and all ages are said to have perished. There being now scarcely a landed proprietor who had not incurred the forfeiture of rebellion, he put into execution his plan of introducing a total alteration of the state of English law and property, by dividing all the lands into baronies and adopting the feudal system in regard to land tenure and services. He also reduced the ecclesiastical property to a similar system, and, to prevent resistance from the clergy, expelled most of the English church dignitaries, and placed Normans or other foreigners in their stead, Lanfranc being made archbishop. Still further to humble the English, he caused French to be used in the courts of justice and in law proceedings, and ordered it to form a leading part of instruction in all the schools throughout the realm. In 1076 he received a demand from Pope Gregory VII., requiring him to do homage for his kingdom, and to pay the accustomed tribute from England to the Holy See. William denied the homage; nor would he allow the English prelates to attend a general council summoned by Gregory, but consented to the levy of Peter's pence. Toward the end of his reign he instituted that general survey of the landed property of the kingdom, the record of which still exists under the title of 'Domesday Book' (q.v.). The manner in which he laid waste a large district in Hampshire, where he demolished villages, churches, and convents, and expelled the inhabitants for 30 miles round, merely to form the New Forest for hunting, exhibits his indifference to the suffering of his subjects, as well as his love of the chase, which he further protected by a most severe code of game-laws. In 1087 he went to war with France, whose king had encouraged a rebellion of Norman nobles, entered the French territory, and committed great ravages, but, by the starting of his horse at Mantes, received an injury which caused his death, at the Abbey of St. Gervais, near Rouen (1087). He left three sons—Robert, to whom he bequeathed Normandy; William, who inherited England; Henry, who received only his mother's property, and five daughters. William the Conqueror was the most powerful sovereign of his time. He possessed superior talents, both political and martial, and employed them with remarkable vigor and industry. His passions were, however, strong; his ambition severe and merciless; and his love of sway often led him to dis-

regard all restraints of justice and humanity. Consult: Lappenberg, 'England under the Anglo-Norman Kings,' translated by Thorpe (1857); Palgrave, 'Normandy and England,' Vol. III. (1864); Freeman, 'History of the Norman Conquest of England' (1867-71); Stubbs, 'Constitutional History of England' (1874); Green, 'Conquest of England' (1884); Freeman, 'William the Conqueror' (1888); Round, 'Feudal England' (1895).

William II., surnamed **Rufus**, from his red face, king of England: b. Normandy 1056; d. New Forest, Hampshire, 2 Aug. 1100. He was the third son of William I. and was sent to England by his father the day before the death of the latter with a recommendation to the barons and bishops that he should be the Conqueror's successor. His wishes were respected and William Rufus was crowned at Westminster 26 Sept. 1087. The division of England and Normandy did not, however, please the great barons, who possessed territories in both; and a conspiracy was formed for effecting the deposition of William in favor of his brother Robert; but the conspiracy was repressed with great vigor; the confederate nobles were forced to withdraw to Normandy, and their English estates were confiscated. It is worthy of notice that in this instance a Norman ruler was supported by his English subjects against his Norman ones. Once firmly seated on his throne, William forgot his promises to the English; and the death of Lanfranc, archbishop of Canterbury, freeing him from an authority which he respected, he extended his rapacity to the church, and seized the temporalities of vacant bishoprics and abbeys, to which he delayed appointing successors. In 1090 he made an incursion into Normandy, to retaliate on his brother Robert; but a reconciliation was effected between them. In 1096 Robert mortgaged his dukedom to William for the sum of 10,000 marks to enable him to fit out an expedition and join the crusaders in the Holy Land. William accordingly took possession of Normandy and Maine, although in the case of the latter he was not allowed to do so without a struggle. William Rufus met his death while hunting in the New Forest. His body was found pierced by an arrow, which is generally believed to have been shot, whether accidentally or purposely cannot be said, by a French gentleman named Walter Tyrrel. Tyrrel immediately galloped to the coast, and embarked for France, where he joined the crusaders. The body was interred without ceremony at Winchester. This event took place when the king was in the 44th year of his age, and 13th of his reign. William Rufus possessed vigor, decision, and policy, but was violent, perfidious, and rapacious. Consult Freeman, 'Norman Conquest of England,' Vol. V. (1876), and his 'Reign of William Rufus' (1882).

William III., king of England and hereditary stadtholder of Holland: b. The Hague 4 Nov. 1650; d. Kensington, England, 8 March 1702. He was the son of William II. of Nassau, prince of Orange, and his mother was Henrietta Mary Stuart, daughter of Charles I. of England. Educated by the grand pensionary John De Witt, he gained the love of the people, who in 1672, when Louis XIV. invaded the republic, appointed him at once captain-general, grand-

WILLIAM

admiral, and stadtholder of the United Provinces, after enforcing the abrogation of a resolution which De Witt had got passed in 1667, and which declared that in future no captain-general should at the same time be stadtholder. William's management of the war against France was masterly. In the campaign of 1673 he opened the sluices in the dikes around Amsterdam, inundating the whole of the neighboring district and forcing the French to retire. He was able to keep the enemy in check, and by his policy engaged the empire, Spain, and Brandenburg to take part with Holland, so that at the Peace of Nijmegen in 1678 the integrity of Holland was respected. William's whole policy was directed against Louis XIV., for whom he entertained a personal hatred, and to curb the ambition of the French monarch he instituted the league of Augsburg, July 1686, between the emperor, Spain, Sweden, and Holland, to which Denmark and some German princes also acceded. His wife, Mary, whom he had married in 1677, was the daughter of James II. of England, and presumptive heiress to the throne. Unexpectedly James' second wife gave birth to a son, 10 June 1688, and the greater part of the Parliament and of the nation now feared that the bigoted James would introduce Roman Catholicism as the state religion, and subvert the constitution. Rumor also asserted that the prince was supposititious. The Episcopalians and Presbyterians in England, under these circumstances, united, in order, by the aid of Holland, to give Mary the succession to the throne. William foreseeing that England, by the policy of his father-in-law, would become more and more closely connected with France, joined with the great majority of the British nation; and the pensionary Fagel persuaded the States-General to support him with ships and troops for the preservation of British freedom and the Protestant religion. William arrived suddenly at Torbay, 5 Nov. 1688, with a fleet of 500 sail, ostensibly equipped against France, and with 14,000 troops. Upon his landing a great part of the nobility immediately declared for him; and James' soldiers by degrees went over to him. In December the king fled with his family to France, after which William made his entry into London. The two houses of Parliament in convention now declared that James II. had broken the fundamental compact between the king and the people, and by withdrawing from the kingdom had abdicated the government. On 13 Feb. 1689, Mary was proclaimed queen, and William, her husband, who had meanwhile gone over to the English Church, was proclaimed king. At the same time the declaration or bill of rights settled the limits of the royal power, and the order of succession. Scotland followed England's example; but in Ireland, whither Louis XIV. sent James with an army, the majority of the Roman Catholics maintained the cause of the deposed king. But William's victories over the army of James on the Boyne 1 July 1690, and at Aughrim, 13 July 1691, assisted by the clemency with which he treated the vanquished party, made him master of Ireland. In the war on the Continent he was less successful. At Steinkirk he was defeated by Marshal Luxembourg in 1692, and at Neerwinden by the same general in 1693; but always succeeded in wresting from the French

the fruits of their victories by skilful retreats and marches. Louis was finally compelled to acknowledge him as king of England at the Peace of Ryswick, in 1697. The Parliament insisted at that time on the disbanding of nearly the whole army, deeming a standing army incompatible with the security of the constitution. Soon after, the will of Charles II. of Spain, who had made the grandson of Louis XIV. his heir, induced William to arm all Europe against Louis in the great alliance of The Hague 7 Sept. 1701. But in the midst of these projects he broke his collar-bone by a fall from his horse between Kensington and Hampton Court, 21 Feb. 1702, and died in consequence of the accident. His wife, Mary, had already died childless in 1694. William's manners were too cold and ungracious to allow him to be popular with the English people. Under a reserved exterior he concealed a strong love of renown and power, and to obtain the majority of votes in Parliament made use of bribery. Immersed in politics and war, he had neither leisure nor inclination for literature and art. In conversation he was grave and unattractive; but in business, penetrating, quick, and decided; in danger, undaunted; in difficulties, unshaken; in war, bold without ostentation. Consult: Burnet, 'History of His Own Times'; Trevor, 'Life and Times of William III.' (1835); Macaulay, 'History of England'; Hallam, 'Constitutional History'; Ranke, 'History of England' (1875); Traill, 'William III.' (1888); Hippold, 'William III., Prinz von Oranien, Erbstatthalter von Holland, König von England' (1900).

William IV., king of Great Britain and Ireland, third son of George III.: b. 21 Aug. 1765; d. Windsor 20 June 1837. From 1779 to 1790 he served in the navy, and after quitting active service was raised successively to all the higher grades of naval command, becoming in 1801 admiral of the fleet. In 1789 he was raised to the peerage with the title of Duke of Clarence. He frequently spoke in the House of Lords, and held the office of lord high-admiral (1827-8). He became heir presumptive to the throne in 1827 and succeeded his brother George IV. as king 26 June 1830. On his accession he retained the ministers then in office with assurances of his confidence in their zeal and ability. In the new Parliament, which met in November, the ministry, being left in a minority on a motion of Sir H. Parnell for referring the civil list to a select committee, immediately sent in their resignation; and a Whig administration was formed with Earl Grey at its head. The great events which render his reign memorable are the passage of the reform act, the abolition of slavery in the colonies, and the reform of the poor-laws. William IV. married in July 1818, Adelaide, sister of the Duke of Saxe-Meiningen, by whom he had no surviving children. He had, however, a large family by Mrs. Jordan, the celebrated actress, who was for many years his mistress, while Duke of Clarence. Her liaison with the duke lasted from about 1790 till 1811, when an arrangement was made by which she and her family were provided for. William IV. was succeeded by his niece Victoria. Consult Fitzgerald, 'Life and Times of William IV.' (1884); Walpole, 'History of England from the Conclusion of the Great War in 1815' (1878-86).

WILLIAM

William I., emperor of Germany and 7th king of Prussia: b. Berlin 22 March 1797; d. there 9 March 1888. He was the second son of Frederick William III. and Louisa of Mecklenburg-Strelitz, and from his earliest years was trained in military exercises. In the campaign of 1813-14 he joined the Prussian forces as captain, receiving then, for bravery in the field, the "Cross of St. George" from the Czar Alexander. On the death of his father in 1840 he became heir presumptive to the throne, and received the title of Prince of Prussia. On the outbreak of the revolution in 1848 he quitted Berlin for England, but was soon recalled and in the following year proceeded against the insurgents with military vigor and suppressed the insurrections in Baden and the Palatinate. His brother having become incapable of ruling, William (1857) was appointed regent, and in January 1861 became king, being crowned at Königsberg in October of the same year. With the assistance of Otto von Bismarck (q.v.) as president of the cabinet, and Von Roon as war minister, he demanded from the nation a large scheme of army reform, and his foresight in this matter was justified by the Prussian successes in the war with Denmark (1864), and the complete overthrow of Austria at Sadowa (1866). The latter war had been brought about by the diplomacy of Bismarck, who now proceeded to form a North-German Confederation with King William as its head, and to conclude a treaty of alliance, offensive and defensive, with the South German States. This growing power of Prussia provoked the jealousy of France, and a crisis was reached in the negotiations concerning the Spanish crown. War was proclaimed between Prussia and France (1870), and the South-German States having declared in favor of the former, King William led the combined German forces through the campaign, which resulted in the defeat of Napoleon at Sedan, and finally in the siege and capitulation of Paris. Meanwhile the North-German Parliament, uniting with the German princes, desired the king to become German emperor. This honor he accepted, and he was crowned as Emperor William I. at Versailles on 18 Jan. 1871. After the conclusion of peace with France, and having entered Paris with his army, the emperor returned to Berlin amid great enthusiasm. The latter part of his reign was passed in consolidating the power of the new German empire, and in parliamentary and political conflicts with the Catholic, Liberal, and Socialist parties in the state (See GERMANY.) His life was attempted several times. Among biographies are those of Forbes (1888); G. B. Smith (1887); Strauss (1887); Simon (French, 1887, Eng. trans.); Marcks, 'Kaiser Wilhelm I.' (1899). Consult also Von Sybel, 'Die Begründung des Deutschen Reichs' (1889-94; Eng. translation 1890-2); Malletson, 'Refounding of the German Empire' (1892); Krause, 'Growth of German Unity' (1892); Oncken, 'Das Zeitalter des Kaisers Wilhelm' (1890-2).

William II. (Friedrich Wilhelm Victor Albert), German emperor and king of Prussia, son of Frederick III. and Victoria, Princess Royal of Great Britain, and grandson of William I.: b. Berlin 27 Jan. 1859. At birth he suffered an injury of the left arm which would have disqualified a private person for the army, but

nevertheless he received a thorough military education. In 1869 he was enrolled in the army as 2d lieutenant, in 1874 entered the gymnasium at Cassel, and three years later, as 1st lieutenant, was admitted to the University of Bonn, where he remained until 1879, his principal studies being political science and law. He then entered upon actual military service, to which, after his marriage (27 Feb. 1881) to Princess Victoria of Schleswig-Holstein-Sonderburg-Augustenburg, he devoted himself with all earnestness, and in 1883 became colonel of the Hussars of the Guard. In spite of his physical defect he was now one of the most capable and dashing officers in the army. He also displayed talents in literature and art, which he has pursued in various directions. Strengthened by physical culture and the diversions of hunting and other sports in which he excelled, he came to the throne (15 June 1888) well trained in mind, mured to exacting labors, and filled with self-reliance and enthusiasm. Statecraft he had learned in the school of Bismarck (q.v.), and his political and personal ideals were imbued with veneration for his grandfather, whose conviction of "divine right" he embodied in his own view of the imperial office. His personal aggressiveness and military methods had given rise to popular fear of indiscretions whereby he might endanger the peace of Germany and of the world, but from the first he has vigorously repelled those suspicions of his motives which have led to his designation as the "War-lord," and against which his conduct in the main has thus far been a vindication. During the mortal illness of his father when Crown Prince, William was called upon to repudiate a charge of conspiracy to keep him from the throne. His own behavior in the three months of his father's reign betrayed no want of filial devotion. Upon his accession William at once asserted his ideas of personal rulership, which he has maintained in theory, and in practice has relaxed only in submission to demands of policy. He has actively concerned himself with every department of German life, and his personal sway has been qualified only by the limitations of the constitution and of public opinion. By travel, in which he has visited all the principal capitals of Europe, he has familiarized himself with international affairs, and he is an expert in world-politics. When Moltke died the emperor declared that he had "lost an army," but when he quarreled with Bismarck he showed no misgivings at the loss of the masterful chancellor and reputed creator of the empire, whose retirement he virtually compelled in March 1890. And indeed by this act, cleverly characterized by his critics as "dropping the pilot," he made himself more distinctly master of the ship of state. Since then his able chancellors—Caprivi, Hohenlohe, Bülow—have been compliant to the imperial will. Shortly before Bismarck's death the emperor sought reconciliation, and their friendship was partially restored. In some things, notably in maintaining the Triple Alliance, the emperor has followed the policy of Bismarck. William has measured his strength against all liberalizing parties, and his early solicitude for the laboring classes has latterly seemed lost in his bitter antagonism to socialistic elements. Bismarck's *Kulturkampf* legacy William has sagaciously disposed of through concessions which he has turned to

profit by making an implicit alliance of the Vatican and the German schools in his anti-revolutionary policies, and by remodeling the schools themselves.

With all his alleged autocratic tendencies William has sought above everything the aggrandizement of Germany, her industrial and commercial supremacy, colonial expansion, and primacy among the great Powers. He has extended the imperial influence to Turkey and Asia Minor, and strengthened German interests in the Far East and in Africa and South America. He holds the press to as strict account as he can; the army and navy, which he would make superior to all others, he keeps in strong control; but his attitude at present indicates no menace, rather a promise of protection to the cause of peace, which on more than one occasion he has doubtless aided in preserving. Herein his conduct has been less aggressive than many of the speeches in which he has addressed himself through Germany to the world. He is admittedly a most remarkable figure among the men and rulers of his time, and in his future career the whole world cannot but feel a profound and cordial interest. The sending of his brother, Prince Henry of Prussia, to the United States, in 1902, did much to promote friendly sentiment, and the emperor's good will has been further shown in his gifts to the American people and to American institutions. Editorial Staff, 'Encyclopedia Americana.'

William I., prince of Orange, count of Nassau, surnamed the SILENT: b. Castle of Dillenburg, Nassau, 16 April 1533; d. Delft, Holland, 10 July 1584. He was the eldest son of William, count of Nassau, and Juliana, countess of Stolberg, and was educated in the Roman Catholic faith by Maria, queen of Hungary, sister of Charles V. He spent nine years in attendance on the person of the emperor, who had so high an esteem for his spirit, prudence, and intelligence, that he asked his opinion respecting the most important matters, and when he was but 22 entrusted him with the chief command of the army in the Netherlands, in the absence of Philibert, duke of Savoy. He also recommended him to his successor, Philip II., who, however, regarded him with distrust. As Cardinal Granvella had now the entire confidence of Philip, and Margaret of Parma, who was charged with the government of the Netherlands, was obliged to do whatever Granvella suggested, especially with respect to the introduction of the Spanish inquisition, and the erection of new bishoprics, the Count of Egmont, the Prince of Orange, and the Count of Horn represented to the king in writing, that unless the cardinal were speedily recalled, his violence would drive the country to rebellion. Though Philip looked on this step as treason, he concealed his anger, and recalled the cardinal (1564). After the remonstrance offered in 1566 by 300 noblemen (the Gueux), with Count Louis of Nassau, the brother of William, at their head,

against the introduction of the Inquisition and the establishment of new bishoprics, had been rejected and the Duke of Alva had been appointed governor of the Netherlands, William had a meeting with Egmont, Horn, his brother Louis, and others at Dendermond, to deliberate on the means of averting the threatening danger. The majority advised an armed resistance, but this proposal came to nothing on account of the opposition of the Count of Egmont. The prince, with his family now went to his castle at Dillenburg. Alva arrived in the Netherlands in 1567, and many men of consequence, including Egmont and Horn, were immediately arrested. In the beginning of 1568 he caused the prince and others, who had retired from the country, to be summoned before the Council of Twelve. The prince did not appear, in consequence of which Alva declared him an outlaw, confiscated his property, and removed his son Philip William, from the University of Louvain, and sent him as a hostage to Spain. The Prince of Orange now determined on waging war against Alva. In a document issued in the summer of 1568, and called his 'justification,' he gave the reasons of his conduct and publicly professed the Protestant religion. In consequence of this he received aid in money and troops from several Protestant princes. William now raised an army of 24,000 Germans, who were joined by 4,000 French soldiers, conducted his forces with great skill across the Rhine and Meuse, entered Brabant, and defeated a division of the hostile army, but was unable to bring the Duke of Alva, who threw himself into the fortresses, to an engagement, or to excite the people, who feared the Spaniards, to a general insurrection. His army now dispersed. He then took part in an expedition to France against the Catholic party of the Guises (1569). In France Admiral Coligny had advised him to fit out privateers against the Spanish, and establish himself particularly in Zealand and Holland, from which the Spaniards would hardly be able to drive him. The prince followed this advice, and the privateers made themselves masters, in 1572, of the town and harbor of Briel, on the island of Voorn, and also took Flushing. As Alva's tyranny became more intolerable, and the people were exasperated by new exactions, several cities of Holland, Zealand, Overijssel, and Gelderland publicly declared for the Prince of Orange. Relying on the assistance of France, which Admiral Coligny had promised to obtain for him, William crossed the Rhine, but the news of the massacre of St. Bartholomew, deprived him for the time of all hope of French aid. He then retired into the province of Holland, which steadfastly supported him. He now resumed negotiations with France, and obtained a treaty in which France promised to support him, provided that it should receive the protectorate over all the provinces of the Netherlands, which he succeeded in wresting from the Spaniards. At the end of 1573 Alva was recalled and replaced by Requesens. In 1574 Louis and Henry of Nassau, William's brothers, made an effort to join him, but were totally defeated by Requesens at Mookerheide, near Nijmegen. Both of William's brothers fell on the field of battle. This blow was compensated by the relief of Leyden, at that time hard pressed by the enemy. The raising of the siege of Leyden saved the province of Holland for the time, but

WILLIAM II, EMPEROR OF GERMANY.

WILLIAM

the Spanish were still formidable, and Holland might have been completely crushed had it not been for the death of Requesens, which took place in March 1576. After this event William succeeded in bringing about the so-called pacification of Ghent (8 Nov. 1576), in which nearly all the provinces of the Low Countries united to expel the foreign troops, and promised mutual toleration in matters of religion. The new stadtholder, John of Austria, sought to break the force of the union by granting, in the perpetual edict, almost all the demands of the people (1577), but his conduct soon manifested his insincerity and the states of Antwerp then called the Prince of Orange to their aid. The people received him with acclamations in Brussels, and he was appointed to the rank of lieutenant-general. The war was now renewed, and by the victory at Gemblours in the end of January 1578, the Spaniards recovered their superiority in the Walloon provinces, which were zealously Catholic. In 1579 Don John of Austria died, and the king appointed Alexander Farnese of Parma as his successor. The policy of Farnese succeeded in gaining over to the king the southern provinces, and the prince, therefore, brought the five northern provinces, Holland, Zealand, Utrecht, Gelderland, and Friesland, into closer connection by the union of Utrecht, 23 Jan. 1579, and thus laid the foundation of the republic of the United Netherlands. In 1580 the king, finding it impossible to triumph over William by fair means, put a price upon his head. This step induced the united provinces to renounce their allegiance to Philip, and William was offered the dignity of sovereign count of Holland and Zealand, which he accepted. But the edict of Philip proclaiming a reward for his life was not without effect. In 1582 an attempt was made by a Spaniard named Jaureguoy to assassinate him at Antwerp, and a second attempt, made at Delft on 10 July 1584, by a Burgundian fanatic Balthasar Gerard, succeeded. William of Nassau was four times married. Maurice of Nassau, who distinguished himself as a general in the Thirty Years' war, was one of his sons, and William III. of England, a grandson of his. Consult: Gachard, 'Correspondance de Guillaume le Taciturne' (1847-66); Motley, 'The Rise of the Dutch Republic' (1856); Klose, 'William I. von Oranien' (1864); Juste, 'Guillaume le Taciturne d'après sa Correspondance et ses Papiers d'Etat' (1873); Putnam, 'William the Silent, Founder of the Dutch Republic' (1895); Frederic Harrison, 'William the Silent' (1897).

William I., Frederick, king of the Netherlands, grand duke of Luxemburg, prince of Orange and duke of Nassau: b. The Hague 24 Aug. 1772; d. Berlin 12 Dec. 1843. He was the eldest son of William V., Prince of Orange-Nassau, and was married to Friederike Luise Wilhelmine, daughter of Frederick William II. of Prussia, in 1791. He distinguished himself in the wars with the French republic, and became an exile with his father, the hereditary stadtholder of the Dutch republic, in 1795, and for several years lived at Fulda. After his father's death, in 1806, he succeeded to the duchy of Nassau, and joining the Prussian army against Napoleon was captured at Jena and his possessions confiscated. Released soon after he fought against the French at Wagram. At

the Congress of Vienna the kingdom of the Netherlands was formed, composed of Holland and Belgium, and 16 March 1815, William I. was proclaimed king. His hereditary estates having been given to Prussia and Nassau, he received in exchange the grand duchy of Luxemburg. Belgium was, however, separated from Holland by the revolution of 1830, and as William was unwilling to recognize its existence as an independent state, he became unpopular. He continued to protest up to 1839, and the next year abdicated in favor of his son, retiring to Berlin at the same time with an immense fortune.

William II., Frederick George Louis, king of the Netherlands: b. The Hague 2 Dec. 1792; d. 17 March 1849. He was the eldest son of the preceding. He distinguished himself in the Peninsular war under Lord Wellington, and also commanded the army of the Netherlands at the battle of Waterloo. In 1816 he was married to the grand duchess Anna Paulovna, sister of Alexander I. of Russia. His reign commenced from his father's abdication in 1840, but although he brought order out of the financial chaos caused by his father, he was by nature opposed to political reform. In 1848 events obliged him to consent to an entire reorganization of the government, but his death took place before the new constitution could go into effect.

William III., Alexander Paul Frederick, king of the Netherlands: b. The Hague 19 Feb. 1817; d. Loo 23 Nov. 1890. He was the eldest son of the preceding and his reign was chiefly distinguished by undertakings of internal improvement. Under his rule, the kingdom enjoyed uninterrupted peace, and material prosperity increased. He carried out the parliamentary reforms instituted in 1848 and in 1860 decreed the abolition of slavery in the Dutch West Indies. In 1866 the Dutch province of Limburg, a member of the Germanic Confederation from 1815, was restored to the Netherlands and by the treaty of 11 May 1867, the grand duchy of Luxemburg was declared neutral territory under the sovereignty of the house of Orange-Nassau. While Prince of Orange, he married in 1839, the Princess Sophia Frederica Matilda, daughter of the late King William I. of Wurtemberg. They had two sons, William Nicholas Alexander Frederick Charles Henry, Prince of Orange (b. 4 Sept. 1840; d. 11 June 1879); and William Alexander Charles Henry Frederick (b. 25 Aug. 1851; d. 21 June 1884), the last male heir of the house of Orange. In 1879 King William was married to Emma, Princess of Waldeck-Pyrmont, their daughter Wilhelmina becoming heir to the throne.

William I., surnamed THE LION, king of Scotland: b. 1143; d. Stirling 1214. He was a grandson of David I., and brother of Malcolm IV., whom he succeeded in 1165. The source of his designation is one of the mysteries of history. His predecessors had long contested with the kings of England the sovereignty of Northumberland and other districts of the north of England, but under Malcolm these claims were virtually abandoned and the king of Scots received, as an equivalent for them, the earldom of Huntingdon and other valuable estates. William still coveted the Northumbrian region, and while attending Henry II. of England in his wars upon the Continent, is supposed to

WILLIAM OF MALMSBURY — WILLIAM AND MARY COLLEGE

have asked for a portion of the disputed territory. On being refused he invaded the district after the example of his ancestors, but on 13 July 1174 fell into the hands of the English. For security he was conveyed to Normandy, and there consented, as the price of his liberation, to perform that homage for his kingdom which the English kings so long vainly required from the government of Scotland. The treaty of Falaise, as the arrangement was termed, from the place of its adjustment, was revoked in 1189 by Richard I. of England in consideration of a payment of 10,000 marks, needed for his expedition to Palestine. William had several disputes with the Church, but was one of the early benefactors of the regular ecclesiastics, and founded in 1178 the great abbey of Arbroath, which he dedicated to Saint Thomas a Becket.

William of Malmesbury, māmz'bēr'i, English historian: b. probably in Somersetshire, about 1090; d. Malmesbury, Wiltshire, about 1143. He was educated at the Benedictine Abbey of Malmesbury of which he subsequently became librarian and precentor, and from which his name is derived. His works are in Latin and are of great historical value. They include: 'De Gestis Regum Anglorum,' a general history of the kings of England from 449 to 1128; 'Historia Novella,' containing the narration to 1142; 'De Gestis Pontificum Anglorum,' an ecclesiastical history of England down to 1123; 'Vita S. Dunstani'; 'Vita S. Wulfstani'; etc. The best edition of his English and Church histories is that of Stubbs in the *Rolls Series* (1887-8). Consult Birch, 'Life and Writings of William of Malmesbury' (1874); Stubbs' Prefaces in the *Rolls Series*; Norgate, 'England Under the Angevin Kings,' Vol. I. (1887).

William of Newburgh, English chronicler: b. Bridlington, Yorkshire, about 1156; d. Newburgh, near Coxwold, Yorkshire, about 1198. He was educated, lived all his life, and died in the Augustinian Abbey of Newburgh. He is one of the chief authorities for the reign of Henry II. His 'Historia Rerum Anglicarum' covers the period from 1066-98, is written in five books, and is highly valuable as a broadminded, just, and clear presentation of the happenings of the times, though his statements are not always accurate. His other works consist of three sermons. Consult Howlett in the *Rolls Series*, 'Chronicles of Stecher, Henry II., and Richard I.' (1884).

William of Tyre, Syrian historian and archbishop: b. probably in Syria, about 1137; d. about 1184. He was educated at Antioch and Jerusalem, and in 1175 was made archbishop of Tyre. He was one of the six bishops who represented the Latin Church of the East at the Lateran Council in 1179. His 'Historia Rerum in Partibus Transmarinis Gestarum' is one of the best histories of mediæval times, and is the principal authority for the history of the Latin kingdom in the East from 1127-84. He also wrote 'Historia de Orientalibus Principibus.'

William of Wykeham, wīk'am, English prelate, architect, and statesman: b. Wykeham, Hampshire, 1324; d. South Waltham, Hampshire, 24 Sept. 1404. He received a liberal education from the lord of the manor of Wykeham, and was afterward recommended by him to the

notice of Edward III., who made him chief keeper and surveyor of the several of the royal castles. He built Windsor Castle, and afterward, taking orders, held various ecclesiastical posts, becoming bishop of Winchester in 1367. He was lord chancellor of England 1367-71, founded in 1373 a grammar school at Winchester, which still exists as Winchester College, and New College, Oxford, which he completed in 1386. He was lord chancellor for the second time 1389-91 and rebuilt the nave of Winchester Cathedral in the Third Pointed manner 1395-1405. He is buried in a magnificent chantry chapel in the south arcade of the nave at Winchester. Consult 'Three Chancellors' (1860); and 'Lives,' by Lowth (1758); Moberly (1887).

William and Mary College, located at Williamsburg, Va. It was chartered in 1693, thus being the second oldest college in the United States; but an attempt was made to found a college in Virginia as early as 1619 when a grant of land for a 'seminary of learning' was made by the Virginia Company; a collegiate school was established at Charles City in 1621, but closed on account of Indian troubles in the next year. In 1635 Benjamin Symes established a free school in Elizabeth City County, the first in the thirteen colonies. In 1660 the Virginia assembly voted a grant of land for a college, but the disturbed condition of England at that time, and the disorders within the colony, prevented any further progress toward establishing an institution of higher learning until in 1691, when Rev. James Blair was sent to England to obtain a charter from the crown. In this he was successful, the charter being signed 8 Feb. 1693. Certain lands, a duty on the exports of tobacco, and other funds were appropriated to the use of the college. During the Revolutionary War the college lost the larger part of its endowment, the buildings were occupied by the British and the American and French troops, and the college was closed for a short time in 1781. After the Revolution, the college was reorganized and received a grant of land from the Virginia legislature; George Washington served as chancellor from 1788-99. During the Civil War the college was closed after 1861; about 90 per cent of its students enlisted in the Confederate service. It was occupied by the Federal troops and most of its buildings and property destroyed. In 1869 the main building was restored, and the college again opened, but under serious embarrassment; so serious did the financial difficulties become that its sessions were suspended in 1882, until 1888, when the State legislature appropriated \$10,000 a year, later increased to \$15,000. In 1893 the college received \$64,000 from Congress as indemnity for loss suffered during the Civil War.

The college has always given history and political science a recognized place in its curriculum, and was the first American college to establish chairs of law and history. Partially perhaps for this reason, its influence has always been felt in State and national history; it numbers among its graduates some of the leading men of the nation, including four presidents of the United States, Jefferson, Monroe, Harrison, and Tyler, also Chief Justice Marshall, Edmund Randolph, and General Scott. The first chapter of Phi Beta Kappa was established at William and Mary in 1776. The college was also the

first to introduce the elective system which was done in part in 1779 under Jefferson's guidance. In 1819 Jefferson declared in a letter to Francis Eppes that at William and Mary the student could pursue the course of his choice. At this time there appear to have been two classes of students—"regulars and irregulars." The first class took a prescribed course for A.B., the latter followed their own inclinations, and attended the schools of their own selection. The college was also the first to try the honor system, and a remarkable degree of freedom was permitted the students in the lecture room, and on examination. They were neither watched nor spied upon, and their word was taken as conclusive on any subject. There are now two courses offered, the Collegiate and the Normal. The Collegiate course is entirely elective in accordance with the group system; three degrees are conferred, A.M. (for graduate work), A.B. and B.L., according to the subjects elected. The Normal course is two years in length, to which is added one year's practice work in the Matthew Whaley Model and Practice School. The campus consists of 42 acres upon which there are eight buildings. In the centre is the main college structure. Though it has passed through three fires, the walls are the same as were originally put up in 1693. They are, therefore, the oldest college walls in the United States. The lawn in front of the college is covered with beautiful trees, and the buildings are furnished with electric lights, artesian well water, and new equipment. The college receives annually from the legislature \$25,000. The students in 1910 numbered 241, and the faculty 20.

LYON G. TYLER, LL.D.,
President of William and Mary College.

William Henry, Fort, in the town of Caldwell, N. Y., at the head of Lake George (q.v.). In August 1757, it was taken from the English by a force of French and Indians under Montcalm.

William Jewell College, located in Liberty, a suburb of Kansas City, Mo. It was founded in 1849 by the Baptists of Missouri; Dr William Jewell of Columbia, Mo., was one of the leaders in the movement for the establishment of the college, and contributed \$10,000 in lands toward the endowment, hence the college was named for him. It was opened to students in 1850, and on account of financial difficulties was closed in 1855-7; just as the college was becoming prosperous, the Civil War again forced the work to suspend from 1861 to 1868; for a part of that time the building was occupied by the Federal troops. Since 1877 the endowment has been raised to over \$200,000. The college offers four courses or groups, leading to the degree of A.B. Some studies are required in all groups, and some are free electives. The curriculum includes several theological courses, completion of which by arrangement with the Southern Baptist Theological Seminary at Louisville, Ky., entitles the student to credit at that seminary. The degree of A.M. is conferred for graduate work. There are also courses in elocution and oratory and music, and an Academic Department. A college band and a college orchestra are maintained. There are 44 scholarships. The student organizations include four literary societies, Philharmonic (a musical society), a Young Men's Christian Association, and mis-

sionary societies. The buildings include Jewell Hall (the original building), Vardeman Hall, Brown Hall, Wornall Hall, Ely Hall, The Cottages, and the gymnasium. The library in 1910 contained 20,000 volumes; the students numbered 549, and the faculty 45.

William Penn Charter School, a secondary day school for boys, located at Philadelphia. In 1683 the governor and council of the province engaged a schoolmaster (Enoch Flower) for "the instruction of the youth" of Philadelphia; from this grew the Charter School, founded in 1689 and incorporated in 1698 by the council and lieutenant-governor as "the public school founded in Philadelphia at the request, costs, and charges of the people of God called Quakers." Although supported by the Quakers, it was open to all, and for more than 60 years continued to be the only public place for instruction in the province. In 1701 Penn was asked to confirm the lieutenant-governor's charter by one under his own hand and seal. This he did on the same day that he chartered the city itself. The school therefore enjoys, in this regard, a unique distinction. The two subsequent charters issued by Penn, one in 1708 and the other in 1711 (the last the legal one under which the board now works) rendered broader and more far-reaching the measures for the school's future development. The school was entirely emancipated from denominational control, and the title of the corporation changed by omitting the words: "at the request, costs and charges of the people of God called Quakers," the title in the final charter standing: "The Overseers of the Public School founded by Charter in the Town and County of Philadelphia in Pennsylvania" (the word "public" being used in the English sense, open to all willing to pay the fees). The school premises are now located in the heart of the city, and taken with the beautiful playing fields in the suburbs of the city, presented to the school in 1903, are valued at \$250,000; and the scholarship funds amount to about \$50,000. It is purely a day college preparatory school for boys, and has for years been famed for both its high standard of scholarship and the intelligent care devoted to physical training. The students have long numbered over 500, it being the largest boys' day school of its class in the United States. Its attendance is by no means confined to residents of Philadelphia, boys being admitted from other places.

William Tell (Wilhelm Tell), the last completed drama of Schiller, was written in 1804, one year before his death. It is considered one of his finest works, being the most mature expression of that idea of freedom with which he had opened his poetic career in 'The Robbers' 20 years before. But whereas Karl Moor was warring against the existing order of things, the Swiss were fighting for the preservation of their ancient rights. Although the play is named after Tell, he is merely the nominal hero. The real protagonists are the whole people. A drama by James Sheridan Knowles, entitled 'William Tell,' was produced by Macready in 1825, and the same theme forms the libretto of Rossini's 'Guillaume Tell' (1829).

Williams, will'yamz, Alpheus Starkey, American soldier: b. Saybrook, Conn., 20 Sept. 1810, d. Washington, D. C., 21 Dec. 1878. Graduated from Yale in 1831, he studied in the

WILLIAMS

law school there in 1834-5, and in 1836 began legal practice in Detroit, Mich. There he held local offices, and in 1840-4 was probate judge of Wayne County. He became proprietor of the *Daily Advertiser* of Detroit in 1843, and remained its editor until 1848. During the Mexican War he was lieutenant-colonel of the 1st Michigan volunteers. In May 1861 he received the commission of brigadier-general of volunteers. Later he was a division commander in the Shenandoah, and in 1862 became temporary commander of the 12th corps, which he directed until April 1863, leading it at South Mountain and Antietam. He was also in command of a corps at Gettysburg and, after his transfer to Tennessee, at Lookout Mountain. After commanding a division of the 20th corps in Sherman's Atlanta campaign, he was appointed in November to command that corps, and he led it in the 'March to the Sea,' and the campaign in the Carolinas. Upon the capture of Savannah he was brevetted brigadier-general of volunteers. Mustered out in January 1866, he was minister to San Salvador in 1866-9, and member of Congress in 1875-8. In 1870 he was Democratic candidate for the governorship of Michigan.

Williams, Annie Bowles 'Jak', American writer of juvenile tales: b. Connecticut 1840. She published 'Birchwood' (1885); 'The Fitch Club'; 'Professor Johnny' (1887); 'Rolf and His Friends'; 'Who Saved the Ship?'; 'The Giant Dwarf'; 'The Riverside Museum.'

Williams, Arthur Llewellyn, American Protestant Episcopal bishop: b. Owen Sound, Ont., 30 Jan. 1856. He received an academic education and engaged in the railroad business in Colorado for several years. He then studied theology and was graduated at the Western Theological Seminary, Chicago, in 1888. Admitted to the diaconate in 1888, and to the priesthood in 1889, he served as missionary in White River Valley, Colo., 1888-9, was rector of St. Paul's Church, Denver, 1891-2, and of Christ Church, Chicago, 1892-9. In October 1899 he was consecrated bishop-coadjutor of Nebraska.

Williams, Channing Moore, American Protestant Episcopal bishop: b. Richmond, Va., 18 July 1829. He was graduated from William and Mary College in 1853 and from the Theological Seminary at Alexandria, Va., in 1855. He took deacon's orders in 1853 and was ordained to the priesthood in 1857. He served as a missionary in China in 1857-66 and in the last mentioned year was consecrated bishop of Yeddo, Japan, resigning his bishopric in 1889, when he retired from episcopal duties, but continuing his missionary labors. Died 2 Dec. 1910.

Williams, Edward (bardic name, *Iolo Morganwg*), Welsh poet and Celtic scholar: b. Llanecvan, Glamorganshire, 1745; b. Flemingstone, Glamorganshire, 17 Dec. 1820. With Owen Jones and Pughe, he edited the 'Myvyrian Archæology' (1801-7), and himself published 'The Fair Pilgrim, a Poem Translated from the Welsh' (1792); 'Poems Lyric and Pastoral' (1794); 'Psalms of the Church in the Desert' (1812) in Welsh. To the 'Fair Pilgrim' he appended specimens of Druidical 'Triads,' which, after a long protracted controversy and on the non-production of their manuscripts, are commonly looked on as a literary forgery. Williams was a friend of Southey and

ranked foremost among Welsh poets of his time. His posthumous Welsh work, 'Secrets of the Bards of the Isle of Britain' (1829) was edited by his son, Taliessin Williams. Consult Waring, 'Recollections and Anecdotes of Edward Williams' (1850).

Williams, Eleazer, American missionary to the Indians: b. about 1788; d. Hogsburg, Franklin County, N. Y., 28 Aug. 1858. After obtaining a secondary education in Massachusetts, upon the outbreak of the War of 1812 he became a United States government agent among the northern Indians, and later fought in several actions and was severely wounded at Plattsburg (14 Sept. 1814). After the war he became a clergyman of the Protestant Episcopal Church, and for many years labored as a missionary among the Indians of the northern Wisconsin region. By many he was identified with Louis XVII. of France (q.v.), and on this subject much has been written from J. H. Hanson's article in 'Putnam's' for February 1853 to M. H. Catherwood's 'Lazarre' (1901). Among his writings were 'Caution against Our Common Enemy' (1815), and a translation into Mohawk of the 'Book of Common Prayer' (1833).

Williams, Ephraim, American soldier: b. Newton, Mass., 24 Feb. 1715; killed near Lake George, N. Y., 8 Sept. 1755. In early life he was a sailor, but in the war with France, 1740-8, served as captain of a New England company in Canada. He received from Massachusetts in return for his services a grant of 200 acres of land in the present townships of Adams and Williamstown and was made commander of all the frontier posts west of the Connecticut River. When hostilities broke out afresh he was put in command of a regiment and ordered to join the New York forces under Sir William Johnson, who were marching northward to attack the French. He was proceeding with a large body of soldiers to attack Dieskau's advance force, when the whole party was entrapped in an ambush of French and Indians, and at the first fire Col. Williams fell mortally wounded. While in camp at Albany he had made his will, bequeathing his property for the establishment of a free school in Massachusetts, which later became Williams College. In 1834 the alumni of Williams College erected a monument to his memory on the spot where he fell. See WILLIAMS COLLEGE.

Williams, Francis Churchill, American author, son of Francis Howard Williams (q.v.): b. Philadelphia, Pa., 23 April 1869. He was graduated from the University of Pennsylvania in 1891 and until 1900 was engaged in journalism. His publications include: 'J. Devlin, Boss' (1901); 'Stories of the College,' joint author (1902); 'The Captain' (1903); etc.

Williams, Francis Howard, American dramatic writer. b. Philadelphia, Pa., 1844. Among his plays are: 'The Princess Elizabeth: A Lyric Drama' (1880); 'The Higher Education' (1881); 'A Reformer in Ruffles' (1881); 'Master and Man' (1884). He has also written 'Atman: A Story' (1894); 'The Flute Player, and Other Poems' (1894); 'Pennsylvania Poets of the Provincial Period' (1893).

Williams, Sir George, English founder of the Young Men's Christian Association. b. Dulverton, Somerset, 11 Oct. 1821; d. London

WILLIAMS

6 Nov. 1905. He became converted in 1837 and was active in attempts to promote the religious welfare of his associates. In 1841 he went to London, gathered together the young men employed in the same establishment as himself, and on 12 June 1844, organized, with others, a society called the "Young Men's Christian Association," which was designed to be "a society for improving the spiritual condition of young men engaged in the drapery and other trades." He was treasurer of the Young Men's Christian Association, 1863-85, and succeeded Lord Shaftesbury as its president in the last named year. He was knighted in 1894. (See *YOUNG MEN'S CHRISTIAN ASSOCIATION*.) Consult Stevenson, 'Historical Records of the Young Men's Christian Association from 1844 to 1884' (1884).

Williams, George Frederick, American politician b. Dedham, Mass., 10 July 1852. He was graduated from Dartmouth in 1872, studied later at Heidelberg and Berlin, was admitted to the bar and has since practised his profession in Boston. He edited Williams' 'Citations of Massachusetts Cases,' and the 'Annual Digest of the United States,' Vols. X. to XVII. He was a member of the State legislature in 1889, sat in Congress 1891-3, and was an unsuccessful Democratic candidate for governor of Massachusetts in 1895, 1896, and 1897.

Williams, George Washington, American author: b. Bedford Springs, Pa., 16 Oct. 1849; d. 1891. He was of African descent, served in the Civil War, subsequently attended school, and was for a time engaged as a preacher and then as a journalist. In 1877 he was graduated from the Cincinnati Law School and in 1879-81 served in the Ohio legislature. He was United States minister to Haiti in 1885-6, and in 1888 was a delegate to the World's Conference of Foreign Missions at London. He was editor of the Cincinnati 'Southwestern Review' and of the Washington 'Commoner,' and published: 'History of the Negro Race in America from 1619 till 1880' (1883); 'History of Negro Troops in the War of the Rebellion' (1887); 'History of the Reconstruction of the Insurgent States' (2 vols., 1889); etc.

Williams, Gershom Mott, American Protestant Episcopal bishop: b. Fort Hamilton, N. Y., 11 Feb. 1857. He studied at Cornell 1875-7, was in mercantile business for several years, and after studying law was admitted to the Michigan bar in 1879. The next year he was ordained to the Episcopal ministry and held rectorships at Detroit, Buffalo, Milwaukee, and Marquette (1880-96). In 1896 he was consecrated bishop of Marquette.

Williams, Helen Maria, English author: b. London 1762; d. Paris 15 Dec. 1827. She was introduced to public notice by Dr. Andrew Kippis, who recommended very highly her first work, a legendary tale in verse, entitled 'Edwin and Elfrida,' which was published in 1782. Between this period and 1788 she published an 'Ode on Peace' (1783); 'Peru, a Poem' (1784); and a collection of miscellaneous poems (1786). In 1790 she settled in Paris, in the same year published a series of 'Letters Written in France,' and in 1792-6 a second series, 'Letters from France,' and in 1795 a third, 'Letters Containing a Sketch of the Politics of France.'

These 'Letters' advocated the doctrines of the Girondists, on whose downfall she was in great danger, and for some time imprisoned. They are one-sided and replete with inaccuracies and misrepresentations. Among her remaining works are: 'A Tour in Switzerland' (1798); 'Narrative of Events in France' (1815); 'Correspondence of Louis XVI.' (1803); 'Letters on the Events Which Have Passed in France since the Restoration in 1815' (1819); an English translation of Humboldt's 'Personal Narrative' (1814); 'Julia,' a novel (1790); and the story, 'Perouren, the Bellows-mender' (1801), on which was based Lord Lytton's 'The Lady of Lyons.' Mention may be made of several well known hymns by her, such as 'My God, all Nature owns Thy Sway,' and 'While Thee I Seek, Protecting Power.'

Williams, Henry Shaler, American geologist and paleontologist: b. Ithaca, N. Y., 6 March 1847. He was graduated from Yale in 1868, occupied the chair of geology at Cornell in 1879-92, resigning in the last mentioned year to accept a similar chair at Yale, which he still occupies. He was secretary of the International Congress of Geologists at Washington in 1891 and was chairman of the section of geology and geography of the American Association of Advanced Sciences in 1892. He has made extensive studies of the Devonian and Carboniferous systems and has published: 'The Classification of the Upper Devonian' (1885); 'Fossil Faunas of the Upper Devonian' (1884-7); 'The Cubiodont Zone and Its Fauna' (1890); 'Correlation Papers, Devonian and Carboniferous' (1891); 'Shifting of Faunas as a Problem of Stratigraphic Geology' (1903); etc.

Williams, Isaac, English theologian and author: b. near Aberporth, Cardiganshire, 12 Dec. 1802; d. Stinchcombe, Gloucestershire, 1 May 1865. He studied at Trinity College, Oxford, in 1831 became fellow there and took priest's orders, and was known as one of the leading Tractarians (q.v.). He was Newman's curate at St. Mary's and was later in charge of the church at Littlemore. With Newman, Froude, and Keble, he contributed to the 'British Magazine' the verse later collected as 'Lyra Apostolica' (1836); and in the 'Tracts for the Times' he wrote Tract 80, 'Reserve in Communicating Religious Knowledge,' the subject of much discussion. In 1842 he was an unsuccessful candidate for the Oxford chair of poetry, the defeat being regarded as also the first for the Tractarians as a party. From 1842 to 1848 he was curate at Dartington, and afterward resided at Stinchcombe, where he assisted somewhat in the clerical duties of the parish. Among his further publications are several books of poetry, such as 'The Cathedral' (1838; 8th ed. 1859; reprinted 1889 ed. Benham); 'Thoughts in Past Years' (1838; 6th ed. 1852), and 'The Baptistery, or the Ways of Eternal Life' (1842-4; 6th ed. 1863); and some volumes of prose, chiefly sermons. 'Selections' from his writings appeared in 1890; his 'Autobiography' in 1892.

Williams, James Douglas, American politician: b. Pickaway County, Ohio, 16 Jan. 1808; d. Indianapolis, Ind., 20 Nov. 1880. After a common-school education, he became a farmer in Knox County, Ind., first held office in 1838 as justice of the peace for Harrison township in

that county, and in 1843 was elected as a Democrat to the House of Representatives in the General Assembly. He sat in the House during seven sessions, and in the Senate for 12. In 1874 he was chosen to Congress, where he served until 1876, resigning upon his nomination as governor of Indiana. He was elected to the office in October, after a vigorous contest, his Republican opponent being Gen. Benjamin Harrison. His administration was one of economy and stability. His chief interest was in connection with the development of the agriculture of Indiana, and he was an incorporator and president of the State Board of Agriculture. He was widely known by his sobriquet of "Blue Jeans."

Williams, Jesse Lynch, American author: b. Sterling, Ill., 17 Aug. 1871. He was graduated from Princeton in 1892 and has since published 'History of Princeton University' with J. De Witt (1898); 'The Stolen Story and Other Newspaper Sketches' (1899); 'The Adventures of a Freshman' (1899); 'New York Sketches' (1902).

Williams, John, English prelate, archbishop of Canterbury: b. Aberconway, Carmarvonshire, Wales, 25 March 1582; d. Glodded 25 March 1650. He was educated at Cambridge, took orders in the English Church in 1600, succeeded Bacon as keeper of the great seal in 1621, an office which he held till 1626, and was consecrated bishop of Lincoln in November 1621. Though a favorite with James I. he incurred the dislike of Charles I., and having supported the Petition of Right in 1628, was prosecuted by Laud before the Star Chamber, charged with betraying the king's secrets. After eight years' legal proceedings he was suspended from his see, fined successively £10,000 and £8,000 and imprisoned in the Tower 1636-40. Released by the Long Parliament and restored to his see, he was made archbishop of Canterbury in 1641, but was again sent to the Tower with 11 other bishops on account of their protest against the validity of acts passed during their enforced absence from the House of Lords. He was released in 1643 and during the Civil War supported the royal cause and fortified and held Conway Castle. Consult: 'Scrinia Reserata,' a Latin life of the prelate, by Hacket and Phillips (1700).

Williams, John, American clergyman, known as "the redeemed captive": born Roxbury, Mass., 10 Dec. 1664; d. Deerfield, Mass., 12 June 1729. He was graduated from Harvard in 1683, was settled in Deerfield in 1686, and ordained in 1688. On 29 Feb. 1704, a party of 200 French and 142 Indians surprised the town, and some of them, breaking open Williams' house, killed two of his children and his negro servant, and forced him with his wife and six of his surviving children (his son Eleazer was absent) to set out with other prisoners for Canada. On the second day's march Mrs. Williams fell from exhaustion, and was despatched with a tomahawk. About 20 other prisoners were murdered under similar circumstances. On his arrival in Canada, after a journey attended by almost unexampled hardships, Williams was treated by the French with great humanity and even courtesy, and at length was redeemed, and arrived in Boston, 21 Nov. 1706,

with 57 other captives, among whom were two of his children. His daughter Eunice, 10 years of age, was left behind, and married an Indian. Williams, soon after his return, resumed his pastoral charge at Deerfield, and published a narrative of his captivity, entitled 'The Redeemed Captive Returning to Zion' (1707), a narrative of his adventures which furnishes a good picture of the frontier dangers of the time.

Williams, John ("Anthony Pasquin"), English author: b. London 28 April 1761; d. Brooklyn, N. Y., 12 Oct. 1818. He was educated at the Merchant Taylors' School, London, went to Ireland about 1781, edited various periodical publications, and in 1784 was obliged to flee the country to escape prosecution for an attack upon the government. In 1787 he went to France and on his return established the Brighton 'Guide.' He was afterward engaged as a dramatic critic and by his ruthless sarcasm made himself the terror of the theatrical world. In 1797 he sued Robert Faulder, a bookseller, for libel, the latter having denounced him as "lost to every sense of decency," but was nonsuited in his case because of proof that he himself had grossly libeled every respectable character in the kingdom, not sparing even the sovereign. Shortly afterward he came to the United States, where he edited in New York a Democratic newspaper. He died in poverty. His publications include: 'Poems' (1789); 'Legislative Biography' (1795); 'Life of Alexander Hamilton' (1804); 'The Dramatic Censor' (1811); etc.

Williams, John, English missionary: b. Tottenham, Middlesex, 29 June 1796; d. Erromango, New Hebrides, 20 Nov. 1839. At 14 he was apprenticed to an ironmonger, but having offered himself to the London Missionary Society, was sent in 1816 to Eimeo, one of the Society Islands. Later he settled in Raiatea, the largest of the group, and labored here with marvelous success, his powers of organization being as conspicuous as his zeal. In 1823 he went to Raratonga, the chief of the Hervey Islands, where he met with continued success. He next built a boat with his own hands in which during the next four years he visited many of the South Sea Islands, extending his missionary labors to the Samoa Islands. In 1834 he returned to England, there superintending the printing by the Bible Society of his Raratongan New Testament, and raising \$20,000 to equip a missionary ship for Polynesia. In 1838 he went out again, visited many of the stations he had already established, and sailed as far west as the New Hebrides, where he hoped to plant a mission, but was killed and eaten by the savage nations of Erromango. He published 'Narrative of Missionary Enterprises' (1837). Consult the biographies by Campbell (1842) and Prout (1843).

Williams, John, American Protestant Episcopal bishop: b. Deerfield, Mass., 30 Aug. 1817; d. Middletown, Conn., 7 Feb. 1879. He was graduated from Harvard in 1835, studied theology and was ordained deacon in 1838 and priest in 1841. From 1837 to 1840 he was tutor in Washington (now Trinity) College, then was for a time assistant minister of Christ Church, Middletown, Conn., and rector of St. George's, Schenectady, N. Y., 1842-8. In 1848

he was elected president of Trinity College and professor of history and literature. He was consecrated assistant bishop of Connecticut in 1851, but retained the presidency of Trinity for two years longer, and then became vice-chancellor. Several students for holy orders having placed themselves under his direction, an informal theological department grew up, which was afterward incorporated as the Berkeley Divinity School at Middletown, Bishop Williams remaining the principal instructor. On the death of Bishop Brownell in 1865, he assumed sole charge of the diocese, whose administration had for a long time been practically in his hands, and at the same time became chancellor of Trinity College. In the General Conventions of 1883 and 1886, he was chosen chairman of the House of Bishops, and in 1887 succeeded Bishop Lee as presiding bishop of the Episcopal Church. His published works include, 'Thoughts on the Gospel Miracles' (1848) and 'Studies in the Book of Acts' (1888).

Williams, John Joseph, American Roman Catholic prelate: b. Boston, Mass., 22 April 1822; d. there 30 Aug. 1907. His elementary education was obtained at the Cathedral parochial school; in the Sulpician College, Montreal, Canada, he studied philosophy, and later theology with the Sulpicians in France. In 1845 he was ordained priest by Archbishop Affre and upon returning to Boston, Mass., was appointed assistant at the Cathedral, in 1855 becoming its rector. Two years later he was made vicar-general of the diocese and rector of Saint James' Church, both of which positions he held for 9 years, being then chosen coadjutor to Bishop Fitzpatrick, whose death, however, occurred before the arrival of the papal bulls for Father Williams' consecration. Therefore, on 11 March 1866, Father Williams was consecrated Bishop of Boston. A vast territory was then under his jurisdiction, as his diocese included the entire State of Massachusetts, but when, in 1870, Bishop Williams went to Rome to attend the Vatican Council, he applied for the division of his diocese, the result being that Springfield, Mass., was erected into an episcopal see. In 1875 Pope Pius elevated Boston to a metropolitan see, Bishop Williams becoming its first archbishop, the pallium being conferred upon him 2 May 1875. Foremost among the monuments to his zeal and energy are the new Holy Cross Cathedral of Boston and Saint John's Theological Seminary. At present (1905), the archdiocese of Boston, one of the largest in the United States, includes a Catholic population of about 700,000; 543 priests; 221 churches; 76 parochial schools; 6 orphanages; 5 hospitals and other benevolent and educational institutions.

Williams, Jonathan, American soldier: b. Boston, Mass., 20 May 1750; d. Philadelphia, Pa., 16 May 1815. He was secretary to his grandfather, Benjamin Franklin, while the latter was ambassador to France, and while abroad read widely concerning fortification and made an especial study of military science. He returned with Franklin in 1785 and was for some years a judge of common pleas at Philadelphia. In 1801 he entered the army, soon becoming inspector of fortifications and taking command of West Point in 1803. He re-

signed in the year last named, but returned to the army in 1805 as chief engineer and superintendent at West Point. While in charge of the fortifications of New York he built Fort Columbus and Castle William on Governor's Island, Castle Clinton (Castle Garden), and Fort Gansevoort. On the breaking out of the War of 1812, as senior officer at Castle William, he claimed command of that fort, and on this being assigned elsewhere, he resigned. He was elected to Congress in 1814, but did not take his seat. As the first person in the United States to apply the principles of scientific engineering he has often been called "the father of the corps of engineers." He published 'The Use of the Thermometer in Navigation' (1799) and translated 'Elements of Fortification' (1801), and 'Kosciusko's Manœuvres for Horse Artillery' (1808).

Williams, Martha McCulloch, American author: b. Montgomery County, Tenn. She was married to T. M. Williams and began writing on removing to New York in 1887. She has published 'Field Farings' (1892); 'Two of a Trade' (1894); 'Next to the Ground' (1901); etc.

Williams, Sir Monier Monier. See **MONIER-WILLIAMS, SIR MONIER**.

Williams, Roger, the pioneer of religious liberty and founder of Rhode Island: b. Wales 1607; d. Providence, R. I., March 1684. There is considerable doubt as to the year of Williams' birth; authorities differ. Some of them claim he was born in 1601, others in 1603. The writer after a careful examination of all the records, places the date at 1607. Consult Straus' 'Roger Williams, the Pioneer of Religious Liberty,' pp 5-11.

The most recent investigations have shown that he was the son of James Williams, a merchant tailor of London, and of his wife, Alice Williams. While yet a mere boy, he attracted the attention of Sir Edward Coke, while taking shorthand notes of sermons and speeches in the Star Chamber, and Coke placed him (1621) in the Charter House School. From there (1623) he went to Pembroke College, Cambridge University, from which he took his degree in 1626. Williams soon developed into a decided opponent of the liturgy and ceremonies of the church, thereby placing himself on the side of the most radical Puritans. On 1 Dec. 1630 he embarked from Bristol with his young wife in the ship *Lyon*, and arrived at Nantasket 5 Feb. 1631. No sooner had he set foot upon the shores of New England than he came in conflict with the ecclesiastical and civil authorities of the colony, whom he found arrayed against him, for asserting and maintaining with unwavering fidelity those principles which have immortalized his name as the champion of religious liberty.

The arrival of Williams in America was noted by Winthrop as that of a "Godly minister." He was already known and esteemed by the leading men in the colony, and he was immediately invited to officiate in the place of John Wilson as teacher of the church at Boston, which, however, Williams declined on the ground that they of Boston were an unseparated people. It is well to note here a distinction between the Pilgrims and the Puritans.

The former were Separatists, and were associated as a distinct church before they left Holland. A principle of their church was, that the State had no right to punish for spiritual sins. The Puritans, on the other hand, though Non-conformists, were not separated from the established church. Their scruples were against conforming to many of the ceremonies of that church. He was invited by the Pilgrim Church at Salem to become an assistant or teacher in place of Higginson, who died a few months before. This call Williams accepted, but the civil authorities, the General Court of Boston, interfered and remonstrated with the Salem church for choosing him. He remained at Salem only a short while, and in August removed to Plymouth, where he was received with much respect. Here he remained for two years, supporting himself by manual labor and officiating as "teacher" in the church among the Pilgrim fathers. During his residence here he became intimately acquainted with various Indian chieftains in the neighborhood, which intimacy had an important bearing in his subsequent life in the founding of Rhode Island.

In August 1633 he returned to Salem and resumed his ministerial labors there, but at every turn he found himself in conflict with the clergy and the court of Massachusetts. He was frequently cited to appear before the court. In October 1635 he was tried before the General Court, consisting of the governor, the deputy governor, 8 assistants, and some 25 deputies. The formal charges against him were four in number, but the basis of them may be summed up by the statement that he maintained that the civil power has no jurisdiction over the conscience, or, in other words, he maintained the absolute liberty of conscience. The court convicted him and sentenced him to banishment. In January 1636 he left Salem to escape arrest, and to seek a refuge from the tyranny of the church brethren. He went first to Seekonk, and afterward with four companions who joined him, embarked in a canoe to seek a spot beyond the jurisdiction of the Massachusetts and Plymouth colonies. The site selected by him was Providence, so named by him in gratitude for "God's merciful providence to him in his distress."

In March 1683 a large section of land was conveyed to him by deed from the Indians, which land he divided equally among his followers. Mrs. Williams and her two infant children joined him, and friends from Massachusetts and England soon joined the Rhode Island Colony.

William Coddington, who had been a merchant in Boston, was elected as magistrate with the title of judge, and three elders were elected to assist him. This form of government continued until 1640. Meanwhile the antagonism of the Boston Colony to Williams continued, and a law was passed which practically excluded the inhabitants of Providence from entering Massachusetts. In March 1641 the government of Rhode Island was regularly organized.

The formation of the New England Confederacy, in 1643, which included the four colonies, Massachusetts, Connecticut, Plymouth and New Haven, was a matter of anxious concern to the Rhode Island and Providence settlements. The open hostility of the Confederacy, together with

the claim made by Massachusetts that the Rhode Island and Providence colonies had no authority to set up civil government, induced these latter colonies to seek a charter from England. At an assembly held in Newport 19 Sept. 1642, a committee was appointed to procure a charter, and in July 1643 Williams set sail from New York for England. Here on 17 March 1644 he obtained a charter which gave to the towns of Providence, Portsmouth and Newport, full power to rule themselves under the name "The Providence Plantations of Narragansett Bay." This charter granted in the most friendly spirit everything that Williams prayed for.

Williams returned to America in 1644, landing in Boston 17 September. He ventured to tread on this forbidden ground by exhibiting a letter from 12 leading members of the Parliamentary party in England, addressed to the government of Massachusetts. He therefore proceeded without hindrance to Providence. In May 1647 a form of government was agreed upon, after many delays, the office of president of the colony, which so naturally belonged to Williams, was bestowed upon John Coggeshall of Newport. Dissensions arose within and without the new colony; Williams was called upon to pacify the Indians and to settle numerous disputes ecclesiastical and civil. In October 1652 Williams was again in England making efforts to secure a renewal of the colony's charter; this he secured and returned to America, landing in Boston in 1654. In this same year the reorganization of the Rhode Island government took place, and on 12 September Williams was elected president of the colony. He was again elected 20 May 1656. In this year the persecution of the Quakers in Boston soon made Rhode Island a Quaker refuge, and they were made welcome largely through the influence of Roger Williams. For many years, until 1677, Williams continued to hold various offices and to guide the affairs of the colony. In the Indian wars of 1675-6 (see KING PHILIP'S WAR), when Providence was attacked, Williams was captain of militia and drilled companies in Providence. See RHODE ISLAND.

The life of Roger Williams was now rapidly nearing its end. His Providence friends did not fully appreciate the life-work of this sturdy champion of soul liberty, which was destined to bring happiness to a continent. At his death the brief record was conveyed to the outer world in a letter dated 10 May 1684, stating, "The Lord hath arrested by death our ancient and approved friend, Mr. Roger Williams, with divers others here." He was buried in a spot which he himself had selected on his own land, near where, 47 years before, he had first landed within the colony he founded.

The principles of religious liberty had been proclaimed in all ages, and under many climes, with more or less plenitude, but Roger Williams was the first to organize and build up a political community with absolute religious liberty as its chief cornerstone. To him the successful pioneer of these principles is due to a larger extent than to any man, the American system of a "free church in a free State."

No portrait of him in bronze or in marble, or of any kind, has come down to us, and when in 1872 the State of Rhode Island presented a statue of her founder to the nation, which now

WILLIAMS.—WILLIAMS COLLEGE

stands in the rotunda of the Capitol at Washington, the artist had to make the memorial from an ideal conception.

Among the great men of his times with whom Williams stood in close personal relations, besides his early patron, Sir Edward Coke, were Cromwell, John Milton, Sir Henry Vane, the younger, Major-General Harrison of the Parliamentary army; Lawrence Lord, president of the Council of State, and others of distinction in England and America. See UNITED STATES—CIVIL AND RELIGIOUS LIBERTY.

OSCAR S. STRAUS,

Author of 'Roger Williams, the Pioneer of Religious Liberty.'

Williams, Rowland, Anglican clergyman and educator: b. Halkyn, Wales, 16 Aug. 1817; d. Broad Chalk, near Salisbury, Wiltshire, 18 Jan. 1870. He was graduated from King's College, Cambridge, in 1841 and was fellow and tutor there in 1839-50. He accepted the chair of Hebrew at the theological college of Saint David's in 1850, acting also as vice-president of that institution. In 1854 he became select preacher at Cambridge and became vicar of Broad Chalk in 1858, while still retaining his offices at the college. His views on inspiration brought him into disfavor with the Welsh clergy and in 1862 he was prosecuted and condemned for heresy in the Court of Arches. He resigned his professorship and retired to his vicarage at Broad Chalk, where he henceforth lived, though in 1864 he secured from the Privy Council a reversal of the judgment against him. His publications include: 'Rational Godliness' (1855); 'The Hebrew Prophets' (1868-71); 'Psalms and Litanies' (1872); etc. Consult *Ellen Williams' 'Life and Letters of Rowland Williams' (1872).*

Williams, Samuel Wells, American missionary and philologist: b. Utica, N. Y., 22 Sept. 1812; d. New Haven, Conn., 17 Feb. 1884. He was graduated from the Rensselaer Institute, Troy, N. Y., in 1832, and in 1833 went to Canton, China, as printer to the American Mission. He was compelled to remove to Macao in 1835, and in 1845-8 was in the United States, after which he resumed his work in Canton. He acted as interpreter to Commodore Perry on his Japanese mission in 1853-4, and in 1857 resigned his position in the mission and became secretary and interpreter to the United States legation. He assisted in the negotiation and ratification of the treaty of Tientsin in 1858-9. Upon the establishment of the United States legation at Peking under Burlingame in 1862 he became its secretary, occupying the post until 1876, when he returned to the United States and accepted the chair of Chinese at Yale, where he remained until his death. He was editor and contributor to the 'Chinese Repository' during the time of its publication (1832-51), and was a leading authority on the Chinese and Japanese languages. He superintended the press work of Medhurst's 'Dictionary of the Hokkien Dialect' (1837) and with Bridgman issued 'Chinese Christomathy' (1841). His other works include: 'Easy Lessons in Chinese' (1842); 'The Topography of China' (1844); 'The Middle Kingdom' (1848); 'A Syllabic Dictionary of the Chinese Language' (1874); etc. The two last mentioned are the greatest of his works and are still among the

highest authorities in their field. Consult F. W. Williams, 'Life and Letters of Samuel Wells Williams' (1888).

Williams, William, American patriot and signer of the Declaration of Independence: b. Lebanon, Windham County, Conn., 8 April 1731; d. there 2 Aug. 1811. He was graduated at Harvard College in 1751, in 1755 served on the staff of Col. Ephraim Williams in the Lake George expedition, and after the revolutionary troubles began was an active member of the council of safety, and in October 1775 was chosen a representative in the Continental Congress. His property was nearly all expended in the war, and he was tireless in obtaining private donations to supply the army, going from house to house to collect articles that could relieve the destitution of the soldiery. He held nearly every office in the gift of his constituents, served nearly 50 years in the State legislature, and was a member of the convention of his State which adopted the Federal constitution.

Williams, Sir William Fenwick, British soldier: b. Annapolis Royal, Nova Scotia, 4 Dec. 1800; d. London 26 July 1883. He was graduated at Woolwich in 1821, entered the Royal Artillery in 1825, and after serving in the East Indies several years was appointed British commissioner to the conference in Erzerum, to settle the boundary dispute between Persia and Turkey in Asia. During the Crimean war he was sent as commissioner to the relief of Kars, and there promptly reorganized the troops. After defending Kars for four months against the Russians he met their commander, Gen. Muravieff, on the heights above the city and defeated him with great slaughter. Assisted by the Hungarian Gen. Kmetz, he did all in his power for the defense of Kars, but on 14 Nov. 1855 was forced by famine to capitulate. On his return to England he was created baronet, received the rank of pasha of the highest order and the decoration of the Medjidieh from the sultan; and was made a grand officer of the Legion of Honor of France. He sat in Parliament for Calne 1856-9 and then assumed the command of the forces of British North America. He was administrator of Canada in 1860-1; became full general in 1868; was governor-general of Gibraltar 1870-3; and retired from the army in 1877.

Williams College, located at Williamstown, Mass. It owes its origin to the bequest of Col. Ephraim Williams, for establishing a 'Free School' in Williamstown. The bequest was made in 1755; the property was sold, and the funds were allowed to accumulate till 1783, when a free school was incorporated by the legislature, and a lottery granted for raising funds to erect a building; in 1790 the building (now the West College) was completed, and the school was opened 20 Oct. 1791. In 1793 the institution was incorporated as a college under its present name, the property vested in the free school was transferred to the college, and a grant of \$4,000 was made by the State to purchase a library and apparatus. The college subsequently received other appropriations from the State; in 1796 the legislature granted two townships of land; in 1809 an additional township; and in 1814 appropriated the taxes from the Massachusetts Bank for 10 years to Harvard, Williams, and Bowdoin. Williams'

WILLIAMSBURG

share in which amounted to \$30,000; in 1899 the legislature appropriated \$25,000, and in 1868, \$75,000. In 1866 the first foreign missionary society in the United States was formed at Williams. In 1836-72 Mark Hopkins (q.v.) was president of the college, and during his administration it attained a high degree of prosperity.

The college course is arranged on the group system, there being three groups of studies, language, philosophy (including history and political economy), and sciences. The work of the freshman year is largely required; after the first year all work is elective, but students must elect a major course (15 semester hours), and a certain amount of work in each group. The degree of A.B. is conferred, and A.M. for graduate work and thesis. There are 76 general scholarships, and one special prize scholarship. The principal college buildings are West College, the oldest, erected 1790; East College, erected in 1798, burned in 1841, and rebuilt; South College; Griffin Hall; Hopkins Observatory, built in 1837, under the direction of Prof. Albert Hopkins, the first college observatory in the United States; Lawrence Hall Library; Jackson Hall; Alumni Hall Chapel; College Hall; Clark Hall; Field Memorial Observatory, erected 1882, containing a fine meridian circle by A. Repsold and Sons, Hamburg; Morgan Hall, Lasell Gymnasium; Hopkins Memorial Hall; Thompson Chemical Laboratory; Thompson Biological Laboratory; Thompson Physical Laboratory; College Infirmary, and Jesup Hall. The library in 1910 contained 68,000 volumes; in addition the two literary societies have libraries containing 9,000 volumes. The productive fund in 1910 amounted to \$1,387,000; the students numbered 560 and the faculty 58; the total number of graduates was 4,669.

Williamsburg, wll'yamz-bërg, Ky., town, county-seat of Whitley County; on the Cumberland River, and on the Louisville & Nashville Railroad; about 95 miles south by east of Lexington. It is in an agricultural and coal-mining region. It has flour and lumber mills and large coal yards. It has one bank which has a capital of \$60,000. Pop. (1890) 1,376; (1900) 1,495; (1910) 1,710.

Williamsburg, Va., city, county-seat of James City County; on the Chesapeake & Ohio Railroad; about 48 miles southeast of Richmond. It is the oldest incorporated town in the State. It was established in 1632, and prior to the Revolution it was the capital of the province. It was also the State capital until 1779. It has many historic associations connected with the pre-Revolutionary days and the Civil War. It is the seat of William and Mary College (q.v.), and it has the Eastern Lunatic Asylum, opened in 1773, the oldest institution of its kind in the United States. On 3 May 1862 it was occupied by the Confederate forces, who had withdrawn from Yorktown, and three days later an attack was made by the Union forces. The battle lasted all day. (See WILLIAMSBURG, BATTLE OF.) Pop. (1910) 2,714.

Williamsburg (Va.), Battle of. Gen. J. E. Johnston abandoned Yorktown (q.v.) on the night of 3 May 1862, and at noon next day had assembled his army at Williamsburg, whence his head of column (Magruder's division) was

ordered to continue the march toward Richmond. Longstreet's and McLaws' divisions remained until the trains could be got on the road, and to cover the retreat. McClellan was surprised to find Yorktown evacuated, had made no provision for such a contingency, and it was noon of the 4th before the pursuit began, when Gen. Stoneman's cavalry and four batteries of horse artillery, followed by Hooker's division of infantry on the direct road from Yorktown to Williamsburg, and Smith's division from Lee's Mills, were on the roads to harass the Confederate rear and cut off those who had marched from Lee's Mills and by that road. Stoneman overtook Stuart's Confederate cavalry about midway between Yorktown and Williamsburg, driving it steadily back to the works in front of Williamsburg, where he was checked by Stuart and by McLaws with two brigades of infantry, and began to withdraw when McLaws attacked him with two regiments and he was obliged to abandon one of his guns stuck in the mud. Gen. Emory, who had been sent to the left with a regiment of cavalry and a battery, to intercept such of the Confederates as were retreating on that road, encountered Stuart himself, with a regiment and a battery, Stuart falling back, skirmishing, until dark. Hooker, who was expected to support Stoneman, found himself cut off by Smith's division, which, moving from Lee's Mills, had been ordered by Sumner to cross over from its proper road and take the one on which Hooker had been ordered by McClellan. Smith reaching it at the Half-Way House before Hooker came up, the latter was obliged to wait several hours until Smith could pass. Smith overtook Stoneman about 5.30 p.m., relieved him, and forming line prepared for a charge through a body of woods and beyond to the Confederate works, but it was approaching night when the formation was completed and the movement began; the woods were found to be dense, with tangled undergrowth; and the movement was abandoned as impracticable, and the troops went into bivouac. Hooker crossed over to the road Smith was to have taken, marched until midnight, and lay down in rain and mud, some distance on Smith's left, but the same distance from the Confederate works. The divisions of Kearny, Couch, and Casey were ordered to follow Hooker and Smith; McClellan remained at Yorktown to supervise the embarkation of Franklin's division, which was to go up York River; and Sumner, at noon of the 4th, was directed to take command of the troops ordered in pursuit. Hooker, acting on the strength of the orders he had received personally from McClellan before marching from Yorktown, opened the battle very early in the morning by advancing on Fort Magruder, which was in his immediate front, and flanked right and left nearly across the peninsula by 12 smaller redoubts, all having cleared ground in front dotted with rifle-pits. The roads were muddy, axle-deep; Grover's brigade began the attack at 7 a.m. by driving in the Confederate skirmishers; and two batteries were pushed to within 700 yards of Fort Magruder, and with the aid of Grover's skirmishers silenced its fire by 9 o'clock. But the contest had not fairly begun. McLaws, who held the Confederate position on the evening of the 4th, had followed the train during the night, and Longstreet was left in command, who placed the

WILLIAMSBURG BRIDGE

brigades of R. H. Anderson and Pryor with some field guns in the works that had been held by McLaws. Anderson on the right and Pryor on the left were thrown against Hooker, followed in quick succession by Wilcox, who reinforced Anderson, and by A. P. Hall, and about 10 A.M. Pickett's brigade was brought up. These five brigades attacked Hooker's three brigades with great impetuosity, making a desperate effort to turn the left, held by Patterson's New Jersey brigade. Grover moved a part of his brigade to Patterson's support, and Taylor's brigade was sent in; but the odds were too great, and by 11 o'clock Hooker's line was pushed back, uncovering the two batteries, both of which were abandoned, one being retaken. Hooker called for reinforcements, but it was not until 3 P.M. that Kearny's division came to his relief. Kearny made a vigorous attack, and by nightfall had regained a part of the field from which Hooker had been driven. Hooker's loss was about 1,600. Hooker says in his report: "History will not be believed when it is told that the noble officers and men of my division were permitted to carry on this unequal struggle from morning until night unaided in the presence of more than 30,000 of their comrades with arms in their hands; nevertheless it is true." Gen. Webb, the historian of the Peninsula campaign, says: "From 7 A.M. till noon Hooker, alone on the left, had been doing all the fighting. No troops fell into line of battle on his right. No other line was engaged anywhere during the forenoon." Sumner, on Hooker's right, had been employed in reconnoitering, with the intention to turn the Confederate left, and near noon Gen. Hancock, with five regiments and a battery, was sent to seize a redoubt, apparently unoccupied, on the Confederate left, one of four redoubts northward of Fort Magruder. By midday he had seized it and, pushing forward, occupied a second empty redoubt and sent back for reinforcements, as he was now confronted by the enemy, who held the two redoubts between him and Fort Magruder. Twice Sumner ordered two brigades to reinforce, and twice he countermanded the order, finally sending him orders to return, but he had sent him some artillery. Meanwhile D. H. Hill's division had been recalled from its march in retreat and ordered to the left of the Confederate line, and Gen. Early, first to arrive with his brigade, obtained permission of Gen. Johnston, who also had returned to the field, to attack one of the batteries, which was annoying the Confederate troops near Fort Magruder. It was after 5 P.M. when D. H. Hill and Early, with two regiments each, pushed forward through dense undergrowth to an open field, early in advance, and when they came within easy range Hancock, who was falling back, following his artillery, turned upon Early, poured in two effective volleys, and charged, driving Early back upon Hill, and both from the field, inflicting a loss of nearly 400 men, among them Gen. Early, who was severely wounded. Hancock's loss was 31. Late in the afternoon McClellan came up and ordered troops to Hancock's assistance, but Hancock had repulsed Early before they reached him. McClellan made dispositions to renew the battle in the morning, but during the night Johnston evacuated Williamsburg, leaving D. H. Hill to bring up the rear. The Union troops engaged numbered about 20,000 men; the Con-

federates, about 15,000. The Union loss, mostly in Hooker's division, was 456 killed, 1,410 wounded, and 373 missing or captured. Incomplete Confederate returns show a loss of 103 killed, 1,458 wounded, and 133 captured or missing. Consult: 'Official Records,' Vol. XI.; Webb, 'The Peninsula'; 'McClellan's Own Story'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.; Johnston, 'Narrative of Military Operations.'

E. A. CARMAN.

Williamsburg Bridge, an immense structure in New York which is the largest span suspension bridge of its kind in the world. Work on the structure was begun in October 1896. The bridge spans the East River from Delancey Street, Manhattan, to South Fifth and South Sixth streets, Brooklyn. Its total length from the street grade in Manhattan to the street grade in Brooklyn is 7,200 feet. The width of the bridge is 118 feet. In carrying capacity it exceeds any other bridge in the world. It provides for two 18-foot roadways, two footpaths, four street railway tracks, two elevated railway tracks, and two bicycle paths. The length of the main span is 1,600 feet, or exactly five feet six inches more than that of the Brooklyn Bridge (q.v.). The bridge is 7,264 feet long, or about 1,275 feet more than the Brooklyn Bridge. The foundations of the new structure consist of timber caissons filled with concrete. The anchorages are massive structures. The one on the Manhattan side rests on 3,500 piles, while the one on the Brooklyn side is built on natural sand. The weight of the steel in each of the towers is 3,048 tons. The steel in the Brooklyn approach weighs 6,085 tons, while that in the Manhattan approach weighs 10,550 tons. The main span weighs 7,773 tons, while the cables and fittings weigh 5,000 tons. The diameter of the suspension cables, outside of the wires, is 18¾ inches. There are 7,696 wires in each cable. Each wire is about 3-16 of an inch in diameter. The timber used in the construction of the bridge amounted to 6,500,000 feet. The excavating equaled 125,000 cubic yards. Of concrete masonry there are 60,000 cubic yards, and of stone masonry 130,000 cubic yards. The steel used amounted to 40,000 tons. The foundations for the towers of the bridge rest on the solid rock. The north pier on the Manhattan side is 56 feet deep at high water, while the south pier is 10 feet deeper. On the Brooklyn side the north pier is 110 feet below high water, while the south pier is only 90 feet deep. The first wire for the construction of the temporary footbridge was strung on 11 April 1901, and the first wire for the permanent cable crossed on Friday, 29 Nov. 1901. The bridge was opened to the public 19 Dec. 1903. Following are figures comparing the Williamsburg Bridge with the Brooklyn Bridge as regards their cost, length, capacity, and details of construction:

BROOKLYN BRIDGE.

Total cost	\$24,750,000
Total length	5,989 feet
Length of span over river	1,595 feet
Height from high water to top of towers	278 feet
Height of centre of bridge structure from East River	135 feet
Weight of suspended structure between towers	6,400 tons
Daily passenger capacity, each way	700,000

WILLIAMSON — WILLIAMSTOWN

Extreme width	85 feet
One deck, net width	71 feet
Number of wires in each cable	5,296
Total miles of wire in four cables	14,361
Diameter of cables	15½ inches
Ultimate strength of each cable, in tons	12,200
One promenade, two trolley tracks.	
Two roadways, two railway tracks.	

WILLIAMSBURG BRIDGE.

Total cost	\$20,000,000
Total length	7,364 feet 4 inches
Length of span over river	1,600 feet
Height from high water to top of towers	333 feet
Height of centre of bridge structure from East River	193 feet
Weight of suspended structure between towers	7,771 tons
Daily passenger capacity, each way	2,000,000
Extreme width	118 feet
Two decks, net width (both)	137 feet
Number of wires in each cable	7,700
Total miles of wire in four cables	17,433
Diameter of cables	18½ inches
Ultimate strength of each cable, in tons	26,500
Two promenades, four trolley tracks, two bicycle paths.	
Two roadways, two railway tracks.	

Williamson, wil'yam-sôn, Alexander Wil-
Ham, English chemist and educator: b. Wandsworth, Surrey, 1 May 1824. He was educated at Paris, Heidelberg, and Giessen, in 1849 was appointed professor of practical chemistry at University College, London, and in 1875 he accepted the chair of chemistry also, occupying both chairs until 1887 when he resigned and was appointed professor emeritus. He has made important researches on etherification, gas analysis, the atomic theory, etc., and has written several important papers concerning his investigations, including 'Etherification and the Constitution of Salts,' which attracted widespread notice. He also published 'Chemistry for Students.' He is a member of different English and foreign scientific societies, and has been president of the Chemical Society and of the British Association.

Williamson, Francis John, English sculptor: b. Hampstead, England, 17 July 1833. He was a pupil of J. H. Foley and later became his assistant, afterward settling at Esher, Surrey, where he has since lived. He has executed many ideal and private commissions, including portraits of the royal family at the order of Queen Victoria. Among his works are statues of Queen Victoria in Australia, India, Ireland, London, etc.; Dean Milman in Saint Paul's Cathedral; and numerous public statues in different parts of the British Isles.

Williamsport, wil'yamz-pôrt, Ind., city, county-seat of Warren County; on the Wabash River and the Wabash Railroad; 71 miles northwest of Indianapolis. It was founded in 1827. It is the trade centre of an agricultural region, and is also situated within three miles of large coal mines; it has a building-stone quarry, grist-mills and warehouses; and two state banks with a combined capital of \$100,000. There is a high school founded in 1884. Pop. (1910) 1,243.

Williamsport, Md., town in Washington County; on the Potomac River, the Chesapeake & Ohio Canal, and the Cumberland Valley and West Maryland R.R.'s; 65 miles northwest of Washington. It was founded in 1787; in 1863 Lee's army crossed the Potomac at this point on the march to Gettysburg. It is situated in an agricultural and timber region, and carries on a considerable trade. It has flour and lum-

ber mills and sash and door factories; and a national bank with a capital of \$100,000. There is a high school, and several elementary schools, including one for colored pupils. Pop. (1910) 1,571.

Williamsport, Pa., city, county-seat of Lycoming County; on the West Branch of the Susquehanna River, and on the Pennsylvania, the Northern Central, and the Philadelphia & R. R.R.'s; about 95 miles north of Harrisburg. It is on the Alleghany plateau, in an agricultural and mining region. The chief manufacturing establishments are steel works, lumber mills, furniture and rubber goods factories, wood-working machinery works, wire rope, nail, and engine factories, boot and shoe factories, silk mills, sewing-machine factory, and fire escape works. In 1900 (government census) Williamsport had 396 manufacturing establishments, capitalized for \$2,863,811 and employing 5,595 persons, to whom were paid annually \$2,065,930. The total cost of raw material each year was \$6,420,337, and the value of the finished product \$11,199,600. The lumber and timber products for 1900 were valued at \$1,429,028; the leather products, \$839,375; and the foundry and machine shop products, \$747,617. The city has an extensive trade in lumber products and coal.

The principal public buildings are the government building, city-hall, opera house, city hospital, Home for the Friendless, and Masonic Temple. The city has two parks, Brandon and Vallamont; and Sylvan Dell and Starr Island are near by. There are over 50 churches, with 14,000 communicants. The educational institutions are Dickinson Seminary (M. E.), a high school, opened in 1869, 14 public schools, two large Roman Catholic parish schools, and two commercial colleges. The seven banks have a combined capital of \$1,225,200. The government is vested in a mayor, who holds office three years, and a council of 39 members. The board of education is chosen by popular vote.

Williamsport was settled in 1779, and set off as a town in 1795. In 1806 it was incorporated as a borough, and in 1866 was chartered as a city. The city grew slowly until 1850, when the lumber industry began. Since then the growth has been rapid and the manufacturing and commercial industries have kept pace with the population. Pop. (1850) 1,615; (1880) 18,034; (1890) 27,132; (1900) 28,757; (1910) 31,860.

JOHN R. BIXLER,

Managing Editor, 'The Williamsport Sun.'

Williamstown, Australia, a seaport in Victoria, on the southwest shore of Hobson's Bay, immediately opposite Port Melbourne, and 9½ miles southwest of Melbourne. The business interests of the town largely centre in the shipping. The piers are commodious, and there are shipbuilding yards, patent slips, and a dry-dock called the Alfred Graving Dock, opened in 1874 and improved in 1897-8. The chief buildings are the churches, the mechanics' institute, the custom-house, the sailors' rest, banks and similar buildings, etc. Basalt and brown coal are worked near the town, and several manufactures are carried on. Pop. about 16,000.

Williamstown, Mass., town in Berkshire County; on the Hoosac and Green rivers, and on the Fitchburg (Boston & Maine) Railroad;

APPROACH TO THE WILLIAMSBURG BRIDGE

Total width, 118 feet, including four street railway tracks, two elevated railway tracks, two eighteen-foot roadways and two foot-passenger and bicycle paths.

WILLIMANTIC—WILLOUGHBY

about five miles west of North Adams and 40 miles east of Troy, N. Y. It was settled in 1753 and was named West Hoosic. In 1765 it was incorporated and the name was changed to Williamstown in honor of Ephraim Williams. In 1793 Williams College (q.v.) was opened, since when it has been a favorite residential town. There are five villages within the town limits. The chief industrial establishments are a cotton mill, a large bleachery, and large freight yards. Market gardening is carried on to quite an extent. There are two banks, one national and one state. Pop. (1890) 4,221; (1900) 5,013; (1910) 3,708.

Willimantic, wil-l-man'tik, Conn., city in Windham County; at the confluence of the Willimantic and Natchaug rivers, and on the Central Vermont and the New York, N. H. & H. R.R.'s; about 35 miles east by south of Hartford. It has the water power from the Willimantic River, which here has a fall of 91 feet within the city limits. The chief manufacturing establishments are cotton warp mills, print factories, thread and silk mills, foundry, machine shops, spool factory, and silk machinery works. The educational institutions are a State normal school, a high school, public graded schools, a large parish school, a public library containing about 6,000 volumes, and the Dunham Hall Library. There are two banks, the national bank has a capital of \$100,000 and the combined deposits (1903) amount to \$850,170. It was incorporated as a borough in 1833, and in 1893 was chartered as a city. Pop. (1910) 11,230.

Willis, wil'is, Nathaniel Parker, American author: b. Portland, Me., 20 Jan. 1806; d. Idlewild, N. Y., 20 Jan. 1867. He was graduated from Yale in 1827, and was employed by S. C. Goodrich ('Peter Parley') to edit two annuals, the 'Legendary' in 1828, and the 'Token' in 1829. In 1828 he established at Boston the 'American Monthly Magazine,' which, after he had conducted it for two and a half years, was merged in the New York 'Mirror.' He now set out on a tour of travel through Europe, visiting France, Italy, Greece, European Turkey, Asia Minor, and finally England, with the rank of an attaché to the American embassy at Paris, but chiefly as a correspondent of the 'Mirror,' for which he wrote his 'Pencilings by the Way,' later (1835) published in book-form. He returned in 1836, became in 1839 editor of the 'Corsair,' a New York periodical (1839-40), and in the same year again went to England. He returned to New York in 1846, and subsequently directed two short-lived papers, 'The New Mirror' (1843-4) and 'The Evening Mirror' (1844-5). Once more in Europe in 1845-6, he became in the last named year editor of 'The Home Journal,' the most successful of all his journalistic ventures, in the management of which he was associated with George P. Morris (q.v.). Willis was from the first a facile versifier, and a prose-writer of great reportorial cleverness. His scriptural poems were in their day very popular, and many are still readable; and his other verse, when nothing else, was metrically able. Sometimes it reached real poetic value, and effective specimens of it have been preserved by the anthologist. His fiction, except the 'Slingsby' papers, written for the English 'New Monthly,'

is generally without interest, save for its extravagance. 'Pencilings by the Way' (1835) abounds in talented sketches of contemporaries. Willis was the most successful American journalist of his time, and his vogue was great. Among his principal works are: 'Pencilings by the Way' (1835); 'Inklings of Adventure' (1836); two dramas entitled 'Two Ways of Dying for a Husband' (1839); 'Loiterings of Travel' (1840); 'Dashes at Life with a Free Pencil' (1845); 'People I Have Met, or Pictures of Society and People of Mark, Drawn Under a Thin Veil of Fiction' (1850); 'Hurry-graphs' (1851); a 'Health Trip to the Tropics' (1853); 'Outdoors at Idlewild' (1854); 'The Rag-bag,' a collection of ephemera (1855); 'The Convalescent, His Rambles and Adventures.' Consult the 'Life' by Beers ('American Men of Letters,' 1885). There is an estimate of Willis in Lowell's 'Fable for Critics.'

Willis's Rooms. See ALMACK'S.

Willmar, wil-mar, Minn., village, county-seat of Kandiyohi County, on Foot Lake and on two branches of the Great Northern Railroad; about 95 miles west by north of Minneapolis. The village was founded in 1868. It is in an agricultural and stock-raising region and has a large trade in grain, hay, dairy products, and live stock. It has nine churches, a high school and graded schools. The three banks, one national and two state, have a combined capital of \$40,000 and deposits (1903) amounting to \$873,070. Pop. (1890) 1,825; (1900) 3,409; (1910) 4,135.

Willpah, an Athapascan tribe of North American Indians who formerly occupied the territory drained by the upper waters of Chehalis River and its tributaries in southwestern Washington. They ceded their lands to the United States in 1864, when but few of them remained.

Willoughby, wil'o-bl, Sir Hugh, English Arctic explorer: b. probably Risby, Derbyshire, about 1500; d. about 1554. In 1553 he was appointed to command an expedition fitted out by London merchants 'for the discovery of regions, dominions, islands, and places unknown,' and on 10 May sailed from Deptford with three vessels, the Bona Esperanza, his own ship, with 35 persons; the Edward Bonaventure, carrying 50 men; and the Bona Confidentia, with 28 men. They sighted the coast of Norway about the middle of July and during a storm in the middle of September the Edward Bonaventure, at Senjen, parted company with the two other vessels, which reached Russian Lapland, where they found a good harbor at the mouth of the river Arzina. Here Willoughby and his 62 companions perished during the course of the winter. The following year Russian fishermen found the ships with the dead bodies of the crews, together with commander's journal, and a will witnessed by Willoughby, showing that some of the mariners were alive in January 1554. Chancellor, after being separated from his comrades, finally reached Archangel, near the mouth of the river Dwina, in the White Sea. News of his arrival was immediately despatched to the Czar Ivan Vasilievitch, who invited the mariners to the court of Moscow. A direct trade with Russia resulted from Chancellor's discovery.

Willoughby, Westel Woodbury, American publicist b. Alexandria, Va., 20 July 1867. He was graduated from Johns Hopkins University in 1888 and for several years practised law in the District of Columbia. He has published: 'The Supreme Court of the United States: its History and Administrative Importance' (1890); 'Government and Administration of the United States' (1891); 'The Nature of the State' (1896); 'Rights and Duties of American Citizenship' (1898); 'Social Justice' (1900).

Willoughby, William Franklin, American economist, twin brother of Westel Willoughby (q.v.) b. Alexandria, Va., 20 July 1867. He was graduated at Johns Hopkins University in 1888; was expert in the United States Department of Labor 1890-1900; and in 1900 was made special agent on education and social economy of the United States Commission to the Paris Exposition. He has several times represented the Department of Labor at international congresses for the investigation of labor conditions in Europe, is a member of the American Economic Society, a fellow of the Royal and American Statistical societies, and a lecturer on economics at Johns Hopkins. He published 'Workman's Insurance' (1898).

Willow, a genus of trees and shrubs (*Salix*) of the order *Salicales*. The species, of which more than 150 have been described, are natives mostly of the North Temperate zone, but a few are indigenous in the tropics and in the South Temperate zone, and some are found close to the limit of perpetual snow in the Arctic zone and upon lofty mountains, where they are reduced very greatly in stature, etc. One of these last, a European species (*S. herbacea*), rarely exceeds an inch in height. Willows are characterized by simple, usually lanceolate leaves, which in the bud are surrounded by a single bud-scale, flowers naked dioecious, in catkins, followed by dehiscent fruits containing little appendaged seeds which usually float readily with the breeze. In general, the species are best adapted to wet ground, along streams, etc., and on this account are frequently planted to dry out damp ground and for improving the sanitary conditions around cess-pools. Like the Australian gum-trees (*Eucalyptus*, q.v.), which are similarly used, they transpire immense quantities of water. Some of the species are of importance along streams and lakes where they prevent the washing of the soil either by current or wave. In pleasure grounds, summer resorts, etc., they are often planted because they will thrive almost anywhere and also because they quickly produce an effect. In such capacity, however, they should be used more as temporary than as permanent trees and should be replaced by better, sturdier trees, such as maples, elms, beeches, and others of slower growth. Some of the species or their varieties produce pleasing effects during winter because of their yellow or red branches; in spring by their yellow catkins, or their weeping habits. Willow wood is white, light, soft, porous, generally durable in water. It is used for turning, cabinet work, fuel, and for charcoal-making. The charcoal is highly valued for making crayons and gunpowder. The trees are widely planted in Europe for pollarding (q.v.), to supply fuel, poles, etc.

The most important industry connected with

willows is the growing of osiers (q.v.) for making baskets, wickerwork, etc. The species popularly used in Europe, where the industry is very important, are: the common osier (*S. viminalis*), which yields general purpose rods; fine basket osier (*S. purpurea*); green-leaved osier or ornard (*S. triandra*); golden, or white osier, or willow (*S. alba*); and varieties of these. In America the climate is considered unfavorable to some of the European species and so native species and varieties are more popular. Propagation for osier culture is always by means of cuttings, which are either pieces of branches or single-eye cuttings. The former are made about 15 inches long, planted 15 to 18 inches asunder in rows from 18 to 24 inches apart; the latter are planted very close together so as to produce attenuated shoots of small diameter. The cuttings are planted preferably upon alluvial soils since such produce the finest rods, and will continue profitable much longer than plantations on lighter soils. On light soils the useful age ranges from 15 to 20 years. Plantations are not made upon clay soils since such give unsatisfactory results.

Having been planted the only attention usually given is an occasional shallow cultivation to destroy weeds. After the leaves have fallen the harvest is made, the rods graded, those for brown baskets dried and piled under cover; those for white baskets tied in bundles, placed upright in shallow trenches containing about 3 inches of water until growth starts in the spring when they are peeled by means of a "break." In unfavorable seasons they may require a sort of fermentive process under litter to loosen the bark. The osier industry of Holland, Belgium, France, and England is very extensive. It is mainly confined to low grounds flooded by the tide. In the United States the leading regions of osier culture are western New York, and southeastern Michigan; lesser areas exist near Baltimore, Md., Milwaukee, Wis., and Cincinnati, Ohio. The annual production of baskets in the United States is estimated at approximately \$4,000,000.

The white or Huntingdon willow (*S. alba*) is one of the most widely used European species, but is little grown in America. It is a large tree, often 80 feet high, with usually a short thick trunk often exceeding 3 feet in diameter. It is specially noted for its exceedingly rapid growth and the large number of uses that are made of it, both ornamentally and economically. The brittle willow (*S. fragilis*), a native of Europe and northern Asia, becomes 30 or more feet in height and is well known in America, where it was introduced as a hedge tree about the middle of the 19th century. Stakes cut from the tree in early spring and driven in the ground will soon become trees. It is less useful than the preceding, but is popular for pollarding. Its twigs and smaller branches are very brittle at the point of union with the main stem. The weeping or Napoleon's willow (*S. babylonica*) is a native of the Caucasus, whence it has been taken to most civilized countries throughout the world, in many of which it has become a favorite tree in cemeteries. It has a large number of varieties. The Egyptian willow (*S. aegyptiaca*) is noted for the perfumed water distilled from its flowers in India.

Among the American species the yellow willow (*S. vitellina*), which is common in the

WILLOW HERB—WILLUGHBY

East, is probably the largest and best known. It approaches in size and habit the Huntingdon willow, with which it was formerly united by botanists. The black willow (*S. nigra*) is also indigenous in the East. It grows about 35 feet tall, and is noted for its rapid distribution along streams into which its brittle twigs fall as they are broken off by every strong wind, and carried far away by the current before they lodge and take root. Other species exhibit this trait more or less also. The pussy willow (*S. discolor*) is also an eastern species well known because of its silky downy catkins which appear in early spring before the leaves. It is usually a shrub, but sometimes becomes a short boled tree 15 or 20 feet high. Its twigs are often gathered in late winter, placed in water in a warm room or greenhouse, and the catkins thus forced into bloom. Treated in this way it is sometimes seen in florists' stores. Other well known American species are *S. lucida* which grows about 12 feet tall, and the heart-leaved willow (*S. cordata*) which grows about twice as large. Some species are popularly called "sallow" in Great Britain. Of these the best known are the long-leaved willow (*S. grandiflora*), gray willow (*S. cinerea*), round-eared willow (*S. aurita*), and round-leaved willow (*S. caprea*). Their chief uses are for hoops, stakes, tools, etc. They are used very little for baskets and wicker-work, since they are usually less pliable than oaks.

A very large number of insects feed upon the willow; 223 have been enumerated by Packard as found in America; in Europe 386 have been recorded. Among these are several species of plant-lice, gall-mites, and scale insects. The larvæ of two longicorn beetles bore in the trunk and branches, and a twig-boring larva, the willow-shoot horn-tail (*Phyllocolpa integer*) bores in the twigs in which the mother deposits her eggs, and in which the pupa state is passed during the winter. The larva of the American cimbex (*Cimbex americana*) which is the largest species of American saw-flies, lives upon the foliage as do also the larvæ of another saw-fly, the yellow spotted willow-slug (*Nematus ventralis*).

Consult: Bailey, 'Cyclopedia of American Horticulture' (New York 1900-2); Packard, 'Insects Injurious to Forest Trees' (Washington 1890).

Willow Grouse, or Ptarmigan. See PTARMIGAN.

Willow Herb. See EPILOBIUM.

Willow Oak. See OAK.

Willow Pattern, a design used in the manufacture of stone and porcelain ware, generally executed in dark blue, in imitation of a Chinese design. The name is taken from a willow tree, which is a prominent object in the design.

Willow Wren, or Willow Warbler, a European warbler (*Phylloscopus trochilus*), dull olive-green on the upper part of the body, yellowish-white on the breast and below. The nest is placed on the ground, most commonly against a bank among long grass or weeds, but often at the foot of a bush, and, like that of the wood wren, is covered with a dome having a rather wide hole in the side, whence this species and its congeners are called "oven birds." The willow wren is a graceful, active bird, sitting rest-

lessly from twig to twig, and its song is loud and sweet.

Willows, Cal., town, county-seat of Glenn County; on the Southern Pacific Railroad; about 150 miles north by east of San Francisco. In the centre of the town is a grove of willows, the only one in that section, hence the name of the place. The county court-house is a fine building, erected in 1894 at a cost of \$150,000. The town ships large quantities of farm products and fruit. It has a state bank which has a capital of \$300,000. Pop. (1880) 750; (1890) 1,176; (1900) 893; (1910) 1,139.

Wills, William Gorman, Irish dramatist: b. Kilmurry, Ireland, 28 Jan. 1828; d. London 13 Dec. 1891. He was educated at Trinity College, Dublin, studied art in the Royal Hibernian Academy, and for a time engaged as a portrait painter. After 1862, however, he devoted himself extensively to literature, though in 1868 he resumed portrait painting. He was the author of 'Notice to Quit' (1861); 'The Life's Evidence' (1863); and the dramas 'Charles the First' (1872); 'Eugene Aram' (1873); 'Marie Stuart' (1874); 'Jane Shore' (1876); 'Olivia' (1878); 'Sedgemoor' (1881); 'Claudian' (1885); 'A Royal Divorce' (1891); etc., and in conjunction with Sidney Grundy, 'Madam Pompadour.' Consult Archer, 'English Dramatists of To-day' (1882); Cook, 'Nights at the Play' (1883); Freeman Wills, 'W. G. Wills, Dramatist and Painter' (1898).

Wills, William Henry, English writer: b. Plymouth, England, 13 Jan. 1810; d. Welwyn, Hertfordshire, 1 Sept. 1880. He was a member of the original staff of 'Punch,' acting as dramatic critic and also contributing both prose and verse. His contributions included: 'Natural History of Courtship'; 'Comic Mythology'; 'Information for the People'; etc. In 1846 he became associated with Dickens, with whom he formed a lifelong friendship, as sub-editor of the *Daily News*. In 1849 he became assistant editor of 'Household Words' and in 1859 of 'All the Year Round.' He published 'Old Leaves Gathered from Household Words' (1860).

Wills, William John, Australian explorer: b. Totnes, Devonshire, 5 Jan. 1834; d. Cooper's Creek, Australia, about 1 July 1861. He studied medicine in London, and in 1852 emigrated to Australia where he was joined in the following year by his father, and together they practised medicine at Ballarat. In 1855, however, he became a surveyor of crown lands and in 1858 was appointed to the staff of the magnetic and meteorological observatory at Melbourne. In 1860 he joined the expedition under Robert O'Hara Burke (q.v.) as third in command, later becoming second, and crossed the continent northward, reaching the Gulf of Carpentaria, but on the return journey both Burke and Wills died of starvation. Wills' journal was recovered and published: 'A Successful Exploration from Melbourne to the Gulf of Carpentaria, from the Letters and Journals of William John Wills' (1863). Consult Howitt, 'History of Discovery in Australia' (1865).

Willughby, wil'-bî, Francis, English ornithologist: b. Wollaton Hall, Nottinghamshire, 1635; d. 3 July 1672. He studied at Cambridge, where he became the pupil of the famous natur-

WILMERDINO—WILMINGTON

alist, John Ray (q.v.), and with him made a continental tour (1663-4), making studies and collecting zoological specimens. Ray edited and translated his Latin 'Ornithologia' (1676) and in 1678 published it in English as 'The Ornithology of Francis Willughby.' Ray also edited Willughby's 'History of Fishes' (1686). To the 'Ornithologia' Buffon and Linnaeus were much indebted, and it is claimed that Willughby originated the Linnæan system of zoological classification.

Wilmerding, Pa., borough in Allegheny County; on the Pennsylvania Railroad; eight miles southeast of Pittsburgh. It was founded in 1859. It was laid out by the Westinghouse Air-brake Company, who have here their large manufacturing works. The water supply comes from the Monongahela River; natural gas is used for fuel, and every street is sewered. Pop. (1910) 6,133.

Wilmington, Del., city, port of entry, county-seat of New Castle County; on the Delaware River at the junction of the Brandywine and Christina creeks, and on the Pennsylvania (Philadelphia, Baltimore & Washington), the Baltimore & O., and the Philadelphia & R.R.'s; about 27 miles southwest of Philadelphia and 70 miles northeast of Baltimore. There are several regular lines of steamers, for passengers and freight, which connect the city with Philadelphia and with the Delaware River and Bay and several Atlantic ports. It ranks as the first city in the State in population, commerce, and industries.

Industries.—The chief industrial establishments are car works (the Pullman Company and the Pennsylvania have shops in the city), steel works, machine shops, foundries, paper mills, cotton mills, malleable iron works, fibre goods factories, and furniture. Leather goods, especially morocco, are manufactured here. In 1900 (government census) the 19 manufacturing engaged in turning out leather, tanned, curried, and finished, were capitalized for \$5,167,304 and had 2,454 wage-earners to whom were paid annually \$1,044,303. The total cost of raw material used annually was \$7,009,165 and the value of the finished products was \$9,379,504. The four iron and steel manufacturing were capitalized for \$4,051,880 and the value of the annual output was \$2,934,993. The 21 foundries and machine shops produced each year goods valued at \$3,299,509; the products of the three railroad car-works were, annually, \$3,274,922, not including repair work, which amounted to over \$1,000,000.

Other industries of importance are ship and boat building, meat packing, pulp manufacturing, and large paper-making machinery manufacturing. The total number of manufacturing establishments, in 1900, was 759, which were capitalized for \$28,372,043, and in which were employed 16,055 wage-earners. The total cost of raw material used annually was \$19,451,815, and the value of the annual output, \$34,053,324. Over 53 per cent of the manufacturing establishments of the State were located in Wilmington. A few miles outside the city limits is a large powder-manufacturing establishment, founded in 1801 by Pierre Samuel du Pont and his sons.

Buildings and Municipal Improvements.—The city is on land elevated sufficient to mate-

rially increase its healthfulness. The city extends about four miles back from the Delaware. The houses are nearly all of brick and stone,—no wooden buildings are permitted to go up in the city proper, but the old wooden buildings are allowed to remain. There are five parks, having a total area of 260 acres, and a number of small squares. The streets are well paved and sewered. There is a good water-works system. The principal public buildings are the government building, county courthouse, and city-hall. A building of special interest is the old Swedes' Church (Holy Trinity), built of brick in 1668. It is said to be the oldest building in the United States which has been in continuous use as a church since its erection. The city owns and operates the water-works.

Churches and Charitable Institutions.—The principal religious societies in the city are represented as follows: Methodists (white), 15 churches, (colored), seven churches; Baptist, Roman Catholic, and Protestant Episcopal, 10 each; Presbyterian, nine; Lutheran and Friends, two each; Congregationalist, Adventist, Jewish, Unitarian, and Swedenborgian, one each. There are a large number of charitable institutions; chief among them are the Home for Friendless Children; Saint Peter's Orphanage (R. C.) for girls; Saint Joseph's Home (R. C.) for colored children; two homes for aged men and women; and two hospitals. At Farnhurst, two miles out, is the Delaware State Hospital for the Insane, and near it the county almshouse.

Educational Institutions.—The State Industrial Schools for Girls and the Ferris Reform School for Boys are located here. Other educational institutions established here are Hebbes School, Wilmington Friends' School, Wilmington Military Academy, Ursuline Academy, a public high school established in 1872, Goldey College, Wilmington Business School, public and parish elementary schools, a free public library, which in 1768 was incorporated as the Wilmington Institute, and which now contains about 41,000 volumes; the Historical Society library, containing nearly 4,000; and the library of the Law Library Association of the county, which has about 16,000 volumes.

Banks and Finances.—There are seven national banks and one state bank with a combined capital of \$1,723,185; three trust companies with a combined capital of \$1,600,000; and a number of loan associations. The annual amount of business is about \$60,000,000. The foreign trade transacted through the port of Wilmington amounts annually to about \$5,000,000, nearly all of which is in exports. The annual cost for city maintenance and operation is about \$725,000. The principal items of expenditure are \$200,000 for schools; \$84,000 for police; \$41,000 for fire department; \$55,000 for water-works; and \$80,000 for interest on debt.

Government.—The government is vested in a mayor, who holds office two years, and in a council composed of 13 members, who are elected by wards, except the president, who is elected at large. The mayor appoints the board of water commissioners and the board of directors of the street and sewer departments. The council elects the city auditor, city clerk, and inspectors of meat, milk, oil, and markets. The judge of the supreme court appoints the police commissioners. The board of education, two

WILMINGTON

members from each ward, the city attorney, and city treasurer are chosen by popular vote.

History.—The first settlement was made in 1638 by a colony from Sweden, under Peter Minuit. They found here an Indian village called Minquas. The Swedes erected a fort to which they gave the name of Fort Christiana, in honor of the young daughter of Gustavus Adolphus, the king of Sweden. The village was called Christianaham. In 1655, the Dutch from New Netherlands bought the land on which Wilmington now stands, and other lands adjoining, from the Indians, and took forcible possession of the fort. The name was changed to Fort Altena. The Dutch retained possession for nine years, when they were supplanted by the English. It came under control of William Penn, after which the colony gave more attention to civic pursuits instead of wars and conquests. In 1731 the village was named Willingtontown, in honor of Thomas Willing, who had laid out the town. Later the name was changed to Wilmington. It was incorporated as a borough in 1739 and the first borough election was held 8 Sept. 1740. In 1832 it was chartered as a city.

Population.—(1880) 42,478; (1890) 61,431; (1900) 76,556; (1910) 87,411.

Consult: Powell, 'Historic Towns of the Middle States'; Ferris, 'History of the Original Settlements on the Delaware.'

Wilmington, N. C., city, port of entry, county-seat of New Hanover County; on the Cape Fear River, and on the Atlantic Coast Line and the Seaboard Air Line R.R.'s. It was first settled in 1730 and was first called New Liverpool and then Newton; in 1739 it was incorporated as a town and named Wilmington, and in 1744 was made the capital of the province. In 1765 the town took a decided stand against British authority, and refused to permit a British man-of-war to land a quantity of stamps, this being the first open armed resistance to the Stamp Act. On 18 July 1775, Fort Johnson, at the mouth of the river, was captured by the militia under Colonel John Ashe; and the royal governor was forced to leave the place. In 1781-2 Wilmington was occupied by the British, Cornwallis having his headquarters here. During the Civil War Wilmington was the most important port of the Southern States, the "gateway" between the South and foreign nations; and was consequently the chief resort of the blockade runners. The harbor and its approaches were strongly fortified by the Confederates; in January 1865, Fort Fisher (q.v.) was taken by the Federals, and this resulted in the evacuation of the other forts and the surrender of Wilmington. Wilmington was chartered as a city in 1866.

It is an important commercial city. Improvements in the harbor and river channel have been made by the Federal government at considerable cost, and the port accommodates vessels of the largest size. There are weekly steamboat lines to New York and points on the Cape Fear and Black rivers, and a large import and export trade, both foreign and domestic. In the fiscal year ending 30 June 1904 the exports amounted to \$21,000,000; the chief shipments are cotton, rice, turpentine, vegetables, lumber, and naval stores. Wilmington ranks fifth in receipts of cotton and fourth in ex-

ports. In manufacturing industries Wilmington ranks fourth in the State. In 1904, capital to the amount of \$5,600,000 was invested in manufacturing establishments, and \$1,380,000 was annually paid in wages; the value of the annual products was \$4,100,000. Eight lumber and timber establishments had an annual output valued at \$1,000,000, other manufactures were turpentine, resin, confectionery, foundry and machine-shop products, ice, chemicals, meal, cotton products, men's clothing, wagons, and carriages. Annual business of the city for 1903 was \$40,000,000 and the annual pay-roll was \$3,250,000. There are five banks with a combined capital of \$520,000 and deposits amounting to \$4,500,000. The principal public buildings are the government building, the county court-house, city-hall, Masonic Temple, the county hospital, the United States Marine Hospital, and the James Walker Memorial Hospital and W. H. Sprunt Annex. Other institutions are a county house of correction, county home, and the Catherine Kennedy Home for Aged Women. Various organizations assist the charitable institutions; such are the Bureau of Associated Charities, Ladies' Benevolent Society, a United Charities, and a Seaman's Friend's Society. There are 33 churches, 14 of which are for colored. There are public schools for white and for colored students, Roman Catholic parish schools, and a public library; and the city also contains Cape Fear Academy, Alderman's School, Academy of the Incarnation, and the Gregory Normal School (for the colored race). The government is administered under the charter of 1866, which provides for a mayor, who holds office two years, and a city council. The governor of the State appoints a board of audit and finance, who determine the salaries and control the municipal finances. The council elect many of the city officials. Pop. (1890) 20,056; (1900) 20,976, (1910) 25,748, an increase of nearly 23 per cent. Wilmington ranks as the first city of the State in population.

Revised by

WILMINGTON CHAMBER OF COMMERCE

Wilmington, Ohio, city, county-seat of Clinton County; on the Cincinnati & Muskingum Valley and the Baltimore & O. R.R.'s; about 53 miles northeast of Cincinnati and 60 miles southwest of Columbus. It is in an agricultural region. The chief manufacturing establishments are bent-wood and bridge-work factories, furnaces, machine shops, auger bit factory, creameries, and flour and lumber mills. The Wilmington College (Orthodox Friends) was established here in 1870. The two banks have a combined capital of \$200,000. Pop. (1910) 4,491.

Wilmington, Capture of. After Gen. Terry's capture of Fort Fisher (q.v.) 15 Jan. 1865, Terry posted his troops on an intrenched line across the peninsula, about two miles above the fort. An advance on Wilmington was not considered prudent until he could be reinforced, as Gen. Hoke, the Confederate commander, was holding Fort Anderson, on the west bank of Cape Fear River, about midway between Fort Fisher and Wilmington, and on the opposite bank had thrown up a line of intrenchments across the peninsula in Terry's front, behind which he had about 4,500 men. Fort Anderson was an extensive earthwork, mounting 10 heavy

WILMINGTON COLLEGE—WILMOT

guns, commanding the approaches by land and water and held by Gen. Hagood's brigade of 2,000 men. Gen. Grant ordered Gen. Schofield, with the Twenty-third corps, from Tennessee to the coast of North Carolina to co-operate with Gen. Sherman. Schofield's troops arrived at Alexandria and Washington late in January, where they were detained some days by the ice in the Potomac. Gen. Cox's division of 4,400 men went by steamers from Alexandria and landed on the peninsula, in rear of Terry, 9 February, raising Terry's command to 8,000 men. Schofield now took command; the fleet under Admiral Porter occupied positions in Cape Fear River and off the coast, covering both flanks of Terry's line, and, 11 February, Terry was pushed forward, supported by Cox, drove in Hoke's pickets and intrenched within 300 yards of his main line. An attempt on the 12th to turn Hoke's left by a co-operation of the army and navy was foiled by high winds and a violent storm. On the night of the 14th an attempt was made to move the pontoons upon their wagons along the beach with the troops; the wagons sank deeply in the sand, progress was very slow and it having become evident that the pontoons could not be got up to the point of crossing of Masonborough Sound before daylight, when the enemy would discover the movement, the attempt was abandoned and attention turned to Hoke's right, where it would not be required to contend with the difficulties of both land and sea. On the 16th Cox's and Ames' divisions were crossed by steamboats to Smithville, on the right bank of the river, where they were joined by Col. O. H. Moore's brigade, of Couch's division, and a battery, and, on the 17th Cox with four brigades and the battery advanced along the main Wilmington road, driving in the Confederate pickets and bivouacking near Fort Anderson, with his right resting on the river. Next morning the advance was resumed and the enemy driven within the works. Moore's and Henderson's brigades were intrenched on the south side of the fort, while Cox, with his other two brigades, followed later by Ames' division, started around Orton Pond, covering the Confederate right, to gain the Wilmington road in rear of the fort, the distance to be traveled being about 15 miles. The guns of Fort Anderson opened fire on the two brigades confronting the fort, and the gunboats opened heavily on the fort, the monitor Montauk lying close to it and the others enfilading its parapet. Gen. Hagood, warned by his cavalry of Cox's movement around his right, hastily abandoned Fort Anderson during the night, taking with him six light guns and falling back behind Town Creek, eight miles above the fort. Hoke also retreated from his lines opposite Fort Anderson to within four miles of Wilmington. By these movements Schofield gained possession of the main defenses of Cape Fear River and of Wilmington, with several pieces of heavy ordnance and a large amount of ammunition, and with but small loss. In this he had the assistance of the gunboats that moved up the river removing torpedoes and silencing batteries on both banks. On the 19th Cox pursued Hagood to Town Creek, behind which and near its mouth he was found intrenched and had destroyed the only bridge. The creek was not fordable and could not be bridged. Terry also advanced on the east side of the river, following Hoke, and

found him in force, and Ames' division was re-crossed to the east bank and joined Terry in the night. Terry again advanced on the morning of the 20th and after some sharp skirmishing came upon Hoke well intrenched with artillery in position. On the same day Cox crossed Town Creek below Hagood's position, by the use of a single flat boat found in the stream, which carried 50 men at a trip, and, by marching through woods and swamps, reached Hagood's flank and rear, attacked and routed his brigade, after a stubborn resistance, capturing two guns, three battle-flags, and 375 prisoners, including Col. Simonton, temporarily commanding the brigade, and nearly all the officers. During the night Cox rebuilt the bridge over Town Creek, crossed his artillery, and the next morning pushed on toward Wilmington without opposition. Terry was unable to make any farther advance, but occupied Hoke's attention, so that he could not send any part of his force to replace the losses in Hagood's brigade. On the 21st Cox secured a portion of the Confederate pontoon bridge across Brunswick River, which Hoke had endeavored to destroy, put the 16th Kentucky regiment onto Eagle Island abreast Wilmington and threatened to cross Cape Fear River above the town. Hoke at once set fire to steamers, boats, cotton, and naval stores, and abandoned the place, retreating in the direction of Goldsboro. Gen. Terry entered the place without opposition early in the morning of 22 February and pursued Hoke across Northeast River. Schofield reports that he took 51 heavy guns, 15 light ones, and a large amount of ammunition. The Union loss from 11 February to the capture of Wilmington on the 22d was about 200 killed and wounded. The Confederate loss is not definitely known, Schofield estimates it at not less than 1,000, in killed, wounded and prisoners. Consult 'Official Records,' Vol. XLVII.; Cox, 'March to the Sea'; Cox, 'Military Reminiscences of the Civil War,' Vol. II.

E. A. CARMAN.

Wilmington College, located at Wilmington, Ohio. It was opened to students in 1870, and chartered in 1875, under the auspices of the Society of Friends. It is open to women on equal terms with men. The college organization includes a preparatory school. Two full collegiate courses are offered, the classical, for which Greek is required, leading to the degree of A.B., and the scientific, leading to the degree of B.S.; a part of the work of the last two years is elective in both courses. A course in bookkeeping is included in the curriculum. The degrees of A.M. or M.S. are conferred for graduate work. There are six county scholarships, and three others; and a student loan fund. The campus consists of 23 acres, and is located in the eastern suburbs of Wilmington. The buildings include the main building, the observatory, South Hall (men's dormitory), the women's dormitory, the gymnasium, and the Auditorium. The library in 1910 contained over 6,000 volumes; the students numbered 190, of whom 42 were in the college.

Wil'mot, David, American jurist and politician: b. Bethany, Pa., 20 Jan. 1814; d. Towanda, Pa., 16 March 1868. He was admitted to the bar in 1834, and practised at Towanda. He was a member of Congress in 1845-51; was elected as a Democrat, but stood

in opposition to the extension of slavery into prospective new territory of the United States; and in 1846 he offered the famous amendment known as the Wilmot Proviso (q.v.). He supported Van Buren in 1848 against Cass, the regular Democratic candidate, and later joined the Republicans. In 1853-61 he was president-judge of the 13th district of Pennsylvania, in 1857 was an unsuccessful Republican candidate for governor of that State, sat in the United States Senate from 1861 to 1863, and from that time until his death served as judge of the United States Court of Claims.

Wilmot, John. See **ROCHESTER, JOHN WILMOT**, 2d EARL OF.

Wilmot, Robert Duncan, Canadian statesman: b. Fredericton, New Brunswick, 16 Oct. 1809; d. Oromocto, New Brunswick, 11 Feb. 1891. He was educated in Saint John, engaged for a time in shipping, and 1846 entered Parliament, where he sat for Saint John until 1861 and again in 1865-7. He was mayor of Saint John in 1849, surveyor-general of New Brunswick, and member of the executive council of the province in 1851-4, provincial secretary in 1856-7, and a delegate to the colonial conference in London, in 1866-7. He became a member of the Senate in 1865, of the privy council in 1878, was speaker of the Senate in 1878-80, and in 1880-5 was lieutenant-governor of New Brunswick.

Wilmot Proviso, an amendment offered in the United States Congress by David Wilmot (q.v.), 8 Aug. 1846, pending the consideration of a bill placing \$2,000,000 at the disposal of President Polk to negotiate a peace with Mexico. The amendment was as follows:

Provided, that, as an express and fundamental condition to the acquisition of any territory from the republic of Mexico by the United States, by virtue of any treaty which may be negotiated between them, and to the use by the executive of the moneys herein appropriated, neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall first be duly convicted.

It was adopted in the House, and was under debate in the Senate when the hour arrived previously fixed for adjournment of the session. At the next session (8 Feb. 1847) Wilmot again introduced it, and a fierce and angry contest began. The House remained firm in favor of the amendment, and it was passed (15 February) by a decided majority, but was not acted on by the Senate. It caused great agitation throughout the country. The principle involved long continued to be an important factor in party politics, its influence being affected by many fluctuations of opinion and political action; and it may be said finally to have triumphed through the act of 19 June 1862 forbidding slavery in "any of the territories of the United States now existing, or which may at any time hereafter be acquired." Consult: Stephens, 'Constitutional View of the Late War Between the States' (1868-70); Wilson, 'Rise and Fall of the Slave Power' (1872-7); Schouler, 'History of the United States of America Under the Constitution' (new ed. 1899); Von Holst, 'Constitutional and Political History of the United States' (new ed. 1899).

Vol. 22 — 26

Wilson, Alexander, American ornithologist: b. Paisley, Scotland, 6 July 1766; d. Philadelphia, Pa., 23 Aug. 1813. In his 13th year he was apprenticed to a weaver, but after seven years abandoned the loom and adopted the life of a pedlar. Three years were thus spent and in 1789, having already prepared a volume of poems for publication, he offered his musings and solicited subscriptions for this work. It was published in 1790, but had little success; and he again returned to the loom. In 1792 he published 'Watty and Meg,' which, having appeared anonymously, was ascribed to Burns, though the style is very different. It is said to have had a sale of 100,000 copies in a few weeks. Having written a severe satire upon a person in Paisley Wilson was thrown into prison, and was afterward compelled to burn the libel with his own hand at Paisley Cross. Upon his release he came to this country, arriving at New-castle, Delaware, in 1794. He again resumed his former trade, but soon turned schoolmaster, acting in this capacity in several places in Pennsylvania. While thus engaged at Kingsessing, near Philadelphia, he became acquainted with William Bartram, the naturalist, and Alexander Lawson, an engraver, whose tastes and instructions stimulated his own talents. He had already undertaken long excursions for making ornithological researches, and devoted much time to the study, when he was engaged, in 1806, to assist in editing the American edition of Rees's Cyclopaedia, and now began to prepare for the publication of his 'American Ornithology,' the first volume appearing in 1808, and the seventh in 1813. The interval had been passed in exploring different parts of the country for the purpose of extending his observations, collecting specimens, and watching the habits of birds in their native haunts. In 1813 the literary materials for the 8th volume of the 'Ornithology' were ready, but its progress was greatly retarded for want of proper assistants to color the plates. Wilson was, therefore, obliged to undertake the whole of this department himself, in addition to his other duties; and these multifarious labors soon exhausted his strength and brought about his death. All the plates for the remainder of the 'Ornithology' having been completed under Wilson's own eye the letter-press of the 9th volume was supplied by his friend, George Ord, his companion in several of his expeditions, who also wrote a memoir of Wilson to accompany the last volume, and edited the eighth. Four supplementary volumes, containing American birds not described by Wilson, were published by Charles Lucien Bonaparte (1825-33). An edition of the original work, with Bonaparte's continuation, and notes and life of Wilson by Sir William Jardine, was published in London in 1832. Wilson continued to write poetry after leaving Scotland, one of his chief productions being 'The Foresters,' a poem describing a pedestrian tour to the Falls of Niagara, and several collective editions of his poems have appeared. A bronze statue of Wilson has been erected at Paisley.

Consult: 'Life of Wilson,' by Peabody, in Sparks' 'Library of American Biography' (1834-56); Brightwell, 'Difficulties Overcome: Scenes in the Life of Alexander Wilson' (1860); Paton, 'Alexander Wilson, the Ornithologist' (1863).

WILSON

Wilson, Allen Benjamin, American inventor: b. Willet, N. Y., 18 Oct. 1824; d. Woodmont, Conn., 29 April 1888. He was a cabinet maker by trade, but in 1849 invented a sewing machine which made a stitch at each movement of the shuttle, thus enabling the operator to make an endless seam at any curve, and thereafter devoted himself to its improvement. In 1851 he secured a patent for the rotating hook, and a year later invented the four-motion feed, which was subsequently adopted in all machines. In 1860 he entered into partnership with Nathaniel Wheeler (q.v.), with whom he established, at Bridgeport, Conn., the then largest factory in the world for the manufacture of sewing-machines. In 1852, however, on the reorganization of the firm, he withdrew from the business and settled in Waterbury, where he engaged in other enterprises. See *SEWING MACHINES*.

Wilson, Alpheus Waters, American bishop of the Methodist Episcopal Church, South: b. Baltimore, Md., 5 Feb. 1834. He was educated at Columbian College, Washington, D. C., was received into the Baltimore Methodist Conference in 1853, and on the organization of the Baltimore Conference of the Methodist Church, South, identified himself with that body. He became the secretary of the board of missions of his Church in 1878 and was elected bishop in 1882.

Wilson, Sir Archdale, English soldier: b. Didlington, Norfolk, 1803; d. London 9 May 1874. He entered the Bengal Artillery in 1819; distinguished himself at the siege of Bharrpur 1825-6, and took part in the Sikh war 1848-9. At the outset of the Sepoy revolt in May 1857 he was the earliest officer to encounter the Sepoys in battle, defeating them on May 30 and 31, and succeeding to the command of the force before Delhi in July, held his position until 24 September, when the city was taken. He was rewarded for his services with a baronetcy, was promoted major-general, made lieutenant-governor in the following March, and took part in the siege and capture of Lucknow 19 March 1858.

Wilson, Augusta Jane Evans, American novelist: b. Columbus, Ga., 8 May 1835. She was married to L. M. Wilson of Mobile in 1868. Her writings include: 'Inez, a Tale of the Alamo' (1856); 'Beulah', the most popular of her novels (1859); 'Macaria' (1864); 'St. Elmo', parodied by Webb in 'St. Twel'mo' (1866); 'Vashti' (1869); 'Infelice' (1875); 'At the Mercy of Tiberius' (1887); 'A Speckled Bird' (1902). The earlier books had a great popularity. They attempted to be massive, but contained no permanent elements, though attaining at times some power of expression. The later volume, written in the same manner, did not obtain recognition.

Wilson, Sir Charles Rivers, English financier: b. London 1831. He was graduated from Oxford in 1851, became a treasury clerk in 1856, was private secretary to Disraeli 1867-8, and comptroller-general of the National Debt Office 1874-94. He became one of the British administrators of the Suez Canal in 1876 and was finance minister to the Khedive of Egypt 1877-9.

Wilson, Sir Daniel, Canadian archaeologist: b. Edinburgh 5 Jan. 1816; d. Toronto, Ont., 7 Aug. 1892. He was educated at Edinburgh

University, and on leaving college entered with earnestness into antiquarian pursuits, and published in 1847, 'Memorials of Edinburgh in the Olden Time.' It was followed by 'Oliver Cromwell and the Protectorate' (1848) and 'The Archaeology and Prehistoric Annals of Scotland' (1851). At this time he was secretary of the Scottish Society of Antiquaries, but in 1853 was called to fill the chair of history and English literature in the University of Toronto. While resident in Canada he published 'Prehistoric Man' (1862, revised 1876); 'Chatterton, a Biographical Study' (1869); 'Caliban, the Missing Link' (1873); 'Spring Wild-Flowers' (1875), a volume of poems; 'Reminiscences of Old Edinburgh' (1878); 'Anthropology' (1885); 'The Right Hand: Left-handedness' (1891). In 1881 he became president of Toronto University, a position which he held until his death. In recognition of his services to education and literature he was knighted in 1888.

Wilson, Florence, commonly known by the Latinized form of his name, *FLORENTIUS VOLUSENIUS*, Scotch theologian: b. near Elgin about 1500; d. Vienne, Dauphiny, France, 1547. He was educated at King's College, Aberdeen, became a member of the household of the learned Cardinal du Bellay, archbishop of Paris, and was appointed by Cardinal Sadolet master of the public school of Carpentras. Here he wrote his famous dialogue 'The Tranquillity of Mind' (1543), much prized for its classical erudition and the beauty of its Latin style.

Wilson, Floyd Baker, American lawyer and author: b. Watervliet, N. Y., 23 June 1845. He was graduated from the University of Michigan in 1871 and from the Cleveland Law College (now Adelbert University) in 1873. Admitted to the bar in 1873, he practised in Cleveland till 1880 and since the year last named in New York, making a specialty of corporation law. He is the author of 'Uphill,' a novel (1880); 'Paths to Power' (1901) and has translated 'La Coja y el Encogidlo' (1901).

Wilson, Francis, American actor: b. Philadelphia, Pa., 7 Feb. 1854. He made his first appearance on the stage in a minstrel company, his debut in regular comedy occurring at the Chestnut Street Theatre, Philadelphia, in 1877. He played in various parts with much success and made his initial appearance in comic opera as Sir Joseph Porter in 'Pinafore.' He later became leading comedian in different New York theatres and afterward organized his own company, himself playing the leading comedy roles. He has published, 'The Eugene Field I Knew'; 'Recollections of a Player'; and 'Going on the Stage'; 'Joseph Jefferson' (1906).

Wilson, George, Scottish chemist, brother of Sir Daniel Wilson (q.v.): b. Edinburgh 21 Feb. 1818; d. 22 Nov. 1859. He was educated at the Edinburgh University; became a popular lecturer on chemistry and in 1855 was appointed professor of technology in Edinburgh University. Among his scientific works were 'Text-book of Chemistry' (1850); 'Researches in Color-blindness' (1855); and 'The Five Gateways of Knowledge' (1856), a delightful hymn or prose-poem of science.

Wilson, Harry Leon, American novelist: b. Oregon, Ill., 1 May 1867. He has edited 'Puck' from 1896 and is the author of 'Zig

WILSON

Zag Tales (1896); *The Spenders* (1908); *The Lions of the Lord* (1908).

Wilson, Henry, American statesman: b. Farmington, N. H., 16 Feb. 1812; d. Washington 22 Nov. 1875. His name was originally Jeremiah Jones Colbath, legally changed to Henry Wilson on his reaching manhood. He was a farm apprentice in his native town till the age of 21, when he moved to Natick and learned the shoemaker's trade. After two years' work at this business he had accumulated a small sum of money, which enabled him to attend the academies at Stafford, Wolfborough, and Concord. But the loss of some of his money forced him to cut short his plan for an education, and he returned to his work at Natick in 1838, and finally built up a prosperous shoe factory. In 1840 he took an active part in the presidential campaign in behalf of the Whig party, and in the same year was elected to the lower house of the Massachusetts legislature, was re-elected. In 1848 he withdrew from the Whig party to State senate. At this time he became known as an active opponent of slavery, and in 1845 was selected with J. G. Whittier (q.v.) to present to Congress the anti-slavery petition from Massachusetts against the annexation of Texas. In 1848 he withdrew from the Whig party because of its rejection of anti-slavery resolutions, and took a prominent part in organizing the Free Soil party, purchasing and editing the *Boston Republican* in the interests of that party. In 1850 and 1851 he was elected to the State senate, and was president of that body during both terms. In 1852 he was president of the Free Soil National Convention, and chairman of the national committee; and in 1853 was a member of the Massachusetts Constitutional Convention. In 1855 he was elected to the United States Senate, and shortly after taking his seat made a speech advocating the repeal of the fugitive slave law and the abolition of slavery in the District of Columbia and in the Territories. For a time in 1855 he was associated with the American party; but on its adoption of a pro-slavery platform he withdrew from it and took an active share in organizing the Republican party on the basis of opposition to the extension of slavery. In 1856 he denounced the assault of Brooks on Sumner, and was challenged to a duel by Brooks; though he refused the challenge, he stated that he believed in his right to defend himself if attacked. During the years of 1856-60 he took part in all important debates in the Senate; and his speech in defense of free labor, in reply to Senator Hammond of South Carolina was widely circulated in the Northern States. In January 1859 he was re-elected to the Senate by an almost unanimous vote of the Massachusetts legislature; and on the assembling of the Senate in 1861, was made chairman of the committee on military affairs, a post which the Civil War rendered one of great labor and responsibility. In this capacity he introduced and carried through Congress, during the extra session of 1861, the acts to authorize the employment of 500,000 volunteers, to increase the regular army, and to reorganize the military system. In 1865 he was a third time elected to the Senate, and took a prominent part in all the reconstruction measures, favoring the granting of full civil and political rights to the negroes, but also desiring a liberal treatment of the

Southern whites. In 1871 he was re-elected to the Senate, but resigned in the next year, when elected to the vice-presidency of the United States on the Republican ticket. In 1873 he suffered a stroke of paralysis from which he never fully recovered. At the time of his death he was engaged in writing the last volume of his *'History of the Rise and Fall of the Slave Power in America'* (1873-5), which he left partially incomplete. He also wrote: *'History of the Anti-Slavery Measures of the 37th and 38th United States Congresses'* (1865); *'Military Measures of the United States Congress'* (1866); *'Testimonies of American Statesmen and Jurists to the Truths of Christianity'* (1867); *'History of the Reconstruction Measures of the 39th and 40th Congresses, 1865-8'* (1868). Consult: Russell and Nason, *'Life and Public Services of Henry Wilson'* (1872); Stowe, *'Men of Our Times'* (1868).

Wilson, Henry Bristow, English Anglican clergyman: b. London 1803; d. Lee, Kent, 10 Aug. 1868. He was educated at Oxford, took orders in the Church of England and was one of the four Oxford tutors who in 1841 sent a protest to the editor of *'Tracts for the Times.'* He later became professor of Anglo-Saxon at Oxford, in 1851 vicar of Great Staughton, Huntingdonshire, and was one of the seven clerical authors of the famous volume of *'Essays and Reviews'* (1860); his contribution being *'The National Church.'* He was tried for heresy before the court of Arches but his sentence of a year's suspension from his benefice was reversed by the privy council. He was also the author of *'The Communion of Saints: An Attempt to Illustrate the Principles of Church Union'* (1851), the Bampton lecture contributed to *'Oxford Essays.'*

Wilson, Horace Hayman, English Orientalist: b. London 26 Sept. 1786; d. there 8 May 1860. Educated for the medical profession, in 1806 he went to Bengal as assistant surgeon in the service of the East India Company, but soon obtained an office in the Calcutta mint, of which he afterward became assay-master and secretary. His leisure was devoted to the study of Sanskrit, and so soon did he become known as an able Sanskrit scholar that in 1812 he was elected secretary of the Asiatic Society of Bengal. He acted for many years as secretary of the committee of public education, and his exertions contributed to revive the interest of the Hindus in their own literature as well as to create among them an interest in the science and literature of Europe. He remained in India till his election in 1832 to the Boden professorship of Sanskrit at Oxford University, and soon after his return to England was appointed librarian at the India House, and elected a fellow of the Royal Society. Among his numerous publications are: *'The Megha Duta, or Cloud Messenger,'* a Sanskrit poem, with an English translation, notes, etc. (1813); *'Sanskrit-English Dictionary'* (1819); *'Hindoo Theatre,'* select specimens translated from the original Sanskrit (1827); *'The Vishnu Purana—a System of Hindu Mythology and Tradition,'* translated from the original Sanskrit and illustrated by notes (1840); *'Grammar of the Sanskrit Language for the Use of Early Students'* (1841); *'Rig-Veda Samhita,'* translated from the original Sanskrit (1850-58), the last vol-

WILSON

umes being prepared by Cowell and Webster, after Wilson's death.

Wilson, James, American jurist: b. near Saint Andrews, Scotland, 1742; d. Edenton, N. C., 28 Aug. 1798. Educated at the universities of Glasgow, Saint Andrews and Edinburgh, he came to America in 1763 and settled in Philadelphia in 1766. After tutoring in what is now the University of Pennsylvania he studied law and was admitted to the bar in 1767. He sat in the Pennsylvania provincial convention in 1774 and in the Continental Congress 1775-7, 1782-3, and 1785-87, and was a signer of the Declaration of Independence. He served as delegate in the Constitutional Convention of 1787, taking a prominent part in the debates and later helping to secure the ratification of the Federal Constitution by Pennsylvania (1790). His speeches in these conventions have been highly commended for their profound comprehension of constitutional theory. In September 1789, he was appointed an associate justice of the United States Supreme Court and in 1790 became professor of law in the University of Pennsylvania. His writings include such important pamphlets as 'Considerations on the Nature and Extent of the Legislative Authority of the British Government' (1774); 'Address to the Citizens of Philadelphia' (1784). Consult his 'Works,' edited by his son, Bird Wilson (1803-4), and Andrews (1896).

Wilson, James, American globe maker: b. Londonderry, N. H., 1763; d. Bradford, Vt., 26 March 1855. Up to the age of 33 he was a farmer in his native place, at the same time reading and studying geography and astronomy. In 1796 he moved to Bradford, Vt., where he began experimenting with balls turned from blocks of wood and covered with paper. This rude beginning was followed by a much better method. The solid balls were thickly covered with layers of paper firmly pasted together, and this shell was then divided into hemispheres, which being removed were again united, and finished with due regard to lightness, strength and smoothness. He procured copper plates of sufficient size for his 13 inch globes, protracted his maps on them in sections, tapering as the degrees of longitude do from the equator to the poles and engraved them with such admirable accuracy of design, that when cut apart and duly pasted on his spheres, the edges with their lines, and even the different parts of the finest letters would perfectly coincide and make one surface, truly representing the earth or celestial constellations. He published his first globes in 1814. When past 80 he constructed a machine which illustrated the daily and yearly revolutions of the earth; the cause of the successive seasons; and the sun's place for every day of the year, in the ecliptic. These movements were produced by turning a crank, which caused the earth to revolve about the sun in the plane of the ecliptic, always retaining its true relative position. For want of a more definite name the machine was called Wilson's Planetarium. The large copper plate, on which are printed the months of the year, with their days, and the corresponding signs of the zodiac with their degrees, was engraved by Wilson after he was 63 years of age.

Wilson, James, American politician: b. Ayreshire, Scotland, 16 Aug. 1835. He came with his parents to the United States in 1852, and settled in Iowa in 1855. He was educated at Iowa College, engaged in farming in 1861, and in that year was elected to the State legislature, where he served for three terms, acting as speaker for the last two years. He was a member of Congress in 1872-7, State railway commissioner in 1877-83, and in 1883-5 was again a member of Congress. He was a regent of the State University in 1870-4, and in 1890-7 was director of the Agricultural Experiment Station and professor of agriculture at the Iowa Agricultural College, Ames, Iowa. He was appointed secretary of agriculture by President McKinley in 1897, was reappointed in 1901, and retained in office by President Roosevelt upon his accession to the presidency.

Wilson, James F., American politician: b. Newark, O., 19 Oct. 1828; d. Fairfield, Ia., 22 April 1895. He studied law, settled at Fairfield, Ia., in 1853, was elected to the convention for a revision of the State constitution in 1856, sat in both houses of the State legislature, and was president of the senate in 1861. From 1861 to 1869 he was a member of Congress, where he was chairman of the judiciary committee and one of the managers of the impeachment of Andrew Johnson. In 1883 he was elected to the United States Senate, and in 1889 re-elected. He was made a commissioner for the Pacific railway.

Wilson, James Grant, American author: b. Edinburgh, Scotland, 28 April 1832. He was brought to this country in infancy by his father, William Wilson (q.v.), served in the Union army during the Civil War, and reached the rank of brigadier-general. After the war he settled in New York and has been president of the New York Genealogical and Biographical Society from 1884. Among his numerous publications are: 'Biographical Sketches of Illinois Officers' (1862-3); 'Love in Letters, Illustrated in the Correspondence of Eminent Persons' (1867); 'Life of Fitz-Greene Halleck' (1869); 'Sketches of Illustrious Soldiers' (1874); 'Poets and Poetry of Scotland' (1876); 'Centennial History of the Diocese of New York, 1775-1885' (1886); 'Bryant and His Friends' (1886); 'Commodore Isaac Hull and the Frigate Constitution' (1889); 'Life of General Grant' (1897); 'The Presidents of the United States' (1901); 'Thackeray in the United States' (1903). He was the editor (with John Fiske) of 'Appleton's Cyclopaedia of American Biography' (6 vols. 1886-9), and alone, of 'Memorial History of the City of New York' (1892-3).

Wilson, James Harrison, American soldier: b. near Shawneetown, Ill., 2 Sept. 1837. He was graduated from West Point in 1860, was promoted lieutenant in 1861, and was chief topographical engineer on the Port Royal expedition. He was brevetted major for conduct at Fort Pulaski, Ga., and subsequently was side-de-camp to General McClellan, participating in the battles of Antietam and South Mountain. In the campaign against Richmond and in the operations against Chattanooga and Knoxville he was assistant engineer and inspector-general of the Army of Tennessee, and in 1863 was made brigadier-general of volunteers, and

WILSON

brevet lieutenant-colonel of regulars for gallantry at Chattanooga. He was brevetted colonel for conduct at the battle of the Wilderness, and was engaged in the siege of Petersburg and in the Shenandoah campaign. In September 1864 he was transferred to the command of the cavalry of the Mississippi Division, took part in General Thomas' campaign in Tennessee and was conspicuous at the battles of Franklin and Nashville. In March 1865 he made a raid into Alabama and Georgia and in 28 days captured Selma, Montgomery, Columbus, and Macon, taking 6,800 prisoners, among whom was Jefferson Davis. He received brevet rank as brigadier- and major-general and in 1866 was mustered out of the volunteer service. He was appointed lieutenant-colonel in the regular army in that year, but resigned in 1879, and was subsequently engaged in railroad engineering until the outbreak of the Spanish-American war when he was appointed major-general of volunteers and was assigned to command a division in Porto Rico. He was retired with the rank of brigadier-general of regulars in 1901. In 1902 he represented the United States army at the coronation of Edward VII. He has published, with C. A. Dana, 'Life of General Grant' (1868); 'Life of Andrew Alexander' (1887); 'China, Travels and Investigations in the Middle Kingdom' (1887-1900).

Wilson, Jeremiah Morrow, American jurist: b. Warren County, Ohio, 25 Nov. 1828; d. Washington, D. C., 24 Sept. 1901. He received an academic education; was judge of the Court of Common Pleas of Fayette County, Ind., 1860-5; judge of the Circuit Court 1865-71, and member of Congress in 1871-5. After retiring from Congress he took up the practice of law in Washington, D. C., and during his professional career in that city was connected with numerous famous cases. Besides having acted as attorney for the Union Pacific Railroad and the Mormon Church, he was counsel in the court-martial of General Swain, and was connected with the "Alabama Claims" and the French "Spoliation" cases; etc.

Wilson, John, American colonial clergyman: b. Windsor, England, 1588; d. Boston, Mass., 7 Aug. 1667. He was educated at King's College, Cambridge; was made fellow there; studied law, but took orders; was minister of Sudbury, Suffolk; and having frequently been suspended as a Puritan, embarked with John Winthrop for America in 1630 and landed at Salem, Mass. At Charlestown he organized what afterward became the First Church of Boston, of which he was ordained pastor in 1632. He was opposed to the so-called "Antinomian heresy" of the time; was associated with John Eliot in missionary work among the Indians; and was chaplain to the force sent in 1639 against the Pequots of Connecticut. He published: 'Some Helps to Faith' (1625); a poem, 'Famous Deliverances of the English Nation' (1626); a Latin poem commemorating John Harvard; and 'The Day Breaking, If Not the Sun Rising, of the Gospel' (1647; new ed. 1865). He had, says Cotton Mather, "so nimble a faculty of putting his devout thoughts into verse, that he signalized himself by . . . sending poems to all persons, in all places, on all occasions."

Wilson, John, Scottish author, best known by his pseudonym "CHRISTOPHER NORTH": b. Paisley 18 May 1785; d. Edinburgh 3 April 1854. He was educated at Glasgow University and Magdalen College, Oxford, and while at Oxford was noted for his skill in boating, cricketing, and other athletic sports. Having at 21 come into a large fortune, he purchased the property of Elleray, on Windermere, and retired there to live at his ease, writing poetry, and engaging in field sports and occasional wild frolics, to which the exuberance of his animal spirits was ever impelling him. In 1812 he wrote the once-famed 'Isle of Palms.' Another poem, in dramatic form, 'The City of the Plague' (1816), was still more successful; but is now forgotten. Wilson's fame with posterity rests on his prose writings, and more especially his contributions to 'Blackwood's Magazine.' Among the numerous papers furnished by Wilson may be mentioned those celebrated ones on fishing, shooting, and kindred pursuits, produced under the well-known sobriquet of "Christopher North," and above all his renowned 'Noctes Ambrosianae,' a series of conversations on literary and general subjects, supposed to take place at certain convivial meetings held in Ambrose's Tavern by the contributors to the 'Magazine' and since reprinted separately. In 1820 he obtained the chair of moral philosophy in the University of Edinburgh, a post he occupied with credit for 32 years. In 1822 to 1824 he published three prose works of fiction, 'Lights and Shadows of Scottish Life'; 'The Foresters'; and 'The Trials of Margaret Lyndsay,' which are marked by pathos and beauty of description, but are far from being faithful transcripts of human nature, and degenerate at times into mawkish sentimentality. A government pension of £300 per annum was bestowed on him in 1851, and the following year he resigned his professorship. There is an incomplete edition of his works by Ferrier (12 vols., 1855-8), and a separate edition of the 'Noctes' by R. S. Mackenzie (3 vols., 1866). Consult 'Mémorial' by his daughter, Mrs. Gordon (1862); Saintsbury, 'Essays in English Literature' (1890); Mrs. Oliphant, 'William Blackwood and His Sons' (1897); Douglas, 'The Blackwood Group' (1897).

Wilson, John, Scottish missionary: b. Lauder, Scotland, 11 Dec. 1804; d. Bombay, India, 1 Dec. 1875. He was educated at the University of Edinburgh, went to Bombay in the service of the Scottish Missionary Society in 1828, and in 1835 transferred his labors to the mission work of the Free Church of Scotland. He established numerous schools; became vice-chancellor of the University of Bombay; contributed largely to the abolition of the practice of suttee; traveled all over India establishing missionary centres; and was universally honored and beloved by the natives, among whom he spent his life from the time he went among them with the exception of the years 1843-7. He founded in 1830 the 'Oriental Christian Spectator,' issued for 30 years, and was the pioneer of Christian periodicals in India. His linguistic ability was remarkable, and his contributions to literature included: 'The Parsi Religion' (1842); 'India Three Thousand Years Ago' (1857); 'Memoirs on the Cave-Temples of India' (1859); 'The Lands of the

WILSON

Bible Visited and Described (1867); and **'Indian Caste'** (1877). Consult George Smith, **'Life of Wilson'** (1878).

Wilson, John Mackay, Scottish author: b. Tweedmouth 1804; d. Berwick-on-Tweed 2 Oct. 1835. He edited for several years the **'Berwick Advertiser'** and was editor and principal author of the popular **'Tales of the Borders'** (1835-40). The latest edition, revised and enlarged to 24 volumes, appeared in 1869.

Wilson, John Moulder, American military engineer: b. District of Columbia 8 Oct. 1837. He was graduated from West Point in 1860, received rank as lieutenant in 1861 and subsequently served in the Manassas, Peninsular, and Maryland campaigns. He was conspicuous for gallantry at Gaines's Mills and at Malvern Hill in 1862, and in 1863 was promoted captain, subsequently serving in the engineer corps. In 1865 he was brevetted colonel of volunteers and both lieutenant-colonel and colonel of regulars for gallantry at the capture of Spanish Fort in Mobile Harbor, and at Fort Blakely. After the war he was in charge of various important engineering works under the government and in 1886-9 was superintendent of public buildings and grounds in the District of Columbia. He directed the completion of the Washington Monument, the construction of the Army Medical Museum and Library, and other public buildings and memorials. He was appointed superintendent of the Naval Academy in 1889; in 1897 was appointed chief of engineers with rank of brigadier-general and was retired at his own request in 1901. In 1902 he was appointed to represent the army at the coronation of Edward VII.

Wilson, John Timothy, American organizer: b. Riceville, Tenn., 29 Jan. 1861. He worked on a farm until 17, filled several positions on a railroad and in 1888 began the organization of the International Brotherhood of Maintenance-of-Way Employees, of which he has been president since its start. It has nearly 100,000 members, has secured increased wages, shorter hours, and improved working conditions, with but one strike on its records. Wilson published **'The Calcium Light'**, an account of this strike (on the Canadian Pacific, 1901).

Wilson, Richard, Welsh landscape-painter: b. Penegoes, Montgomeryshire, 1714; d. Llanberia, Carnarvonshire, May 1782. He went to London, and studied portrait-painting with Thomas Wright. He then practised his profession in London, at length went to Italy, and at Venice, Zuccarelli, the artist, persuaded him to devote himself wholly to landscape. After staying some time at Rome and Naples, where he acquired great reputation, he returned to England in 1756, and settled in the metropolis. He had for a while much employment; but was at length doomed to undergo indifference and neglect, and was glad to obtain the office of librarian to the Royal Academy in 1776. His taste was exquisite, and whatever came from his easel bore the stamp of elegance and truth. Among his best works are the **'Niobe'**, **'Ruins of the Villa of Maecenas'**, **'Phaethon'**, **'Snowdon'**, **'View of Rome from the Villa Madama'**. Two of his works are to be seen in the New York Metropolitan Museum.

Wilson, Sir Robert Thomas, English soldier and author: b. London 17 Aug. 1777; d. there 9 May 1849. He was educated at the Westminster and Winchester schools, volunteered for the war in Flanders in 1793-4, and was a member of the staff during the Irish rebellion of 1798. He served in Holland in 1799 and in 1800 was engaged under Abercrombie in Egypt. He served under Lord Hutchinson on a secret mission to the allied armies on the Russian frontier in 1806-7, and in 1808-10 commanded a Lusitanian legion and later a Spanish brigade in Spain and Portugal. He sat in Parliament for Southwark in 1818-31 and for his espousal of the cause of Queen Caroline he was dismissed from the army in 1821, but subsequently reinstated. He received promotion to full rank as general in 1841 and in 1842-9 was governor of Gibraltar. He was author of several works on military subjects, several of which were not published until after his death, when they were edited by his son-in-law, Rev. Herbert Randolph. They include: **'History of the British Expedition to Egypt'** (1802); **'Sketches of the Campaigns in Poland'** (1810); **'Military and Political Power of Russia'** (1817); **'Narrative of Events During the Invasion of Russia'** (1860); **'Diary'** (1861); etc. Consult Randolph, **'Life of Gen. Sir Robert Thomas Wilson'** (1863).

Wilson, Rufus Rockwell, American author: b. Troy, Pa., 14 March 1865. He was engaged in journalism in Pittsburg, Washington, and New York in 1883-91, and has published: **'Rambles in Colonial Byways'** (1900); **'Washington--The Capital City'** (1901); **'New York, Old and New'** (1902); **'Lincoln in Caricature'** (1903); etc.

Wilson, Theodore Delevan, American naval constructor: b. Brooklyn, N. Y., 11 May 1840; d. Boston, Mass., 29 June 1896. He served an apprenticeship in the Brooklyn navy yard and in 1861 was appointed a carpenter in the construction department of the navy. In 1866 he was appointed assistant naval constructor; subsequently he was engaged in the navy yards at Pensacola, Philadelphia, and Washington. In 1869-73 he was instructor in naval architecture and shipbuilding at the Naval Academy, Annapolis, Md., and in the last mentioned year was promoted to be naval constructor. He was chief constructor of the navy from 1882-93, when he resigned because of failing health, and was granted a two years' leave of absence, resuming his duties at the Boston navy yard in 1895. He was an honorary member of the Institute of Naval Architects of England, the first American to be elected to that body. He patented in 1870 the **'air-ports'**, since generally adopted in the navy and in merchant-ships, and in 1880 patented a bolt extractor which has since come into general use. During his service he designed the battleship **Maine**, the cruisers **Boston**, **Chicago**, and **San Francisco**, the gunboats **Concord**, **Bennington**, **Petrel**, and other vessels. He wrote **'Shipbuilding, Theoretical and Practical'** (1873), which was adopted as a text-book at the Naval Academy.

Wilson, Thomas, English Anglican prelate: b. Burton, England, 20 Sept. 1663; d. Isle of Man 7 March 1755. He was educated at Trinity College, Dublin, and was curate of Newchurch Kenyon, 1686-92. He then became

WILSON

chaplain to the Earl of Derby, who appointed him bishop of Sodor and Man in 1697. His episcopate lasted 38 years and is noted for his strict insistence upon his privileges as head of the ecclesiastical court. This occasioned frequent disputes with the governor of the Isle of Man and he was at one time imprisoned for two months. He was the author of 'Principles and Duties of Christianity' (1707), commonly called the Manx Catechism—the first book printed in the native tongue; 'The Knowledge and Practice of Christianity Made Easy to the Meanest Capacities' (1775); 'Short and Plain Instructions for the Better Understanding of the Lord's Supper' (1736); 'Sacra privata, Private Meditations, Devotions, and Prayers' (1800); 'Parochialia, or Instructions for the Clergy' (1788); 'Maxims of Piety and Christianity' (1789). He instituted a Manx translation of the Bible, completed 1772-5. Consult 'Lives' by Crutwell (1781); Keble (1847).

Wilson, William, American poet: b. Perthshire, Scotland, 25 Dec. 1801; d. Poughkeepsie, N. Y., 25 Aug. 1860. He edited the Dundee 'Review,' 1821-3, did newspaper work in Edinburgh, where he was a friend of the brothers Chambers, and coming to this country in 1833, established himself at Poughkeepsie as bookseller and publisher. His 'Poems,' edited by Lossing, appeared in 1870 and revised and enlarged editions in 1875 and 1884.

Wilson, William Dexter, American philosopher and Episcopal clergyman: b. Stoddard, N. H., 26 Feb. 1816; d. Syracuse, N. Y., 30 July 1900. He was graduated from the Harvard Divinity School in 1838 and took orders in the Episcopal ministry in 1842. In 1850-68 he occupied the chair of philosophy at Hobart College, resigning in the last mentioned year to become registrar and professor of moral philosophy at Cornell University. He was made professor emeritus there in 1886 and during the last years of his life was dean of Saint Andrew's Seminary at Syracuse. He published: 'Introduction to the Study of the History of Philosophy' (1872); 'First Principles of Political Economy' (1875); 'The Foundations of Religious Belief' (1883); 'Theories of Knowledge Historically Considered' (1889); etc.

Wilson, Sir William James Erasmus, English surgeon and philanthropist: b. London 25 Nov. 1809; d. Westgate-on-Sea, Kent, 8 Aug. 1884. He went through a course of hospital practice in Paris, where he became known to Cuvier and Geoffroy de St. Hilaire, later attached himself to the Aldersgate School of Medicine, and was engaged in 1831 as assistant to Dr. Quain, professor of anatomy in University College. His first work, 'Practical and Surgical Anatomy,' was published in 1838, followed in 1840 by the 'Anatomist's Vade Mecum.' About this time he determined to devote himself to dermatology, and soon became the acknowledged authority in that hitherto obscure branch of medical science. He became fellow of the Royal College of Surgeons in 1843, and president in 1871. In 1845 he was elected a fellow of the Royal Society. By the time he had reached his 50th year he had amassed considerable wealth, and he then began a series of public and private acts of munificence, founding a professorship of dermatology in the College of

Surgeons, the chair of which he filled for nine years, contributing £7,000 to Epsom Medical College, restoring the ancient church of Swanscombe, Kent, founding a chair of pathology at Aberdeen, subscribing liberally to the Royal College of Music, and to the Margate Sea-bathing Infirmary. He devoted much attention to Egyptology, was president of the Egypt Exploration Fund, and furnished £10,000 for the transport of the obelisk known as 'Cleopatra's Needle' from Alexandria to its present site on the Thames Embankment. In 1881 he was knighted. Besides many publications in his special science he published, 'Cleopatra's Needle, with Notes on Egypt and Egyptian Obelisks'; and 'The Egypt of the Past.'

Wilson, William Lyne, American educator and legislator: b. Jefferson County, Va., 3 May 1843; d. Lexington, Va., 17 Oct. 1900. He was graduated from Columbian College in 1860, and later studied at the University of Virginia. He served as a private in the Confederate army through the Civil War, and in 1865-71 was professor of ancient languages at Columbian College. He was meantime engaged in the study of law, in 1867 was admitted to the bar, and several years later began practising law in Charlestown, W. Va. He was elected president of the University of Virginia in September 1882 and in the same month was elected to Congress. In June 1883 he resigned his presidency of the university, but served continuously in Congress until 1894. He framed the Wilson Tariff Bill (see *Tariff*), but disapproved of the amendments it received in the Senate. In 1895 was appointed postmaster-general by President Cleveland, and from 1897 until his death was president of Washington and Lee University.

Wilson, Woodrow, American educator and historian: b. Staunton, Va., 28 Dec. 1856. Graduated from Princeton in 1879 he studied law in the University of Virginia, and practised at Atlanta, Ga., in 1882-3. After special studies in history and politics at the Johns Hopkins University (1883-5), he was an associate-professor at Bryn Mawr in 1886-8, in 1888-90 professor of history and political economy in Wesleyan University, and in 1890 was appointed to the chair of jurisprudence and politics at Princeton. Upon the resignation of President F. L. Patton (q.v.) in 1902, he was elected president of the university, the first layman so chosen. He contributed largely to periodicals on administrative and political subjects, and took high position as a scholar and author by a series of works, including: 'Congressional Government: A Study in American Politics' (1885), which gained for him recognition on both sides of the Atlantic, and in England was taken as authoritative on American institutions; 'The State: Elements of Historical and Practical Politics' (1885), a standard book; 'Division and Reunion 1829-1889' (1893); 'An Old Master, and Other Political Essays' (1893); 'More Literature, and Other Essays' (1896); 'George Washington' (1896); and 'A History of the American People' (1902). He was the Democratic candidate for Governor of New Jersey in 1910, and was elected by a plurality of 40,056. In 1912 he was nominated by the Democratic National Convention at Baltimore for President of the United States, and elected 5 November.

WILSON — WILSON'S CREEK

Wilson, N. C., town, county-seat of Wilson County; on the Atlantic Coast Line Railroad; about 42 miles east by south of Raleigh. It is in an agricultural region in which the chief products are cotton and tobacco. The principal manufacturing establishments are cotton and lumber mills, carriage factories, foundries, machine shops, tobacco works, and flour mills. The town owns the electric light plant and the waterworks. The three banks have a combined capital of \$210,000. There are public and private schools for both races. Pop. (1870) 2,126; (1900) 3,525; (1910) 6,717.

Wilson Bill, The, a tariff measure enacted by Congress in 1895, succeeding the McKinley Bill (q.v.) of 1890. The Wilson tariff bill was based on the cost of raw material rather than on the cost of production, and was passed in the interest of the manufacturer. By this bill wool was placed on the free list or was made free of duty.

Wilson College, a college for women, located at Chambersburg, Pa. It was established in 1870 under the auspices of the Presbyterian Church. The majority of the board of trustees are Presbyterians, and the college is under the special care of the Synod of Pennsylvania. The courses offered are a classical course leading to the degree of A.B., a musical course leading to the degree of bachelor of music, and an art course entitling the student to a diploma in art. Each course is four years in length; the work in all courses includes required and elective studies, the latter coming mostly in the junior and senior years. Bible study is required in all courses. History and theory of art and music are included among the regular electives of the classical course; and arrangements are made so that students can take technical art and music courses and at the same time do the full amount of work required for the A.B. degree. There are also preparatory, classical, art, and music courses. Gymnastic work is required for three years of the college course, and the outdoor sports of rowing, tennis, basketball, and hockey are encouraged. The students maintain three literary societies, one for the preparatory and younger students; membership in one of these societies is required. The college campus comprises 25 acres located in the suburbs of Chambersburg; the Conococheague flows through the grounds, affording opportunity for rowing and fishing. The buildings include Main Hall, Fletcher Hall, South College, Science Hall, the Dining Hall, the Gymnasium, Frank Thomson Music Hall, with a large auditorium, the infirmary, and Harmony Cottage. Tuition is free to ministers' daughters who live at the college. The library in 1910 contained 7,000 volumes, the students numbered 365, of whom 177 were in the classical course.

Wilson Law. See ORIGINAL PACKAGE.

Wilson's Creek, or Oak Hills, Battle of. After the battle of Carthage (q.v.) 5 July 1861, Col. Sigel retreated to Springfield. Gen. N. Lyon who, with 2,350 men, had left Boonville in pursuit of Gov. Jackson, was joined near Clinton, on the 7th, by Major S. D. Sturgis, with 2,500 men and pushing southward learned on the 9th that Gen. Jackson had defeated Sigel at Carthage and formed a junction with Gens. Sterling Price and Ben McCulloch, who were marching from the southwest, upon which he

made a rapid march to Springfield, to anticipate Confederate attack on that place. He arrived on the 13th, and, with Sigel's forces, his united command numbered about 6,200 men. He spent the latter part of July in drilling his troops and procuring supplies and sent many urgent but unavailing appeal to Fremont at Saint Louis for reinforcements. The Confederates under Price and McCulloch numbered over 8,000 men, poorly armed with shotguns and country rifles, and had followed Sigel as far as Cassville, about 50 miles from Springfield. Here reinforcements arrived, swelling their force to 11,000 men with 15 guns, and 31 July they advanced toward Springfield. Lyon heard of their advance on 1 August and marched out on the Cassville road to meet them, with about 6,000 men and 18 guns, hoping to attack the largest and most advanced force, drive it back on the others and strike them in detail. On the next day his advance met and had a lively encounter with Price's advance under Gen. Rains, at Dug Spring, and drove it back. After advancing several miles he returned to Springfield on the 5th and reported the condition of affairs to Fremont, that he was largely outnumbered and probably would be compelled to abandon Springfield and fall back to Saint Louis or into Kansas (see SPRINGFIELD). McCulloch had refused to support Price in the affair at Dug Spring and now refused to advance unless he was acknowledged as in supreme command. Price consented to serve under him and at midnight of the 5th McCulloch advanced hoping to surprise Lyon, but finding that he had gone followed and on the 6th went into camp on Wilson's Creek within ten miles of Springfield. As the Confederates showed no disposition to advance from Wilson's Creek, Lyon, on the 8th, proposed to make a night march and attack them at daylight next morning, from which he was dissuaded, but it was agreed to march on the night of the 9th and attack the Confederate left at daybreak of the 10th. After this plan had been agreed on Col. Sigel persuaded Lyon to permit him with his brigade of two regiments, a six-gun battery, and two companies of cavalry to make a flank march around the Confederate right and attack from the south, while Lyon with the remainder of his force should attack on the north. Sigel, with his 1,200 men and six guns, moved four miles down the Cassville road, and making a long detour to the left, at daybreak was within a mile of the Confederate rear. Meanwhile Lyon had marched from Springfield and at 4 A.M. struck the advanced picket of Rains' Missouri command, which gave the alarm, the Confederates turned out of their camps and prepared for action and at 5.30 A.M. one of the most stubborn battles of the war began. The point selected by Lyon for his main attack was on the south side of Wilson's Creek and was held by Gen. Price with about 3,200 Missourians including Guibor's and Bledsoe's batteries, reinforced later by Churchill's regiment and Woodruff's battery, both from Arkansas. On Price's right, north of the creek, was McCulloch's brigade; on McCulloch's left and rear and on the same side of the creek was Pearce's Arkansas brigade, while in Price's rear, on the south side of the creek, were Churchill's regiment and the cavalry commands of Green and Major.

Gen. Lyon, with about 4,000 infantry and cavalry and the two batteries of Totten and

WILSON'S RAID

Dubois advanced more than a mile, driving in the Confederate skirmishers to the main line, which was posted on a wooded ridge perpendicular to the creek and to the Union line of march. He made an attack and the Confederates on the right were driven from the crest to the foot of the ridge. At the same time Capt. Plummer, with 300 regular infantry and 200 Home Guards, moving on the left and beyond the creek, upon entering a cornfield was attacked by the 3d Louisiana and other parts of McCulloch's brigade and after a fierce fight was checked. Dubois' battery opened upon these Confederates from across the creek and drove them back in some disorder and Plummer was withdrawn. It was now 8 o'clock, there was a temporary lull in Lyon's front, save by an effort of Price to turn his right, which was repulsed, and meanwhile Sigel had become engaged. Sigel had gained the Confederate rear and when he heard Lyon's musketry, he put his guns in position, drove Churchill, Major and Green from their camps, while they were at breakfast, crossed the creek and marching to the Springfield and Fayetteville road, formed across it at Sharp's Farm, the Confederates that had retired before him joining Price. McCulloch now sent a battalion of mounted Missourians and some Texans, and a part of the 3d Louisiana against Sigel. Bledsoe's battery opened on his front, Reid's battery joined in the enflading fire, the Louisiana men charged and captured five of his guns, and he was driven from the field, pursued the way he had come by the Texas and Missouri cavalry, and his command broken and scattered, Sigel himself narrowly escaping capture. Col. Salomon, with 450 men, made a wide detour and reached Springfield in fair shape, but Sigel's command took no further part in the battle. The contest had been renewed by Price, and the Confederates now turned their entire attention to Lyon, and McCulloch's brigade and Pearce's Arkansas brigade were sent to reinforce Price. Lyon ordered up every available man to meet the shock he saw impending, and about this time Price made a determined advance in two lines which nearly covered Lyon's entire front. For an hour the fighting was desperate, with varying success, till at last the Confederate effort was exhausted and there was another lull. Nothing had been heard from Sigel, and Pearce's Arkansas brigade was coming up to the support of Price's right, and Lyon made disposition to meet the new danger. His horse had been killed under him, and himself wounded and stunned, but recovering and again mounted, he swung his hat and led a charge against the Confederate right, which was met by a severe fire, the charge was not checked and the enemy were driven back, but Lyon received a wound near the heart, endeavored to dismount from his horse, and as he fell into the arms of his orderly, almost immediately expired. Major Sturgis succeeded to the command and the contest was continued for a half hour, when the Confederates gave way a short distance to re-form and make another effort. This was soon made and resulted in a disastrous repulse, and the battle was ended. Taking advantage of this last repulse, Sturgis, against the advice of some of his officers, ordered a retreat and withdrew through the dense undergrowth of the woods in which the battle mainly was fought, and the Confederates, as one of their officers writes,

"were glad to see him go" and did not pursue. Lyon's dead body was left on the field; it was subsequently delivered by the Confederates and taken to Springfield where it was buried. When Sturgis reached Springfield he yielded the command to Sigel, who had arrived there before him. Next morning Sigel marched for Rolla, over 100 miles distant. McCulloch refused to pursue Sturgis from the field of battle, and Price, resuming command of the Missouri troops, on the next day took possession of Springfield. The Union force in the battle numbered about 5,400 officers and men. The Confederates had over 10,000 armed men on the field, but 3,000 of them took little or no part in the fight. As officially reported the Union loss was 223 killed, 721 wounded, and 291 missing; the Confederate loss 265 killed, 800 wounded, and 30 missing. The Union reports were not full and a revised statement gives 258 killed, 873 wounded, and 186 missing, an aggregate of 1,317. Col. Snead, Price's adjutant general, places the Confederate loss at 279 killed and 951 wounded, an aggregate of 1,230.

Consult: 'Official Records,' Vol. III.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. I.; Snead, 'The Fight for Missouri.'

E. A. CARMAN.

Wilson's Raid from Chickasaw to Selma, Alabama, and Macon, Georgia. After the defeat of Hood's army at Nashville (q.v.) 15-16 Dec. 1864, Gen. James H. Wilson proceeded to complete the organization of a cavalry corps, with which it was proposed to overrun the South, and destroy its railroads and manufacturing centres. Early in March 1865, 27,000 men had been gathered and organized, nearly all well mounted, finely equipped and brought to a high state of efficiency. Some of this force was detached for other duty. Wilson, who had been encamped along the north bank of the Tennessee River from Gravelly Springs to Waterloo Landing, crossed the river on 18 March and started from Chickasaw and Waterloo, on the 22d for a march through northern Alabama, his first objective point being Selma, a great manufacturing place. He had the three divisions of Generals Emory Upton, Eli Long, and E. M. McCook, aggregating 12,500 mounted men with 24 guns. He had also 1,500 dismounted men, who were to act as train guards till they could be mounted from captured horses. Gen. Sherman says it was the largest, most efficient and most powerful body of horse that had ever come under his command. It was not excelled by any body of cavalry in the army. Accompanying it was a small canvas pontoon train of 30 boats, hauled by 50 six-mule teams, and a supply train of 250 wagons which were sent back to the Tennessee as fast as they were unloaded. This train carried 45 days' rations of coffee, 20 of sugar, 15 of salt and 80 rounds of ammunition. Each man carried five days' light rations, with 100 rounds of ammunition, and five days' rations of hard bread and ten of sugar and salt were carried on pack animals. As the entire country near the Tennessee was nearly destitute of forage it was necessary to scatter the troops over a wide extent and march as rapidly as circumstances would permit. This, Wilson says, was rendered safe by the fact that Gen. Forrest's Confederate forces were at the time much scattered, some near West Point, Miss., 19

WILSON'S RAID

miles southwest of Eastport, while Roddey's forces occupied Montevallo, on the Alabama and Tennessee Railroad, nearly the same distance to the southeast. By starting on diverging roads the enemy was left in doubt as to the real object and compelled to watch equally Columbus, Tuscaloosa, and Selma. Therefore the divisions marched on different roads, but the objective point of each was Selma, distant 180 miles, and the average march of each division to reach it was 250 miles. The command moved southward in three columns and on the 26th reunited at Jasper, about 80 miles southeast of Tusculum, from which it crossed the two forks of the Black Warrior, and pushed for Montevallo, a centre of iron manufacture. Gen. Croxton's brigade was detached to move on Tuscaloosa, to burn bridges, factories and public stores, and rejoin the command in the vicinity of Selma. Iron-works and rolling mills were destroyed near Elyton and 31 March, after passing Montevallo a mile, Upton encountered Roddey, who disputed the road to Randolph. After two brisk engagements Roddey was driven back, losing 100 men, and was pursued by Upton, who occupied Randolph at dark. Here a courier was captured, with despatches to Forrest, showing that several columns were moving to join Forrest for the defense of Selma, and detachments were sent to check them. McCook was left at Randolph to guard the trains and rear, while Wilson, with the divisions of Long and Upton, on 1 April, rode straight for Selma, encountered and brushed away several detachments of Forrest's cavalry and at Ebenezer Church came upon Forrest in position, with the brigades of Roddey, Crossland and D. Adams, about 1,500 men, covering the two roads from Randolph by which Wilson had marched. Long's division and Alexander's brigade of Upton's attacked and carried the position in less than an hour, the Confederates retreating in great disorder toward Selma despite all of Forrest's efforts to rally them. At night the whole command bivouacked about Plantersville, 19 miles from Selma, after almost constant fighting during the day of 24 miles, during which Wilson had captured 3 guns and over 200 prisoners. Early in the day McCook, with Col. La Grange's brigade, had been ordered to march rapidly to Centreville, 40 miles distant, to seize and hold the bridge over the Cahaba, and to fall upon Jackson's Confederate cavalry division, which had thrust itself between the main body and Croxton. At daylight 2 April Wilson resumed his march and by rapid movement, without opposition, the troops were in sight of Selma and mostly in position by 4 P.M. The city had been sufficiently fortified, as was believed, against any possible cavalry attack. The works contained 24 bastions and a number of strong redans, with deep ditches, and an interior line of four detached forts. They were of semicircular form, nearly three miles in extent, with both flanks resting on the Alabama River, above and below the city. They mounted 32 guns and were held by Forrest, with about 4,000 veteran cavalry and some 2,000 Alabama militia, home guards and citizens, mostly old men and young boys. Wilson had obtained accurate plans of the works and of the ground in front of them. During the day these sketches were shown to all his general officers and the plan of attack explained, from

which it resulted that upon reaching the vicinity of the works, the various brigades went quickly into position, with great precision. At a given signal Long's division was to lead in the assault, supported by Upton, but before the signal had been given Long had become engaged and without waiting he ordered the charge, and in the gathering darkness his men went forward, under a severe fire of artillery and musketry, scaled the works and after a hand to hand encounter drove the Confederates from them and took many prisoners. Some of Upton's men joined in the fight. Gens. Forrest, Armstrong, Roddey and Adams escaped, with a number of men, under cover of darkness. A portion of Upton's division pursued on the Burnsville road until long after midnight, capturing 4 guns and many prisoners. Wilson had engaged and in support, 8,000 men. His loss was 44 killed, 277 wounded, and 7 missing. Forrest's loss in killed and wounded was less. It was one of the most remarkable feats ever accomplished by cavalry, and its result was the capture of 2,700 prisoners, many colors, nearly 2,000 horses, 104 field and siege guns and an immense quantity of ammunition. Wilson destroyed the arsenal, with 44 buildings, covering 13 acres, filled with machinery and munitions, powder works, 3 gun foundries, 3 rolling mills, and several machine shops, and large accumulations of quartermaster and commissary stores. On the 3d Upton's division was sent from Selma to open communication with McCook and Croxton, west of the Cahaba. McCook had found Jackson's cavalry between himself and Croxton, and after skirmishing with it at Scottville, had retired east of the Cahaba. Nothing was heard of Croxton and Upton, and McCook returned to Selma, on the 6th. Croxton made a wide detour to the west and south of Tuscaloosa, and then northward and eastward across Alabama into Georgia before rejoining the corps. Preparations were now made to march on Montgomery. It was necessary to prepare 900 feet of bridging to cross the Alabama River, which was running high, horses enough had been captured to mount the whole command, supplies in the country were abundant, and on the 9th the entire command, except Croxton's brigade, started for Georgia by way of Montgomery. When the advance, which had not been strongly resisted, was near Montgomery, on the 12th, the mayor surrendered the city, Adams, who was in command having retreated, after burning 90,000 bales of cotton. With bands playing and colors flying the column marched through the city and encamped. Here five guns, a large quantity of stores, small arms and cotton were destroyed, also five steamboats loaded with military supplies. On the 14th the command moved with the greatest celerity to secure the crossings of the Chattahoochee at Columbus, on the direct road to Macon, and West Point, further up the river. On the afternoon of the 16th Upton's division, in the advance on the Columbus road, struck Buford's cavalry pickets and drove them rapidly through Girard to the lower bridge over the Chattahoochee. The bridge was fired by the Confederates before it could be seized, and it was then decided to make a night attack upon the central bridge, one of the three that crossed the river at this point. Three hundred men of the 3d Iowa cavalry, properly supported, were

WILTON—WILTS

selected to make the attack. The lines were quietly formed and moved up to within range of the intrenchments covering the bridge and at a signal the attack began at 9 p.m.; the troops opened a rattling fire from their Spencer rifles, which was replied to by a storm of canister from 27 guns, but the Iowa men went over the works at many points and all rushed for the bridge. At the same time the Confederates tried to escape by the bridge, which was so crowded with the men of both forces that the Confederates holding the works at the east end of the bridge and commanding it with two guns, were restrained from firing and the Union forces made a rush upon them and gained possession, and Columbus was taken. Wilson's loss was 6 killed and 24 wounded. He captured 1,200 prisoners, nearly half of the militia that had defended the place under command of Gen. Howell Cobb and Robert Toombs. Columbus was one of the great manufacturing centres of the Confederacy, and its capture resulted in the destruction of a great quantity of war material, 63 guns, the ram Jackson, mounting 6 guns; 125,000 bales of cotton, 15 locomotives, 250 cars, a navy yard and armory, 2 rolling mills, powder magazines and an arsenal, with a great quantity of machinery, 2 iron-works, 3 foundries, and 10 mills and factories turning out war material. The Confederates abandoned and burned the gunboat Chattahoochee 12 miles below Columbus. On the same day that Wilson captured Columbus, La Grange's brigade captured West Point. La Grange had been detached at Tuskegee and marching northeast, after some sharp skirmishing, appeared before West Point about 10 a.m. of the 16th to find that the bridge spanning the river was defended by an earthwork, mounting 3 guns, and held by Gen. R. C. Tyler, with about 265 men. The fort was taken after a hard fight, during which La Grange's men bridged the ditch of the work, under fire. Gen. Tyler and 18 of his men were killed, 28 wounded, and 218 captured. La Grange had 7 killed and 29 wounded. The captures were 3 guns, 500 stands of small arms, 19 engines and 245 cars loaded with army supplies. After destroying the bridges, railway equipment and stores, La Grange moved toward Macon. With the main column Wilson also marched for the same place on the 18th and when nearing the city, on the 20th his advance was met by a communication from Gen. Beauregard, with information of a truce between Gens. Johnston and Sherman. Before the communication could reach Wilson, who was marching near the rear of his column, his advance had dashed into Macon and received the surrender of Gens. G. W. Smith, Howell Cobb and other prominent officers, and these, with the garrison, were held as prisoners of war. Here Wilson heard of the surrender of Gen. Lee, and next day, 21 April, he received a despatch from Gen. Sherman, to suspend hostilities until notified of the result of the negotiations then pending between Sherman and Johnston. The surrender of Macon included four generals, 3,500 men, 5 colors, 60 guns, a large number of small arms, and great quantities of military stores and supplies.

Croton, who had been detached from McCook's division at Elyton, on 27 March, rejoined the corps at Macon 1 May. He had captured Tuscaloosa and advanced as far as Bridgeville,

then returned to Tuscaloosa and Jasper, thence his line of march was 100 miles north of that pursued by Wilson, and on the way through Alabama he had a sharp engagement at Blue Mountain, near Talladega. He marched 633 miles, most of the time through a mountainous country, so destitute of supplies that his command could be subsisted and foraged only by the greatest efforts. Swimming four rivers, destroying five large iron-works—the last in the cotton States—three factories, numerous mills, immense quantities of supplies, capturing four guns and several hundred small arms, and near 300 prisoners, he rejoined the corps, with men and horses in fine condition. He lost in all 172 officers and men. The closing act of Wilson's campaign was the capture of Jefferson Davis by regiments from his command.

In the campaign Wilson had marched 535 miles, captured five fortified cities, 288 guns, 6,820 prisoners, and 23 colors. He subsequently paroled over 59,000 officers and men of the armies of Lee, Johnston, and Beauregard, and had destroyed a vast amount of property of every kind. He lost 99 killed, 598 wounded, and 28 missing, an aggregate of 725.

He had conducted the most notable cavalry movement of the War, none other equaled it in skilful planning, bold and successful execution. Consult: 'Official Records,' Vol. XLIX.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.; Cox, 'The March to the Sea'; Platt, 'Life of Gen. Geo. H. Thomas'; Boynton, 'Gen. Geo. H. Thomas at Nashville.'
E. A. CARMAN.

Wilton, Joseph, English sculptor: b. London 17 July 1722; d. there 25 Nov. 1803. He studied in Paris and in Rome, and while at Rome in 1750 won the gold medal awarded for sculpture by Benedict XIV. on the occasion of his jubilee. He returned to England in 1755 and in 1758 became director of the art gallery of the Duke of Richmond. He was one of the founders of the National Academy and one of its first exhibitors. His busts and monuments were in much demand, among the former being those of Bacon, Cromwell, Isaac Newton, Chesterfield, Chatham and other prominent characters. From 1790 until his death he was keeper of the National Academy.

Wilton, Maine, town in Franklin County; on the Maine Central Railroad; about eight miles southwest of Farmington. It was settled in 1789 and in 1803 was incorporated. It has lumber mills, trunk and carriage factories, creameries, woolen mills, and agricultural implement works. The educational institutions are Wilton Academy, public schools, and a school library. Pop. (1910) 2,143.

Wilton Carpet, a variety of carpet made similar to Brussels, excepting that the wire is flattened instead of being round, and has a groove along the upper surface, which acts as a director for the knife by which the loops are cut and the wire liberated.

Wilt, or Wiltshire, England, a southwestern county bounded on the north and northwest by the county of Gloucester, on the west by Somerset, on the south by Dorset and Hants, on the east by Hants and Berks; area 1,350 square miles. Capital, Salisbury. The north is principally a fertile flat, with scarcely any per-

WIMAN—WINATSHIPUM INDIANS

ceptible slope, except on the frontier where it begins to rise in the direction of the Cotswold Hills, and near the centre, where it is broken by a ridge of downs; the south, though presenting at a distance the appearance of an almost uninterrupted plain, has an undulating surface, broken by downs and intersected by some fertile and well-watered valleys. In this south division is Salisbury Plain, an elevated plateau, covered with a scanty herbage. On the plain are the megalithic remains of Stonehenge, situated about nine miles north of Salisbury, and those of Avebury, about five miles west of Marlborough. The chief rivers are the Bristol Avon, the Salisbury Avon, and its tributaries Bourne, Willy, and Nadder. Though the arable land is of considerable extent, the larger proportion of the surface is kept in pasture, devoted chiefly in the south division to the rearing of sheep, and in the north to cattle-grazing and the dairy. Wiltshire bacon and cheese are famous. The manufactures comprise woollen goods, for which the principal localities are Wilton, famous particularly for carpets, Bradford, Trowbridge, Westbury, etc.; excellent cutlery and steel goods at Salisbury, ropes and sackings at Marlborough, iron founding at Devizes. Pop. about 300,000.

Wim'an, Erastus, American mercantile agent: b. Churchville, Ontario, 21 April 1834; d. Saint George, S. I., 9 Feb. 1904. He entered the mercantile agency service in 1858 and in 1867 removed to New York, where he became interested in rapid transit schemes for Staten Island. He increased the number of steamboat trips between that island and New York from 15 to 65 a day, built the Arthur Kill bridge, and in 1902 secured congressional authority for the construction of a tunnel under New York Bay connecting New York, Long Island, and Staten Island. His later years were clouded by financial reverses and the frustration of his extensive plans for rapid transit. He wrote 'Chances of Success' (1893).

Wimbledon, wim'bl-dôn, England, a town of Surrey, southwest of London, of which it is practically a suburb, at the northeast extremity of the common of same name, which until 1889 was well known in connection with the shooting competitions of the National Rifle Association. It has a free library, alms-houses, three hospitals, and many fine residences, being a favorite residential locality. The common has an area of about 1,000 acres.

Wimborne, wim'bérn, or **Wimborne Minster**, England, a market-town of Dorsetshire, on the Wimar Allen River, near its confluence with the Stour, about seven miles northwest of Bournemouth. It is of historical interest in connection with its fine cruciform minster, the collegiate church founded by Edward the Confessor which succeeded the convent established by Saint Cuthburh, King Ine's sister, in 705. The minster exhibits various styles of transitional architecture from the Norman onward, has a central and a west tower, and contains several interesting features, including the tomb of Ethelred I., and a mediæval chain-library, one of the few in existence where the books are chained to the shelves. The grammar school in the town was founded in 1496. Pop. about 5,000. Consult: Yeatman, 'Wimborne Minster'

(1878); Perkins, 'Wimborne Minster and Christ Church Priory' (1899).

Wimodausis, The, a benevolent secret society, composed exclusively of the wives, mothers, unmarried daughters and unmarried sisters of Master Masons. It originated in Pittsburgh, Pa., in 1895. The object of the society is: "To promote friendship and a kindly interest in the welfare of the members, and to stimulate intellectual activity by an interchange of thought on all subjects which will tend to the mutual advancement of the wives, mothers, daughters, and sisters of Master Masons."

Wim'ple, or **Wimpel**, a covering of silk or linen for the neck, chin, and sides of the face, worn usually out of doors. It is still retained as a conventual dress for nuns.

Winamac, win'a-mák, Ind., county-seat of Pulaski County; on the Tippecanoe River, and on the Pittsburg, Cincinnati & Chicago Railroad; about 90 miles southeast of Chicago and 23 miles northwest of Logansport. It has considerable trade; the principal shipments are farm and dairy products. The principal public buildings are the court-house, four churches, and the public and parish schools. The two banks have a combined capital of \$50,000 and deposits (1903) \$140,650. Pop. (1890) 1,215; (1900) 1,684; (1910 est.) 1,800.

Winan'dermere. See **WINNEMERE**.

Winans, Ross, American inventor: b. Vernon, N. J., October 1796; d. Baltimore, Md., 11 April 1877. He went to England to examine English railroad systems in the interest of the Baltimore & Ohio Railroad; and after his return built the first locomotive used on that railroad. He also invented the camel-back locomotive and the eight-wheeled car, and established in Baltimore some of the largest machine shops in the United States. He was active in political matters prior to the Civil War and in 1861 was elected to the extra session of the Maryland legislature, but was imprisoned in Fort McHenry. He was author of several pamphlets on religious subjects and also of 'One Religion, Many Creeds' (1870).

Winans, Thomas DeKay, American engineer, son of Ross Winans (q.v.): b. Vernon, N. J., 6 Dec. 1820; d. Newport, R. I., 11 June 1878. He was taken into partnership by his father on coming of age, and was sent by him in company with his brother William to make contracts with the Russian government for furnishing and managing the equipment of a railroad between Moscow and Saint Petersburg. With Andrew M. Bostwick and Joseph Harrison he entered into a contract for \$3,000,000, and afterward was engaged in other lucrative contracts with Russia. Upon his return to the United States he became interested in invention, and with his father and brother invented a system of steam navigation known as the "cigar-ship"; a tubular adjustment for the feeding of young trout; and various other mechanical devices.

Winatshipum Indians, a small tribe of the Salishan stock of North American Indians, also known as Piskawus or Piskouse, residing on Wenatchee River (whence the name of the tribe) and the north branch of Yakima River in Kittitas County, Washington. They took part in the Yakima treaty of 1855, but do not live

WINCHELL — WINCHESTER

on the reservation. There are six smaller tribes or bands connected with them and speaking the same language.

Win'chell, Alexander, American geologist: b. North East, Dutchess County, N. Y., 31 Dec. 1824; d. Ann Arbor, Mich., 19 Feb. 1891. He was graduated from Wesleyan University, Middletown, Conn., in 1847, became professor of physics and civil engineering at the University of Michigan in 1853 and of botany and geology there in 1855. He served as State geologist of Michigan 1859-62, professor of geology in the Kentucky University 1866-9, director of the Michigan Geological Survey 1869-71, and chancellor of Syracuse University 1872-4. From 1879 till his death he was professor of geology and palaeontology in the University of Michigan. He lectured extensively and published 'Sketches of Creation' (1870); 'Geological Chart' (1870); 'The Doctrine of Evolution' (1874); 'Science and Religion' (1877); 'Preadamites' (1880); 'Sparks from a Geologist's Hammer' (1881); 'World-Life' (1883); 'Geological Studies' (1886); 'Walks and Talks in the Geological Field' (1886).

Win'chendon, Mass., town in Worcester County; on the Miller River, and on the Boston & Albany and Boston & Maine (Fitchburg Division) R.R.'s; 35 miles north-northwest of Worcester. It was settled in 1752, and incorporated as a town in 1764; the town includes the villages of Winchendon, Waterville, and Winchendon Springs. It is principally a manufacturing town; the chief manufactures are wooden-ware, wood-working machinery, toys, and cotton goods; there is a national bank with a capital of \$200,000, and a savings bank. It contains the New England Home for Orphan and Destitute Children; and has several elementary schools, and the Murdock High School established in 1865 with a school library of about 1,500 volumes, and occupying a fine building valued at \$100,000; there is also a public library. The town owns and operates the system of water-works. Pop. (1910) 5,678.

Win'chester, England, an ancient city, capital of Hampshire, situated on the right bank of the Itchen, 11 miles north of Southampton. The most important edifice is the cathedral; the oldest parts date from the 11th century, but the greater part of the main building was erected at various times from the 13th to the 16th century, William of Wykeham (1324-1404) having an important share in the work. It has a central tower without a spire and no other towers; length from east to west, 545 feet, width of the transepts 186 feet. The length of the nave, which has a beautiful interior, is 351 feet, height 86 feet; the transept contains several beautiful chapels and altars. Numerous monuments include the tombs of William Rufus, of Edmund, son of King Alfred, of William of Wykeham, Cardinal Beaufort, and of Izaak Walton; the shrine of Saint Swithun; etc. Other notable edifices and establishments are St. Mary's College (Winchester College or School, one of the great English public schools), founded by William of Wykeham in 1387, richly endowed and accommodated in a large range of buildings, of which the chapel, hall, and library are beautiful specimens of architecture; the guildhall; the old castle, which has been restored and assize courts built adjoining; a corn-ex-

change; barracks for 2,000 infantry; the hospital of St. Cross, founded in 1132, several other charitable institutions, a free library and museum, school of art, etc. The Abbey Gardens are very beautiful, and statues of Alfred the Great by Hamo Thornycroft, erected for the millenary of the king celebrated at Winchester in 1901, and of Queen Victoria by Alfred Gilbert, adorn the town. There are no manufactures or trade of any consequence. Winchester was called *Caer-Gwent* by the Britons, *Venta Belgarum* by the Romans—under whom it was an important place, with a Christian church—and *Wintanceaster* by the Saxons. It became the capital of England under the Saxons, when the country was united under the sway of Egbert, in the first half of the 9th century, and it retained this dignity till the middle of the 11th century, being a royal residence and place where parliaments met after this also. After the battle of Naseby it stood a week's siege by Cromwell. Pop. about 22,000.

Winchester, Ill., city, county-seat of Scott County; on the Big Sandy Creek, and on the Chicago, Burlington & Quincy Railroad; 45 miles west-southwest of Springfield, Ill. It was first settled in 1830. It is in an agricultural region for which it is the shipping point; it contains grain elevators, flour mills, a meat-packing establishment, and a plow factory; there are two private banks. It has a public high school. Pop. (1910) 2,000.

Winchester, Ind., city, county-seat of Randolph County; on the White River, and on the Grand Rapids & I. and the Cleveland, C., C. & St. L. R.R.'s; about 68 miles northeast of Indianapolis. It is in an agricultural region and in a natural gas belt. It has flour and lumber mills, brick and tile works, machine shops, and a number of repair shops. The educational institutions are a high school, established in 1804, public graded schools, and the Randolph County Law Library. The three banks have a combined capital of \$140,000. Pop. (1910) 4,266.

Winchester, Ky., town, county-seat of Clark County; on the Chesapeake & O. and the Louisville & N. R.R.'s; 18 miles southeast of Lexington. It is in an agricultural region, in the "Blue Grass" country. It has flour mills, spoke and rim factory, planing mills, and machine shops. The principal shipments are farm products and live-stock. The educational institutions are the Kentucky Wesleyan College (M. E. South), opened in 1866, and the public and private schools. The two banks have a combined capital of \$200,000. The town was incorporated in 1792. Pop. (1890) 4,861; (1900) 5,964; (1910) 7,156.

Winchester, Mass., town in Middlesex County; on the Boston & Maine Railroad; about eight miles north by west of Boston. In 1638 the place was known as Waterfield, which, in 1640, was changed to Charlestown Village. In 1642 it was called Woburn, and in 1850 the present name was adopted. It has many places of great beauty, and it is a favorite residential suburb for Boston. It has manufactories for watch hands, leather and felt goods. There are machine shops and grist mills. A part of "Middlesex Falls," a State park, which has an area of 3,020 acres, is in this town. It has a State Aviary, and a Home for Aged People.

The educational institutions are a high school, established in 1850, graded public schools, and a public library which contains about 14,000 volumes. There are two banks. Pop. (1900) 7,248; (1910) 9,309. Consult Hurd, 'History of Middlesex County.'

Winchester, Tenn., town, county-seat of Franklin County; on the Elk River, and on the Nashville, Chattanooga & Saint Louis Railroad; about 80 miles south by east of Nashville. It is near the foot of the Cumberland Mountains, in an agricultural region. The town has considerable mining and lumbering interests. It is a favorite health resort. The chief industrial establishments are lumber and planing mills, wagon and carriage factories, wood-working factories, marble works, flour mills, and machine shops. It has one bank with a capital of \$75,000. Pop. (1910) 1,400.

Winchester, Va., city, county-seat of Frederick County; on the Cumberland Valley and the Baltimore & O. R.R.'s; about 81 miles west by north of Washington, D. C. It is in an agricultural and stock-raising region and has considerable lumbering interests. It has flour and paper mills, lumber mills, woolen mills, glove factories, tanneries, and machine shops. The educational institutions are Valley Female College (M. E. South), opened in 1874; the Shenandoah Valley Academy, Fairfax Hall, the John Kerr High School (white), established in 1872; a high school for colored pupils, elementary schools for both races, and a public library. The principal public buildings are the court-house and the city-hall. There are National and Confederate cemeteries.

Fort Loudoun, built under Washington, and Washington's headquarters are of historic interest. Washington's occupancy of Winchester was in 1755, after Braddock's defeat. Washington was stationed here, in command of the colonial and British forces. During the Civil War, Winchester was for some time a battle centre. On 19 Oct. 1864 Sheridan left Winchester on his famous ride to Cedar Creek. Pop. (1910) 5,864. See WINCHESTER, BATTLE OF.

Winchester, Battle of. See ORANGE, BATTLE OF.

Winchester, Military Operations at and Near. Winchester was an important strategic point during the Civil War, and it is stated on good local authority that it was occupied or abandoned 68 times by the troops of both armies. It was held by the Confederates until 11 March 1862, when Gen. J. E. Johnston having retreated from Centreville and Manassas, Gen. "Stonewall" Jackson, under Johnston's orders, withdrew from the place and retired up the Shenandoah Valley, and the Union troops, under Gen. Banks, occupied it on the 12th. Gen. Shields, who had followed Jackson up the valley, with a division of Banks' command, fell back to Winchester and Jackson followed him as far as Kernstown (q.v.), four miles south of Winchester, where Shields attacked and defeated him on 23 March; Jackson again retreating up the valley, Banks following and finally taking up a fortified position at Strasburg. Jackson flanked Banks out of Strasburg by moving through Luray Valley and defeating Col. Kenly at Front Royal (q.v.) 23 May, and Banks retreated to Winchester closely pursued by Jackson.

Winchester, First Battle of.—Banks arrived in Winchester late on the 24th with about 8,000 men and 16 guns. Col. Donnelly's small brigade was put in position to cover the Front Royal and Millwood roads, and was supported by eight guns, judiciously placed on rising ground. Col. Gordon's brigade, on the right, held a low ridge running southwest from the town and west of the Valley turnpike, a little over half a mile from the suburbs. Its left rested on the turnpike and its right extended westward along the ascending ridge in front of Winchester. Skirmishers were thrown out in advance and guns were placed on either flank. Five companies of Michigan cavalry were held in reserve under cover of the ridge. Between Gordon and Donnelly was an interval of nearly a mile, which was filled by the principal part of Gen. Hatch's cavalry brigade and two guns. The line formed the arc of a circle, covering Winchester from the west around by the south to the east. Jackson confronted this position with 16,000 men and 48 guns, and with the main body lay close to Gordon, while Ewell, with two brigades which had marched directly from Cedarville on Winchester, bivouacked opposite Donnelly's position. Jackson's plan was to hold Gordon fast, throw Ewell upon Donnelly, and then move his main body around Gordon's right, and he expected to advance upon a disorganized and demoralized army. At dawn of the 25th Ewell advanced the 21st North Carolina and opened with his artillery, whose shells fell among Donnelly's men, as they were preparing coffee, and brought them to arms as they saw the Carolinians advancing in line across an open field upon the centre of the position crossing the Front Royal road. The North Carolina men met a severe front and flank fire from the stone fences, and as they fell back Capt. Best's guns threw canister into their disordered ranks and they left the field with a loss of 80 officers and men, including the two field officers with them. A Confederate officer says, "The slaughter was appalling and the survivors fled to the rear in the utmost confusion." Ewell now brought up two batteries, and an artillery duel ensued, which soon ceased as a heavy fog settled over the field. Ewell then made an unsuccessful attempt to turn Donnelly's right and then endeavored to turn his left and gain the Martinsburg road in his rear. The attempt was checked, Donnelly losing some ground, but at this moment he received an order to retreat, as Gordon had been driven from position and was in retreat through Winchester. Donnelly moved his three regiments and guns from the field in perfect order, under a heavy fire of shot and shell, and continued his retreat, keeping to the right of the Martinsburg road. He had made a successful resistance of over four hours against double his number, with trifling loss.

Jackson attacked Gordon's small brigade with six brigades, his attack beginning at daybreak, and being several times repulsed. Finally he got artillery in position and opened on Gordon's front and gradually worked his infantry toward the left. Then he moved two brigades around Gordon's right. Gordon detected the movement while it was in progress and changed position to meet it, pouring a destructive fire of musketry into the Confederate ranks, making great gaps in the line, without checking its advance; the gaps were closed and with almost perfect align-

WINCHESTER

ment the two brigades came on and flanking Gordon's two right regiments drove them back in some disorder. The five companies of Michigan cavalry were now brought up and as quickly swept away. At this juncture Jackson ordered forward his entire line of six brigades and Gordon ordered a retreat through Winchester, which was conducted in a manner to command Jackson's admiration. There was some confusion in the streets of the town, but once clear of it, Hatch's cavalry and the artillery covered the withdrawal, until the infantry was well on the Martinsburg pike. Jackson with his main body pursued five miles beyond Winchester and Banks continued his retreat to the Potomac, crossing it at Williamsport on the 26th. Banks' loss May 23-25, including Front Royal and the retreat from Strasburg to the Potomac, was 62 killed, 243 wounded, and 1,714 missing. Jackson's loss was 68 killed, 329 wounded and 3 missing. Jackson remained at and in the vicinity of Winchester until 31 May, when, his rear being threatened by the converging columns of Fremont from the west and McDowell from the east, he retreated up the valley and the Union troops reoccupied Winchester. Consult 'Official Records,' Vol. XII.; Allan, 'Jackson's Valley Campaign.'

During Lee's campaign against Pope the town was occupied by Gen. Julius White with a brigade of over 2,000 men. On the night of a Sept. 1862 White, under Gen. Halleck's order, spiked four heavy siege guns in the works and withdrew to Harper's Ferry; the Confederates occupying the place next day. The Confederates held the place in small force until 3 December, when, upon the advance of a Union column from Harper's Ferry, under Gen. Geary, they retired, and Geary occupied the town next day. Geary soon withdrew and the Confederates reoccupied and held the town until near the end of December, when it was again taken by Union troops under Gen. Milroy. Milroy fortified the place and occupied also Berryville and Romney, with outposts toward Strasburg and Front Royal. Harper's Ferry, Martinsburg, Williamsport and posts westward to Cumberland and New Creek were held by Union troops belonging to Gen. B. F. Kelley's command.

Winchester, Second Battle of.—When Gen. Lee began his preparations for the second invasion of Maryland, which culminated in the battle of Gettysburg, he turned his thoughts to the clearing of the Shenandoah Valley. At this time Winchester was held by Gen. Milroy, with the two brigades of Gen. W. L. Elliott and Col. Ely, numbering about 7,000 effective men. Col. McReynolds' brigade of 1,800 men was at Berryville. The main works defending Winchester were on a ridge north of the town and consisted of two forts known as the "main fort" and the "Star fort," mounting four 20-pounder Parrotts and two 24-pounder howitzers. Surrounding these were smaller works connected by rifle-pits. The expressed object in holding the place was to observe and hold in check the enemy in the valley, and to secure the Baltimore & Ohio railroad against depredations. Milroy was expressly instructed to undertake no offensive operations in force. On 7 June Gen. Lee began his operations in the valley by ordering Gen. Imboden, in the upper valley, to make a demonstration with his cavalry brigade on Romney

in order to cover the movement against Winchester and prevent the Union troops at that place from being reinforced by Kelley's troops on the line of the Baltimore & Ohio railroad. Gen. Jenkins' cavalry brigade was ordered to join Ewell's infantry corps near Front Royal. Both Imboden and Jenkins were in position by the 10th, and on that day Ewell set out from near Culpeper Court House for Winchester by way of Gaines' Cross Roads, Chester Gap and Front Royal, to Cedarville, which was reached on the 12th. Here, next day, Ewell detached Roder's division and Jenkins' cavalry brigade to move on Berryville and endeavor to capture McReynolds' brigade, but, warned by Milroy, McReynolds made good his retirement, with small loss, joined Milroy at Winchester on the night of the 13th, and was assigned to the Star fort, immediately north of the main work. On the same day Early's division marched on Winchester by Newtown and the Valley pike, while Edward Johnson's division moved upon the town by the direct road from Front Royal. The two divisions, driving in Milroy's outposts, were in position before Winchester on the evening of the 13th. For some days Milroy had felt the pressure from Confederate cavalry, but had no idea that Lee was threatening the valley until a prisoner taken in a skirmish on the Strasburg road, on the evening of the 13th, informed him that he was confronted by Ewell's corps and that Longstreet's was near. Fully recognizing the fact that an orderly withdrawal was impracticable, he resolved to act on the defensive, and, if not relieved, force his way through what might appear the weakest part of his lines. At night of the 13th Ewell ordered Early to attack the works on the north and west of the town next morning, while, as a diversion, Johnson demonstrated against the east and southeast. In the forenoon Johnson made his attack on the eastern side of the town, between the Millwood and Berryville roads, held by Col. Ely's brigade, and was repulsed by the 8th and 89th Pennsylvania, which charged Johnson's retreating troops, but were speedily driven back by fresh troops, and after some sharp fighting Johnson gained part of the town, but was quickly shelled out and made no further effort. West of the ridge on which the main forts were thrown up, and about 1,300 yards distant, is another parallel ridge, called Flint Ridge, where an isolated earthwork of slight strength had been thrown up to command the Pughtown and Romney roads. It was held by the 110th Ohio, a company of the 116th, and a regular battery, commanded by Lieut. Wallace F. Randolph, all under command of Col. J. W. Keifer. Early, leaving Gordon's brigade south of the town to engage Milroy's attention, moved with the remainder of his division to the left and west, then north, crossed the Romney road, and about 5 p.m., having gained Round Mountain, south of the Pughtown road, and put 20 guns in position, without being perceived, opened an unexpected fire on Keifer's work and soon silenced Randolph's battery, upon which Hays' brigade, in two lines, made a quick dash, and after a stubborn resistance carried the work, and captured the battery of six guns. Keifer, with a loss of over 40 men, withdrew under cover of the fire from the guns of the main works. This was followed by an artillery duel which was kept up until 8 p.m., during which Milroy with-

WINCHESTER

drew his detachments to his main works. Darkness ended the contest.

Milroy was now in a critical position. His cannon ammunition was nearly exhausted and he had but one day's rations for his men. At 9 p.m. he assembled his brigade commanders, and it was concluded to give up further effort to defend the place, to abandon all the artillery and wagons, and to force a way through the Confederate lines that night, taking with them only the horses, small arms and usual supply of ammunition. All the guns were spiked and the ammunition thrown into the cisterns. At 1 a.m. of the 15th Milroy, abandoning his sick and wounded, avoiding the town, moved silently through a ravine about a mile and struck the Martinsburg pike, which was followed cautiously, with many halts to close up the stragglers, for about three miles, when, about 3.30 a.m. Elliott's brigade, which was in the advance, was fired upon by Confederate skirmishers and it was soon ascertained that their main body was east of and very near the road. The retreat had been anticipated and intercepted. Under Ewell's order, Gen. Johnson had left one brigade to prevent Milroy from escaping toward the east, and moved with the remainder of his division by way of Jordan Springs to Stephenson's Depot, about five miles north of Winchester, to intercept the retreat in that direction. Just as Johnson's head of column reached the railroad, 200 yards from the Martinsburg pike, Milroy's men were heard coming down the road and Johnson formed his line on elevated ground in a woods east of the road and in a field south of and adjoining the woods. The greater part of his men were sheltered by a stone fence which bounded a railroad cut. As soon as Elliott took in the situation he formed line of battle with his three leading regiments to push back the Confederates and thus clear the way for the rest of the column to pass on toward Martinsburg. An hour's fight ensued with varying success, Johnson's right being forced back and his artillery silenced, but the left of his line held firm against all efforts to shake it. The main road being blocked, Milroy determined to try another, and directed the troops to fall back a short distance and turn to the right. Part of them did so, but the greater number filed to the left, leaving the Martinsburg road and taking that to Bath. The diverging columns could not be reunited. A part of the command, accompanied by Milroy, reached Harper's Ferry by way of Smithfield late in the afternoon. Those retreating on the Bath road made good their escape, crossed the Potomac at Hancock and rallied to the number of 2,700 at Bloody Run. The greater part of Ely's and McReynolds' brigades were captured. Johnson claims the capture of 2,300 men, 175 horses, and 11 colors. The capture of Winchester and defeat of Milroy gave the Confederates 28 guns, 300 loaded wagons, many horses, and 4,000 prisoners. The Union loss was 95 killed, 348 wounded, and 4,000 captured or missing. The Confederate loss was 47 killed, 219 wounded, and 3 missing. Consult: 'Official Records,' Vol. XXVII.; Doubleday, 'Chancellorsville and Gettysburg.'

On marching into Maryland Gen. Early left a small garrison at Winchester and after the return from Gettysburg Lee's army was encamped around the place until it fell back beyond

the Rappahannock. The town was not then reoccupied in force by Union troops, being only visited occasionally by small detachments from Harper's Ferry and Martinsburg. It was subject also to Confederate forays from the upper valley. In December 1863 Gen. Early was sent into the valley, and throughout the winter and early spring of 1864 kept his troops very active, occasionally making dashes into Winchester. On 29 Feb. 1864 Gen. Sigel was assigned to the command of the Union troops in the lower valley and soon thereafter Winchester was occupied as an outpost to Harper's Ferry and Martinsburg. Sigel was relieved by Gen. Hunter after the battle of New Market (q.v.), 15 May, and when Hunter was repulsed at Lynchburg and forced to retreat to the Kanawha Gen. Early moved down the valley, and driving everything out of it, encamped near Winchester, 3 July, preparatory to his attempt on Washington (q.v.). After his failure on Washington Early returned to the lower valley and being hard pressed from the east and north fell back toward Strasburg, at the same time sending Ramseur's division of infantry toward Stephenson's Depot, a few miles northeast of Winchester, to support his cavalry and check Gen. Averell's division of Union cavalry, advancing from Martinsburg. Averell defeated Ramseur at Stephenson's Depot (q.v.), 20 July, and followed him through Winchester. He was joined by Gen. Crook's division, on the 22d, Crook assuming command, and the two divisions of 11,000 men advanced to Kernstown on the 23d. Early returned, defeated Crook at the second battle of Kernstown (q.v.) 24 July, drove him through Winchester and across the Potomac, and reoccupied Winchester and Martinsburg. Early's successes called for a strong commander of the Union forces to oppose him, and Gen. Sheridan was selected. On 7 August when Sheridan assumed command, near Harper's Ferry, Early's army was concentrated west of the Opequon River, covering Winchester and Bunker Hill. Sheridan advanced from Hallowtown toward Winchester, on the morning of the 10th, and Early, abandoning Bunker Hill and Winchester, fell back to Strasburg to await reinforcements coming from Lee's army at Richmond. Sheridan followed to Cedar Creek on the 12th. Early's reinforcements arriving, Sheridan's infantry fell back to Winchester on the night of the 10th, the cavalry following next day. From Winchester Sheridan, on the 17th, fell back to Berryville, behind the Opequon, leaving his cavalry to cover the withdrawal. Wilson's cavalry division, Lowell's cavalry brigade, and Penrose's brigade of New Jersey infantry, 850 men, were ordered to cover the flank of the army in its march from Winchester to Berryville. The Jersey brigade was deployed along a small branch of the Opequon, south of and near Winchester, with dismounted cavalry on the flanks, the remainder of the cavalry massed near the town. Early had followed Sheridan from Cedar Creek and, in the afternoon of the 17th, his cavalry advance driving in the Union cavalry, was checked and held by the Jerseymen, until Wharton's division of infantry attacked their right, and Ramseur's their front, while Gordon's division advanced against the cavalry. Under this pressure the entire Union line gave way about dark and fell back to Summit Point. The Jersey brigade lost 97 killed and wounded and about 200 prisoners.

The cavalry had about 30 captured. Early again occupied Winchester and advanced to confront Sheridan at Halltown. For some days both parties were feeling each other's lines and suffering some losses, and 2 September, Gen. Averell, who had been guarding the crossings of the Potomac, south of Hancock, advanced through Martinsburg to near Bunker Hill, where he attacked and routed Gen. Lomax's cavalry division of two brigades, capturing 2 battle-flags, 55 prisoners, some wagons, and a herd of cattle, finally driving Lomax nearly into Winchester next day, but Averell, in turn, was driven back by Rodes' infantry division. On the 13th Gen. McIntosh, with five cavalry regiments and two guns, started from Sheridan's lines near Berryville, captured some prisoners, and on approaching Winchester caught sight of an infantry line and charged it, driving it to a piece of woods, which he surrounded, capturing the 8th South Carolina of Kershaw's division, with its battle-flag. The rest of Kershaw's division advanced and McIntosh fell back with his 143 prisoners. These minor encounters were followed on the 19th by the greatest battle fought at Winchester, which to distinguish it from other battles of Winchester is known as the battle of the Opequon (q.v.), in which Sheridan with 38,000 men defeated Early's 15,000 and drove him from Winchester up the valley, not again to return. From this to the close of the war Winchester remained in Union possession. See also *SHERMAN'S VALLEY, MILITARY OPERATIONS IN*. E. A. CARMAN.

Winckelmann, vīnk'el-mān, Johann Joachim, German archaeologist and art historian: b. Stendal, Prussia, 9 Dec. 1717, d. Trieste, Austria, 8 June 1768. He studied theology at Halle, spent several years as private tutor and schoolmaster and in 1748 was appointed by Count Heinrich von Bülow secretary in his library at Nöthnitz, near Dresden. In 1755 he joined the Roman Catholic Church, and through the efforts of the papal nuncio at Dresden was enabled to visit Rome. Here he became librarian to Cardinal Albani, an art connoisseur and collector, and gave the public his ideas on ancient art. The more important of his works are *'Geschichte der Kunst des Alterthums'* (1764); and *'Monumenti Antichi Inediti'* (1767-8); with various sets of letters on the remains at Herculaneum and Pompeii. He was recognized as the leading authority in Europe in the field to which he had devoted himself. In 1768 he revisited Germany, but at Munich a longing for Italy so overmastered him that he determined to return. Going by way of Vienna, he was well received there, and was presented to the Empress Maria Theresa, who bestowed rich presents on him. At the beginning of June he departed for Trieste, where, for the sake of the gold medals and valuables in his possession, he was murdered by a fellow-traveler, named Arcangeli. The robber was interrupted, and fled without securing any booty, but was subsequently taken and executed. A collective edition of Winckelmann's works was published (1808-20) and another (1825-9). Winckelmann is considered by all authorities as the founder of modern scientific archaeology, and his conception of the beautiful elicited Lessing's *'Laokoon'*. Consult: Justi, *'Winckelmann, sein Leben, seine Werke*

und seine Zeitgenossen' (1866-72); John, *'Biographische Aufsätze'* (1866); Vogel, in *'Allgemeine deutsche Biographie'*, XLIII. (1898).

Wind, a current of air established at certain times and places within the body of the atmosphere at large, and flowing during periods longer or shorter in certain general directions; such currents being occasioned chiefly by differences of temperature at different times or localities, and by variations in the production and condensation of watery vapor. The portion of the surface of the globe over which any particular wind, permanent or occasional, may extend, is comparatively small, as is consequently the tract of the entire aerial ocean resting on that surface that is involved. At all times, also, there are parts of the atmosphere that are sensibly at rest or calm; and such apparently motionless tracts of air are sometimes of very great extent. For a statement of the physical properties of the air, see *ATMOSPHERE*, and in reference to the mechanical principles of equilibrium, mobility, and disturbance of a fluid mass circumstanced as is the air, see *PNEUMATICS*. The atmosphere is held to the earth only by gravity, and the action of this force does not interfere with its fluidity or elasticity, nor with the effect of any pressures acting at points within it; so that its parts have entire freedom of motion about or among each other, and it is in every part sensitive to the slightest disturbing forces. Since, however, the globe with its aerial envelope is to be regarded as moving in unresisting space, and since the friction of the earth's surface upon the lowest stratum of air, and of the strata successively one upon another, has sufficed to communicate to the entire body the earth's own velocity, it follows that the atmosphere, if it were left at rest within itself, must partake of the earth's movements as perfectly as if it were a solid part of that body. The simplest of the disturbances affecting the atmosphere are the movements of "atmospheric waves" of greater or less magnitude and duration, but of two sorts, the daily and the occasional or irregular, the occurrence of which is shown by certain periodical or rare, but gradual variations of barometric pressure. From the nature of the medium, these waves are, as compared with those of water, on a vast scale. The indications of the barometers at stations scattered over a large area of country show that these waves move singly, and indicate their breadth, and the direction and rate of advance; a generally increased or maximum pressure showing at a given time the presence of the crest, while at distances on either side of this a minimum pressure shows the margins or accompanying troughs of the wave. Of daily atmospheric waves, or tides, there are two: (1) that due to attraction of the sun and moon, and which in periods and character is therefore similar to the oceanic tides, but which, its maximum effect on the mercury column not exceeding $\frac{1}{16}$ of an inch, cannot be a cause adequate to produce winds; (2) the heat tide, or elevation of a crest of air along a meridional line following the sun at no great distance, while the cooling on the opposite side of the globe occasions the advance of a corresponding line of depression, this tide having therefore for its period a solar day, and within that period but a single crest, instead of two opposite ones. Beside these pe-

WIND-FLOWER—WIND INSTRUMENTS

riodic fluctuations, there are occasional vast atmospheric waves, due perhaps to previous winds, or to great local disturbances of temperature, or to combinations of causes not yet understood. The disturbances by heat that give rise to ordinary periodical or irregular winds, are such as occur along certain latitudes, or as are local and irregular altogether. An increase of temperature equal to 50° F. dilates the air receiving it by only about one tenth of its volume. From the direct rays of the sun air absorbs heat chiefly near the surface of the earth, and yet slowly even here, the warming of the air being more largely due to secondary radiation from the heated surface of the land or water. The heat acquired within a given time is usually by a very gradual increase, and limited in amount. If the warming of the air is quite uniform over a large surface, the equilibrium between the affected and the surrounding bodies may be steadily adjusted and preserved, so that no wind shall result; and it is a common experience of the hot season that, though the air at a place may be intensely heated, or through many degrees within a few hours, yet no wind may occur. During subsequent cooling of the same body of air a wind is more likely to arise, and especially so if clouds form at no great distance. Very generally, however, the effect of heating a tract of air in excess over that around it, is to occasion expansion and diminution of density; the column of air so affected moves or flows upward, and while the effect of its momentum further relieves its lowermost portions of pressure, and diminishes the resistance they can oppose to the surrounding air, the ascending body, losing at considerable height its excess of heat, acquires the density of air at such elevation, and flows over or outward, increasing the weight and pressure of some or all the surrounding portions. The lateral equilibrium below is thus destroyed, and a double movement of the air established, the air flowing in from one or more directions below the heated space, and flowing out above. But the momentum acquired in some given direction by the air rushing into the affected space may predominate, and, the conditions of neighboring portions of air favoring, a wind may thus be established that shall blow far beyond the point of first disturbance, as well as successively affect portions of atmosphere further back of it, and also extend widely, continuing for a long time before equilibrium and calm are restored. As a well known fact, however, high or widely extending winds are more likely to arise just before or during storms in which a considerable body of watery vapor is condensed and precipitated from the air, and yet more likely to be felt chiefly after such storms. Winds are also known to be produced in consequence of rapid and great evaporation, and even during the rapid formation of belts or masses of cloud without rain. In all the great oceans, however, there are certain winds, called trade-winds, which always blow in the same direction, though with seasonal variations in the area over which they blow. These are cold currents of air constantly flowing in from the polar regions to replace the warmer and lighter air which is constantly ascending from the tropical belt, and which finds its way back, at first entirely through the upper strata of the atmosphere, to the regions in which the cold currents take their rise.

The direction of these winds, which is nearly due west, but slightly south or north, according as it is a northeast or southeast trade-wind, results from the axial rotation of the earth from west to east. The general character of the air-movement is twofold. There is a movement from the poles toward the equator, and a return movement from the equator to the poles. In low latitudes the latter takes place exclusively in the higher strata of the atmosphere, but in higher latitudes its effect is often felt on the surface of the earth. In these latitudes, then, the winds may be divided into equatorial and polar, the former being as a rule more or less westerly, the latter more or less easterly. The equatorial winds are distinguished in general by the highest temperature, the greatest degree of saturation, the most cloudy weather, the most frequent rainfall, and the lowest atmospheric pressure; and the polar by the lowest temperature, the least degree of saturation, the clearest weather, the least rainfall, and the highest atmospheric pressure. This explains why the southwest wind is that which brings the most rain, and why a falling barometer is as a rule a sign of approaching rain, and also why the barometer, as is well known, usually shows an upward tendency with an east wind. Certain winds have a seasonal character, being either confined to certain seasons of the year, as the harmattan of the Guinea coast and the eolian winds that blow from the north in summer in the eastern part of the Mediterranean, or changing their direction at certain seasons, such as the monsoons of the Indian Ocean. See METEOROLOGY.

Wind-flower, the delicate *Anemone nemorosa*, *A. quinquefolia*, and other members of this genus of the *Ranunculaceæ*, so-called because the ancient Greek name of some plant associated in Greece with the winds has been given to the *Anemone*, or because the little plants bloom when spring winds are rampant. The two species mentioned send up an early flowering stem, bearing about its centre a whorl of three digitately divided leaves; above them is a solitary white-petaled starry flower, often tinged with shell-pink on the outside. They expand fully only in sunshine, and nod with half-closed corollas on cold, dark days, and at night. The plants choose mossy stumps in swamps, or damp thickets for their habitat, and have large basal leaves later in summer. On the prairies the red wind-flower (*A. multifida*) and the pasque-flower (*A. patens var. nuttalliana*) bear this name. Another European wind-flower is *Gentiana pneumonanthe*, a low, blue-flowered marsh plant.

Wind Instruments, a general name for musical instruments played by the human breath, as the flute, the cornet, etc., or by artificially produced currents of air, as the organ, harmonium, etc., in all of which the vibrations of a column of air produce the sound. The wind instruments of an ordinary orchestra are usually divided into two classes: wood instruments and brass instruments; the organ or harmonium being classed apart. The woods, some of which are partially composed of ivory, are the piccolo, flute, flageolet, clarinet, basset-horn, oboe, and bassoon. Their tone is light, smooth, and soft, and almost vocal in its character, and can be produced in all the delicate

WIND SIGNALS—WINDLASS

crescendo and diminuendo shadings. The brasses comprise the cornet-a-piston, horn, trumpet, trombone, euphonium, bombardon, etc. Their tone is somewhat harder, and generally more powerful and majestic than that of the woods. Being fixed-toned instruments (except the trombone) they cannot, like the strings, play in perfect tune, and they can only produce one sound at a time. For the number of the wind instruments and their proportion to stringed and percussion instruments in an orchestra, see **ORCHESTRA**.

Wind Signals. See **WEATHER SIGNALS**.

Windage. See **PROJECTILES**.

Wind'ber, Pa., borough in Somerset County, on the Pennsylvania and the Johnstown Passenger R.R.'s; about eight miles east of Johnstown. It is in an agricultural and coal-mining region, and has extensive coal-mining interests. The Berwind White Coal Mining Company have 10 operations, in which are employed 5,000 persons. In the W. P. Kelley Brick Company works there are about 100 men; and in the planing mills and construction works of the Pennsylvania Lumber and Construction Company, about 80 men are employed. Other industrial establishments are a brewery, machine shops, coal, brick and lumber yards. The Lake Trade Coal Company, which has operations and large coal holdings at Hilliard, Butler County, has its home office in Windber. The borough is well laid out; it has wide streets paved with brick; and a number of fine buildings. There are three large public schools containing 20 rooms. One building was erected in 1903 at a cost of \$50,000. There are two banks; the Windber national bank has a capital of \$50,000. There are seven church buildings, one mission, and a strong Y. M. C. A. organization. The borough has a municipal hall. The government is vested in a burgess and a council of seven members. The expenses annually of the excellent volunteer fire department are \$10,000.

The Berwind White Coal Mining Company were chiefly instrumental in establishing the borough, by means of their extensive operations and coal holdings in the vicinity. Nearly all their employees reside in the borough. Windber was laid out for an industrial centre and an ideal residential town. The town was platted by J. S. Cunningham, and in 1900 it was incorporated as a borough. It has water-works, electric lights, and two newspapers. Pop. (1910) 8,013. About 75 per cent are foreign born.

AMOS CLAR,

Editor 'The Windber Era.'

Windbreak, in agriculture, rows of trees planted along the edge of fields of grain, orchards, etc., to break the force of the wind and to protect the crops.

Winder, win'dér, William Henry, American general: b. Somerset County, Md., 18 Feb. 1775; d. Baltimore 24 May 1824. He was graduated from the University of Pennsylvania and became a lawyer in Baltimore. In March 1812, at the breaking out of the War of 1812, he was appointed lieutenant-colonel of infantry, and was made colonel in July of the same year. He led a successful expedition from Black Rock to the Canada shore, 28 Nov. 1812; was promoted to be brigadier-general in March 1813; ap-

pointed adjutant and inspector-general in May 1814; commanded at the battle of Bladensburg, and the unsuccessful defense of Washington, in August 1814, and was honorably discharged in June 1815. He then resumed his law practice, and was subsequently a member of the Maryland senate.

Windermere, win'dér-mér, or Winander-mere, England, a lake in Lancashire and Westmoreland, about 11 miles in length, and from one third of a mile to a mile in width, its area being a little over five square miles; its depth varies from 30 to 240 feet. Its outlet is the river Leven, which discharges its waters into Morecambe Bay. The lake is surrounded by gentle, well wooded eminences, and the neighborhood is noted for its beautiful scenery, celebrated by the Lake poets, Wordsworth, Coleridge, and Southey. Wordsworth lived at Rydal Mount, about two miles from the head of the lake. Windermere, pop. (1901) 2,379, is a small town near the eastern shore.

Wind'galls, puffy swellings about the fetlock-joints of animals, particularly of horses, resulting from an increased secretion of synovia arising from work, particularly on hard roads; they are generally unassociated with any pain, heat, or lameness, and are not generally considered to be causes of unsoundness. If the horse be young they may disappear if the animal be allowed a long rest and the parts blistered once or twice. Old horses having windgalls are generally kept at work, the legs being bandaged when in the stable.

Windham, win'dám, William, English orator and statesman: b. London 3 May 1750; d. there 4 June 1810. He was educated at Eton, Glasgow, and Oxford, and was returned to Parliament as member for Norwich in 1784. During the early part of Pitt's administration he sat in the opposition, but during the course of the French Revolution joined Burke in condemning the revolutionary principles, and advocating the war that Pitt declared against France. He was secretary-at-war in Pitt's cabinet 1794-1801, and under the Fox and Grenville ministry, which came into office in January 1806, held the rank of colonial secretary. During his tenure of office, which continued till March 1807, he brought in and succeeded in passing against strenuous opposition, a measure for reducing the duration of the period of enlistment for soldiers, and making various provisions for improving the condition of the soldier. Windham was a man of thoroughly independent character, but his independence sometimes passed over into eccentricity. A collection of his speeches with a 'Life' by Amyot, was published in 1806; his diary, edited by Mrs. Baring in 1866.

Wind'hover, a name in Great Britain for the kestrel (q.v.), referring to its habit of holding a stationary position facing the wind, while it searches the ground beneath it for indications of prey.

Windlass, in mechanics, a machine for raising weights from a pit, consisting of a cylinder or roller moving on an axle supported on a frame, and turned by levers inserted in square holes cut in the cylinder, or by a crank fitted on to one or both ends of the axle. One end of a rope or chain is attached to the cylinder, and

WINDMILL

the other to the weight, which is raised by the rope being shortened in passing round the roller.

Windmill, a machine for furnishing power for grinding grain, pumping water, or doing other useful work, operated by the wind. History does not record the date of invention of the windmill; but it is known that it was used in Europe as early as the 12th century A.D. A common form of European windmill is shown in figure 1. The sails, upon which the wind

sends its edges to the wind, and is therefore not affected by it; a change in the direction of the wind tends to cause rotation of the auxiliary wheel which in rotating brings the main windwheel into proper relation with the wind. Before the invention of the auxiliary steering wheel, and to a large extent after its invention, the main windwheel was kept in position by hand. In many cases the whole tower, instead of merely the upper part thereof, is made to pivot about its vertical axis, this latter construction being generally followed in German practice, while that above described is common to machines built by the Dutch. In some very crude windmills of the European type no provision whatever was made for changing the direction of the windwheel. The speed of a windwheel tends to vary with the wind velocity. In windmills of the European type, where speed regulation is desired, it is accomplished by varying either the load or the sail area exposed to the action of the wind. A friction brake is often used to vary the load, while to vary the sail area the canvas forming the sail surface is rolled up or unrolled, or the sail surface is formed from slats, after the fashion of the Venetian blind, and changed by opening or closing the slats. The devices for varying the sail area are actuated either by hand or by a suitable automatic governor. It is to be observed that the sails of the European windmill occupy only a small portion of the area swept by them. In the American type the sails are much greater in number and occupy, comparatively, a much larger part of the area swept by them. The greater number of sails makes it possible to reduce the diameter of the windwheel, for a given power, considerably below that necessary in the European windmill; as a result the American windmill is much smaller than that of Europe. The windwheels of the latter were often as large as 100 feet in diameter; those of the American type are rarely larger than 30 feet in diameter.

FIG. 1.

acts in driving the machine, consist of a light framework upon which canvas is stretched. The surface of the canvas makes an angle (called the angle of weather) with the plane of the windwheel, and this angle is usually about 18° at the inner end of the sail, gradually decreasing to about 7° at the outer end. The length of the sail is generally about five sixths the length of the arm, the width of the outer end one third the length, and the width of the inner end one fifth the length. For proper action the axis of the windwheel shaft should be parallel to the direction of wind. In most cases it is, however, inclined upward at an angle of about 15° to permit the ends of the sails to clear the tower, and since the direction of the wind is, in general, horizontal, this condition for proper action is not fully realized in windmills of the European type. To allow the windwheel to be turned as the direction of the wind changes, the upper part of the structure is adapted to rotate about the vertical axis of the tower, being supported upon rollers at A, and the auxiliary wheel B is provided to maintain it in its proper relation with the direction of the wind. This auxiliary wheel is so connected, by gearing, with the fixed part of the structure that in rotating it causes the movable part of the structure to turn about its axis. When the main windwheel is properly directed the auxiliary windwheel pre-

FIG. 2.

American windmills are built in a very large variety of styles, some being constructed principally of wood, others entirely of metal. Each is, however, designed to automatically maintain

WINDMILL

the windwheel in its proper relation with the direction of wind, to deliver the power developed either by means of a rotating shaft or re-

lent churning of the water resulting from the rapid action of direct stroke windmills, and to reduce the losses in the pump due to friction and to backlash of the valves. When the windmill is to be used for general power purposes, which may include pumping, sawing, grinding, etc., the power is transmitted through a train of gears to a vertical shaft, those of this general type being known as geared, or power windmills. Any torque exerted by the gearing upon the vertical shaft reacts upon the windmill itself, tending to rotate it out of its normal position with regard to the direction of wind. Neglecting friction, the torque at the vertical shaft is equal to that exerted by the windwheel divided by the number of turns which the vertical shaft makes to one turn of the windwheel. Hence the effect of the vertical shaft in disturbing the position of the windwheel becomes smaller in amount as the ratio of gearing between them is increased, and for this reason the ratio of gearing is in best practice made about six to one; that is, the vertical shaft makes six revolutions to one revolution of the windwheel. This high ratio is also an advantage in that it allows the diameter of the vertical shaft, for a given size of windwheel, to be made considerably less than that which would be necessary with a smaller ratio.

When the pressure of the wind upon the windwheel becomes so great as to approach the danger point, it is lessened by reducing the sail area exposed to the wind. In the windmill shown in figure 2 the windwheel is so placed that a line drawn through its centre parallel to the

FIG. 3.

reciprocating rod, and to automatically keep its speed below a certain definite and safe limit. A certain number of methods have been devised for each of these operations. Different combinations of these methods, together with variations in minor details, result in the large variety of styles. Figures 2, 3, and 4 show several windmills of the American type, these particular forms being selected because among them may be found examples of each of the methods by which the results before mentioned are accomplished. The windwheel may be held in proper position with regard to the direction of wind in three ways, namely, by means of a rudder or tail, as in figures 2 and 3, by means of an auxiliary steering wheel, as in figure 4; and by the pressure of the wind upon the windwheel itself, which is placed on the opposite side of the tower to that from which the wind proceeds, as in figure 4. When the windmill is to be used for pumping purposes exclusively, the power is, in general, transmitted from the windmill to the pump by means of a reciprocating vertical rod, as in figures 2 and 3. Those in which the pump rod makes one complete stroke for each revolution of the windwheel, as in figure 4, are termed direct stroke windmills; when the pump rod makes only a fraction of a stroke for each revolution of the windwheel, as in figures 2 and 3, the windmill is said to be back geared. The back gearing may be accomplished either by means of a pair of spur gears, as in figure 2, or by means of a rack and pinion, as in figure 3. In pumping windmills of recent construction back gearing is very largely employed, its object being to avoid the great shocks and vio-

FIG. 5.

normal direction of the wind passes to one side of the axis about which the windmill pivots. The tail is in each case supported upon the windmill frame by the hinge joints C, C', and is held in its normal position with reference to the windwheel by the spring D. Wind-pressure upon the windwheel tends, therefore, to stretch the spring, and it does so when it is sufficient to overcome the initial tension of the spring, thus turning the windwheel so that the wind acts obliquely upon it, and reducing the exposed sail area. The initial tension of the spring is so determined that

WINDMILL

it will begin to stretch when the pressure of the wind upon the windwheel approaches the safe limit. In the windmill shown in figure 3 the windwheel is so placed that a line through its centre parallel to the normal direction of the wind intersects the axis about which the windmill pivots. The side vane E is fixed to the windmill frame, upon which the tail is also carried, being supported by the hinge joints, C, C'. The tail is held in its normal position with reference to the windwheel by means of the spring F. Pressure of the wind upon the vane E tends therefore to stretch the spring F, and the spring is so determined that it will be stretched when the wind pressure upon the vane E approaches the safe limit. As the spring is stretched the position of the windmill is changed so that the exposed sail area is reduced, in the same

posed sail area. Other methods of regulation, involving centrifugal governors or variations from the arrangements above described, have been devised, but have not come into extended use. The particular mechanical details involved are subject to very wide variation, but the arrangements shown in the figures serve to illustrate the principal types.

Windmills of the usual forms are, in general, mounted upon towers of heights ranging from ten to a hundred or more feet, so that the wind which acts upon them will not be seriously affected by obstructions which may exist in their immediate neighborhood. Provision is always made for controlling, or furling, the windmill from a convenient place near the base of the tower, generally by means of a wire, termed the furl-wire. Furling is in general accomplished

FIG. 4.—Vaneless Aeromotor.

manner as with the windmills shown in figures 2 and 3. In the windmill shown in figure 4 it is evident that any change in the relative positions of the steering wheel and the main windwheel will result in a change in the position of the latter relative to the wind. The frame carrying the steering wheel is pivotally mounted upon the frame which carries the main windwheel, and is held in its normal position with reference to it by the coiled spring H. In the ordinary running position the wind falls perpendicularly upon the side of the tail of the steering wheel, and when the pressure upon it exceeds the safe limit it overcomes the resistance of the spring and changes the position of the steering wheel so that the wind falls upon its face; this causes the steering wheel to act, which moves the main windwheel so that the wind falls obliquely upon it, thus reducing the ex-

posed sail area to such an extent as to prevent the action of the windmill. The reduction of the exposed sail area is in each case accomplished in the same manner as in the process of regulation, except that the force necessary to lift the weight or overcome the tension of the spring is applied through the furl-wire and transmitted by a suitable arrangement of levers or pulleys, instead of being supplied by the energy of the wind. Thus in the windmills shown in figures 2 and 3 a pull transmitted through the furl wire is applied to the tail in such manner as to bring it into a position parallel to the plane of the windwheel. In that of figure 4 the auxiliary wheel is turned through an angle of 90° by means of a pull on the furl-wire. It is to be observed that in each of the windmills heretofore mentioned the windwheel is adapted to rotate about an axis the normal

WINDMILL

position of which is parallel to the direction of the wind. A number of types of windmills have been devised in which the windwheel rotates about an axis, the normal position of which is in a plane perpendicular to the direction of the wind, but they have not attained a

FIG. 6.

sufficient degree of success to warrant considering them here. If A represents the plane area, in square feet, swept by the sails of the windwheel, V , the velocity of the wind in feet per second, and δ the weight in pounds of a cubic foot of the air, then the weight of air available per second for use by the windwheel is

$W = AV\delta$, and its energy is equal to $\frac{WV^2}{2g}$

g being a constant representing the acceleration due to gravity. The power in foot-pounds per second brought to the windwheel by this air is,

therefore, $L = \frac{WV^2}{2g} = \frac{V^3 A \delta}{2g}$. This expression

indicates that, other conditions remaining the same, the power of a windwheel varies directly as the cube of wind velocity, and directly as the area swept by the sails, both of which relations have been substantially verified by experiment. In the construction of windmills considerations of strength require that, in general, the linear dimensions of all of the parts shall bear the same proportional relation to each other, regardless of the size of the windwheel. Other conditions being equal, the weight of a windmill, therefore, varies directly as the cube of the diameter of its wheel, while its power varies directly as the square of the diameter of the wheel. Hence, in increasing the size of windmills, the weight, and the consequent cost of material, increase more rapidly than the capacity, and it is not, therefore, found practicable to increase their size beyond a certain degree. When a windmill is in operation the air currents which act upon it are so modified and broken up, by their contact with the sails and other members, as to render accurate mathematical treatment of the case impossible, in the present state of our knowledge. For this and other reasons, mathematical considerations of the case are chiefly of theoretic interest, and the development of the form of the windwheel has been due rather to experiment than to theory.

The most notable among the experiments which have been made upon windwheels are those made about the middle of the 18th century, upon windwheels of the European type, by John Smeaton, and those made in 1882 upon windwheels of the American type by Thomas O. Perry. In these experiments the following im-

portant facts were, among others, established: (1) The maximum power which may be obtained from a given windwheel varies directly as the cube of the wind velocity. (2) The sail speed of a windwheel, when developing its maximum power, varies directly as the wind velocity. (3) The load upon a windwheel, when developing its maximum power, varies directly as the square of the wind velocity. (4) The capacity of a windwheel varies directly as the square of its diameter. (5) The number of turns which a windwheel will make in a given time varies inversely as its diameter. (6) There is nothing gained by having the sail area of a windwheel greater than seven eighths of the area swept by the sails, and there is little gained by having it more than three fourths the latter area.

In order that the maximum power may be obtained from a windmill, in winds of varying velocity, the load must vary directly as the square of the wind velocity. In practice the load is seldom, if ever, made to vary in this manner. The most common form of installation is that in which a pumping windmill is directly connected to a single acting pump operating under a constant head. In such cases the average load during a complete cycle of the pump is practically constant regardless of the wind velocity. Moreover, the load varies, in general, from about zero during one stroke to a maximum at about the middle of the other stroke. This periodic variation of load is also a source of loss, especially when the windwheel is rotating slowly, and the amount of kinetic energy stored in it is small. In the case of power windmills the load depends upon the character of the work. Some grain-grinders

FIG. 7.

for use in connection with power windmills are constructed so that the grain is fed to them by centrifugal action, and in these instances the load upon the windmill is made to increase as the speed increases.

Mathematical Formulae.—In the following mathematical discussion all differences of pressure and density in and about the windwheel are neglected, and friction between the air currents and the various members of the wheel, eddies, and similar disturbing effects are also neglected. In order that the sails may derive power from the stream of air particles which acts upon them, the air particles must be deprived of a portion of their velocity by reason of their contact with the sails. The general manner in which this decrease of velocity of air particles occur is indicated in figure 5. The ideal conditions here indicated are assumed for convenience in determining the maximum attainable efficiency. Let V represent the initial velocity and direction of the wind, and V_1

WINDMILL

its direction and velocity as it leaves the wind-wheel. Both V and V_1 are assumed parallel to each other and to the axis of the wheel. Let A = area swept by the sails, and let δ = density of the air. Then the weight of air which acts upon the sails per unit of time is $AV_1\delta$, and the energy given up by the air is, $\frac{AV_1\delta}{2g} V^2 - \frac{AV_1\delta}{2g} V_1^2$. But the weight of air

brought to the wheel per unit of time is $AV\delta$, and its energy is, $\frac{AV\delta}{2g} V^2$. The efficiency of the wheel is, therefore,

$$E = \frac{\frac{AV_1\delta}{2g} V^2 - \frac{AV_1\delta}{2g} V_1^2}{\frac{AV\delta}{2g} V^2} = \frac{V_1 V^2 - V_1^3}{V^3}$$

$$E = \frac{V_1}{V} - \frac{V_1^3}{V^3}$$

To determine the relation between V and V_1 , corresponding to maximum efficiency, V may be considered constant and this equation then investigated for maxima and minima by means of

the calculus, $\frac{dE}{dV_1} = \frac{1}{V} - \frac{3V_1^2}{V^3}$

Putting $\frac{dE}{dV_1} = 0$,

$$\frac{1}{V} = \frac{3V_1^2}{V^3}$$

$$V^2 = 3V_1^2$$

$$V_1 = \sqrt{\frac{1}{3}} V$$

$$V_1 = .578 V$$

That is, for maximum efficiency, V_1 should be .578 of V . Substituting this value in the expression for efficiency, it becomes

$$E = \frac{.578 V^2 - (.578 V)^3}{V^2}$$

$= .578 - .191$, $E = .387$. That is, the maximum efficiency attainable is 38.7 per cent. Certain differences of pressure which exist in the region of the windwheel in operation tend to make possible higher efficiencies than this. Experiment indicates that efficiencies slightly in excess of 38.7 per cent may actually be realized.

For perfect action between a moving vane and a stream of fluid particles, the direction of the stream relative to the vane must be parallel to the surface of the vane throughout the period of contact, and the velocity of the stream relative to the vane must be constant throughout this period. This condition is indicated by figure 8. In the windwheel, a section of two sails of which is shown in figure 7, it is evident that, there being no change of relative velocity or of density, all of the air which approaches the sail at F cannot pass out at G , owing to the decrease in the width of the passage. Of the air which approaches at F , only

that part which passes between points J and K is effective in doing work on the sail, while the remainder (that which passes between H and J) must pass around the wheel and does no work. In view of these facts, the theoretical efficiency of a given sail element may be determined by the following graphical construction: Let $B D$ (figure 8) represent the actual direction and velocity of the wind. Let $A D$ represent the actual direction and velocity of the sails' motion. Let ϕ be the angle made by the trailing edge of the sail with the plane of the wheel. Then $B A$ = velocity and direction of the stream of air relative to the sail at impingement, and $B'A'$ = velocity and direction of the stream relative to the sail at escape. $B'A'$ is equal in length to $B A$. Now draw $A'J$ parallel and equal in length to $A D$, and draw $B' J$. Then $B' J$ = actual direction and velocity of the stream of air at escape. Draw $B''K$ perpendicular to $B'A'$ produced. Then $B''K$ is the width

FIG. 8.

of the stream of air which acts upon the sail element $A B'$. For convenience the radial depth of the element, and therefore of the stream of air, is assumed to be unity. If δ is the density of the air, the weight of air which acts upon the element per unit of time is $B''K \times B A \times \delta$ ($B A$ being the velocity of flow and $B''K$ the area of the stream). The original velocity of this air was $B D$, and its final velocity $B' J$. Hence the work done by it is equal to,

$$\frac{B''K \times B A \times B D^2 \times \delta}{2g} - \frac{B''K \times B A \times B' J^2 \times \delta}{2g}$$

But the available energy is equal to

$$\frac{B''B' \times B D \times B D^2 \times \delta}{2g}$$

Hence the efficiency is,

$$E = \frac{\frac{B''K \times B A \times B D^2 \times \delta}{2g} - \frac{B''K \times B A \times B' J^2 \times \delta}{2g}}{\frac{B''B' \times B D \times B D^2 \times \delta}{2g}}$$

$$E = \frac{B''K \times B A \times B D^2 - B''K \times B A \times B' J^2}{B''B' \times B D^3}$$

DANIEL R. SCHOLES,
Of the Aermotor Company, Chicago.

WINDOM—WINDSOR

Windom, win'dóm, **William**, American financier: b. Waterford, Ohio, 10 May 1847; d. New York 29 Jan. 1891. He was admitted to the bar in 1859, engaged in law practice at Mount Vernon, Ohio, and in 1852 was prosecuting attorney of Knox County, Ohio. He held this position for three years, when he removed to Minnesota. Sent to Congress from that State in 1859, he was re-elected to serve four successive terms, a period of 10 years, ending his career in the House in 1869. He was appointed to the United States Senate in 1870 to fill the unexpired term of Daniel S. Norton, deceased, and was also elected for the terms ending in 1878 and 1883. He resigned, however, in 1881, to accept the Treasury portfolio in President Garfield's cabinet, and on his retirement from the cabinet after that President's death returned to the Senate, where he served the remainder of his term. He was occupied with various financial interests in New York from 1883-9, when he was appointed secretary of the treasury in President Harrison's cabinet and occupied that position until his death. He was one of the earliest exponents of the gold standard, and was considered available as a Presidential candidate in three national conventions, those of 1880, 1884, and 1888.

Window, an open space reserved, as in a wall, for the admission of daylight into the interior. (See also **DOMESTIC WINDOW**.) The window generally is in a vertical wall. The opening may be filled with glazed sash or casement arranged to open and shut, as in the modern houses; or with glazed sash of wood, iron, or lead fixed firmly to the solid frame of the window, or with only a single panel here and there made to open, as in the case of churches both ancient and modern; or the space may have a slab of semi-transparent stone let into it through which much light may enter, as in some Oriental and ancient European buildings; or a slab of marble with holes cut in it may be inserted, or in place of this a continuous grating, as of bronze, both of which were frequent in classical Roman buildings; or, finally, the space may be left without permanent filling of any sort, shutters being used to close it when needed, as in many parts of Europe in the Middle Ages, and as common now in the tropics. Still a further modification of the last-named scheme is found in those tropical houses which have all the openings filled with *jalousies*, namely, shutters with slats (louver shutters), some of which may even be fixed fast, while others open on hinges. As the climate becomes too warm for the necessity of closing the windows at any time in the year, these devices tend to replace solid shutters and casements.

Architecturally the window is of the greatest importance to certain styles, and in others does not count at all. Thus in Grecian architecture there are no windows; and in Greco-Roman architecture the window has never been a controlling member because the great windows of the public halls are commonly the lunettes under the vaulting, simply pierced and filled with gratings instead of built up solid with masonry. The window of the ancient Roman dwelling, also, so far as we know it, was of less consequence because there were no openings of any great size in the outer walls, and the rooms opening inward upon the court or garden were

more or less without walls on that side, a large doorway and a square window above the bed-place needing nothing but a curtain or the like to screen them. Even in Byzantine and Syrian art the window, though beginning to be emphasized by a stone trimming or casing, is not that which the style depends upon. But in the mediæval styles of northern and western Europe the window is the chief feature after the roofs with their fixed slope and their height above the walls. The earliest Romanesque had windows, small indeed, but with jambs richly molded in the thickness of the heavy walls; and the later style takes on some of the variety and brilliancy of the Gothic work. The Gothic window in a church is the opening up of the whole wall space between buttress and buttress and below the vault; and this space tends to be filled with elaborate tracery. Even apart from the tracery, the moldings of the jamb—often with colonnettes produced by fitting a round molding with capital and base, and with sculpture added to the sill-course—may be very decorative. In dwelling-houses tracery was rare, but the window, if large, was closed with a pointed arch and the head filled with a slab of stone pierced with a decorative opening and supported by colonnettes, or in some other way architecturally treated. The very numerous windows with square heads, that is, with lintels instead of arches, are made ornamental by moldings, sometimes very rich and elaborate, and by the free use of colonnettes to carry the lintels. In the neo-classic style a curiously regulated and ordered system of arranging the windows became customary in the early days of the Renaissance, and was completely developed in the 16th century in Italy, and 50 years later in the north. Under the name of fenestration this ordering of the windows has become a most important part of designing, especially in the street fronts of city buildings. The window-cavings may even be ornamental in themselves, though with an ornamentation not strictly belonging to them, but borrowed, as it were, from other parts of the structure: thus, small pediments are used to crown the window openings, and even columns are used, one on either side of the window opening, to support these pediments. But the main thing is still the arrangement of the windows in the wall and the proportioning of these openings and the solid wall between them.

RUSSELL STURGEON.

Window Glass. See GLASS.

Window Tax, a tax formerly imposed in Great Britain on all windows in houses (latterly above six in number). It was abolished in 1851, a tax on houses above a certain rental being substituted.

Window Tax War. See UNITED STATES, WARS IN THE.

Windsor, win'zor, Canada, a seaport town, capital of Hants County, Nova Scotia, on an inlet of Minas Bay, and on the Windsor & Annapolis Railway, 45 miles northwest of Halifax. Its chief institution is King's College (q.v.), or Windsor University, founded in 1788. It is a busy shipping port, is electrically lighted, and has a considerable export trade in the gypsum and limestone of the region.

Windsor, Canada, the largest town in Essex County, situated on the banks of the Detroit

WINDSOR — WINDTHORST

River, opposite the city of Detroit. Five railways enter the city, including the Grand Trunk, Canadian Pacific, Michigan Central, Wabash, and the Ontario division of the Pere Marquette. The location makes Windsor one of the desirable residential cities of the continent. It has 10 churches, 10 schools, a Collegiate institute and Saint Mary's Academy. The chief manufactures are the Canadian Salt Co., paint and varnish works, sash, door and planing factories, boiler works and machine shops, with various minor industries. It has several miles of paved streets and an adequate sewerage system. There is a rapid increase in population which is about 17,000.

Windsor, Conn., town in Hartford County; on the Connecticut and Farmington rivers, and on the New York, New Haven & Hartford Railroad; six miles north of Hartford. It is in an agricultural section in which the chief products are vegetables, fruit, and tobacco. The principal manufactures are worsted goods, paper, electrical motors, knit goods, tobacco products, and dairy products. The educational institutions are the Hayden Hall-Home School for Girls, a town high school, kindergartens, 10 public schools, and a public library.

The first settlement was made in 1633 by William Holmes and companions from Plymouth. They established here a trading post. In 1635 Roger Ludlow and a colony from Dorchester, Mass., settled near the trading post and called the place Dorchester. In 1637 the name was changed to Windsor. In 1639 Windsor united with Hartford, and Wethersfield, under "Fundamental Orders," to form the commonwealth of Connecticut. Pop. (1900) 3,614; (1910) 4,178. Consult: Stiles, 'Ancient Windsor'; 'Memorial History of Hartford County.'

Windsor Locks, Conn., town in Hartford County; on the Connecticut River, and on the New York, New Haven & Hartford Railroad; about 12 miles north of Hartford. It was a part of the town of Windsor until 1854, when it was set off and incorporated. It is a manufacturing town; extensive water-power is obtained from the Connecticut by means of a canal. The chief industrial establishments are paper mills, cotton yarn and thread factories, a foundry, machine shops, steel works, and silk factories. Other manufactures are furniture, trucks, school globes, and carpet-loom chains. In 1900 (government census) Windsor Locks had 37 manufacturing establishments, capitalized for \$2,117,150; the annual output of which was valued at \$1,311,268. The principal public buildings are Memorial Hall, presented by Charles E. Chaffee to J. H. Converse Post 67, G. A. R.; four churches, and the public and parish schools. It has one bank. Pop. (1890) 2,758; (1900) 2,997; (1910) 3,715.

Windsor, or New Windsor, England, a town in Berkshire, on the Thames, 21 miles by rail west of London. Windsor and Eton (q.v.) practically form one town, which is chiefly interesting on account of the castle and park, a favorite residence of the English sovereigns since the time of William the Conqueror. The original royal palace, where the Saxon kings lived before the Conquest, was at Old Windsor, about two miles distant, but the present site

was chosen and the castle built by William; later extensions were added by Henry I. and Henry II., but during the reign of Edward III. it was torn down and rebuilt by William of Wykeham, Bishop of Winchester. The new castle received various additions by the orders of succeeding monarchs until the time of Queen Victoria, who restored and sumptuously decorated Albert chapel as a memorial to the Prince Consort, Albert. The buildings comprise upper, lower, and middle wards, extending along the crest of an eminence rising 42 feet above the river, and covering 12 acres in the Little or Home Park, which is connected with the Great Park and adjoining Windsor Forest, the whole occupying an area of 13,000 acres, 56 miles in circumference. The lower ward on the west contains Saint George's chapel, the Albert chapel, the houses of the military knights, cloisters, etc.; the Middle Ward, dominated by the Round Tower, rising to a height of 80 feet, built by Edward III. to accommodate the round table of the Knights of the Order of the Garter, containing the rooms which were up to 1666 used as a prison; the Upper Ward on the east, comprised of the sovereign's private apartments, the library and the long corridor. Saint George's Hall, the Waterloo Chamber, the Throne Room, and the old Ball Room, comprising the state apartments in the Upper Ward, have valuable collections of paintings, statuary, etc. Under Saint George's chapel is the burial vault of several English rulers and members of the royal family. The royal palace and the mausoleum of Frogmore, Cumberland Lodge, and Virginia Water are in the park. The town hall of Windsor was built by Christopher Wren in 1658.

Windthorst, Ludwig, leader of the Catholic or Center party in the German Reichstag from 1874 to his death: b. at Kaldenhof, near Osnabrück in Hanover, 17 Nov. 1812; d. Berlin 14 March 1891. He received his early education at the Caroline Gymnasium in Osnabrück and studied law at Göttingen and Heidelberg. He began the practice of law at Osnabrück. He occupied various official positions in connection with German Courts of Law and his talents and impartial character were widely recognized. Politically he clung to the opinion that there should be a union of the German states including Austria. He emphasized the necessity for the preservation of the independence of the various petty German governments and of absolute freedom of religion and education. In 1851, he was elected president of the second chamber of the Legislature of Hanover, and in 1853 became the Minister of Justice in the cabinet of George V. He held this same portfolio ten years later. In this position, his treatment of vexed questions between Catholics and Protestants called forth praise from both parties. When the reigning house of Hanover fell as the result of the war of 1866, he was sadly disappointed, but fitted himself at once into the new order of things in the fatherland, by accepting election for the town of Meppen, to the Prussian Lower House and to the Reichstag of the North German Confederation. Here he soon came to occupy a prominent place as a valuable assistant of the leader of the Catholic party, Mallinckrodt. At Mallinckrodt's death, 1874, Windthorst was selected to replace him.

WINDWARD ISLANDS—WINE

For nearly twenty years, he remained a successful leader of the party, which under his influence gradually came to have the balance of power in the Reichstag. While he was a devoted Catholic, he was an intense lover of his country, believed thoroughly in the maintenance of the German army in order to assure peace, and the last speech that he ever made, scarcely a month before his death, was in favor of a liberal programme of development for the navy. Once when Vatican influence seemed to be used to urge a political measure, in which the German government was very much interested, he came out distinctly in opposition. Just before the declaration of the infallibility of the Pope, he joined with those who thought the moment inopportune but he was always devoted to the Holy See. He was the model of a successful party leader; an expert in the management of men; an excellent judge of character and one of the best Parliamentary debaters of the 19th century. In spite of his years of occupation of an influential political position, he died quite poor. When the Catholics of Germany wished to recognize his great services to their cause by the subscription of a large sum of money, he diverted it to the foundation of a church in honor of the blessed Virgin to be erected in Hanover. Few statesmen have been more bitterly maligned than was Windthorst at the beginning of his career. After his death, political foes joined with friends in recognizing his talents, his uprightness of character and the absolute purity of his motives, besides his lofty patriotism. His great merit is to have succeeded in preventing Bismarck from making the Church merely a department of state in Germany. The Catholic party agreed that it was to his talents as a leader that they owed most of their success in the struggle with the German Chancellor. Consult: Menzenbach, 'Windthorst' (Treves 1892); Knapp, 'Windthorst' (Männer der Zeit Series) Leipzig 1898.

JAMES J. WALSH, M.D.,
New York City.

Windward (wind'ward) Islands, a group of the West Indies forming the southern part of the Lesser Antilles, including Saint Lucia, Saint Vincent, Grenada, and the Grenadines. They are of volcanic origin, the larger islands are mountainous; the lower levels being generally fertile and producing sugar, cocon, and spices; logwood and other timber are also obtained. They belong to Great Britain; the governor resides at Saint George's, Grenada. The islands have no common legislature, laws, or tariff; but there is a common court of appeal, and they unite for other purposes. See also the names of the individual islands of the group.

Wine and Wine-making. It may have been design, but it was probably an accident, that first led man to crush or to press grapes in order to obtain a palatable and stimulating beverage. As long as the juice is confined within the grape, it becomes sweeter and sweeter as the fruit grows riper and riper. But when the skin is broken by crushing or pressing, and when the juice is allowed to remain a short time exposed to warmth and air, it changes its character and develops new and unsuspected qualities or properties.

The series of changes from the fresh grape juice to an alcoholic drink may be best illustrated by describing the process briefly as follows:

When the juice, or "must," is exposed to temperatures ranging from 50° F. to 65° F. the liquid very soon begins to become turbid, small bubbles collect on the surface and the grape skins, stems, and other solid particles, form a dense cover or "cap" on the top. Carbonic gas, which is developed in increasing quantities, escapes with a loud bubbling sound, and, as the temperature rises, the juice appears as though it were really boiling. After a few days, and sometimes after a few hours, the ebullition subsides and gradually the crust and undissolved substances fall to the bottom. Meanwhile, the must has lost its sweetish taste, and its original character and chemical composition; among other things, it has acquired a richer, deeper color, a vinous flavor and odor, and a certain amount of alcohol.

This interesting natural process, which leads to the formation of alcohol, was described by the term "fermentation," from the Latin *fermentum*, the root word being *fervere*, to boil. This feature of the phenomena, whereby the evolution of the gas makes the liquid appear to boil, evidently struck the early wine-makers and natural philosophers as most important. It was a long time before the true nature of the process of vinous or alcoholic fermentation was clearly perceived and properly understood.

Early in the last century (from 1810-25) chemical analyses by Gay-Lussac, Thénard, and De Saussure fixed accurately the composition of sugar in the must and of alcohol in the wine. In 1835 Cagniard de Latour found that the globules were definite organisms, capable of reproducing themselves by budding, and thus apparently belonging to the vegetable kingdom. He came to the conclusion that, in the course of vegetation, these globules, or "ferments," disengaged carbonic acid gas and converted the liquid into an alcoholic liquor.

This discovery, which is at the basis of the modern principles and practices of wine-making, was confirmed two years later (1837) by Schwann at Jena and Kützing at Berlin. The newly-found organism was regarded by some as belonging to the fungi and by others to the algae. Meyen showed that the organism was a fungus, and established a new genus for it under the name of *Saccharomyces*. In other words, the agents of alcoholic fermentation are called "yeasts" and belong to the order *Saccharomyces*.

Recent Researches in Alcoholic Fermentation.—The work of the great chemist Pasteur threw a flood of light upon the whole process of fermentation. His investigations extending over a series of years were first summed up in his 'Studies on Wine' (*Études sur le Vin*), published in 1872, and further in his book, 'Studies on Beer' (*Études sur la Bière*), published in 1876.

To Pasteur belongs the honor of establishing beyond question that fermentations were the work of infinitely small organisms called "microbes." He classified and described many of these micro-organisms. He divided them into two classes: aerobic, those which can not live without the presence of free air; and anaerobic,

WINE AND WINE-MAKING

those which can exist in the absence of air. The former *saccharomyces* are found at or near the top of the liquid during fermentation; the latter are at work lower down in the body of the liquid.

The microscopical examination of the agents of alcoholic fermentation has revealed quite a number of different forms and varieties. Some 25 or 30 types of the genus *Saccharomyces* have been identified.

The question may very naturally be asked: Where do these yeast organisms come from? Pasteur showed very clearly that the ripe grape is covered with a mass of micro-organisms. These microbes collect on the fruit and stems, and constitute the "bloom" of the grape. Just why they should fix themselves on the fruit, and remain, as it were, in readiness to be transformed from their dormant state to one of great activity when carried into the juice of the fruit is a mystery. At the same time a great number of other and less desirable yeast cells (bacteria) become submerged in the grape juice, or must, and these foreign yeasts are the ones that give the wine-maker trouble, and lead to many diseases of wine.

Cultivated and Selected Yeasts in Wine-making.—A brilliant Danish chemist, Emil Chr. Hansen, took up the study of alcoholic fermentations and "disease ferments," where Pasteur left off. He brought out many new facts with regard to the many different races or species of *Saccharomyces*, which gave very different characters to beers. Hansen found that it was practical to separate and cultivate the better species or races of brewer's yeasts. With great skill and much care he was able to select two varieties of "low" yeast and then he worked out a method for the pure cultivation of yeast.

The use of pure cultivated yeasts has been attended with good results in wine-making. Musts have been prepared with pure yeasts and have been compared with musts fermented at the same time without such yeast. In most cases the pure-yeast wine has been regarded as superior to the other. One practical value of employing pure cultivated yeasts in wine-making is that under proper conditions they will control the progress of fermentation, and thus overcome the influence of the undesirable organisms in the must, such as mold-fungi, wild yeasts, bacteria, and mycoderma. By using selected yeasts from celebrated vintages, wine-makers have been able to obtain finer flavors and bouquets, all of which adds to the quality and value of their product.

Fermentation and Enzymes.—In order to grasp and properly understand the various problems connected with the phenomena of fermentation, it is necessary to say something about its relation to enzymes. The term "enzyme" is now used to indicate the *soluble* ferments secreted or formed in the yeast cell. Pasteur's theory makes fermentation a vital act, depending on a living organism. Recent discoveries show fermentation to be also a chemical act. A few years ago the German chemist, Büchner, proved that alcoholic fermentation can be carried out by a soluble ferment which is extracted from the yeast cell. So that we can have the phenomena of fermentation without the growth and multiplication of yeast cells. To this enzyme in the yeast extract Büchner has given the name *zymase*.

The effect of these recent discoveries in fermentation may be very great and far-reaching, and just what practical form they will take in wine-making and other industries it is impossible to predict.

The Vintage.—The word "vintage" has come to have quite a wide signification. It may be used to include three distinct steps: (1) the gathering of the grapes; (2) the processes of fermentation, and (3) the general cellar operations connected with the care and handling of the new wine.

The practices of wine-makers are different in different countries, and in different localities of the same country. This is owing to difference in soils, climates, conditions, varieties of grapes used, and in the kinds or types of wines to be produced. And yet, the main principles which give the best results in practice in one country are practically the same in any other country where wine is made.

It should be borne in mind, however, that wine-making is partly an art and partly a science. As such, it can not be learned and mastered by reading, or from books. The best we can here do is to describe briefly some of the more important details connected with the manufacture of wines.

Gathering of the Grapes.—The general rule is that grapes should not be gathered till they have reached a state of complete maturity. This condition is shown by certain well-known indications, such as the brownish color of the stem, the softening of the berry, and its easy separation from the stem, the skin is translucent, the juice becomes sweet, thick, and somewhat sticky.

The wine-maker determines the best time for gathering the grapes by using various instruments, known as a must-scale, mustimeter, glucometer, etc. They are employed for the purpose of finding out the saccharine richness or strength of the grape juice, or must. To judge of the sugar content of the grapes a few bunches representing the average condition are first gathered, the juice is expressed and strained through a cloth, collected in a suitable receptacle, and then the must-scale is carefully dropped into it. The quality of the must will be indicated on the stem of the scale. The grapes should be tested from day to day until the density, as shown on the scale, remains stationary, when it is time, as a rule, to gather the crop.

The oldest scale, that of Baumé, was devised to indicate the specific gravity of liquids, or their weight, as compared with that of water. Later scales give the density of the liquid direct, the density of water being indicated by 1. The glucometer invented by Dr. Guyot is very convenient and is used by the French wine-makers. This scale indicates at once, the degree Baumé, the quantity of sugar in the must per hectolitre, and the amount of alcohol that will result from the fermentation of the must per hectolitre. The Salleron mustimeter is another very useful instrument, highly regarded by French wine-makers. The instruments mostly used in this country are Oechsle's must-scale and Balling's saccharometer. All the different must scales are also used during fermentation to determine when the sugar contained in the must has been entirely transformed into alcohol.

Composition of the Must.—A very good idea of the qualities of a good, average must may be

WINE AND WINE-MAKING

Three distinct phases of fermentation will be observed: (1) The first day or two when the ferments are multiplying; (2) the tumultuous fermentation, accompanied by a violent bubbling of the liquid and a rise in temperature, and (3) the active but relatively quiet fermentation.

As a general rule, the more rapid the fermentation the better is the result. In the Southern States and in southern California the process may be completed in one, or two days. In the northern or temperate climates the time will run from seven to ten days.

The Influence of Temperature.—As we have already indicated, temperature exerts a controlling influence on fermentation. The yeast works best in temperatures ranging from 59° F. to 75° F. Below 59° its action is very feeble and slow; above 75° fermentation becomes retarded and even stops if the temperature passes much above 90°.

Thus, wine-making both in very hot and in very cool climates often presents many difficulties to be overcome. The must frequently becomes what is called "stuck"—that is, fermentation ceases before all the sugar is transformed into alcohol.

If the trouble comes from too low a temperature, the remedies are: (1) To raise the temperature by heating part of the must; (2) to heat up the fermenting room; (3) to increase the activity of the yeast by adding sediment from vats already through fermentation, and (4) to stir up the pomace so as to bring the germs in contact with the air, as the yeast is always "greedy for oxygen."

When the temperature of the must in the vats rises too high, it is necessary to lower the temperature in one way or another. Several methods are employed for cooling the must. Among these we may mention the use of shallow vats, racking off, and refrigerating systems. The difficulties of wine-making in our Southern States and in Southern California can be overcome only by the adoption of a suitable system for cooling musts.

The success of the wine-maker will always depend on his success in being able to control the progress of fermentation. Therefore, he should be able to control the temperature, which during fermentation has a most important influence (1) on the yield in alcohol, (2) on the qualities of wine, and (3) on the keeping quality of wines.

Drawing off the Wine.—Active fermentation can be recognized as being over, by the falling of the temperature, the settling down of the solid mass, or marc, by the clearing of the liquid, and the vinous taste and smell. The new wine will show from 0° to 2° by Balling's saccharometer, nearly all the sugar having been transformed into alcohol. It is either run into a large tub and emptied into casks, or it is pumped into casks. The drawing off of the new wine leaves in the vat the "marc," which contains a considerable quantity of wine. The marc when pressed furnishes what is known as "press-wine"; this represents usually about one fourth of the product, and the vat-wine three fourths.

Wine Presses and Press Wines.—It is not necessary to enter into a detailed description of the different forms of wine presses. They are worked by a screw or by hydraulic pressure to be operated either by hand or steam power. Where grapes are handled on a large scale, as

in some sections of France and California, continuous presses of recent invention are used. They are composed of two or more cylinders, worked as crushers, and after passing through these cylinders the grapes are carried by a screw, which forces them in a perforated horizontal cylinder, terminating in an orifice through which the marc in a compact cake is expelled. Even the best presses are not perfect as far as the yield or quality of the wine is concerned. Recent experiments show that the marc can be exhausted without presses.

The first run from the press is of course the best. It is often mixed with the vat wine. The second, third and fourth lots are inferior, and seldom mixed with the other wine; the last run is used for making vinegar or brandy.

Utilization of the By-Products.—From the husks and lees are obtained the following products: Second wines, "Piquettes," and by distillation, brandies and tartar. The second wines are produced by adding water to half the amount of the wine already drawn off, sufficient sugar to give from 6 to 7 per cent of alcohol, and tartaric and tannin when acidity is needed. The piquettes are sour wines obtained by adding pure water to the marc, before or after pressing; the cask is filled and closed. In course of time a "wine" having from 3 to 4 per cent of alcohol is produced, but it will not keep long. This is the cheap but healthful drink so largely consumed by the peasants and working people in France.

Brandies.—They are obtained either by distilling the marc direct, or by the distillation of a piquette wash. The best kind of brandy of the Cognac type is produced by distillation of a sound, clean wine. This process of distillation requires improved stills and special treatment. The "wash" for brandy spirits is obtained by running water into a tank filled with the marc, or pomace; the overflow is allowed to run into a second tank containing pomace, and the overflow from this tank passes into a third tank filled with pomace. It is seldom profitable to distil the wash unless it contains from 5 to 7 per cent alcohol.

Tartar.—This is extract from the lees, or deposited as a crust in the vats. It is obtained by causing a mixture of the marc and water to boil slowly for an hour or so, when the boiling liquid is drawn off and cooled the tartar crystallizes out. From the crude product is manufactured "cream of tartar," and tartaric acid.

Manufacture of White Wine.—The making of white wine differs from that of red wine principally in the matter of not having fermentation of the must take place in contact with the skin and solid parts of the grape. Two processes are to be taken into account: (1) The making of white wine from white grapes, and (2) the making of white wine from red or dark-colored grapes. The first-named process is of course the easiest one. Briefly stated, it consists in crushing the grapes, draining them, putting the drained marc in the press, and then leaving the juice from both of the operations to ferment. The main thing is to get the liquid free from impurities, as white wine should be perfectly clear. The usual method is to allow the must to settle and the suspended impurities to be deposited. The liquid must therefore be kept perfectly still for the required time; in other words, it is kept from starting into fer-

WINE AND WINE-MAKING

mentation. This is accomplished by the process called "sulphuring." The effect of applying sulphurous acid to the must is to paralyze the action of the ferments or yeasts.

After the must has become clear, it is separated from the deposit and run into the vat to undergo fermentation. During this process the must should be aerated as much as possible in order to drive off all odor of the sulphurous acid, as well as to encourage the activity of the yeast. The fermentation starts slowly and is always less vigorous than in case of red wines. When the fermentation is over, the white wine should be racked and put in casks which have been lightly sulphured and allowed to remain until perfectly cleared.

The manufacture of white wine from red or dark-colored grapes is attended with much more difficulty and labor than in the process of using white grapes. Without going into details, the main points to be observed are: (1) To avoid breaking the skins of the grapes, and thus start fermentation before crushing; (2) to proceed rapidly with the work of crushing and pressing; (3) to crush the grapes so as not to free the coloring matter in the skins; (4) to suppress all traces of coloring matter in the must, and separate the suspended impurities by the method above described. It is the opinion of expert wine-makers that in order to obtain the best results, white wine should be made from both white and red grapes.

Sweet Wines.—The familiar French term for sweet wines is *vins de liqueur*. These wines are the result of manipulation; that is to say, sweet wines are not obtained by the plain and simple process of fermentation of fresh grapes, but they have more or less alcohol added, and in some cases sugar is added. The best-known types of sweet wines are: Port, Sherry, Tokay, Madeira, Malaga, etc.

Port Wine.—Wines of this type are produced by fermenting the must down to 6 to 8 deg. of sugar, and then from 4 to 7 per cent alcohol is added to arrest further fermentation. This will give a wine having a strength of from 14 to 15 deg. alcohol. In the following spring the wine is racked, and from 2 to 3 deg. more of alcohol added. Thus, in the course of a year or so Port wine is gradually brought up, or "fortified," to 20 and 22 per cent. alcohol. Contributing to the final result are the methods of "blending," whereby color, body, flavor, bouquet, etc., are obtained.

Sherry Wine.—Our word "Sherry" is derived from the Spanish name Xeres, and this type of wine was originally produced and shipped from the town of Xeres. It is made from several varieties of white grapes grown in the province of Andalusia. The usual Spanish custom is to sprinkle each pressing of grapes with a certain amount (two or three handfuls) of gypsum. This operation, called plastering, is regarded as favoring fermentation. The must is fermented down to about 8 or 10 deg. sugar, and then alcohol is added, bringing the wine up to 16 or 18 deg. alcohol.

One feature of the manufacture of sherry wine in Spain is the system of *Soleras*. The word describes fine old mother wine, and the system consists in blending wines of different ages or years. Thus, the casks of sherry wine are arranged in groups, piled in tiers, and the groups graded according to quality. When wine

for blending or shipment is drawn from the group of casks constituting the oldest solera, they are refilled with wine from the casks of the next younger solera, and these again from the next, and so on down to the last group.

Another feature in the production of sherry is baking the wine by natural or artificial heat. The casks containing the wine are ranged in a building with the roof and exposed side covered with glass. The temperature in this sherry house during the day runs as high as 140° F. and is maintained at night by fires. Several of the large producers of sherry in California attain the same end by baking the wine in a specially-built chamber or room, which is heated by steam or hot air.

Champagne and Sparkling Wines.—The word "Champagne" was originally very properly applied to wines, whether still or sparkling, made in the champagne district of France. It now has a wider and more special meaning. By custom and popular usage champagne is the name given to a type of sparkling wine produced by a process of fermentation in the bottle. Thus, we have not only French champagne, but German champagne, Italian champagne, American champagne, etc. Sparkling wines are produced in most wine-making districts; some of the best known are, Sparkling Saumur, Sparkling Burgundy, Sparkling Beaujolais, in France; Sparkling Moselle in Germany; Sparkling Catawba, in the United States, etc. There are also "imitation champagnes." These are still wines which have been made sparkling by having carbonic acid gas forced into them, somewhat after the same fashion as soda water is produced.

The manufacture and manipulation of champagne requires considerable skill and knowledge. Some of the steps in the process may be described:

After the wine has gone through its first fermentation, it is racked off into casks, and a blend of the juices of different grapes is made. Then the wine is bottled and put in a warm place in order to start a second fermentation. At the proper time the bottles are stored in cool vaults, where the temperature is 50° F. or lower the year round, and where fermentation proceeds very slowly. It is important to keep the vaults at an even temperature, in order to prevent serious loss from breakage which a sudden rise in temperature would cause.

At first the bottles are stacked in horizontal layers, and as the wine begins to mature the bottles are placed in A-shaped racks. The bottles are gradually worked neck downward, in order to bring the sediment, which forms during the slow fermentation, down upon the cork. This is accomplished by the workmen giving each bottle a quick shake once or twice a day during a period of four to six weeks.

When the wine is taken to the finishing room, the sediment down on the cork is "disgorged"—that is, the workman loosens the cork and the lively pressure of the gas in the bottle forces out the sediment, leaving the body of the wine perfectly clear. Champagne in this state is "brut"—almost absolutely "dry." To please the taste and palate of consumers, the wine is sweetened by adding a little liqueur, or "dosage" as the French call it, composed of rock candy syrup dissolved in old wine or brandy. The final operations comprise putting in a fine cork in the bottle, wiring and capping it, pasting on

WINE AND WINE-MAKING

the label and casing the bottles in boxes for shipment. It has been figured that a bottle of champagne from start to finish is handled about 200 times.

Handling and Taking Care of Wine.—It is always necessary to keep casks or barrels of wine in a well-ventilated, cool place. When wine is drawn off, and when there is loss from evaporation, the barrel should be filled up.

New wine soon begins to clear itself by the deposit of solid matters held in suspension. The thick deposit which forms at the bottom of the cask is called the lees. In order to prevent the lees from mixing with the liquid, wines are "racked" or drawn off several times a year. The sudden changes of temperature in the spring and autumn disturb wines, and so it is the practice to rack them at these periods. When racking it is not desirable to let the wine come in contact with the air. In order to obtain perfectly clear wines it is usually necessary to filter or clarify them.

The following method for clearing red wines, such as claret, etc., may be recommended: Take the whites of five fresh eggs for every 50 gallons of wine, beat them up into a foam. Then put this foam into a gallon of the wine to be fined, and after beating it again pour the mixture into the barrel.

Then take a stick and stir the whole barrel of wine until the foam appears at the bung-hole, which should be in about ten minutes. Leave the bung off over night. The next day fill up the barrel with same kind of wine, and drive in the bung. The wine should be bright in from 10 to 15 days; if not, then fill up, and, at the end of another week it should be.

For clearing white wines, such as Riesling, Hock, Sauterne, etc., take one wineglassful of dissolved isinglass for every 50 gallons of wine. Beat this into a foam with a gallon of the wine to be fined. Pour it back into the cask, and follow the directions above given for red wines. Usually the white wines take a little longer time to clarify than do clarets.

Some Diseases of Wine.—Wines are subject to many diseases. They often become "sick." Then they need "nursing" and doctoring.

Acid Wines.—They are due to the change of alcohol into acetic acid under the action of the air and heat. When wine has become slightly sour, rack it into a cask strongly sulphured, and clear it with six whites of egg to about 250 bottles. Some try to correct acid wine by mixing it with good, sound new wines, or with fresh lees, but the cure is only temporary. Wines so corrected only have their acidity disguised, and must be used soon.

Greasy Wines.—When wines turn greasy they cloud and rope like oil. White wines are more subject to this disease than red. Wines weak in alcohol and tannin are subject to the disease. Therefore, the addition of brandy spirits and tannic acid is recommended. Some also use a half a pound of alum for a cask, which should be stirred thoroughly and rack off several days afterward.

Flat or Cloudy Wines.—This is found in wines poor in alcohol and having an excess of albuminous material. The trouble is cured by transferring the wine to a freshly sulphured cask and adding alcohol. The wine should be fined, and after a few days from 50 to 60 grains of tartaric acid per 50 gallons should be added.

Bitterness.—This is, or was, one trouble with French Burgundy wines. The disease is not so common in this country. The defect may be corrected at the start by putting the wine in sulphured cask, and adding sufficient alcohol, tannic acid, and tartaric acid.

Classification of Wines.—The following is a list of well-known types of wines, arranged according to the countries where produced:

1. FRENCH WINES.—Claret, Graves, Sauternes, Barzac, Burgundy, Hermitage, Roussillon, Chablis, Frontignac (Muscat), Champagne, Saumur, etc.
2. GERMAN WINES.—Riesling. The terms Rhine, Moselle, and Pfalz are usually applied to the growths in those districts. The word Hock is also applied to certain Rhine wines.
3. AUSTRIAN WINES.—Vidua, Goldsch, Hungarian Wines.—Tokay, Ausbruch, etc.
4. ITALIAN WINES.—Barolo, Barbera, Nebbiolo, Valtellina, Asti, Chianti, Lacryma Christi, Falerio, Capri, Marsala, Muscat of Syracuse, etc.
5. SPANISH WINES.—Sherry, Malaga, Val de Penas, Vinos Finos (Spanish Reds).
6. PORTUGUESE WINES.—Port, Lisbon, Colares, Corcovello.
7. MADEIRA AND CANARY ISLAND WINES.—Madeira, Malvasia, Canary (each), Malvasia.
8. GREEK AND IONIAN WINES.—Hymettus, Nemea, Kephissus, Corinth, Patras, Santoria, etc.
9. SWISS WINES.—Muschel, Gringet, and Monvins.
10. TURKISH WINES.—Candia (Island of Crete), Cyprus, Mt. Lebanon, etc.
11. RUSSIAN WINES.—Crimean, Kakhobian (Caucasus), Donk, and Kravich Champagne.
12. AUSTRALIAN WINES.—Australian Burgundy, Hermitage, Sauterne, Port, etc.
13. CAPE OF GOOD HOPE WINES.—Cape Madeira, Constantia.
14. PERSIAN WINES.—Shiraz.
15. WINES OF THE UNITED STATES.—(a) From native varieties of grapes grown east of the Rocky Mountains: Seppernong (in the Southern States), Catawba, Delaware, Norton's Virginia and Iowa, Claret, Concord, Iona, Champagne, etc. (b) European or foreign varieties of grapes are grown in California; therefore we have the following "types": Claret, Burgundy, Zinfandel, Riesling, Sauterne, Port, Sherry, etc.

For convenience we may group some of the leading wines as to color and taste, although it should be remembered that many of them are made in color both red and white; in taste sweet and dry.

Red Dry Wines	Catawba
Claret	Delaware, etc.
Burgundy	Red Sweet Wines
Hermitage	Port
Barolo	Tokay
Valtellina	Constantia
Chianti	Roussillon
Zinfandel	Tarragona (Port)
Norton's Va.	White Sweet Wines
Ives Seedling	Sauternes
Cynthiana, etc.	Sherry
White Dry Wines	Muscatel
Graves	Angelica
Sauternes	Lacryma Christi
Chablis	Marsala
Moutschet	Malaga
Rhine, or	Catawba
Riesling	Delaware
Moselle	Seppernong, etc.

Alcoholic Strength, etc., of Wines.—The figures in the following table have been taken from the various analyses by competent authorities:

	Specific gravity	Per cent of alcoholic weight on volume
Claret	995.0	9.6
Rhine	992.8	10.2
Sauterne	993.7	11.7
Burgundy	991.3	10.3
Champagne	1010.9	10.4
Sherry (natural)	985.9	16.0
Sherry (fortified)
Marsala (natural)	995.9	16.0
Marsala (fortified)
Port (natural)	999.2	14.5
Port (fortified)	21.5
(Specific gravity water = 1000)		

WINE AND WINE-MAKING

During the past 20 years many analyses of European wines have been made, and the data thus obtained have been used for the purpose of arriving at a standard for judging wines. In this way it is possible to determine the purity and quality of any type of wine. The limits of composition and the ratios which have been adopted in European countries for applying analytical results in judging the purity and quality of wines, together with a number of analyses of American wines, have been compiled by W. D. Bigelow of U. S. Department of Agriculture. (See Bulletin No. 59 on "The Composition of American Wines," 1900.)

The standards which have been adopted for European wines are met in all particulars by the best American wines. This is shown by the chemical analyses of American wines receiving awards at the Paris Exposition of 1900. (See Bulletin No. 72, Bureau of Chemistry, U. S. Department of Agriculture, 1903.) According to this report, "the percentage of alcohol in the samples of dry wines conforms to the standards that have been adopted for European wines. The ratio of alcohol to extract and the sum of the alcohol expressed in grams per litre and the total acidity expressed as grams per 100 cc. conform to the ratios adopted in France for wines to which neither alcohol nor water has been added." It is also stated that, the percentage of acids in the samples examined conforms to the standards of the wine-producing countries. These and other facts go to prove (what is not generally known or held) that our American wines challenge favorable comparison with European wines. It is only a few foreign types of special excellence which surpass those which we produce. In all respects—in purity, cleanness, color, taste, bouquet, etc.—the average American wines are better than the average wines drunk in Europe.

The Wine Production of the World.—The following figures in most cases from official reports show the vintage of the leading wine-making countries of the world for years 1900 and 1903:

COUNTRY	1900 Gallons	1903 Gallons
France	1,485,719,000	1,710,000,000
Italy	583,000,000	856,520,000
Spain	517,000,000	428,000,000
Portugal	138,600,000	108,320,000
Austria	70,400,000	192,800,000
Rumania	91,300,000	52,140,000
Chile	68,200,000	74,200,000
Russia	52,800,000	70,620,000
Bulgaria	74,800,000	39,100,000
Germany	79,208,000	79,600,000
Argentina	40,708,000	34,350,000
Turkey	48,400,000	34,360,000
Greece	19,800,000	..
Switzerland	34,320,000	22,190,000
United States	31,400,000	34,000,000
Serbia	26,400,000	6,605,000

Thus, we see that the United States stands 15th in the list of wine-making countries. The annual wine yield of this country is but a drop in the bucket of the world's supply, which, during the past five years, has averaged about 3,000,000,000 gallons per annum.

The consumption per capita of wine in the United States is very small compared with the immense quantities of wine consumed by the people of Continental Europe. It is hardly half a gallon per person per annum; that is to say,

with a population of 80,000,000 people, the consumption of wines in the United States is now about 40,000,000 gallons per annum. The city of Paris alone consumes almost that quantity of wine in a year.

Statistics show that Americans are a coffee-, beer-, and whiskey-drinking people. The daily use of light wines at table is confined to a comparatively small number in this country, mostly to those of foreign birth or parentage. There are those who believe that the drinking of light wines is conducive to temperance. Thus, they point to the example set by the millions of wine-drinking people of Europe, where almost every man, woman and child drinks his wine at meals, and where drunkenness is not the evil it is in other countries. However, the consumption of wine has been increasing year by year in the United States, and at the present rate it is likely to be doubled within the next 15 or 20 years.

The Wine Industry in the United States.—The wine industry in this country is of comparatively recent date and growth. In 1850 the total output of wine in the United States was not more than 250,000 gallons. In 1860 it was about 500,000 gallons. In 1870 it had risen to about 5,000,000 gallons. In 1880 the wine yield of the country was about 15,000,000. In 1890, when the statistics of viticulture were gathered for the first time in the United States, there were 307,000 acres of vineyards, and a production of over 24,000,000 gallons of wine. The census of 1900 showed a production of over 30,000,000 gallons of wine for the United States.

According to the "American Wine Press," as against the output of about 35,000,000 gallons of wine in 1902, the estimated yield of 1903 is about 33,500,000 gallons, as follows:

	Gallons
Southern States	1,500,000
New York	4,500,000
Ohio	3,000,000
Western States	1,000,000
California	21,000,000
All other States	500,000

Total wine crop.....33,500,000

The greatest progress in viticulture and wine-making has been made in California during the past 20 years. That Golden State with its great range of climate and with its variety of soils has an area almost equal to that of France. The production of wine in California began to assume large figures in 1877, when it was 4,000,000 gallons. In 1880 the yield was more than double, or 10,000,000 gallons. In 1890 the wine crop of California rose to fully 20,000,000 gallons. The estimated vintages of California wines during the years 1893 to 1903 have been as follows:

YEAR	Gallons
1893	22,000,000
1894	16,000,000
1895	14,000,000
1896	13,500,000
1897	34,000,000
1898	18,500,000
1899	21,430,000
1900	21,000,000
1901	22,300,000
1902	25,000,000
1903	23,000,000

Two Distinct "Types" of American Wines.—The wines produced in the United States are divided into two classes: (1) Wines made east of the Rocky Mountains; (2) wines of California and the Pacific Coast States.

WINE-BERRY — WINES

This division is due to the fact that there are two entirely different stocks, or kinds, of grapes grown in the United States.

East of the Rocky Mountains, only American or native varieties of grapes are grown.

In California and on the Pacific Coast, practically only European or foreign varieties of grapes are grown.

Therefore, our Eastern wines are of a different "type" from California wines, which for the most part resemble and have the well-known characteristics of their European prototypes.

The leading grape and wine-growing States east of the Rocky Mountains are: North Carolina, Virginia, New Jersey, New York, Ohio, Michigan, and Missouri. The bulk of the grapes grown in these States are still used for eating or table purposes.

Considerable progress in Eastern wine-making has been made in producing a fine quality of champagne by the French process of fermentation in the bottle. A number of brands of American champagne, in color, taste, sparkle, and purity, compare very favorably with the best imported kinds. The headquarters of the champagne industry in the United States is in the Lake Keuka region of Western New York, which produces about 75 per cent of the output. Considerable champagne is also produced in northern Ohio, and thus far only a small amount in California. The total production of American champagne is now estimated at more than 100,000 cases, or 1,200,000 bottles per year.

In conclusion, the manufacture of wine and champagne is an infant industry in the United States. But we have in the Eastern States and in California, all the opportunities and all the conditions for success. We have here the right climates, the proper soils, the best varieties of grapes, sufficient capital, and the most intelligent labor and supervision in the world. Therefore, with all these things, and with the growing demand and liking for wines, the wine industry should have a great and prosperous future.

Bibliography.—The best books on wines and wine making are in French or German. The following standard French works may be noted: Ladrey, 'L'Art de faire le Vin' (1882); Maumené, 'Traité théorique et pratique du travail des Vins' (1890); Coste-Floret, 'Procédés modernes de Vinification' (1895); Salleron et Mathieu, 'Etudes sur le Vin Mousseux' (1895); Sebastian, 'Les Vins de Luxe' (1897).

There are but few books in English of recent date on wine-making. We note the following: Thudichum & Dupré, 'Origin, Nature, and Varieties of Wine' (1872); Rixford, 'The Wine Press and the Cellar' (1883); Husmann, 'Grape Growing and Wine Making' (1897).

LEE J. VANCE,

Editor 'American Wine Press,' New York.

Wine-berry, a Japanese plant (*Rubus phacelarioides*), with long recurring canes which root at the tips and are clothed with red glandular hairs. The leaflets are usually three, white, tomentose beneath, and the flowers are in dense axillary clusters, forming a loose panicle. The bristly calyx-lobes enlarge in fruit, and enclose the immature berry as in a bur, but eventually spread apart; the mature fruit is small, soft, cherry-red in color, in flavor insipid or acid. The wine-berry is said to prolong the season of *Rubus* fruits, as it ripens in

September, and to be good for preserves. The plant is also interesting, especially in spring, for the shrubberies.

The grape, the whortleberry, the gooseberry, and the red and the black currants are called wine-berry; as are also the edible, berry-like fruits of the poisonous toad-plant (*Coriaria sarmentosa*), a large shrub of New Zealand.

Wine Measure, an old English measure by which wines and spirits were sold. The gallon contained 231 cubic inches.

Wine Press, a machine in which the juice is pressed out of grapes. The wine press of the Bible was a vat, in which the juice was expressed by the feet of men who trampled the fruit.

Winebrenner, win'bren-er, John, founder of the denomination known as the "Church of God": b. Frederick County, Md., 24 March 1797; d. 12 Sept. 1860. He was ordained a minister of the German Reformed Church in 1820, and was called in the same year to the Salem Church, Harrisburg, Pa. He retained that charge until 1827 when his outspoken attitude against slavery and the traffic in intoxicating drinks led to his being asked to withdraw, and in 1828 he ceased to be connected with the Reformed Church. In October 1830 he established the denomination called the "Church of God," whose members also became known as Winebrennerians. He edited for some time the 'Gospel Publisher,' afterward the 'Church Advocate,' and issued several works, including 'A Treatise on Regeneration'; 'Practical and Doctrinal Sermons'; the 'Church Hymn Book'; etc. See CHURCH OF GOD.

Winebrennerians. See CHURCH OF GOD.

Wines, Enoch Cobb, American penologist: b. Hanover, N. J., 17 Feb. 1806; d. Cambridge, Mass., 10 Dec. 1879. He was graduated from Middlebury College, Vt., in 1827, taught school in Philadelphia and Burlington, N. J., and entering the Congregationalist ministry in 1849 held pastorates at Cornwall, Vt., and Easthampton, L. I. He became secretary of the New York State Prison Association in 1862, and afterward devoted his life to the promotion of reform in the administration of criminal law and treatment of criminals. He founded the National Prison Association in 1870 and was instrumental in securing the attendance of representatives from 26 governments at the International Penitentiary Congress in London 4 July 1872. Among his writings are included: 'Two Years and a Half in the Navy' (1832); 'A Trip to China' (1832); 'Hints on Popular Education' (1838); 'Prisons and Reformatories in the United States and Canada' (1867); 'State of Prisons and Child-Saving Institutions' (1880).

Wines, Frederick Howard, American statistician, son of E. C. Wines (q.v.): b. Philadelphia, Pa., 9 April 1838. He was graduated at Washington College, Pa., in 1857, and studied at Princeton Theological Seminary; was a chaplain in the Union army 1862-4; pastor of the First Presbyterian Church, Springfield, Ill., 1865-9, was secretary of the Illinois State Board of Commissioners of Public Charities 1869-93, and again 1897-9. He was made assistant director of the United States census in 1899.

WINFIELD—WINLOCK

His publications include: 'Defective, Dependent, and Delinquent Classes in the United States' (10th Census); 'Crime, Pauperism, and Benevolence in the United States' (11th Census); 'Punishment and Reformation' (1895); 'Liquor Problem in Its Legislative Aspects'; etc.

Winfield, Kan., city, county-seat of Cowley County; on the Walnut River, and on the Missouri Pacific, the Atchison, T. & S. F., and the St. Louis & S. F. R.R.'s; about 40 miles southeast of Wichita. It was settled in 1870, and in 1871 was incorporated. The chief industrial establishments are flour mills, grain elevators, machine shops, and stock yards. In the vicinity are limestone quarries. In 1900 (government census) Winfield had 75 industrial establishments, capitalized for \$588,481, whose annual finished products brought \$1,136,346. It has two schools of college rank; Saint John's Lutheran College, opened in 1893; and Southwest Kansas College (M. E.), opened in 1886. Other educational institutions are a public high school, Winfield Business and Academic College, public graded schools, a public and school libraries. The State Imbecile Asylum of the Southwest is located here. The three banks have a combined capital of \$200,000 and deposits (1903) amounting to \$1,470,750. Pop. (1910) 6,700.

Wing, an organ of flight. In birds, the wings consist of the bones of the fore limbs, specially modified to form a support and axis, while attached to this skeleton are the muscles moving the limb (see ORNITHOLOGY), externally clothed with strong flight-feathers or 'wing quills.' (See FLIGHT.) In the bat (q.v.) the wing consists of an expansion of the skin, supported on four of the fingers, which are extremely long. This leather-like membrane, or 'patagium,' extends from the fore limbs to the hind limbs, and in many cases between the hind limbs and tail as well. In such mammalia as the flying-foxes, flying-squirrels, flying phalangers, and in the lizards known as flying-dragons (qq.v.), the wing is a mere expansion of skin, extending along the sides of the body, often connecting hind and fore limbs, and serving as a parachute to sustain the animals in their flying leaps from tree to tree, but in no sense serving as an organ of true flight. In insects (q.v.), the wing is formed of two delicate skin layers, supported on hollow tubes or *nervures*, placed in communication with the respiratory or breathing system. The wings of insects become thus related to respiration, and by their movements probably aid in the diffusion of air through the breathing tubes.

Wingate, George Wood, American lawyer: b. New York 1 July 1840. He was educated in the public schools, and served with the 22d New York Volunteers during the Civil War. He originated systematic rifle practice for the instruction of the National Guard, and through his efforts the Creedmoor rifle range on Long Island was established. He was president of the National Rifle Association for 25 years, and is the author of 'Wingate's Manual of Rifle Practice' (1872); 'The Great Cholera Riots' (1880); 'On Horseback Through the Yellowstone' (1886); 'History of the 22d Regiment' (1896); etc.

Winged Bull, in architecture, a decoration of frequent occurrence in ancient Assyrian temples, where winged human-headed bulls and lions of colossal size usually guarded the portals.

Winged Lion, the symbol of the evangelist Saint Mark, which was adopted as the heraldic device of the Venetian Republic. A celebrated bronze figure of the winged lion of Saint Mark surmounting a magnificent red granite column, formed out of a single block, stands in the Piazzetta of Saint Mark at Venice.

Wing'abell, the name of several bivalve shells, which have wing-like extensions of the hinge-margin, as *Unio alatus*, or are wing-shaped; especially species of the genus *Pinna*. See PINNA.

Winifred, Wenefride, or Winefride, Saint, according to the legend, a noble British maiden, possibly of the 7th century, whose head the Prince Caradoc cut off when she fled from his unholy proposals. The head rolled down a hill, and where it stopped a spring gushed forth; famous afterward as a place of pilgrimage, Holywell in Flintshire. She was restored to life by Saint Bueno, who replaced her head, survived the miracle 15 years, and after the death of Saint Bueno entered the nunnery of Gutherin, in Denbighshire. Her festival is observed on 3 November.

Winkelried, vink'el-réd, Arnold von, Swiss patriot. He was a knight of the Swiss canton of Unterwalden, whose self-sacrificing valor is said to have decided the victory of Sempach, 9 July 1386. The Austrian troops, under Archduke Leopold, were formed into a compact body which resisted the efforts of a small body of Swiss drawn up in the form of a wedge and rushing to the attack. The Austrians were now beginning to surround their enemies when Winkelried, seeing the desperate condition of affairs, burst from the ranks, threw himself upon the ranks opposed to him, and, grasping all the pikes within his reach, buried them in his bosom, and bore them by his weight to the earth. Over his dying body his companions rushed into the opening he had made in the Austrian line and defeated their enemy with great slaughter. The truth of this legend has been much discussed, but in 1886 a monument to Winkelried was raised at Stanz, Unterwalden. Consult: H. Von Liebenau, 'Arnold von Winkelried, seine Zeit und seine That' (1862); Kleissner, 'Die Quellen zur Sempacher Schlacht und die Winkelried Sage' (1873); Burkli, 'Der wahre Winkelried: die Taktik der alten Urschweitzer' (1886); T. Von Liebenau, 'Die Schlacht bei Sempach.'

Winkle, a local name about Long Island Sound and New York Bay for either of the large conchs (q.v.), *Fulgur* and *Sycotypus*, which are extremely common and very destructive to cultivated oysters. Their shells were utilized by the Indians as spoons, ladles, digging-tools, etc.; and out of their central columns were made the inferior beads called 'white wampum.'

Winlock, Joseph, American astronomer: b. Shelbyville, Ky., 6 Feb. 1826; d. Cambridge, Mass., 11 June 1875. He was graduated from Shelby College in 1845 and in that year was appointed professor of mathematics and astron-

WINNEBAGO — WINNIPEG

omy there. He was engaged as one of the computers in the office of the 'American Ephemeris and Nautical Almanac' in 1852-6, and in the last mentioned year was appointed professor of mathematics in the United States navy. He shortly afterward returned to the office of the 'Nautical Almanac' as second superintendent, but in 1859-61 was at the Naval Academy at Annapolis, Md., in charge of the mathematical department; on the outbreak of the Civil War he resumed direction of the 'Almanac.' In 1866 he was appointed to the chair of astronomy at Harvard, at the same time becoming director of the observatory at Cambridge, in which offices he continued until his death. He was elected by Congress to the National Academy of Sciences in 1863, was in charge of the expedition to Kentucky to observe the solar eclipse of August 1869 and of that to Spain in December 1870. He made numerous and important improvements in the equipment of the Harvard Observatory, and his researches and observations were of great scientific value.

Winnebago (Algonquian name: "Turbid water people"), an important tribe of the Siouan stock of North American Indians, who are closely related to the Chiwere division (the Iowa, Oto, and Missouri) and to the Mandan. Their own name is *Hochângara*, "People of the parent speech." They were first mentioned in the Jesuit Relation of 1636, but the first use of the name Winnebago occurs in the Relation of 1640. It is said that they were almost annihilated by the Illinois tribe in early days, and that the historical group was made up of the survivors of this warfare. In 1639 they were on Green Bay, Wis.; in 1736 they resided on Lake Superior, but by 1761 they were again on Green Bay and in 1768 had a village on a small island in Winnebago Lake. In 1822 their population was estimated at 5,800 and their country extended from Winnebago Lake southwestward to the Mississippi. By treaty of 1805 and 1832 they ceded their lands south of Wisconsin and Fox rivers for a reservation on the Mississippi above the Oneonta; in the latter year one of their villages was at Prairie la Crosse. They suffered several visitations of smallpox; the third, which occurred in 1836, carried off more than a quarter of the tribe. A part of the Winnebago long remained widely distributed over their old country east of the Mississippi and along that river in Iowa and Minnesota; in 1846 they surrendered their reservation for another above the Minnesota, and in 1856 they were removed to Blue Earth, Minn. Here they were mastering agriculture when the Sioux war broke out and the settlers demanded their removal. Those who had taken farms were permitted to remain, but the others were taken to Crow Creek, on the Missouri, whence they soon escaped; but their privations and sufferings were such that of the 2,000 removed to Crow Creek, only 1,200 reached the Omaha reservation, whither most of them had fled. These survivors were assigned a new reservation on the Omaha lands, where they remain, allotted lands in severalty. There are now 1,131 under the Omaha and Winnebago Agency, Nebraska, and 1,403 in Wisconsin. See McGee, 'Siouan Indians' (14th Rep. Bureau Amer. Ethnology, Washington, 1897).

Winnebago, win-ê-bâ'gô, a lake in the eastern part of Wisconsin, the largest in the State. It is about 750 feet above sea-level, nearly 28 miles long and 10 miles wide in the broadest part; area, 212 square miles. It has an abundance of fish. Its clear waters, well wooded shores, with the pretty towns intervening, make it most attractive. On the east shore is found a curious wall made by stones being pressed against the shore at times of ice expansion. The Fox River is both an inlet and an outlet of the lake. It is navigable from its mouth at the head of Green Bay; so Lake Winnebago has steamer connections, by means of the Fox River and Green Bay, with the Great Lakes.

Winnemucca, win-ê-mûk'ka, Nevada, town, county-seat of Humboldt County; on the Humboldt River, and on the Southern Pacific Railroad; about 170 miles northeast of Reno. It is in a silver mining region, and is surrounded by some excellent farm lands. It has large shipments of live-stock, beef, and wool, and some grain. The national bank has a capital of \$25,000, and, in 1903, deposits of \$626,170. Pop. (1910) 1,786.

Winnemucca, a lake in the western part of Nevada. It is in a desert valley in which is Pyramid and several other lakes. Winnemucca is 26 miles long, north to south, from two to five miles wide, and from 50 to 87 feet deep. Truckee River is the only inlet, which is also an inlet of Pyramid Lake. It has no apparent outlet. The mineral matter, chiefly salt, is 36 parts per 1,000.

Winnepesaukee ("Beautiful water of the high land"), a division of the Pennacook confederacy of the Algonquian stock of North American Indians, formerly inhabiting the vicinity of Winnepiscogee Lake, New Hampshire.

Winnishah. See OJANAKICHE.

Winnipeg, Canada, a city, capital of the province of Manitoba, situated on the prairie at the junction of the Assiniboine and Red rivers, which latter runs north from the city for 45 miles and empties into Lake Winnipeg, an immense body of water encircled by the forest and noted for the abundance and excellence of its whitefish. Winnipeg is the midway city between the Atlantic and Pacific oceans on the Canadian Pacific, a transcontinental railway of Canada. The city is likewise equidistant from the shore of the Gulf of Mexico on the south and the Arctic Sea on the north. Winnipeg is a railway city of radial importance. In addition to its communications east and west on the main line of the Canadian Pacific Railway, it has also the Emerson, Gretna, Deloraine, Glenboro, Lac du Bonnet, Teulon and Lake Winnipeg branches running to different parts of the province. Another great railway running from Lake Superior to Edmonton—a stretch of 1,500 miles—the Canadian Northern, has its centre in Winnipeg. It has as branches the Emerson, Neepawa, Lake Manitoba, and Hudson Bay lines, while divisions east through Ontario and Quebec and west in British Columbia are being hastened to be a transcontinental railway.

Winnipeg is also the headquarters of the Grand Trunk Pacific Railway, which has its western terminus at Prince Rupert on the Pa-

WINNIPEG.

1. Law Courts.
- 2 City Hall Square, with Municipal Building on the left.

cific and will reach tidewater at St. John, New Brunswick, on the Atlantic.

Winnipeg has likewise navigation down the Red River, by means of the completed lock at St. Andrews to Lake Winnipeg, and when the Grand Rapids on the Saskatchewan are overcome will have water communication to the foot of the Rocky Mountains.

The city has twelve substantial bridges across the Red and Assiniboine rivers. Those across Red River connect with Elmwood and St. Boniface, important suburbs. And south of the Assiniboine are Fort Rouge, Crescentwood and Winnipeg South.

Trade and Commerce.—In trade Winnipeg is the great city of western Canada, and is the centre of the wholesale and jobbing trade of the Canadian west. Being the grain shipping port eastward from the prairies the city may be compared to a great elevator spout through which the products of the West reach the markets of the world. It is the largest wheat exporting centre, it is said, in the world.

The two great water power electric companies of Pointe du bois (Circ) and Lac du Bonnet both bring power fifty miles from Winnipeg River. Cheap power is making the city an important manufacturing centre after the model of Chicago. At present the industries established in the city are furniture and upholstery, brooms and brushes, oatmeal, flour and grist mills, awnings, tents, and mattresses, clothing, bookbinding, carriage works, soda water works, breweries, biscuit, confectionery, and baking products, coffee and spice mills, harness and saddlery, marble works, tinware, sash, door and boxes, saw-mills, cigar factory, oil-mills, plumbing and gas, tanneries, soap, jewelry, etc.

The city has retained a number of its municipal franchises. The water supply is obtained from a system of artesian wells, which supply good water from the limestone rock at a depth of sixty feet.

Originally begun on a bare prairie of black alluvium, the city has, during the last seven years, devoted much attention to street and other improvements. Numerous parks in different parts are tastefully laid out and cultivated. Trees have been planted and boulevards constructed at the public expense, and so marked has been the transformation that it is now proposed to change the name the "Prairie City" to the "Elm City".

The city has 207 factories employing 15,000 hands, with a constantly increasing output as shown by the following figures: 1900, \$8,606,248; 1905, \$18,983,248; 1910, \$36,000,000.

Finances, etc.—As being the trade centre of western Canada, Winnipeg is also the financial headquarters of the region. Indeed, Winnipeg stands third as a financial centre in Canada, coming after Montreal and Toronto. There are doing business in the city as chartered banks 19 main and 26 branches, representing a paid-up capital of \$102,000,000, and including almost all the leading banks of Canada. The bank clearings were: 1908, \$614,111,801; 1910, \$953,415,281; 1911, \$1,172,762,142. Almost all the loan and investment companies of Canada are represented as well as the fire and life insurance companies of eastern Canada with a number of local western companies. The total

city assessment was: 1900, \$25,077,400; 1906, \$80,511,727; 1911, \$172,677,250. The annual expenditure for building was: 1909, \$9,226,325; 1910, \$15,116,450; 1911, \$17,550,000.

Religion.—The leading religious bodies are represented by some 80 or 90 churches. In the province and city the religious bodies best known, in the order of their numbers, are: Presbyterian, Church of England, Methodist, Roman Catholic, Lutheran, Baptist, and Congregational. The most stately church buildings are Holy Trinity, Knox, Saint Mary's (Roman Catholic), Westminster, Central, Augustine, St. Stephen's, Broadway Methodist, Grace, St. Andrews, St. Giles and Icelandic Lutheran. The population of Winnipeg is noted as being one of the most church-going on the continent. The religious harmony of the city is remarkable, truly catholic feeling pervading all classes.

Education.—In education the city stands out prominently. Its public school buildings are probably unsurpassed as a whole for architecture, completeness and comfort by any other city in the world. Specialists are appointed in music, drill, sewing, drawing, nature study, manual training, household science, etc. The highest in the system is the collegiate institute, a classical school, and in 1912 two technical high schools have been added at a cost of \$700,000. The education of teachers for the province is conducted in the normal school, which is situated in the city. The literary taste is cultivated by the Carnegie Library, free to all classes of citizens. A public museum and picture gallery are under way of construction. Winnipeg is also the seat of the University of Manitoba. This is an unique institution. It is provincial and has confided to it the sole power of granting degrees, of conducting all examinations in arts, medicine, the entrance in law, surveying, and civil engineering. This year 1200 candidates have been examined by the university. The university has an endowment in lands of 150,000 acres, now estimated at a million and a quarter of dollars, of which about one third have up to date been sold. The university is well equipped, occupying a spacious building on a plot of seven acres on Broadway, where other necessary buildings may be erected. Besides council chamber, offices, and examination hall, the university teaching in science is accommodated in this building, good laboratory facilities being supplied the professors. The university has accepted a new site, given freely, near Tuxedo Park in the west of the city. The site is of 166 acres. In the south of the city is the Manitoba Agricultural College—a large and successful institution. The school attendance has grown as follows: 1871, 1 teacher, 35 pupils; 1900, 119 teachers, 7,500 pupils; 1910, 340 teachers, 17,736 pupils; 1911, 375 teachers, 21,219 pupils. The specially notable character of the university is its group of affiliated colleges. These are four classical colleges, namely, Saint Boniface (Roman Catholic), Saint John's (Church of England), Manitoba (Presbyterian), Wesley (Methodist), along with a Medical College and a College of Pharmacy. For all these the university lays down the curriculum and conducts the examinations. They have large and attractive buildings and grounds,

WINNIPEG—WINONA

full staffs of professors, strong financial support, and are a powerful influence in the city. Of other educational institutions there are Havergal College (Church of England) and Saint Mary's Academy (Roman Catholic) for girls.

Charities.—With charitable institutions the city is well provided. The Winnipeg General Hospital, Saint Boniface General Hospital, and several private hospitals are doing successful work, to the first named a Nurses' Home and Maternity Hospital being attached. The Women's Home, Children's Home, Children's Aid Shelter, Old Folks' Home, Saint Mary's Boys' Home, and Free Kindergarten Institution bear testimony to the energy of charitable ladies. Several cemeteries make up the city of the dead in the suburbs of Winnipeg. These are Saint John's, Kildonan, Saint James', Elmwood, and that belonging to the city—Brookside, besides Saint Boniface and another Roman Catholic cemetery in the south of the city.

History.—The history of the city of Winnipeg is based on that of an earlier historical movement. The city includes the site of Fort Garry—the Mecca of the Hudson's Bay Company traders of Rupert's Land. Indeed, Fort Garry was not the first. In 1738 Fort Rouge, on the south side of the Assiniboine, was built by a lieutenant of Verendrye, the French explorer. In 1804 Fort Gibraltar was erected by the Montreal fur traders. In 1812-14 Fort Douglas, as the centre of settlement, was undertaken by the officers of Lord Selkirk, the Scottish colonizer. This was the true beginning of Manitoba and Winnipeg, when a band of Scottish Highlanders founded a farming settlement on Red River, coming in by way of Hudson Bay. Fort Garry (1) was built in 1822, Fort Garry (2) in 1835, the latter a beautiful stone fort. This became the seat of government in the Hudson's Bay Company and Red River Settlement. In 1870 Rupert's Land was transferred to Canada, and the village of Winnipeg then began as a small nucleus of houses half a mile from Fort Garry. From this hamlet sprang into being Winnipeg, which was incorporated as a city in 1873. It is now a metropolis with a great future. That there are to be three great cities in Canada: Montreal, Winnipeg, and Vancouver, is now the voice of the prophets. Winnipeg is a cosmopolitan city, having some 20 or 30 nationalities represented in considerable numbers, but all heartily united in one Canadian spirit. Few cities on the American continent present such marvelous progress as this.

Population.—The population of the city has been, including suburbs: (1902), 48,411; (1904), 67,262; (1908), 128,000; (1910), 151,450; (1911), 172,000.

GEORGE BAYCE,

Author of the Remarkable History of the Hudson's Bay Company, etc.

Winnipeg, Lake, Canada, is in the provinces of Saskatchewan and Manitoba and the district of Keewatin, and lies at an altitude of 710 feet above sea-level, between 50° 20' and 53° 50' north latitude and 96° 20' and 99° 15' west longitude. It is 250 miles long, 25 to 70 miles wide and covers an area of over 8500 square miles. It contains a number of islands, the longest being *Reindeer* and *Big Island* embracing respectively 70 and 60 square miles. It

receives the surplus waters of Lakes Winnipegosis and Manitoba and discharges by Nelson River in a northeasterly direction into Hudson Bay. The principal rivers flowing into it are, from the south, Red River, from the west, Dauphin and Saskatchewan Rivers; and from the east, Winnipeg, Bloodvein, Berens and Poplar Rivers. Lake Winnipeg is comparatively shallow, nowhere reaching the depth of 100 feet, a consequence being that its frequent storms are often exceedingly dangerous; this feature is augmented by its exposed condition owing to the low character of its shores which, on the south, are also very marshy. Fish in abundance are found in its waters, the white fish being widely known and valued on account of their size and flavor.

Winnipeg, River, Canada, rises near Savanne in 48° 47' north latitude and 89° 57' west longitude, and flows in a general westerly direction under the names of Savanne, Seine and Rainy Rivers into the Lake of the Woods. After it leaves this lake it is known as Winnipeg River and follows an extremely tortuous and often turbulent course until it finally discharges into Lake Winnipeg. It is navigable for a distance of 208 miles.

Winnipegosis, win-t-pé-goo'sis, Lake, a lake in northwestern Manitoba, extending into Saskatchewan. It lies to the west of Lake Winnipeg (q.v.) and parallel with it; its length is 127 miles, the width 17 miles; its elevation above sea-level 828 feet. It is generally shallow, the greatest depth not being over 40 feet. It receives the Red Deer and Swan rivers, and a few other smaller streams, and discharges into Lake Manitoba to the southeast, through the Water Hen River.

Winnipiseogee, win-t-pé-sá-gé, a lake in the east central part of New Hampshire. Its average length is 25 miles; width from one to 10 miles, area 178 square miles; and 475 feet above sea-level. The outlet is Winnipiseogee River, which flows into the Merrimack River. It has an irregular coast line, and contains a number of islands. The waters abound with fish. There are many summer cottages on the islands and along the shores.

Winna'bora, S. C., city, county-seat of Fairfield County; on the Southern Railroad; about 34 miles north of Columbia. It is in an agricultural region, and in the vicinity are large stone quarries. At one time the city manufactured all the cotton-gins used in the United States. The educational institutions are Mount Zion Institute, established in 1878, as a public high school, but chartered as a school in 1777, and graded elementary schools. The bank has a capital of \$120,700. Pop. (1890) 1,738; (1900) 1,765; (1910 est.) 1,800.

Winona, wi-no'na, Minn., city, county-seat of Winona County; on the Mississippi River, and on the Chicago, Milwaukee & Saint Paul, the Chicago, Burlington & Quincy, the Green Bay & Western, the Winona & Western, and the Chicago & Northwestern R.R.'s; about 105 miles southeast of Saint Paul. The surrounding scenery is most picturesque, the peculiar rocks in and near the city are of interest. Sugar Loaf and Trempealeau Mountains are remnants of once lofty elevations, but are now included with the high bluffs which border the city. The

A HERD OF WINNIPEG BUFFALO

WINONA — WINSLOW

city has steamer connection with all the Mississippi River ports, and the bridges which span the river at this point connect the city with places in Wisconsin. It is in an agricultural and stock-raising region.

The chief manufacturing establishments are flour and lumber mills, agricultural-implement works, wagon and carriage factories, railroad shops, breweries, and patent medicine works. In 1909 (government census) Winona had 99 manufacturing establishments which were capitalized for \$7,879,000 and in which were employed 2,404 persons, who received annually wages to the amount of \$1,438,000. The total cost of the raw material used each year was \$7,330,000 and the value of the finished product was \$11,200,000. Winona has excellent transportation facilities and ships annually large quantities of grain, hay, vegetables, lumber, and live stock.

The principal public buildings are the government buildings, the court-house, municipal buildings, the Winona General Hospital, the Margaret Simpson Home, opera house, churches, and schools. There are 24 churches including a Roman Catholic cathedral. The educational institutions are a State normal school, established in 1868; Winona Seminary (R. C.), for young women, a public high school, opened in 1887, 10 public and four parish schools, Toland's Business University, and several private schools. There are five banks, which have a combined capital of \$700,000, and deposits amounting to about \$5,200,000. The city owns and operates the water-works.

Winona was settled in 1851 and in 1852 was laid out as a town. In 1857 it received a city charter. Its growth has been somewhat rapid; but it has had no fictitious booms nor serious drawbacks. Pop. (1890) 18,208; (1900) 19,714; (1910) 18,583.

Winona, Miss., town, county-seat of Montgomery County; on the Southern and the Illinois Central R.R.'s; about 85 miles north by east of Jackson. It is in an agricultural region in which cotton and grain are the chief products. It has flour and grist mills, cotton gins, and agricultural implement works. The two banks have a combined capital of \$150,000. The high school was established in 1887. Pop. (1910) 2,500.

Winoski, Vt., village in Chittenden County; on the Central Vermont Railroad; two miles north of Burlington. It has an electric railway to Burlington. It is in a fertile agricultural region, and has considerable manufacturing interests. The chief industrial establishments are sash, door, and blinds factories, wagon and carriage works, cotton and woolen mills, iron and brass works, machine shops, flour mill, and furniture factory. It has a high school, Providence Academy (R. C.), public and parish schools, and the Fanny Allen Hospital. There is one bank with a capital of \$55,000 and deposits of about \$1,000,000. Pop. (1910) 4,520.

Winoski, or Onion, a river in Vermont, which has its rise in the northeastern part of the State, flows west, breaking through the Green Mountains, and enters Lake Champlain about five miles northwest of Burlington. Total length about 100 miles. In several places it has cut deep picturesque gorges, and it has

several falls. The falls at Middlesex and Winoski furnish extensive water-power for manufacturing. The valley of the Winoski is noted for its beautiful scenery.

Winship, George Parker, American author and librarian: b. Bridgewater, Mass., 1871. He was graduated from Harvard in 1893, was assistant in history there in 1893-5, and has since been in charge of the John Carter Brown Library, Providence, R. I. He has written: 'The Coronado Expedition' (1896); 'Geoffrey Chaucer' (1900); 'Cibola Bibliography' (1900); etc., and has edited Wafer's 'Darien' (1903); and 'The Harris Papers' (1903).

Winalow, winz'16, Edward, American colonial governor: b. Droitwich, Worcestershire, England, 19 Oct. 1595; d. at sea, between Santo Domingo and Jamaica, 8 May 1655. While making a tour of the Continent he became a member of John Robinson's Leyden congregation. He was one of the passengers in the Mayflower, and in the first conference with Massasoit offered himself as a hostage, and won the attachment of the Indian chief, which he increased in 1623 by curing him of a severe illness. After the death of his wife during the first winter at Plymouth he married Mrs. Susannah White, mother of Peregrine White, her husband having died in that same winter also, and theirs was the first marriage in New England. In 1623-4 he made two voyages to Europe as agent for the colony, of which he was chosen governor in 1633, 1636, and 1644. While visiting England again in 1639, as agent for the colony, he was imprisoned by Laud in the Fleet prison for 17 weeks on the charges of having taught in the church, although a layman, and of having performed marriage as a magistrate. Another voyage was made by him in 1646 to answer charges against the colonists of religious persecution and intolerance. In 1649 he again visited England, was instrumental in the organization of the society for the propagation of the gospel in New England, and was employed in various public affairs under the Commonwealth. In 1655 Cromwell appointed him one of three commissioners to superintend an expedition against the Spaniards in the West Indies, and he died before its completion. He was the author of several works, mostly controversial writings in defense of New England. The principal are 'Good News from New England' (1624); 'Hypocrisie Unmasked' (1646); 'The Danger of Tolerating Levellers in a Civil State' (1649); and 'Glorious Progress of the Gospel amongst the Indians' (1649). These have been reprinted by the Massachusetts Historical Society.

Winalow, Forbes Benignus, English alienist: b. London, of a Massachusetts family, August 1810; d. Brighton, Sussex, 3 March 1874. He came to this country in early life, studied medicine in New York, was graduated from the College of Surgeons, London, in 1835, and took his M.D. at Aberdeen. Having after 1830 paid special attention to the study of insanity, he opened a private asylum at Hammersmith, and later another in London, and came in time to be a supreme authority on all relating to diseases of the brain. He founded and edited the 'Quarterly Journal of Psychological Medicine and Mental Pathology' (1848) and the 'Medical Critic' (1861), was the juridical and president

of the Medical Society of London (1853), and a member of numerous scientific bodies. He published: 'The Application of Phrenology to the Elucidation and Cure of Insanity' (1831); 'Anatomy of Suicide' (1840); 'Plea of Insanity in Criminal Cases' (1843); 'Notes on the Lunacy Act' (1845); 'Softening of the Brain' (1849); 'Lethaesian Lectures on Insanity' (1854) 'Obscure Diseases of the Brain and Disorders of the Mind' (1860; 4th ed 1868); 'Light, its Influence on Life and Health' (1869); etc.

Winslow, Hubbard, American Presbyterian clergyman: b. Williston, Vt., 30 Oct. 1799; d. there 13 Aug. 1864. He was graduated from Yale in 1825 and from Yale Theological Seminary in 1828. He was pastor of the First Church, Dover, N. H., 1828-32, and of the Bowdoin Street Church, Boston, 1832-44, and during the next 10 years was the principal of the Mount Vernon Young Ladies' Institute at Boston. He edited the 'Religious Magazine' 1837-40, lectured widely on religious and secular topics, was pastor of the First Presbyterian Church, Geneva, 1857-9, and of the Fifth Street Presbyterian Church, New York, 1861-2. He was a voluminous writer, and among his works may be cited 'The Doctrine of the Trinity' (1831); 'Controversial Theology' (1832); 'The Appropriate Sphere of Woman' (1837), republished as 'Woman as She Should Be' (1838); 'Elements of Intellectual Philosophy' (1852); 'The Hidden Life' (1863).

Winslow, John, American soldier: b. Plymouth, Mass., 27 May 1708; d. Hingham, Mass., 17 April 1774. In 1740 he was appointed by the council captain of a company recruited in Boston for the expedition against Cartagena (q.v.); and in June 1754 sailed in the provincial ship Massachusetts to build a fort on the Kennebec. This he began on a point half a mile below the Tecumuck Falls, where it was finished by William Lithgow in the next year. With Scott he was a commander of the 1,800 troops sent by New England in 1755 to remove the French from the posts established on the Bay of Fundy. The French forts at Beauséjour and Gaspereau were taken, and on 11 August Winslow, then with rank of lieutenant-colonel, and in command at Mines, was instructed to remove the Acadians in his vicinity, a task which he described to the French inhabitants as "very disagreeable." He strictly followed his orders, however, as "it is not my business to animadvert." In 1756 he was appointed to command the campaign on Lake Champlain, holding now the grade of major-general, and was stationed at Fort William Henry. He led another expedition to the Kennebec in 1758-9, and subsequently was chief justice of the court of common pleas for Plymouth County, and a member of the legislature and the council. He was associated with Samuel Adams in the preparation of documents regarding the Stamp Act troubles.

Winslow, John Ancrum, American naval officer: b. Wilmington, N. C., 19 Nov. 1811; d. Boston, Mass., 29 Sept. 1873. He was appointed midshipman in the navy in 1827, was promoted lieutenant in 1830, and served in the Mexican War, participating in the expeditions against Tabasco, Tampico, and Tuspan. He was made commander in 1855, in 1861 joined the Mississippi flotilla, and in 1866 was commissioned cap-

tain. In 1863-4 he was in command of the steamer Kearsarge, assigned to the special duty of pursuing the Confederate privateer Alabama. On 14 June 1864 he found the Alabama off Cherbourg, France, and blockaded her in that harbor until 19 June, when Captain Semmes notified Winslow of his intention to fight. The Kearsarge steamed seven miles out from shore in order to be on neutral waters, and then turned to meet the privateer. The Alabama fired the first shot, and the battle continued for an hour and a half, the vessels fighting in circles, which brought them constantly closer until the distance between them was but 600 yards. The Alabama then began to sink and raised the white flag. Winslow numbered but three killed and wounded out of his crew of 163 officers and men, and took 65 prisoners. It was the most important sea fight of the war between two ships, and Captain Winslow received a vote of thanks from Congress, and was promoted commodore, his commission dating from the hour of his victory. He was in command of the Gulf squadron in 1866-7, was promoted rear-admiral in 1870, and was commander-in-chief of the Pacific squadron in 1870-2.

Winslow, Josiah, American colonial governor, son of Edward Winslow (q.v.); b. Marshfield, Mass., 1629; d. there 18 Dec. 1682. From the command of the Marshfield military company in 1652 he rose to the rank of major and commander-in-chief of the forces of the Plymouth colony in 1658. He was chosen deputy in 1657, and was one of the commissioners of the united colonies from 1658 to 1670. He was assistant governor of the Plymouth colony for several years prior to 1673, and from that date till his death was its governor, the first native-born governor in New England. During King Philip's War he was *ex officio*, and, according to rank, general-in-chief of the entire army of the united colonies. He wrote a poem commemorative of Governor Bradford, which may be found in Morton's 'New England Memorial' (1669).

Winslow, Miron, American missionary: b. Williston, Vt., 11 Dec. 1789; d. Cape of Good Hope, Africa, 22 Oct. 1864. He was graduated from Middlebury College, Vt., in 1815 and from Andover Theological Seminary in 1818. He went as a missionary of the American Board to Ceylon 1819, and continued in the mission field for 44 years. He founded the Madras mission 1836; was president of the native college at Madras 1840; translated the Bible into Tamil 1835, and published 'A Tamil and English Dictionary' (1862), a great work, containing over 67,000 Tamil words.

Winslow, William Copley, American Egyptologist, son of Hubbard Winslow (q.v.): b. Boston, Mass., 13 Jan. 1820. He was graduated from Hamilton College, Chilton, N. Y., in 1862 and from the General Theological Seminary, New York, in 1865. He took orders in the Episcopal Church, was rector of Saint Luke's Church, Lee, Mass., 1867-70, and for many years secretary of the Free Church Association in the Episcopal Church. He was assistant editor of the New York *World* 1862-3, and editor of the 'Christian Times' 1863-5, and was long vice-president, secretary, and treasurer of the Egypt exploration fund for the United States. He has written: 'Israel in Egypt':

WINSOR — WINSTON-SALEM

'The Store City of Pithom' (1885); 'A Greek City in Egypt' (1887); 'The Egyptian Collection in Boston' (1890); 'The Pilgrim Fathers in Holland' (1891); 'Governor Edward Winslow'; etc.

Winsor, win'sôr, Justin, American historian and librarian. b. Boston, Mass., 2 Jan. 1831; d. Cambridge 22 Oct. 1897. He was educated at Harvard and subsequently studied at Paris and Heidelberg. He was superintendent of the Boston Public Library 1866-77, and librarian of Harvard 1877-97. He published: 'History of the Town of Duxbury' (1849); 'Bibliography of Original Quartos and Folios of Shakespeare' (1875); 'Reader's Handbook of the American Revolution' (1880); 'Memorial History of Boston' (edited 1880-2); 'Narrative and Critical History of America' (edited 8 vols. 1884-9), his most scholarly achievement; 'Christopher Columbus' (1891); 'From Cartier to Frontenac' (1894); 'The Mississippi Basin: The Struggle in America between England and France' (1895). He ranked as the highest authority on the early history of North America.

Win'sted, Conn., borough, county-seat of Litchfield County; on the Mad and Still rivers, and on the Central N. E. and the New York, N. H. & H. R.R.'s; about 28 miles northwest of Hartford. It is in an agricultural region, and is the commercial and industrial centre for quite an extent of country. The Mad River furnishes considerable water-power, which is utilized for manufactories for cutlery, clocks, leather, spool silk, edge tools, pins, hosiery, and undertakers' supplies. The town of Winchester, in which is the borough of Winsted, had, in 1900 (government census), 133 manufacturing establishments, capitalized for \$2,971,429, and employing 1,746 wage earners. The value of the annual products was \$2,928,822. From 1900 to 1904 the manufacturing industries have increased; the number of employees (1904) is now about 3,000. The educational institutions are Gilbert High School, Saint Margaret of Cortona Academy, public and parish schools, and the Memorial and Gilbert School libraries. Located in Winsted are the Litchfield County Hospital of Winchester, Old People's Home, and the Gilbert Home for Indigent Children. There are four banks, which, in 1903, had deposits amounting to \$3,737,080. Winsted receives considerable water-power from Long Lake, a body of water on the western side of the borough; and the water-supply comes from Crystal Lake.

The place was settled in 1756. The town of Winchester was founded in 1771, and Winsted was incorporated as a borough in 1858. The government is vested in a warden and six burgesses. Pop est 7,000. Pop of the town of Winchester (1900) 7,763; (1910) 7,754.

A. B. STEVENS,
'Winsted Daily Citizen.'

Win'ston, John Anthony, American politician: b. Madison County, Ala., 4 Sept. 1812; d. Mobile, Ala., 21 Dec. 1871. He was educated at Lagrange College, Ala., and at the University of Nashville, Tenn., and subsequently engaged as a cotton planter and commission merchant. He was elected to the State Assembly in 1839-40, and in 1842; to the State Senate in 1845, serving until 1852; and was president of that body in 1845-8. At the Baltimore convention

of 1848 he was the recognized leader of the Alabama Democracy, and in 1853-6 was governor of his State. He was the first native-born governor of Alabama, and by his refusal to sign certain bills for aiding railroad companies by State loans he gained the title of the "veto governor." His course was sanctioned, however, by the people, as he was re-elected in 1855 and his measures were sustained by the legislature in the following session. He was a delegate to the Charleston convention of 1860 and opposed secession, but later became a colonel in the Confederate army. He commanded a brigade in the Peninsular campaign, and was conspicuous for gallantry at Seven Pines, but his health compelled his retirement from the army soon afterward, and he took no further active part in the War. He was a member of the State constitutional convention in 1865, and in 1866 was elected to the United States Senate, but was refused admission.

Winston, N. C. See WINSTON-SALEM.

Winston-Salem, N. C., twin city, county-seat of Forsyth County; on the Norfolk & W. and the Southern R.R.'s; 115 miles north of Raleigh and 28 miles west of Greensboro. Winston and Salem have independent municipalities, but as they are one commercially and industrially, they are usually called Winston-Salem. The city is the commercial centre of a fertile agricultural region, especially noted for its tobacco. It is a manufacturing city of importance; the tobacco manufacture is the leading industry; there are large tobacco warehouses, and plug and leaf tobacco factories, representing about \$2,000,000 capital invested; other industrial establishments include chemical works (the largest in the South), roller mills, cotton mills, knitting mills, a box factory, machine shops and foundries. The business is mostly concentrated in Winston, while Salem is mainly residential. The streets are broad and well paved, and there is a large park; the city has an electric railway, and two systems of water-works, one under the ownership of the municipal government of Winston. Of the public buildings the court-house in the central square of Winston and the city-hall and armory are the most notable; in 1904 plans were laid out and soon work was begun on the erection of a United States government building. There is an excellent public school system, including a graded school for colored children; and the city is also the seat of the Salem Academy and College, a Moravian school for young women, founded in 1802, the Salem Boys' School (Moravian); and the Slater Industrial and Normal School, a non-sectarian institution for the colored race.

Salem was founded, in 1766, by Moravians as a church community. For a number of years the town was governed by the church in affairs secular as well as religious. The Moravian bishop, Count Zinzendorf (q.v.), made the plans for the city and for the government which existed during the first years. The government of Salem is now administered under the revised charter of 1891; the government of Winston under the charter of 1899, in both cases the mayor is elected every two years. Pop. Winston (1890) 8,018; (1900) 10,006; (1910) 17,167. Pop. Salem (1890) 2,711; (1900) 3,642; (1910) 5,533.

G. R. WIMM,

Sec'y Winston-Salem Chamber of Commerce.

Wint, Peter De. See DE WINT, PETER.

Winter, John Strang. See STANNARD, HENRIETTA.

Winter, William, American author and dramatic critic; b. Gloucester, Mass., 15 July 1836. He was graduated from the Harvard law school in 1857; was admitted to the Suffolk County bar, but never practised; published in 1854 a book of verse, 'The Convent, and Other Poems'; and was for a time a successful lyceum lecturer. From 1860 he was a contributor to the 'Saturday Press' and other New York periodicals; for several years was assistant editor of the 'Albion'; and in 1865 became dramatic reviewer for the *Tribune*, for which he has since continued to write. He was at one time also managing editor of the New York 'Weekly Review'; and he has been a frequent contributor to leading magazines and reviews. In addition to his criticism, he became known also for his biographical studies, and his sketches of travel abroad and historic foreign localities. His prose style is one of considerable distinction, and his verse is finished in character. He wrote further: 'The Queen's Domain and Other Poems' (1858); 'My Witness' (1871), poems; 'Thistle-down' (1878), poems; 'Poems,' complete edition (1881); 'The Jeffersons' (1881); 'English Rambles' (1883); 'Henry Irving' (1885); 'Shakespeare's England' (1886), chapters of travel and historical study; 'Stage Life of Mary Anderson' (1886); 'The Wanderers' (1888); 'Gray Days and Gold' (1891); and 'Old Shrines and Ivy' (1892), essays on England; 'Shadows of the Stage' (1892-3-5); 'The Life and Art of Edwin Booth' (1893); and 'The Life and Art of Joseph Jefferson' (1894). He also edited (1881) the works of Fitz-James O'Brien (q.v.), and 'The Shakespearian and Miscellaneous Plays of Edwin Booth' (1899).

Winter, one of the four seasons, the coldest of the year. Astronomically considered, winter begins in northern latitudes when the sun enters the sign of Capricorn, or at the solstice about 21 December, and ends at the equinox in March; but in its ordinary sense it is taken to include the months of December, January and February.

Winter-berry, several members of the genus *Ilex*, of the holly family, are known by this name, including the inkberry (q.v.). They are all native to eastern North America, but the species commonly indicated by the name is the black alder (*I. verticillata*), an arborescent shrub, common in swampy places and along the banks of streams, often overhanging the water. The acute, oval leaves turn black in autumn, and the axillary cymes of tiny polygamodioecious, whitish flowers, are succeeded by brilliant scarlet berries, that are as large as a pea, and are so crowded on the bare branches as to appear verticillate. They remain on the shrub all winter, and twigs are often sold by city florists for winter decoration. The bark of the winter-berry is tonic and astringent, and in infusion has been employed as a lotion for dressing ulcers.

The smooth winter-berry (*I. laevigata*) is a handsome shrub at all seasons and is similar to the black alder, but has larger stalked drupes, of a more orange tint, less crowded, and ripening earlier.

Winter-cherry, a solanaceous herb (*Physalis alkekengi*) of the south of Europe, cultivated for its ornamental fruit. It is a downy perennial, with semi-decumbent stems and broad deltoid leaves. The axillary, solitary flowers have campanulate five-lobed and whitish corollas. The calyces are also five-toothed and campanulate, but in fruit become inflated so that they are like miniature membranous balloons surrounding a pulpy, globose, cherry-like berry, which is edible, well-flavored, and acidulous, serving chiefly for preserves. These fruit-bladders are of a bright scarlet hue, and glow far into the winter. They will even keep their color for some time when cut. The plants are also known as *alkkekengi*, bladder-herb, strawberry-tomato, etc. The Japanese winter-cherry (*Physalis franchetii*) is very similar, but larger, having branches perhaps two feet high, with vigorous, soft, green foliage. They are profusely hung with bright orange-colored translucent lanterns, three inches in diameter.

Winter Cress. See CRESS.

Winter Flounder. See FLOUNDER.

Winter Wren. See WREN.

Wintergreen, a name applied to several ericaceous plants which retain their foliage over winter. In eastern America, the aromatic little *Gaultheria procumbens* (see GAULTHERIA) is generally the plant referred to by this name. It is a low shrub, barely six inches high, found in rocky woods, with creeping stems, half-hidden, from which arise erect, reddish branches, bearing ovate glossy leathery leaves. These are serrate with bristly tipped teeth and are gathered in a tuft at the top of the slender stalk, the fleshy, white or pinkish, urn-shaped flowers nodding underneath. The fruits are bright scarlet, mealy and spicy in flavor; and are really enlarged fleshy calyces which have enclosed the seed-capsules and assumed the form of a berry. They are sometimes called checker-berries, and remain throughout the winter. The whole plant is aromatic in taste, and is frequently eaten, foliage, berries and all. The spiciness is due to the volatile oil of *Gaultheria* (q.v.) which is a stimulant, astringent, and diuretic drug, but is chiefly used for flavoring, confectionery or pharmaceutical preparations. It is a commercial product distilled from the wintergreen where it is plentiful, or from the sweet-birch (*Betula lenta*). The various members of the genus *Pyrola* are called wintergreen, such as the round-leaved wintergreen, a common plant with a few orbicular, or oval, long-petioled and coriaceous leaves. The flowers are somewhat like those of the lily of the valley, and are fragrant. The spotted wintergreen (*Chamaepitys maculata*) is another plant found in shady woods. It has a decumbent stem, sending up slender branches, which bear a few lanceolate leaves mottled with white, and several white flowers, tinged with purple. The flowering wintergreen is the charming fringed polygala (*Polygala paucifolia*), with a tuft of leaves at the top of the stem, that are not unlike those of *Gaultheria*; but it has a magenta-colored blossom with flaring wings. Still another wintergreen is the chickweed-wintergreen (*Trientalis americana*) a spring blooming herb, with a dainty white, starry blossom, poised above a whorl of foliage like tiny peach leaves.

WINTERHALTER — WINTHROP

Winterhalter, vin'tér-hál-tér, Frans Xavier, German painter: b. Memmenschwand, near Saint Blasien, 20 April 1806; d. Frankfurt-on-the-Main 8 July 1873. He was educated at the academies of Munich and Karlsruhe, and also studied a while in Italy. In 1834 he established himself in Paris, where he obtained the patronage of Louis Philippe, and of many persons of note. In like manner he was liberally patronized by the English court. His productions were principally portraits, with a few fancy pieces and pictures of genre. In France he painted portraits of Louis Philippe and his queen, of all the members of the Orléans family, of Napoleon III. and his empress, and of the prince imperial. He was the favorite court painter in England during the life of the prince consort and executed portraits of the Duke of Wellington, Sir Robert Peel, and other distinguished persons for the queen. His fancy pictures have little other merit than as elegantly composed figure pieces. He finished carefully, and imparted a pleasing and well-bred expression to his faces, with little or no character.

Winter's Bark, the cortex of an evergreen magnoliaceous shrub (*Drimys winteri*) of the mountains of South America. In commerce this bark is quilled or curved, gray outside, brown internally. It has a peculiar aromatic odor, a very pungent and astringent taste, and serves as a tonic, stimulant and anti-scorbutic drug. Paratado bark is a variety of winter's bark. There are many substitutes for the drug, and much of the winter's bark of commerce is obtained from the West Indian *Cinnamodendron corticosum* and *Canella alba*.

Winter's Tale, A, a comedy by Shakespeare based on Greene's 'Pandosto' (1588), later known as the 'Historie of Dorastus and Fawnia.' Forman's Diary gives the date of the production of 'Winter's Tale' as 1611 and the play was included in the First Folio of Shakespeare 1623. In Greene's story, as in Shakespeare's, Bohemia is made a maritime country, and Dolphos an island. The name 'Winter's Tale' is derived partly from the fact that the play opens in winter, and partly from the resemblance of the story to a marvelous tale told by a winter's fire.

Win'terast, Iowa, city, county-seat of Madison County; on the Chicago, Rock Island & Pacific Railroad; about 45 miles southwest of Des Moines. It is in an agricultural region in which the chief products are wheat, corn, and hay. In the vicinity are large stone quarries. It has flour mill, creameries, machine shop, and coal and stock yards. It has an extensive trade in farm and dairy products. The four banks have a combined capital of \$125,000. There are 10 churches, public and private schools, and a public library, founded in 1891. Pop. (1910) 2,818.

Winther, vin'tér, Rasmus Villads Christian Ferdinand, Danish poet: b. Fensmark, Zealand, Denmark, 29 July 1796; d. Paris 30 Dec. 1876. He was educated at the University of Copenhagen and became immediately popular on the appearance in 1828 of his first volume of poems. He was one of the truest interpreters of the Danish national character. Some of his numerous publications are: 'Sang og Sagn' (Song and Legend) (1841); 'Lyriske

Digte' (Lyrical Poems) (1849); 'Nye Digte' (New Poems) (1850); 'Hjortens Flugt' (The Flight of the Hart) (1856), a lyric romance of the Danish Middle Ages, his greatest work.

Winthrop, win'thróp, Fitz-John, American colonial governor, son of John Winthrop (1606-76) (q.v.): b. Ipswich, Mass., 14 March 1638; d. Boston, Mass., 27 Nov. 1707. He studied at Harvard and afterward in England, where he served in the army of the Protectorate until the Restoration. Returning to Connecticut in 1663 he was elected to the Assembly in 1671, served as major in King Philip's War and in 1686 as a member of the council of Governor Andros. He was a magistrate in 1689, major-general commanding the expedition against Quebec in 1690, Connecticut agent at London 1693-7, and governor of Connecticut from 1698 till his death.

Winthrop, James, American jurist, son of John Winthrop (1714-79) (q.v.): b. Cambridge, Mass., 1752; d. there 26 Sept. 1821. He was graduated from Harvard in 1769, was librarian there 1772-87, and for several years was chief justice of the Massachusetts court of common pleas, and register of probate. He published 'An Attempt to Translate the Prophetic Part of the Apocalypse into Familiar Language' (1794); 'Systematic Arrangement of Prophecies relating to Antichrist' (1795); etc. His library was bequeathed to Allegheny College, Meadville, Pa.

Winthrop, John, American colonial governor: b. Edwardston, near Groton, Suffolk, England, 12 Jan. 1588; d. Boston, Mass., 26 March 1649. He studied at Trinity College, Cambridge, was bred to the law, and, according to the testimony of Cotton Mather, was commissioned at 18 a justice of the peace. His earlier years were spent on his estate of Groton Manor, but his Puritan tendencies and the current of his political sympathies presently interested him in plans for colonization in America. When in 1629 a charter was obtained creating a corporation under the name of the 'Governor and Company of the Massachusetts Bay in New England,' the piety, learning, and talents of Winthrop led to his election as governor. Converting his hereditary estate, yielding an annual income of £600 or £700, into money, he set sail in the *Arabella* from Yarmouth 7 April 1630, with a company of about 900 persons. On the voyage he composed a small treatise, entitled 'A Model of Christian Charity.' On 12 June they arrived at Salem, Mass., and the government was immediately transferred to him by Endicott, who had been the acting governor for two years by authority of the London company, before the transfer of the charter to New England. He was re-elected every year until 1634, when his popularity had somewhat declined, partly on account of his long continuance in office. In 1636, when Sir Henry Vane was elected governor, Winthrop was chosen deputy governor, and during this and the following year occurred the celebrated controversy in regard to Mrs. Hutchinson and her doctrines. In this matter Vane and Winthrop were on opposite sides, and in the election of 1637 the latter was chosen governor over Vane. The inhabitants of Boston, however, were friendly to Vane and Mrs. Hutchinson, and Winthrop was at first slighted by his neighbors. Subsequently he engaged in a controversy with his defeated

WINTHROP

opponent in regard to the alien law passed by the general court. He was re-elected every year until 1640; and in 1642 the troubled state of the colony induced the settlers to call him again to the head of the government. He was again elected in 1643, in the two following years was made deputy governor, and in 1646 governor again, which office he continued to hold the remainder of his life. In his principles Winthrop was opposed to an unlimited democracy, and when the people of Connecticut were forming a government, he wrote them a letter in which he said that "the best part of a community is always the least, and of that best part the wisest part is always the lesser." But he was attached to civil liberty, disinterested, pure, and conscientious. "It would be erroneous," says Palfrey, in speaking of the commonwealth of Massachusetts, "to pretend that the principles upon which it was established were an original conception of Winthrop's mind; but undoubtedly it was his policy, more than any other man's, that organized into shape, animated with practical vigor, and prepared for permanency, those primeval sentiments and institutions that have directed the course of thought and action in New England in later times." Winthrop kept a journal containing an account of the transactions in the colony down to the year 1649. The first two books were first published in 1790, and the manuscript of the third, which was for a long time lost, was found in 1816 in the tower of the Old South Church. The three were published in a revised edition entitled 'The History of New England from 1630 to 1649,' with notes by James Savage (1825-6). Consult 'Collections of the Massachusetts Historical Society,' 3d series, Vols. 9 and 10; R. C. Winthrop, 'Life and Letters of John Winthrop' (1864); Whitmore, 'Notes on the Winthrop Family and its English Connections' (1864); Twitchell, 'John Winthrop' (1891); Earle, 'Margaret Winthrop' (1895).

Winthrop, John, American colonial governor, son of Governor John Winthrop, of the Massachusetts Bay Colony. b. Groton Manor, Suffolk, England, 12 Feb. 1606, d. Boston, Mass., 5 April 1676. He was educated at Bury Saint Edmund's Grammar School, at Trinity College, Dublin, and at the Inner Temple, London, where he studied law. He obtained a commission in the army, and served with Buckingham in the expedition for the relief of the Huguenots near La Rochelle, France, in 1627, went in the following year to Turkey as an attaché of the British embassy, traveled in various countries of Europe, in 1631 joined his father in Massachusetts, where he became governor's assistant, and in 1633 settled at Ipswich, of which he was one of the principal founders. Obtaining a commission under a grant to the Earl of Warwick, he founded Saybrook, at the mouth of the Connecticut River, in 1635, built there a fort, and was made titular governor. In 1645 he removed his family from Boston to Pequot Harbor, and in the following year founded New London. After the union of Saybrook with Connecticut he became a magistrate of the increased colony (1651), and from 1657 to the end of his life served almost continuously as its governor. He was bearer to Charles II. (1662) of a loyal address from the Connecticut government, and received from the king a suitable charter for the

colony. Under an equally favorable charter he secured the union of the Connecticut and New Haven colonies. He was one of the commissioners of the United Colonies of New England in 1675. A student of physics and chemistry, through his scientific attainments he became a member of the Royal Society, to whose 'Transactions' he was a contributor.

Winthrop, John, American physicist, great-grandson of John Winthrop (1588-1649) (q.v.): b. Boston 19 Dec. 1714; d. Cambridge, Mass., 3 May 1779. He was graduated from Harvard in 1732 and from 1738 until his death was Hollis professor of mathematics and philosophy there. He was one of the most important American scientists of the 18th century and exercised much influence upon the scientific thought of his contemporaries, in particular upon Franklin and Count Rumford (q.v.). He noted the transits of Mercury in 1740 and 1761, going to Newfoundland in the latter year for this purpose in a vessel supplied for the purpose by the Massachusetts Province. He twice declined the presidency of Harvard, was for some years a judge of probate for Middlesex County, and was a member of the governor's council 1773-4. He was a prominent advocate of political liberty. He published 'Lecture on Earthquakes' (1755), and is sometimes claimed as the founder of the science of seismology. He published: 'Answer to Mr. Prince's Letters on Earthquakes' (1756); 'Account of Some Fiery Meteors' (1755); 'Two Letters on the Parallax and Distance of the Sun as deducible from the Transit of Venus' (1769); etc.

Winthrop, Robert Charles, American political leader: b. Boston, Mass., 12 May 1809; d. there 16 Nov. 1894. He was graduated from Harvard in 1828, studied law with Daniel Webster, and was admitted to the bar in 1831. He soon became active in political life, allying himself with the Whig party, and in 1834 was elected to the Massachusetts legislature, where he served five years, being speaker of the House for three years. In 1840-50 he was a member of Congress, and in 1847-9 speaker of the House of Representatives. In 1850, on Webster's resignation from the Senate, Winthrop was appointed his successor for the unexpired term, but in 1851 failed to secure election to the Senate. In 1851, as Whig candidate for governor, he received a plurality of votes, but the constitution at that time required an absolute majority for election; the election, therefore, went to the legislature, where he was defeated. During his term in Congress he had shown himself a conservative, and, though opposed to the extension of slavery, and to the Mexican War, he had no sympathy with the extreme abolitionists, and desired compromise between North and South. His defeat was due, therefore, to a coalition between the Free-Soilers and the Democrats in the Massachusetts legislature. After the Whig party dissolved, he took no prominent part in political work, he did not join the Republican party, but occasionally spoke in behalf of the Democrats, though not actively affiliated with them. He made frequent public addresses on various national anniversaries and occasions, being the chief speaker at the laying of the cornerstone of the Washington Monument in 1848, and on the completion of the work in 1885. He was

WINTHROP—WIRE AND WIRE DRAWING

president of the Massachusetts Historical Association for 30 years, and had a leading part in the organization and direction of the Peabody Educational Fund (q.v.). He wrote 'Life and Letters of John Winthrop' (1864); 'Washington, Bowdoin, and Franklin' (1876); 'Memoir of Henry Clay' (1880).

Winthrop, Theodore, American soldier and novelist; b. New Haven, Conn., 22 Sept. 1828; d. Big Bethel, Va., 10 June 1861. He was graduated at Yale in 1848; traveled extensively in Central and South America; studied law at Saint Louis, was admitted to the New York bar in 1855, and joined the 7th New York regiment in 1861. The 'Atlantic Monthly' from June to September of that year contained sketches by him of early war scenes. He was killed at the head of an assaulting column of Northern troops at Big Bethel. He left completed material for five volumes of novels and essays: 'Cecil Dreeme' (1861); 'John Brent' (1862); 'Edwin Brothertoft' (1862); 'The Canoe and Saddle' (1862); and 'Life in the Open Air, and Other Papers' (1863). His sister published 'Life and Poems of Theodore Winthrop' (1884).

Winthrop, Maine, town in Kennebec County; on the Maine Central railroad; 30 miles northeast of Lewiston and 10 miles west of Augusta. It has oil-cloth factories, woolen mills, agricultural implement works, a corn cannery, and a grist mill. There are six churches, a high school, and graded elementary schools. It has a state bank. The oil-cloth industry was begun in Maine, in 1845, by C. M. Bailey of Winthrop. Pop. (1910) 2,114.

Winthrop, Mass., town in Suffolk County; on Massachusetts Bay and on the Boston, Revere Beach & Lynn railroad; about five miles northeast of Boston. It is a popular beach resort, and a favorite residential section for Boston. The town was originally a part of Boston, then of Chelsea, and later of North Chelsea. In 1852 it was set off and incorporated. It contains many features of historic interest, chief of which is the Dean Winthrop house, built in 1649. It has also Forts Heath and Banks, the Winthrop Shore Reservation, the Ingalls Park, and the Frost Public Library. Pop. (1890) 2,726; (1900) 6,058; (1910) 10,132.

Wintun ("people," "Indians"), a group of tribes, which, with the Patwin group form the Copehan linguistic stock of North American Indians. The habitat of the stock is northern California from Mount Shasta, including the headwaters of the Sacramento and the valley of McCloud River; thence southeastward along the Sacramento Valley to the mouth of Chico Creek, from which point to its mouth the Sacramento forms the southeastern boundary. On the west the Coast range intersects the territory of the Copehan stock, the westernmost limit of which extends almost to the south branch of Trinity River, about lat. 40° 30' N. From the latitude of Cape Mendocino the Coast range forms the western boundary as far as John's Peak, whence it extends in an irregular line southeastwardly to San Pablo Bay. The tribesmen live largely by fishing, although various roots, nuts, berries, farinaceous seeds, and clover blossoms form part of their subsistence. They are fond of the water and are constant

bathers in the streams that drain their country. Salmon are caught with spears, in the use of which they were exceedingly expert. Their weapons were formerly bows and arrows, and slings. They were indifferent hunters, but were successful in ensnaring deer in traps of their own construction. The population of the score or more of tribes forming the stock is not known, only the Nomlaki and the Wailaki being officially recognized. These are under the Round Valley Agency and are small in number.

Wire and Wire Drawing. Wire is defined as metal elongated into threads or small rods, of thicknesses varying from about half an inch to even less than $\frac{1}{16}$ of an inch, but intended for each size to be uniform throughout the piece, these threads or rods having usually the cylindrical form, and being commonly produced by the process known as wire drawing. Essentially, this process consists in drawing or pulling a suitably prepared piece of the metal thus worked through a series of holes made in a hardened steel plate, called a draw-plate, and which successively diminish in diameter. In this way the cross section of the wire is gradually reduced to that of the last hole through which it is passed; its length, meanwhile, being correspondingly and greatly increased. As a consequence, wire can be produced only from such metals as are susceptible in this way of being pulled out or extended by stretching into rods. Such metals are said to be drawable, or to have the property of ductility. This property is not to be confounded with that of malleability, namely, that in virtue of which a metal is laminable, or admits of being hammered or rolled into thin plates; since the same metal is often malleable and ductile in very different degrees. Thus, while gold possesses both these properties in an extreme, and probably in the highest known degree, iron is ductile in a degree far beyond that in which it is malleable, and with tin and lead the reverse is true. Of the familiarly known metals, the most ductile, and in the order named, are gold, platinum, silver, copper, steel, iron, brass, zinc, lead, and tin; while aluminum, and some of the ordinarily brittle metals when made perfectly pure, as bismuth, are said to possess very high ductility. In early times metals were brought to the filamentous form only by means of beating them under the hammer into thin plates, then dividing these by cutting instruments into narrow strips, and rounding finally with the hammer and file. The earliest known mention of "wire drawers" and "wire millers," as those who produced wire by drawing were variously called, occurs in 1351 and 1360, in the histories respectively of Augsburg and Nuremberg, the previous accounts being only of "wire smiths," or those who fabricated wire with the hammer. The change from the old to the new method was accomplished, or very soon followed, by the introduction of a machine by which wire was successfully produced without direct aid of the hand; this machine, probably the invention of one Rudolf, of Nuremberg, was impelled by water power. The precious metals appear to have been the first subjected to this process—brass and iron not until some time later. White wire, or blanch iron wire, is mentioned in a list of articles not to be imported into England in 1463; and in 1484 both iron and latten (fine brass) wire are

WIRE CLOTH—WIRE GLASS

similarly named. Up to 1565 English iron wire was drawn by hand only, and was of so poor a quality that most of that used in the country, and also wool cards and other articles involving the employment of wire, were imported; and that in the year named patents were granted to manufacture wire in England.

The modern system of wire drawing is described under **WIRE, MANUFACTURE OF**.

In 1903 there were 29 wire mills in the United States giving employment to 10,000 persons. The amount of capital invested was \$4,242,173, and the total value of product was \$9,421,238. In the same year there were 597 wire working establishments, having an output valued at \$19,942,882. See **STEEL MANUFACTURE**.

Wire Cloth, a sieve-like fabric whose woof and weft are of wire; the size of the wire, the shape and sizes of the meshes, being adapted to the uses of the completed screen, sifter, or sieve, or the character of the machine in which it is to be used.

Wire Gauge, an instrument or mechanism for measuring the thickness of wire and sheet metals. It is usually a plate of steel having a series of apertures around its edge, each corresponding in width to the diameter of wire of a certain number.

Wire Glass, a modern invention used in building construction, being a combination of wire and glass. Wire glass is either ribbed,

fractured, but it will retain its place, and the perils incident to falling glass and the ingress or egress of draft and flame are avoided. Wire glass appeals to both the practical and the æsthetic in architecture. Practically it supplies the requisite light and ventilation as well as protection against fire, while it admits of a considerable saving in space, weight and cost. Æsthetically it is admissible to all window openings, because it obviates the necessity of cumbersome and unsightly hinged shutters, and the projecting lugs and adjusters which support and secure them. Metal sashes fitted with wire glass are rustless, water-proof, durable, sanitary, noiseless in operation and as workable as ordinary window sashes.

The first attempts to introduce a metallic mesh into the body of the glass were for the purpose of increasing its strength and to prevent its falling apart when broken. In this respect the product has been thoroughly developed, but in addition it has proved to be one of the most remarkable fire retardants available for building purposes, and in view of the exceptional hazard attaching to window and skylight openings in all buildings, its uses as a fire retardant is outranking in importance as well as quantity, its other values. Many experiments have been made to develop different processes of manufacturing wire glass, but, owing to the inherent difficulties of maintaining the homogeneous quality of the glass, preventing damage from excessive heat to the wire and securing a practically central location of the wire in the body of the glass, only two methods have proved effective. One of these, known as the Shuman process, from the name of its inventor, Frank Shuman, of Philadelphia, consists of rolling a sheet of glass, laying the wire mesh upon the body of the glass, pressing the same into the glass instantly and while still plastic, and by a coincident process, smoothing over the slight abrasions made in the surface of the glass so as to secure a true and smooth surface on both sides of the glass. The other process known as the Appert process, from its inventor, Leon Appert, of France, involves the rolling of one sheet of glass, laying of the wire mesh upon this sheet and immediately and by a simultaneous and continuous process pouring and rolling a second sheet upon the top of the wire so as to completely imbed it and secure at the same time an absolutely solid single sheet of finished glass. Wire glass is now made in all the varieties known to the rolled glass process, including rough or hammered glass; ribbed glass, figured glass. Wire glass is also polished like plate glass, giving an entirely clear and transparent glass, and is largely used in fire-proof office buildings where there is any external exposure to fire.

The mechanical strength of plate glass is effectively increased by the introduction of the wire mesh, so that it will submit to much greater strains, and in fact one of its first purposes and effects was to eliminate the necessity for using in skylights one half inch glass, it having been proved that by using one quarter inch wire glass all the requirements were met, the breakage risk decreased and a very large factor of weight and expense in structural material eliminated.

Vice-Pres. Mississippi Wire Glass Co.

Wire Glass Fire-Proof Window.

rough rolled, polished plate or "maze," having wire netting imbedded in its centre during the process of manufacture. The temperature at which the wire is imbedded in the molten glass insures cohesion between the metallic netting and the glass, and the two materials become as one, so that if the glass is broken by shock, by intense heat or from other cause it remains practically intact. It combines the strength of the wire netting and the glass plate, and the wire is so thoroughly covered as to obviate the possibility of rust or corrosion. Wire glass will break, but it will not scatter. It can be

WIRE, MANUFACTURE

Wire, Manufacture of. At the present time all wire is made by the drawing process, and while permitting the production of a much thinner wire than could be obtained from the rolls, it also gives a wire of greater tensile strength, so much so that the smaller the size to which the wire is drawn down, the greater is its ultimate breaking strength. The wonderful strength of piano wire is well known. The breaking strength of English piano wire ranges from 225 pounds for No. 12 music wire, which is 0.029 inch in diameter, to 650 pounds for No. 22, which is 0.052 inch in diameter, indicating an ultimate tensile strength, ranging from 300,000 to 240,000 pounds per square inch. This wire is composed of carbon, 0.570; silicon, 0.090, sulphur, 0.011; phosphorus, 0.018; and manganese, 0.425.

In the past, all classes of iron wire were made entirely from wrought iron, and required very careful preparation of the raw material to insure toughness and high tensile strength; but, with the discovery of the Bessemer and the open-hearth converting processes, and the consequent lowering of the cost of production accompanied by an enormous increase in the strength of the raw material, wrought iron was quickly supplanted by steel. The great increase in the strength of steel wire over that of wrought iron may be better appreciated from the following statement of facts. The ultimate strength of the best bright hard-drawn wrought-iron wire is about 35 tons to the square inch, while that of ordinary Bessemer steel is 40 tons, and that of open-hearth steel is 60 tons to the square inch. In the special grades of wire manufactured from high carbon, open-hearth steel and from the best cast steel, the values range from 100 to 170 tons per square inch.

A description of the process of manufacture may be commenced with the billets. The bulk of the wire of commerce is made from Bessemer steel billets, while open-hearth billets are worked up into rods for the manufacture of chain, for special grades of wire, and for various finished products requiring great tensile strength. The billets are generally stored near the continuous heating furnaces located at the upper end of the rod mill. In the larger plants, when the mill is in full operation, four furnaces are continually at work, with a fifth held in reserve. The billets, which are 4 x 4 inches in section, and 36 inches in length, are fed into the furnace transversely, side by side, and are pushed through the furnace door by a hydraulic charging machine. After they have been heated to the right temperature for rolling, they are pushed out, one after the other, through the rear door of the furnace onto a conveyor which takes them to the rod mill, where they are passed through the roughing rolls. This mill consists of eight pairs of rolls, and by its operation reduces the billet from its section of 4 x 4 inches to a rod $\frac{3}{4}$ of an inch square and of great ultimate tensile strength. Each pair of rolls is placed at an increased distance from the one preceding, so as to allow for the increase in the length of the rod due to the decrease of the sectional area of the billet, and the alternate pairs of rolls are provided with different shaped grooves so as to press the rods into shapes alternately square and oval, oval and round, etc., thus working the metal thoroughly

and improving its qualities. In the eighth pair of rolls the grooves are $\frac{1}{4}$ of an inch square, and from them the rods are carried to the finishing mill where they are given ten more passes and brought down to the required dimensions.

The finishing mill lies at right angles to the roughing mill with its ten pairs of roll arranged side by side. As the rods issue from one pair of rolls, they are seized with a pair of tongs by workmen who bend them around and feed them into the next pair. The rapid increase in length is accommodated by the increased speed of the successive pairs of rolls, that of the tenth pair being about 1,350 feet per minute, or about 15 miles per hour. The entire operation of rolling down the billet to a finished rod $\frac{3}{4}$ inch square and about a quarter of a mile long, is accomplished in one heat. As the rods issue from the last pair of rolls, their ends are seized and attached to the drums of the Garret reels on which they are wound up into coils of convenient size, and then dropped onto a conveyor by which they are carried to the wire mill.

In the wire mill, the coils are thoroughly cleaned of scales, oil, and dirt by being placed in wooden tanks containing a weak solution of sulphuric acid. They are then taken out and hung up on a circular track, where they are allowed to remain long enough to oxidize slightly on the surface in order to permit a good grip upon the wire in the process of drawing. Further oxidation is prevented by placing them in a solution of lime, and then they are placed in the bakeries and dried out thoroughly. Up to this point the product is technically known as "rods," and only after it has been drawn down is it known under the commercial designation of "wire."

The wire drawing machine consists of a stout bench upon which is mounted a cast-iron drum, around which the wire is wound as it is drawn through the dies. The die-plates are heavy blocks of cast-steel, perforated with tapering holes exactly gauged to the desired size of the wire. In drawing, the coil of wire is placed on a spool fastened to the floor of the shop near the end of the bench, and the end of the wire having been swaged down, it is inserted in the larger end of the hole in the die-plate, passed through, and attached to the drum and wound up until the entire coil has been drawn down. Since the wire is drawn cold, the consequent strains are removed by placing the coils in the annealing pots, where they are carefully sealed with sand to exclude the air, and are then exposed to a steady heat for a period of eight or nine hours. Of the total finished product taken out of the annealing pots, a portion is ready for the market without any further treatment; a portion is galvanized; but the most of it is converted into wire nails and barbed wire. See NAILS, MANUFACTURE OF.

Barbed wire is manufactured in various patterns. The general process may be outlined by a brief description of the machine employed in making what is known as a-point Glidden barbed wire. Four coils of wire on reels are placed behind the machine. The wire from two of the reels serves to form the strands, while that from the other two is used to form the barbs. The two strand wires, which are larger than the other two, are led between a

WIRE NAILS—WIRE ROPE

pair of friction wheels and pulled to a proper tension, and then crossed by the other two transversely, one on each side. At fixed intervals of a few inches, according to the desired spacing of the barbs, the two barb wires are caught by a pair of revolving fingers and twisted around one of the strand wires, and at the conclusion of the twist, two pairs of shears cut the ends of the barbs diagonally into sharp points. The wires then pass into a combined winding and twisting machine by which the two strand wires are twisted around each other, and then to the spool where it is wound up ready for the market. When once started, the operation of wire making is continuous and rapid, and the larger plants are capable of producing as much as 150 tons of barbed wire per day, while the total output of wire from the mills in the United States amounts to about 2,000,000 tons per year, of which about 500,000 tons are converted into wire nails. See also STEEL MANUFACTURE.

W. MOREY, JR.,
Consulting Civil Engineer.

Wire Nails. See NAILS.

Wire Rope, a variety of ropes of iron or steel wire extensively employed in raising and lowering apparatus in coal mines, as standing rigging for ships, as substitutes for chains in suspension bridges, and for telegraph cables. Endless wire ropes or cables are also used on traction railways, and in transmitting power over long distances where ordinary belting would prove unsuitable. Wire ropes were used in 1822 for a suspension bridge at Geneva, and for a similar structure of great span at Freiburg in 1835. A variety of machines are in use for making wire rope. The relative values of round ropes of iron, steel, and hemp are here tabulated:

Hemp		Iron		Steel		Breaking Strain
Diameter in inches	Weight per foot lbs.	Diameter in inches	Weight per foot lbs.	Diameter in inches	Weight per foot lbs.	
1 1/4	1.16	1 1/4	.75	1 1/4	.39	8
1 1/2	2.00	1 1/2	1.40	1 1/2	.63	14
1 3/4	2.66	1 3/4	1.80	1 3/4	.89	18
2	3.16	2	2.45	2	1.20	26
2 1/4	5.66	2 1/4	4.15	2 1/4	2.00	40

Dimensions and Durability.—In the United States the wire rope generally in use is composed of a hemp centre around which are laid six strands of 7, 9, 12, or 19 wires, thus forming a rope of either 42, 54, 72, or 114 wires. Ropes with seven wires are generally used for standing ropes, guys, transmission of power, etc. Ropes with nine wires are generally used for haulage ropes in mines, on inclines and for transmission of power. Those with 12 wires to the strand are generally used for ship-rigging and 19 wires for hoisting. Wire rope is as pliable as hemp rope of equal strength and therefore can be operated over sheaves and drums of the same size and is far more durable and efficient. Durability of wire rope depends principally upon the diameter of the sheaves or drums; the greater the size of the

sheaves or drums, the longer the rope will last. Experience has demonstrated that the wear increases with the speed. It is therefore better to increase the load than the speed. One fifth of the ultimate strength of rope is considered a fair working load. Wire rope must not be coiled or uncoiled like a hemp rope. When not on a reel, roll on the ground like a wheel or hoop to prevent twisting or untwisting. Galvanized rope should never be used for running rope. To preserve wire rope under water or under ground, add one bushel of fresh slacked lime to a barrel of mineral or pine tar—boil and apply hot. On incline planes the grooves of the pulleys or idlers should be lined with wood or babbit metal. It is recommended to use as few idlers as possible. In a great many cases, they do more harm than good. For transmission of power the sheaves should be lined with leather or India rubber, to secure increased adhesion and prevent wear. The use of cast-steel rope is becoming general because of its lightness, greater strength and durability. To get the best results, steel rope should be made of the best quality of crucible cast steel. Ropes made from low grades of steel are inferior to iron ropes. The use of Bessemer steel in running ropes is not advisable. Ropes should be examined frequently and a new rope ordered before the old one is allowed to wear out. Attention to this will insure safety and prevent serious accidents.

Galvanized Steel Cables are largely used for suspension bridges and are composed of six strands with wire centre.

Diameter in.	Approximate circumference in.	Weight in pounds per foot	Approximate breaking strain in tons of 2,000 lbs.
2 3/4	8 1/4	12.7	310
2 1/2	7 1/4	11.6	283
2 1/4	7 1/4	10.5	256
2 1/2	7 1/4	9.50	232
2 1/4	7 1/4	8.52	208
2 1/2	6 3/4	7.60	185
2	6 1/4	6.73	164
1 3/4	5 3/4	5.90	144
1 1/2	5 1/4	5.10	124
1 1/4	5	4.34	106
1 1/2	4 3/4	3.90	90
1 1/4	4 1/4	3.10	75
1 1/2	4	2.57	62

Galvanized Steel Hawseers are usually 37 wires to the strand and combine great strength with pliability. The demand for towing a number of heavy loaded barges, practically in all kinds of weather, has called for a wire hawser stronger than any Manila hawser made. The two grades presented in the table—Cast-steel and Special—are made with a hemp centre and six strands of 37 wires each.

Approximate Diameter in.	Circumference in.	Weight per foot lbs.	Approximate breaking strain in tons of 2,000 lbs.

1	3	1.44	31	40

WIRE ROPE

Flattened Strand Ropes.—Instead of being made up of strands of circular form in cross-section, flattened strand ropes are constructed with strands, each of which has one or more flattened surfaces, so that one flattened surface is exposed on the outside of the full length of rope, with the result that a plurality of wires in each strand must at all times take the wear instead of there being only one external wire in peripheral working in each strand, as is the case with ropes of ordinary construction while new. Until the wear has greatly advanced and consequently a considerable diminution of strength has taken place in an ordinary rope, the friction is borne in a very marked manner upon the crown of the one wire nearest the periphery of the rope in each strand, and in cases where small wire is used it is rapidly worn through, while heavier wire has a tendency to fracture where the abrasion has taken place. Owing to the number of wires that are at all times exposed to wear in a flattened strand rope for a considerable distance along their respective lengths, a smooth or comparatively smooth surface is presented even while new, and the wear is consequently light upon any individual wire and the tendency to become brittle is minimized. These ropes are exceedingly flexible and are less liable to the crushing action which frequently takes place in other ropes. They are made up with the wires in the strands and the strands in the rope laid in the same direction or reversely. Owing to the comparatively little wear which takes place in these ropes, so large a margin between working load and breaking strain is not required as in ropes of ordinary construction. Flattened strand ropes are free from all tendency to spin or kink and a considerable saving in wear of pulleys and sheaves is effected by their smooth surface which is shown in the two following illustrations:

New.

Worn.

The end sections show a comparison of structure and wearing surface of round and flattened strand rope.

Hercules Wire Rope.—This is a very high grade of rope, the steel for which is specially prepared for it under a patent process and then

the wire tempered and drawn by a patent process, producing a steel strong and tough and that is uniform in density, texture, elasticity, elongation and strength, every wire being carefully tested for these points and the tests registered for reference. It is a rope that was evolved originally for use in extra hazardous places and where there is liability for rough usage.

Aerial Wire Rope Tramways.—Aerial tramways may be used to advantage both in operation and construction for transporting material from one place to another. This is especially true with ores, coal, stone, lime, rock, gravel, earth, sand, and cord wood. Packages, lumber, logs, light merchandise and water may also be transported economically. Usually the material is loaded on the cars at one terminal or an intermediate loading station and carried to the opposite terminal where it is discharged. By means of various devices it can be arranged for the discharging of the material at any point along the line for use in such work as constructing dams, carrying refuse from plants, etc. Aerial trams can be constructed in a hilly country without the necessity of making tunnels, cuts, embankments or bridges as compared to railway construction. Rivers and ravines are spanned while hills and other constructions are overcome by building the line directly over them and supporting it by towers or derricks at these points. Grades are no barrier to this construction as they can be built to surmount practically any grade and in fact where the loads are carried down grade and the grade is sufficient the entire tramway will be self-propelled, due to the forces of gravity. An aerial tramway is free from surface traffic, so that the underlying ground may be used for other purposes. Tramways are not affected by the elements, such as snow, sleet, rain or frost and may be operated irrespective of the weather.

There are two distinct classes of aerial tramways; namely, single rope systems and double rope systems. The single rope system is the simpler in construction of the two and for limited capacity not exceeding eight tons per hour, an average condition of route is economical in both construction and operation. This system consists of a moving endless rope to which are attached in various manners the carriers or buckets. The entire line is supported by sheaves placed on towers which are located dependent upon the profile of the ground. At each terminal the cable passes around a sheave or series of sheaves, generally one of them being provided with grips in its periphery for driving or controlling the tramway. When divisible material is carried, mechanical loaders are used and the buckets are arranged so that they discharge automatically. This is all accomplished while the line continues in operation. Bulky material can be loaded and taken away from the carriers while the tramway continues in motion, owing to its slow speed. The double rope system is always preferable to a single system owing to the fact that a separate track rope is used upon which the buckets travel instead of one cable performing the work of both supporting and propelling. This diminishes and divides the strains developed thereby, greatly increasing the life of the cable and plant. The double rope system will fulfil almost any requirements in the

WIRELESS TELEGRAPHY — WISCONSIN

tramway line and may be built practically any length. The practicability of long lengths of tramway is fully demonstrated by the tramway built for the North American Copper Company at Encampment, Wyo., which has a total length of over 16 miles and is built in four sections, making it the longest tramway in this country. The double rope system is capable of carrying capacities as great as 200 tons per hour and in fact even greater, when conditions demand it. The double rope system in general consists of two tracks or standing cables, upon which the loaded and empty carriers travel respectively and an endless traction rope for propelling them. The track cables are stretched at high tension, one end being anchored solidly and the other being fastened to a tension device. All of the cables are supported by towers, which are located according to the shape of the ground over which the line passes.

In all of the above classes, the traction rope passes around a sheave or a series of sheaves at either terminal; one, however, being generally provided with grips in its periphery for clamping the cable in order to secure the necessary friction for driving or controlling the tramway. In long lines, tension stations are provided for dividing the tension and take up on the track ropes. Double rope systems may be sub-divided into three classes. One in which the carriers are attached and detached to and from the traction rope by means of a friction or compressing grip. The second in which the carriers are permanent fixtures to the traction cable, the loading of same being effected by mechanical loaders while the buckets are automatically tripped at the discharging point. And the third in which the traction cable has permanent fixtures attached to it in the shape of clips or buckets. The buckets in this system are automatically attached and detached to and from same at either terminal of the line by means of a locking device. This latter system is furthermore designed so that the buckets are automatically discharged at the unloading end without any attendants to look after same. A simple tramway which is known as a two-bucket tramway may sometimes be used to advantage where the grade is steep and where the capacity is moderate. This is true for short lines. It consists of two cables stretched parallel to each other, upon each being operated a bucket, the two buckets connected to a traction rope which passes around a sheave or series of sheaves at the upper end of the line. When the loaded bucket descends by gravity, it pulls up the empty bucket on the opposite cable and vice versa. This type is sometimes used on level ground or even up-grade simply by applying power to the line for operating. The most suitable system of tramways to be used in any case depends upon the profile of ground, capacity, nature of material to be transported and terminal requirements and should be investigated thoroughly before deciding upon any particular construction.

Wirt, wert, William, American jurist and statesman: b. Bladensburg, Md., 8 Nov. 1772; d.

Washington, D. C., 18 Feb. 1834. He received a grammar school education, became a private tutor, studied law, was admitted to the bar in 1792, and commenced practice at Culpeper Court House, Va. In 1799 he removed to Richmond, was elected clerk of the house of delegates, and in 1802 received from the legislature the appointment of chancellor of the eastern shore of Virginia. In 1803 he published in the 'Richmond Argus' his 'Letters of a British Spy,' purporting to be papers left at an inn by an English member of Parliament traveling in Virginia. They consist principally of sketches of prominent public orators, with remarks on eloquence and some pages of local description, and proved extremely popular. A second series appeared in the following year in the 'Richmond Enquirer' under the title of 'The Rainbow.' Wirt was an assistant in the prosecution of Aaron Burr and in the course of the trial displayed a learning and eloquence which established his reputation as one of the foremost lawyers in the country. A series of papers somewhat in the style of the 'Spectator,' begun by him and several of his friends in 1810 under the title of 'The Old Bachelor,' appeared in 33 numbers of the 'Richmond Enquirer,' and afterward in book form. His 'Sketches of the Life and Character of Patrick Henry' appeared in 1817, and became immediately popular. In 1816 Wirt was appointed by President Madison attorney of the United States for the district of Virginia, and from 1817 to 1829 was attorney-general of the United States. On his retirement he passed the rest of his life in the practice of his profession at Baltimore. He delivered in 1826 in the hall of representatives in Washington a eulogy on Adams and Jefferson. In 1832 he was the candidate of the Anti-Masonic party for president of the United States. Consult: Kennedy, 'Memoirs of the Life of William Wirt' (1849); Trent, 'English Culture in Virginia' (1889).

Wiscasset, Maine, town, county-seat of Lincoln County, on the Sheepscot River, and the Maine Central Railroad; 40 miles northeast of Portland. It is in a region noted for picturesque scenery, and is a popular summer resort. It has a good harbor, and is a port for coasting vessels; some vessels are built here, and the town also contains a shoe factory and large saw-mills. There is a national bank, capital \$100,000, and a savings bank. It has several elementary schools, and a public academy (high school) founded in 1877. Pop. (1890) 1,733; (1900) 1,273; (1910) 1,267.

Wisconsin, wis-kon'sin, a north-central State of the United States, sometimes called the "Badger State." Admitted to the Union 29 May 1848. It is between lat. 42° 30' and 47° N. and lon. 87° 30' and 92° 30' W. Bounded on the north by Lake Superior and the upper peninsula of Michigan, east by Lake Michigan, south by Illinois, and west by Iowa and Minnesota. The Mississippi and St. Croix rivers flow along the greater part of the western border. Its gross area is 56,040 square miles, or 35,840,000 acres. The State is divided into 71 counties. Its greatest length is 316 miles and breadth 295 miles. The State capital is Madison, and the leading manufacturing and commercial city is Milwaukee. The population in 1910 was 2,333,866.

Topography.—Wisconsin represents an elevated undulating plain with an altitude of from 600 to 1,800 feet above sea level. A ridge some 30 miles south of Lake Superior forms the watershed of the State, the ground sloping therefrom in all directions. High cliffs extend along the east shores of Green Bay and Lake Winnebago. The greatest depression in the State is the surface of Lake Michigan, 578 feet above the sea. The Mississippi River at the mouth of the Platte, eight miles above Dubuque, is 591 feet; at Prairie du Chien, 602; at La Crosse, 632; and at the mouth of the St. Croix, 677—it therefore has a descent in this part of its course of 5 inches per mile. The descent of Fox River from Lake Winnebago to Green Bay is 170 feet, forming one of the most valuable series of water powers in the West. No part of the United States excels the valley of the upper Mississippi in the great beauty of its bluff and woodland scenery.

Rivers and Lakes.—The Mississippi River forms the western boundary of the State for about 250 miles, and in that distance receives the waters of the Wisconsin, Black, Chippewa, and Saint Croix, all large streams, draining respectively areas of 11,000, 2,200, 9,000 and 3,600 square miles. The other principal rivers are the Rock, another tributary of the Mississippi; the St. Louis, Bois Brulé, Bad, and Montreal, flowing into Lake Superior; the Menominee, Peshtigo, Oconto, Pensaukee, and Fox, with its tributary the Wolf, flowing into Green Bay; and the Manitowoc, Sheboygan, and Milwaukee, tributaries of Lake Michigan. Innumerable smaller streams irrigate almost the whole surface; their waters are usually clear, originating in springs and small lakes. Several of these at the north are precipitated over rocky barriers, forming often beautiful cascades or rapids; and at the south several run through narrow rocky gorges called "dalles." The Mississippi is navigable for steamboats throughout its course along the border of the State; the Wolf and Fox rivers are navigable for small steamboats, the latter having been artificially improved with slack-water dams; and many of the streams afford ample water power for manufacturing purposes. Besides the two great lakes, Superior and Michigan, there are numerous others, especially in the central and northern portions of the State; these are from 1 to 20 or 30 miles in extent, often with high, picturesque banks, and deep water, abounding in fish. The largest lake in the State is Winnebago, 28 miles long and 12 miles wide, covering an area of 212 square miles. The other principal lakes are Saint Croix, Pepin, Little and Great Butte des Morts, Mendota, Monona, Waubesa, Kegonsa, Puckaway, Pewaukee, Geneva, Green, and Koshkonong.

Climate.—The mean annual temperature of the southern portion of the State is 46° F.; mean temperature of winter 20°; of spring and autumn 47°, and of summer 72°. The waters of Lake Michigan materially affect the temperature of the counties along its shores, moderating both the excessive heat of summer and the cold of winter; and hence the temperature of January at Milwaukee is found on the Mississippi River half a degree of latitude farther south, and that of July at Saint Paul, 2° farther north. The northern part of Lake Michigan is generally covered with ice in the winter, but the sheet

seldom reaches as far south as Milwaukee, where navigation generally continues open during the entire year. Snow almost always falls in the northern part of the State before the occurrence of heavy frosts, protecting the ground and the roots of plants from freezing, and from its melting accelerating the growth of vegetation in the spring. The prevailing winds of spring are from the N. E.; of summer, S. E.; of autumn and winter, W. The winters are cold, mostly uniform, with many clear, dry days; the springs are backward; the summers short and often hot; the autumns prolonged, mild, and usually pleasant. The annual quantity of rain and melted snow is about 32 inches. The barometer varies in its extremes from 28 to a little above 30 inches, the mean being about 29.5.

Geology.—The rock formations present in the State of Wisconsin begin with the very oldest, the Archæan, and extend up to the Devonian, which is represented by a small area near the city of Milwaukee. The Archæan rocks occupy a dome-like area in the north-central part of the State, mantled about by the sandstones, shales, and limestones of the Cambrian and Silurian age. The Archæan rocks consist of granite, greenstone, gneiss, schist, quartzite, and crystalline limestone. The Cambrian and Silurian rocks have their beds sloping in all directions away from the central Archæan area. Within the Silurian rocks the Trenton and Niagara formations are filled with fossils. In addition to the large central area of Archæan rocks, a smaller area is found forming the elevated area of bluffs near the town of Baraboo. The later beds of the Archæan formation are rich in minerals, particularly those containing copper and iron. In the southwestern part of the State the Silurian formations are important by reason of the areas of zinc and lead which they contain.¹

Minerals.—The mineral resources of the State are very extensive. Lead, copper, iron, and zinc occur abundantly and are mined with profit. The principal mineral productions in 1900 included red hematite, 733,212 long tons; brown hematite, 12,793 long tons; granite (1900) \$742,878; sandstone, \$335,470; limestone, \$38,269; clay products, \$3,000,486; coke, 48,000 short tons in 1900 (no report in 1909); and mineral water valued at \$15,958. The lead mines of the State were first discovered by the French, in the middle of the 17th century; but attracted little attention until 1826, from which time the quantity of lead produced increased rapidly, until the discoveries in the Black Hills overshadowed the importance of the Wisconsin mines.

Agriculture.—Nearly 60 per cent of the land area of Wisconsin is included in the farms of the State. There were 176,546 farms in 1910. Much of the northern part was until recently covered with extensive forests of white pine, balsam, hemlock, and other cone-bearing evergreens, but these have suffered serious diminution from lumbering operations. The soil in the north is, in large measure well adapted to agriculture, although there are large sandy tracts only suited to the growth of pine forests; the prairies in the south and central portions are exceedingly rich and productive, raising the cereals, tobacco, sugar beets, and potatoes in great quantities.

¹ This paragraph is by Prof. William H. Hobbs, of the University of Wisconsin.

WISCONSIN

According to the somewhat uncertain census returns, the principal farm crops in 1910 were corn, 51,188,000 bushels, valued at \$26,618,000; wheat, 3,659,000 bushels, valued at \$3,366,000; oats, 69,136,000 bushels, valued at \$23,506,000; barley, 22,429,000 bushels, valued at \$14,355,000; rye, 4,890,000 bushels, valued at \$3,465,000; buckwheat, 196,000 bushels, valued at \$147,000; potatoes, 24,700,000 bushels, valued at \$9,386,000; and hay, 2,260,000 tons, valued at \$34,126,000. The average values per acre of the principal crops are as follows: Flowers and plants, \$1,396; onions, \$125; nursery products, \$116; tobacco, \$86; small fruits, \$67; miscellaneous vegetables, \$54; hops, \$53; broom corn, \$39; sweet potatoes, \$85; potatoes, \$23; dry beans, \$16; flaxseed, \$13; dry peas, \$12; cereals, \$9; hay and forage, \$8; and orchard fruits, \$5. The crops yielding the best average returns per acre were grown upon highly improved ground. Their production required a relatively great amount of labor, and large expenditures for fertilizers.

The value of all livestock on farms in 1910, was \$158,454,043. Of this amount 43.3 per cent represents the value of horses and colts; 42.5 per cent cattle, including dairy cows and meat cattle, 8.6 per cent swine, 2.3 per cent sheep and lambs; 2.8 per cent poultry; and 5 per cent that of all other livestock. Dairying is an important branch of agriculture in Wisconsin. In 1900 the value of dairy products was \$26,779,721, being 17 per cent of the value of all farm products. Of this amount, 78.6 per cent represents the value of dairy produce sold, and 21.4 per cent that consumed on the farms of the producers. Of the former amount, \$15,717,043 was received from the sale of 252,450,051 gallons of milk; \$4,508,775 from 26,931,757 pounds of butter; \$686,689 from 1,638,601 gallons of cream, and \$135,038 from 1,558,575 pounds of cheese.

Manufactures.—In 1910 Wisconsin had 9,722 manufacturing establishments, employing 3605,066,000 capital and 205,022 persons, paying \$110,743,000 for wages and \$346,383,000 for materials; and having an aggregate output valued at \$590,466,000. The principal manufactures, according to the values of output (1900): lumber and timber, \$57,634,816; flour and grist, \$26,327,942; foundry and machine shop products, \$22,252,730; cheese, butter, and condensed milk, \$20,120,147; leather, \$20,074,373; malt liquors, \$19,394,709; packed meat, \$13,661,125; and paper and wood pulp, \$10,895,576. The iron output aggregated over 116,000 tons of pig-iron and 60,000 tons of rolled iron. Manufactures of leather amount to \$9,000,000; and beer is produced, chiefly at Milwaukee, to the value of \$11,000,000 annually. The remarkable growth of manufactures in Wisconsin is to be attributed to an abundant supply of materials and excellent market facilities. Manufacturing is not concentrated in a few localities, but is well distributed throughout the State. Six large rivers—the Menominee, Saint Croix, Chippewa, Wisconsin, Rock, Fox, and Wolf—with many smaller streams, and the outlet of many of the 2,000 fresh-water lakes in the northern part of the State afford enormous water power, as yet only partially developed. On the shores of Lake Michigan and Green Bay are 11 important manufacturing cities, all accessible to lake-going vessels; and the cities of Ashland and Superior, on

Lake Superior, are large and growing manufacturing centres. Wisconsin in 1900 was the first among the States in the value of its timber and lumber products; Michigan, which was first in 1890, having suffered a much greater decline. But so rapid has of late been the work of the lumbermen, that Wisconsin's lumber industry is fast dropping to a much lower stage, the principal operators having already withdrawn from the State to the South and far Northwest. Most of the timber has been removed from the southern part of the State, yet in the north there is still much pine, hemlock, spruce, and deciduous varieties. During the year 1900 there were produced 3,389,166,000 feet of sawed lumber. The manufacture of flouring and grist-mill products ranked second among the industries of the State in 1900, with 717 establishments, 1,412 wage-earners, and products valued at \$26,327,942. In 1890 there were 497 establishments, 1,770 wage-earners and products valued at \$24,252,297. The increase in the value of products during the decade was \$2,075,645. There were 47 establishments engaged in the manufacture of paper and wood pulp in 1900, with 4,240 wage-earners, and products valued at \$10,985,576. In 1890 there were 27 establishments, 1,779 wage-earners, and products valued at \$4,475,368. The increase in the value of products during the decade was \$6,420,208. These mills are situated mainly on the large rivers which afford the abundant power so essential to the successful conduct of this industry. The large quantities of spruce, hemlock, and other woods used are furnished by the forests of the State, and the quality of the water is unexcelled for paper-making purposes. There were 76 establishments engaged in the manufacture of furniture in 1900, with 7,775 wage-earners, and products valued at \$3,721,823. In 1890 there were but 46 such establishments, 2,600 wage-earners, and products valued at \$3,616,317. The increase in the value of products during the decade was \$5,105,506.

Transportation.—The first railroad in Wisconsin was built in 1850. In 1904 the principal railroads traversing the State were the Chicago and Northwestern; the Chicago, Milwaukee and Saint Paul; the Wisconsin Central; the Chicago, Saint Paul, Minneapolis and Omaha, and the Minneapolis, Saint Paul and Sault Sainte Marie. The total length of railroads within the State in 1904 was 6,970 miles.

Banks and Banking.—In the State in 1909 there were 125 national banks in operation, having 135,551 depositors and \$40,774,994 savings deposits. There were also 358 State banks with 170,548 depositors and \$34,870,310 deposits, 3 savings banks with 6,249 depositors and \$1,144,513 deposits; and 8 loan and trust companies with 12,617 depositors and \$2,237,470 deposits. The exchanges at the United States clearing house at Milwaukee, during the year ending 30 Sept. 1909 aggregated \$590,078,300, an increase over those of the preceding year of \$52,052,380.

Government.—The government of the State is in accordance with the constitution adopted 18 February, and ratified by a vote of the people 14 March 1848. By it certain personal rights are secured to every citizen, adequate remedies for wrongs secured, the crime of treason clearly defined, leases of land for agricultural purposes longer than 15 years prohibited, and aliens ab-

lowed to hold and convey property; all white male citizens and persons who have declared their intention to become citizens, who are 21 years of age and who have resided in the State one year, have the right to vote. The governor is elected for a term of two years, and receives a salary of \$5,000 per annum. Legislative sessions are held biennially in odd-numbered years, beginning on the second Wednesday in January, and there is no limit to length of session. The Legislature has 33 members in the Senate and 100 in the House, each of whom receives \$500 per biennial period and mileage. There are 11 representatives in Congress. The State government in 1908 was Republican. There is a supreme court of six members elected for 10 years.

State Finances.—In 1910 Wisconsin had no indebtedness except for the following trust funds. School fund, \$1,563,700; normal school fund, \$515,700; university fund, \$111,000; agricultural college fund, \$60,600; total, \$2,231,000. The actual valuation in 1910 was Real estate, \$1,901,290,225; personal property, \$577,271,961; total \$2,478,561,786; State tax rate, \$1.36 per \$1,000, and total taxes raised, \$1,345,570. The receipts for the year are over \$5,300,000, expenditures, \$5,000,000; balance in the State treasury, about \$300,000.

Charities and Correction.—The penal and charitable institutions are managed by a State board of control, appointed by the governor. The incurable insane are cared for in county asylums, supported both by the State and county. There are State insane hospitals at Mendota and Winnebago; a School for the Blind at Janesville; Home for the Feeble-Minded at Chippewa Falls; School for the Deaf at Delavan; Industrial School for Boys at Waukesha; and State School for Dependent Children at Sparta. The State Prison is at Wausau, and the State Reformatory at Green Bay.

Education.—In 1908 the children of school age in Wisconsin numbered 690,493; the enrollment in public schools, 465,306, the average daily attendance, 309,415. There were 8,000 public school buildings, public school property valued at \$18,000,000, and 14,659 teachers. For higher education there were 269 public high schools, 19 private secondary schools, 12 public and 3 private normal schools, 10 universities and colleges for men and for both sexes, and the Milwaukee-Downer College for Women, at Milwaukee. The principal colleges include the University of Wisconsin (q.v.), at Madison; Beloit College, at Beloit; Marquette and Concordia Colleges, at Milwaukee; Lawrence University, at Appleton; Northwestern University, at Watertown; Ripon College, at Ripon; Milwaukee Medical College and Wisconsin College of Physicians and Surgeons, at Milwaukee.

Religion.—The strongest denominations in the State are the Roman Catholics, Lutheran, Independent Synods, Methodist Episcopal; Congregational; regular Baptist, Evangelical Association, German Evangelical Synod; and Presbyterian. There are about 7,000 Evangelical Sunday-schools, with 22,880 officers and teachers, and 450,000 scholars.

Population.—Soon after the admission of Wisconsin to the Union in 1848 efforts were made to attract immigration by the offer of cheap lands, and the result has been an unusually large foreign element in the population—

chiefly German and Scandinavian, but including also French, Swiss, and most other European peoples. Many of these foreigners settled in communities, some of which have tenaciously preserved their original language and customs. The population in the State in 1830 was 3,245; (1840) 30,945; (1850) 305,391; (1860) 775,881; (1870) 1,054,670; (1880) 1,315,497; (1890) 1,686,880; (1900) 2,069,042, and in 1910, 2,333,860. There are also about 6,000 tribal Indians living on Federal reservations. The leading cities in the State in the order of their population are as follows: Milwaukee, 373,857; Superior, 40,384; Racine, 38,002; La Crosse, 30,417; Oshkosh, 33,068; Madison, 25,531; Sheboygan, 16,359; Green Bay, 19,100; Eau Claire, 18,310; Marinette, 14,610. Fond du Lac, 18,797; Appleton, 16,773; Janesville, 13,894; Ashland, 11,594; Wausau, 16,950; Manitowoc, 13,027; Kenosha, 21,371.

Indian Reservations.—The Indian reservations in Wisconsin are La Pointe, Menominee, Oneida, and Stockbridge. The Stockbridge are self-supporting, largely through annuities and sales of lumber-cutting rights, but take little interest in agriculture. The Menominee and Chippewa, on the Menominee and La Pointe reservations, respectively, also derive most of their support from the sale of their timber. The Menominee are dependent upon Government rations for 20 per cent of their subsistence. La Pointe, or Bad River, reservation, is situated in Ashland county, and comprises an area of 194 square miles. These Indians are a portion of the Lake Superior band of Chippewa (Algonquian) with a population of 627. The Menominee and Stockbridge reservations, embracing areas of 368 and 18¼ square miles, are located in Shawano and Oconto counties. The Menominee (Algonquian) are an aboriginal Wisconsin tribe and have a present population of 1,487. Their principal occupations are lumbering and farming. The Stockbridge and Munsee tribes, of Algonquian stock, originally lived in New England; later they moved to western New York, and thence to Wisconsin; they are non-consolidated, and number 376. The Oneida reservation, now existing as such only in name, is situated in Brown and Outagamie counties. The entire area, 102 square miles, has been allotted, with the exception of a small tract for school purposes. The Oneida (Iroquoian) were formerly a portion of the Six Nations of New York, where they resided before being sent to Wisconsin. Their present population is 1,704. In Calumet County are many Stockbridge, Brothertown, and Munsee farmers, without tribal relations, and following the pursuits of husbandmen. There are nearly 8,000 Indians and half-bloods in the State, either as citizens or in tribal relations—as large a number as at any period in its history.

History.—The region west of Lake Michigan was first visited by French explorers. Jean Nicolet, an agent of Champlain, arrived in 1634. In 1658-59 two fur traders, Radisson and Groselliers, visited the Mississippi and the former wrote a journal of their travels. In 1665 a Jesuit mission at La Pointe was founded by Father Claude Allouez, and three years later he established the mission of St. Francis Xavier on the shores of Green Bay. In 1673 Father Jacques Marquette, accompanying Louis Joliet,

reached the Mississippi by passing through Wisconsin; and later Duluth, Father Louis Hennepin, the famous La Salle, and other Frenchmen traced waterways within the territory. Trading posts were established about this time, becoming dependencies of Mackinac. The earliest explorers found the Chippewa on the borders of Lake Superior, at war with the Sioux, on the headwaters of the Mississippi. The Menominee, Winnebago, Mascouten, Miami, Pottawatomie and Kickapoo occupied other portions of the same district. At a later period the Pottawatomie and the Sauk and Foxes were in possession. Artificial earth-mounds (see *MOUND BUILDINGS*), in the form of animals, such as the lizard, bird, turtle, and buffalo, are still to be found in various parts of the State. The navigation of the upper lakes was begun in 1679, when La Salle's "Griffon" made a trip from Niagara River to Green Bay, and was lost on her return voyage. About 1750 a fixed settlement was established at Green Bay by Charles de Langlade; and at the close of the Revolutionary War, Prairie du Chien, at the mouth of the Wisconsin, grew into a like settlement; a few years later La Pointe (at first on the mainland, but soon thereafter on Madeleine Island, in Chequamegon Bay) and Portage became permanent trading posts. England retained Mackinac after the treaty of 1763, and American dominion was not felt by the Wisconsin traders until after the War of 1812-15. The formation of Astor's American Fur Company to establish fur trade in this region was followed by a law forbidding English traders within the territory, which resulted in an increase of American influence. By the ordinance of 1787 Wisconsin became a part of the Northwest Territory. In 1800 it was included in Indiana Territory. In 1809 the region was annexed to the territory of Illinois, as then formed, and so continued till the conversion of the latter into a State in 1818, when Wisconsin, which was yet a wilderness, was annexed to Michigan Territory for such government as was needed. In 1826 lead was discovered in large quantities at Potosi and Mineral Point, and there was a great rush of immigrants to that section. The Indians soon became troublesome, and the Black Hawk war ensued in 1832. Treaties were a few years later made with the Indians, by which most of them removed to reservations beyond the Mississippi. In 1836 the population had increased to such an extent that a territorial government was organized, which at first included a part of the upper peninsula of Michigan, the whole of Minnesota and Iowa, and that part of the Dakotas lying east of the Missouri and White Earth rivers. On the admission of Michigan into the Union as a State, a part of the Lake Superior region was set off to her, and when the Territory of Iowa was formed, it included all the region west of the Mississippi; later, the territory west of the St. Croix was given by Congress to Minnesota. The first effort to procure the admission of Wisconsin to the Union as a State was made in 1846. A constitution drafted during that year was ratified in March, 1848, and the State was admitted to the Union by Act of Congress, 20 May 1848. Under this constitution, with some amendments, it is still governed. During the War of Secession the

State furnished 91,327 soldiers to the Federal Army.

Bibliography.—Wisconsin Historical Collections, 17 vols. (1854-1904); Parkman Club Publications (1896-7); Butterfield, 'Discovery of the Northwest' (1881); Hebbard, 'History of Wisconsin Under the Dominion of France' (1890); Lapham, 'Wisconsin' (1846); Smith, 'History of Wisconsin' (1854); Strong, 'History of the Territory of Wisconsin' (1885); Thwaites, 'Story of Wisconsin' (1890 and 1899); and 'Stories of the Badger State' (1900); 'Historic Waterways' (1888 and 1903); Legler, 'Leading Facts in the History of Wisconsin' (1898); and various monographs published by the State Historical Society.

Revised by R. G. THWAITES.

Wisconsin, a river in the State of Wisconsin. It has its rise in Vieux Desert Lake, on the northern boundary of the State, flows south to Portage City, then southwest, and enters the Mississippi four miles below Prairie du Chien. Total length about 625 miles. It is navigable for 200 miles to Portage City, from which point it is connected with Fox River by a canal. Shifting sandbars in this river are a hindrance to navigation. There are several waterfalls along its course, the most famous of which are known as The Dalles of Wisconsin and Grandfather Bull Falls. Some of the bluffs which line the picturesque gorges are fully 400 feet high.

Wisconsin Phalanx. See *RRON, Wis.*

Wisconsin, University of, the State University located at Madison, Wis. As early as 1836 the legislature of the territory then known as Wisconsin passed an act for the establishment of "Wisconsin University" at Belmont, now in the State of Iowa, but the institution was never organized; again in 1838 a law was passed for the establishment of the "University of the Territory of Wisconsin," a board of visitors was appointed, and the national endowment of two townships of land received. Nothing further was done, however, until 1848, when the State Constitution provided for the establishment of a State university, and the university was incorporated by act of the legislature. A preparatory department was opened in 1849, and the collegiate department in 1850. In 1854 a second grant of two townships of land was made by Congress; but this land as well as that of the first grant was sold at very low prices to attract settlers, and the income derived from the fund was meagre; no State appropriation was made till 1870. In 1858 the University was reorganized, the work of the preparatory department restricted, and the collegiate department organized in six schools; during the War of Secession a large number of students entered the army, and though the work of the university was not suspended, no commencement was held in 1864. Since the war the progress of the university has been continuous. In 1866, a reorganization was effected. The Federal grant under the "Morrill Act" for the establishment of colleges of agriculture and industrial arts was given to the university. Colleges of agriculture and engineering were then established as integral parts of the university. Women, who had been admitted since 1863 to a "normal" department, were given the opportunity to follow a regular collegiate course. At this time, however, the co-educational system was not

complete as the work of the women was kept separate from that of the men; but a few years later complete co-education was established. In 1873 the legislature appropriated \$10,000 a year to the university; in 1876 an annual tenth of a mill tax was appropriated; in 1883 and 1891 other mill taxes were added; in 1899 all mill taxes were consolidated with a grant of one per cent of the railroad licenses into a specific annual grant, which was increased in 1901 and again in 1903. The total income from all sources was \$674,000 in 1902-3. At the time of the first annual grant of \$10,000 a system of free tuition to graduates of high schools in the State was adopted, which led to the elimination of the preparatory department a few years later. This also resulted in making the university the actual head of the public school system of the State.

Since 1899 the university has extended its work in all directions; a number of special courses have been added, particular emphasis has been laid on graduate work, and the number of graduate students increased. The university now includes the following colleges and schools: (1) the College of Letters and Science; (2) the College of Mechanics and Engineering; (3) the College of Law; (4) the College of Agriculture; (5) the Graduate School. It also conducts a summer school and a university extension department. The College of Letters and Science includes beside the general departments of instruction in arts and science, the several special departments as follows: The courses in commerce, pharmacy, education, and home economics, the School of Music, the pre-medical course, the normal graduates' course, and the Washburn Observatory. The degree of A.B. is conferred upon the graduates of the College of Letters and Science, except in the pharmacy and normal graduate courses; for this degree the work is largely elective; in the Freshman year an English course is required, and during this year the other studies are elected from two groups, (1) language, (2) mathematics, science, and history. Certain minima in these groups must be offered, the total covering somewhat less than two years' work. Not later than the beginning of the Junior year a major subject in some one department must be elected, and the remainder of the work is free electives. A limited amount of elective work may be taken in the colleges of Engineering and Agriculture, in the School of Music, or in the special courses of the College of Letters and Science. A special two years' course is arranged for normal school graduates, for completion of which the degree of Ph.B. is conferred. The special courses in pharmacy cover four years, leading to the degree of B.S., or two years, leading to the degree of Graduate in Pharmacy. The College of Engineering was organized in 1870; it offers six four years' courses leading to the degree of B.S.; these are in civil, sanitary, mechanical, electrical, and general engineering, and applied electrochemistry; the course in general engineering includes an elective course in mining engineering. The College of Agriculture offers a "long course" of four years, leading to the degree of B.S., a short course of two years, winter and summer dairy courses, and a farmers' winter course; this college also includes the Agricultural Experiment Station and the organization of farmers' institutes. The College

of Law was established in 1868; it offers a three years' course leading to the degree of LL.B. The Graduate School received its present organization in 1895. It includes work in the College of Letters and Science, the College of Engineering, and the College of Agriculture, courses especially for graduate work being offered in each department of these colleges; the school as a whole is under the control of a faculty committee. The degrees conferred are A.M., M.S., Ph.D., C.E., E.E., and M.E. The Summer School offers courses in the subjects of the general college curriculum, in education, in gymnastics, and a special normal course, it also includes a summer school in shop and laboratory work for mechanics. Tuition in the university is free to Wisconsin students except in the College of Law. There are eight scholarships for undergraduates, and four student loan funds; there are also 31 fellowships, five of which are in special departments, and 18 graduate scholarships, six of which are for special purposes.

Gymnasium work and military drills are required of men students during part of the course, and gymnasium work of women students. There is also ample provision for athletic sports, which are under the general control of an Athletic Council, on which the faculty is represented. The University of Wisconsin is the only institution of the kind in the West which has a boat crew. The women students have organized an athletic association. The students maintain four men's literary societies and one women's society in the College of Letters and Science, and two debating societies in the College of Law; the four men's societies and the two law societies form the intercollegiate debating society from which debaters for intercollegiate contests are chosen; two of the men's societies and the women's society were organized in the early days of the university, and have always had a prominent part in student life. There are also a Science Club, dramatic clubs, and numerous other special associations, a Woman's Self-Government Association, and chapters of the honorary fraternities of Phi Beta Kappa and Tau Beta Phi (engineering). The university campus contains about 450 acres, bordering on the south shore of Lake Mendota; in the eastern part of the grounds, the land rises abruptly in two hills, of which the eastern and higher is known as University Hill. On this hill are most of the college buildings; the Washburn Observatory stands on the western hill, which is known as Observatory Hill, further west is the farm with its barns and buildings; to the east of University Hill is the Lower Campus, used largely for athletic sports; the State Historical Society Library Building, containing the libraries of the society and the university, also stands at the western end of this campus. Among the prominent buildings on and near University Hill are North Hall, South Hall, and University Hall, Chadbourne Hall, Assembly Hall, Science Hall, and the Engineering Building; on and near Observatory Hill are the Hiram Smith Hall (dairy), the Horticultural-Physics Building, and the new Central Agricultural College (completed in 1904). The University Library in 1904 contained 86,000 volumes; in addition to which there are departmental libraries, the State Historical Library, and other libraries open to students. The State

Historical Library and the University Library are in one building, practically on university ground, and although they are administered by separate staffs, are in effect one library for the use of students. Thus there are about 250,000 bound volumes and half as many pamphlets accessible for the purposes of the university. The collection is particularly strong in American and English history, Greek, political and social science, Shakespeare, and the publications of American learned societies. The students in 1904 numbered 3,227, of whom 1,312 were in the College of Letters and Science, 744 in the College of Engineering, and 525 in the College of Agriculture. The University of Wisconsin ranks among the first of the State universities both in numbers and in standard of scholarship.

H. B. LATHROP,

Associate Professor of English Literature, University of Wisconsin.

Wisdom, Book of, the name of one of the so-called apocryphal books of the Old Testament. See **WISDOM OF SOLOMON**.

Wisdom of Solomon, a book regarded by Protestants as apocryphal, but accepted by Roman Catholics as part of the canon of the Old Testament. It purports to be the work of Solomon, but the Protestant view is that it was the composition of a Jew of Alexandria about a century before Christ. The author states that he is a king and the son of a king, that he prayed to God for wisdom, and received both wisdom and riches. God directed him to build a temple on the holy mount. Righteousness and wisdom are commended, and unbelievers and idolatry are denounced, and examples are given from the Mosaic writings to show how the judgments of God overtake the worshippers of false gods, and the wicked generally. Nor is the author content with indicating earthly penalties for wrongdoers. He points plainly to rewards in a future life for the good, and punishments for the wicked, and without referring to the resurrection of the body, he teaches the immortality of the soul. The book was highly esteemed among the Jews, and was evidently well known to St. Paul, as the epistles to the Romans, the Corinthians, and Ephesians indicate. Under the name of 'Wisdom' in the Roman Catholic canon of the Old Testament, the book is in the list recognized by the Council of Trent as inspired Scripture. The Roman Catholic position is that it was truly the work of Solomon, and that the Alexandrian Greek version was a translation from the original Hebrew.

Wise, Daniel, American Methodist clergyman and author: b. Portsmouth, England, 10 Jan. 1813; d. Englewood, N. J., 1898. He came to the United States in 1832, entered the Methodist ministry, edited the 'Sunday School Messenger' 1838-43, and 'Zion's Herald' 1852-6, as well as many Sunday School publications. He published more than 50 books for young people, mostly under the pen-names of 'Francis Forrester' and 'Laurence Lancelwood.' Among these are: 'Personal Effort' (1841); 'Life of Ulric Zwingli' (1850); 'My Uncle Toby's Library' (12 vols. 1853); 'Vanquished Victors' (1876); 'Heroic Methodists' (1882); 'Boy Travelers in Arabia' (1885); 'Men of Renown' (1886); and 'Some Remarkable Women' (1887).

Wise, Henry Alexander, American lawyer and political leader: b. Drummondstown, Accomac County, Va., 3 Dec. 1806; d. Richmond, Va., 12 Sept. 1876. He was graduated from Washington College, Pa., in 1825, was admitted to the bar in 1828, and began the practice of law at Nashville, Tenn. In 1830, however, he returned to Accomac County, where he built up a large practice as a lawyer. He was early active in the Democratic party; was a delegate to the national convention of 1832, and in the same year was elected to Congress. After the election, he fought a duel with his opponent, on the latter's challenge. On the removal of the government deposits from the United States bank, Wise, with other Democrats in the House, joined the Whigs in opposition against President Jackson. He was, however, re-elected to Congress in 1834 and in 1836; and also opposed Van Buren's banking and sub-treasury plan. In 1837 he acted as the second of Graves, of Kentucky, in a duel with Cilley, of Maine, both members of Congress, in which the latter was killed. This occurrence led to much denunciation of Wise, who was, however, ascertained not to be responsible for the affair. In 1840 he was instrumental in securing the nomination of Tyler for the vice-presidency, and after Tyler became President exerted an important influence on the administration policy. In 1844 he was appointed minister to Brazil; and on his return to the United States in 1847, again gave his support to the Democratic party. In 1854 he was Democratic candidate for governor of Virginia, conducted an active campaign, particularly against the Know Nothing party, and was elected by a majority of 10,000. Toward the end of his term as governor occurred the seizure of Harper's Ferry by John Brown and his followers, and the execution of John Brown at Charlestown, 2 Dec. 1859, was one of the last acts of his administration. He was a member of the State convention which met at Richmond in 1861 to consider the relations of Virginia to the Federal government, and one of the committee on Federal relations to whom the principal business of the convention was referred. He favored a compromise between North and South, and the avoidance of hostilities if possible; but after Virginia declared for secession he loyally supported the Confederate cause. He was appointed a brigadier-general in the Confederate army, and occupied the Kanawha Valley; but was rapidly driven out by Gen. Cox, in a series of skirmishes. He continued to serve in western Virginia until he was sent to Roanoke Island, N. C., with instructions to defend it. At the time of the attack upon the island by Gen. Burnside, in February 1862, he was ill on the mainland, but the greater part of his brigade, known as the Wise legion, took part in the action. He was later at the battle of Appomattox. After the war he resumed the practice of law in Richmond. He wrote 'Seven Decades of War' (1872). Consult: B. H. Wise, 'Life of Henry Alexander Wise' (1899); J. S. Wise, 'End of an Era' (1899).

Wise, Henry Augustus, American naval officer: b. Brooklyn, N. Y., 12 May 1819; d. Naples, Italy, 2 April 1869. He entered the navy as midshipman in 1834, served on the Florida coast during the Seminole War and

on the Pacific coast during the Mexican War, and rose to be chief of the bureau of ordnance and hydrography in 1866. Under the pseudonym of 'Harry Gringo,' he wrote 'Los Gringos; or, An Interior View of Mexico and California, with Wanderings in Peru, Chili, and Polynesia' (1849); 'Tales for the Marines' (1855); 'Scampavias, from Gibel-Tasek to Stamboul' (1857); 'The Story of the Gray African Parrot' (1856), a book for children, and 'Captain Brand of the Centipede' (1860).

Wise, Isaac Mayer, American rabbi and educator: b. Steingrub, Bohemia, 3 April 1819; d. Cincinnati, Ohio, 26 March 1900. He studied at Prague and Vienna, became rabbi at Radnitz, and, desirous of a broader field, emigrated to New York in 1846. He was elected rabbi of a synagogue at Albany, N. Y., but the ritual changes which he favored led to a division in the congregation, and a new temple was organized by his friends. In 1854 he was elected rabbi of the Congregation B'nai Teshurun, of Cincinnati, Ohio. In the same year he wrote a 'History of the Israelitish Nation,' and began to publish 'The Israelite,' followed in 1855 by 'Die Deborah.' Throughout his long years of activity, he sought in pulpit, press, and on platform to advance the cause of progressive Judaism and became its practical and popular leader, to whose efforts were due the Union of American Hebrew Congregations, the Hebrew Union College, and the Central Rabbinical Conference. Among his published works are: 'Essence of Judaism' (1860); 'Judaism, Its Doctrines and Duties' (1862); 'Prayer Book' and 'Hymnal' (1863), which were quickly followed by his 'Origin of Christianity,' 'The Cosmic God,' 'The History of the Hebrews,' 'Second Commonwealth,' 'A Defense of Judaism versus Proselytizing Christianity,' and 'Pronaos to Holy Writ.' He was president of the Hebrew Union College from its foundation in 1875 until his death.

Wise, John, American colonial clergyman: b. Roxbury, Mass., August 1652; d. Ipswich, Mass., 1725. He was graduated from Harvard in 1673 and 10 years later was settled as minister of the second parish church in Ipswich in which position he continued till his death. For remonstrating against the violation of charter rights in levying a province tax without authority from the Assembly, he was fined and imprisoned by Governor Andros in 1687. In 1689 he brought a suit against Chief Justice Dudley for denying him the privileges of the *habeas corpus* act, and in 1690 was chaplain to the expedition to Quebec. He took a decided and successful stand against the attempts of Increase and Cotton Mather to place the Massachusetts churches under the authority of ecclesiastical councils, putting forth two essays on the subject, 'The Churches' Quarrel Espoused' (1710) and 'A Vindication of the Government of New England Churches' (1717). A large edition of both essays was published in 1772 and a 4th edition with historical memoir by J. S. Clark (1860). In the memoir it is stated that several striking passages in the Declaration of Independence are nearly literal transcripts from the 'Vindication.' Consult Tyler, 'History of American Literature' Vol. II. (1878).

Wise, John Sargent, American lawyer, son of Henry Alexander Wise (q.v.): b. Rio de Janeiro, Brazil, 27 Dec. 1846. He studied at the Virginia Military Institute at Lexington, which he left in 1864 to join the Confederate army, was graduated from the law department of the University of Virginia in 1867 and began to practise his profession in Richmond. In 1881 he was elected to Congress from Virginia. He was defeated for governor of his State in 1885. He has published 'Diomed' (1898); 'The End of an Era' (1899), 'The Lion's Skin' (1903); 'A Treatise on American Citizenship' (1906).

Wise, Peter Manuel, American alienist: b. Clarence, Erie County, N. Y., 7 March 1851; d. 22 Sept. 1907. He was graduated at the medical department of the University of Buffalo in 1872; was president of the New York State Commission on Lunacy 1896-1901; and was professor of psychiatry at the University of Vermont 1891-5. He published 'Text-Book for Training Schools' (1896); and monographs on 'Asylums of Great Britain' (1882); 'Sexual Perversion' (1883); etc.

Wise Men of the East, The, the three Magi, who, according to the Gospel of Matthew (ii. 1, 2), followed the guiding star to Bethlehem in order to render homage to the new born King of the Jews. A legend, which can be traced back to the 3d century, calls them kings and later times distinguished them as Melchior, Gaspar, and Balthasar. They are honored at the feast of the Epiphany and in art the youngest is portrayed as a Moor. Their bones are said to have been placed in the cathedral of Cologne and hence they are often referred to as the Three Kings of Cologne.

Wiseman, wiz'man, Nicholas Patrick Stephen, English Roman Catholic prelate: b. Seville, Spain, 3 Aug. 1802; d. London 15 Feb. 1865. He was of Irish parentage, was brought to Ireland in youth and was educated at Waterford, at the Roman Catholic College, Ushaw, near Durham, and the English College at Rome. He took orders in 1825, became professor of oriental languages in the Roman University in 1827 and in 1828 rector of the English College. He returned to England in 1835 and there delivered in 1836 at St. Mary Moorfields, London, a series of lectures on 'The Principal Doctrines and Practices of the Catholic Church,' which attracted much attention. He was consecrated titular bishop of Melipotamos in 1840 and was made archbishop of Westminster and cardinal in 1850. This ecclesiastical appointment caused great excitement among English ultra-Protestants, who termed it a "papal aggression" and resulted in the 'Ecclesiastical Titles Act' prohibiting the assumption of local ecclesiastical titles by Roman Catholics, which was not repealed until 1872. In the midst of the excitement Wiseman put forth a temperate address explaining the constitutional rights of Roman Catholics, entitled 'An Appeal to the Reason and Good Feeling of the People on the Subject of the Catholic Hierarchy' (1850), which was very instrumental in bringing about a better state of feeling. In 1856 he established with O'Connell 'The Dublin Review' and was a regular contributor to it. He was the author of 'Lectures on the Connection between Science and Revealed Religion' (1836); 'Letters on Catho-

the Unity' (1842); 'Papal Supremacy' (1850); 'Fabiola' (1854); 'The Four Last Popes' (1858); etc. Consult: 'Mémorial' by G. White (1865); Lord Houghton, 'Monographs' (1875); Ward, 'Life and Times of Cardinal Wiseman' (1897); Fitzgerald, 'Fifty Years of Catholic Progress' (1900).

Wisham. See WUSHEM.

Wishart, wish'art, George, Scottish preacher and agitator: b. Pitarrow, Forfarshire, about 1512; d. Saint Andrew's 28 March 1546. Leaving Scotland in 1538 to avoid persecution, he became in 1543 a tutor in Christ Church College, Cambridge, where he led, according to the testimony of one of his pupils, a life of singular abstemiousness, charity, and purity. In July 1543, he returned to Scotland with the commissioners sent to negotiate a marriage treaty between Prince Edward and the infant queen of Scots. Under their protection he preached at Montrose, Dundee, and other Scottish towns, and his preaching led the people to destroy some convents and Roman Catholic churches. Arrested at Ormiston by the Earl of Bothwell, he was delivered to Cardinal Beaton, who sentenced him to be burned at Saint Andrew's. Consult Rogers, 'Life of George Wishart, the Scottish Martyr' (1876).

Wishart, or Wischaart, George, Scottish bishop: b. Yester, East Lothian, 1609; d. Edinburgh 1671. He is said to have been educated at the University of Edinburgh, and having entered the Episcopal Church, received a charge at Saint Andrew's. In 1639, having refused to take the covenant, he was deposed from the ministry, and during the supremacy of the Presbyterian party was several times imprisoned. He subsequently became chaplain to Montrose, and after that leader's death to Elizabeth, electress palatine and titular Queen of Bohemia. He accompanied her to England, and on the Restoration was made rector of Newcastle, and in 1662 was consecrated bishop of Edinburgh. He is chiefly known by his 'History of the Wars of Montrose' (1647), written in elegant Latin. When Montrose was executed in 1650, a copy of this work was hung in contumely about his neck. Several English translations of Wishart's work have appeared, the latest in 1819.

Wishoskan, a linguistic stock of North American Indians, comprising the Patawat, Weeyot or Wiyot, and Wishosk tribes, occupying the coast of California from a little below the mouth of Eel River to a short distance north of Mad River, including particularly the country about Humboldt Bay. They also extended up the streams named into the mountain passes. Of these tribes little is known, as they are classed with the "Diggers" on account of their habit of living largely on roots. Their number is small.

Wishram. See WUSHEM.

Wismar, vis'mär, Germany, the second seaport of Mecklenburg-Schwerin, on the Baltic, at the head of a bay of the same name, 20 miles north of Schwerin. It has an excellent harbor, carries on an active over-sea trade, and has varied manufactures. Of the mediæval walls only four gates remain; but the numerous quaint old houses are a feature of the place, and several of the brick churches, as well as the

Fürstenhof, once a ducal residence, date from the 14th and 15th centuries. It was a Hanse town in the 13th century, passed to Sweden in 1649, was taken by the Danes in 1675, and by the Danes, Prussians, and Hanoverians in 1712, when its strong fortifications were destroyed, and in 1803 was pawned to Mecklenburg-Schwerin, which secured it finally in 1828. Pop. about 22,000.

Wismar, Benjamin Blydenburg, American clergyman: b. Goshen, N. Y., 19 Sept. 1794; d. Boston, Mass., 9 Feb. 1835. He was graduated at Union College in 1813 and at Princeton Theological Seminary in 1820. In 1821-32 he was pastor of the Old South Church, Boston, Mass. In the latter year he became secretary of the American board of commissioners for foreign missions, which office he held until his death. Among his works are: 'History of the Old South Church' (Boston 1830); 'Moral Condition and Prospects of the Heathen' (1833).

Wisner, George Y., American civil engineer: b. West Dresden, N. Y., 11 July 1841. He was graduated at the University of Michigan in 1865; served in government survey on the Mississippi River and the Great Lakes 1865-80, and on surveys of the Mississippi, Illinois, and Des Plaines rivers 1880-4. He was superintendent of the 10th and 11th United States Lighthouse districts 1884-7 and since the last-named year has engaged in private practice. His publications include: 'Geodetic Field Work' (1883); 'Brazos River Harbor Improvement' (1891); 'Breakwaters, Sea Walls and Jetties' (1893); 'Hydraulics of Rivers Having Alluvial Beds' (1896); 'Sewage Disposal' (1896); 'Report of Deep Waterway Commission' (1900); 'Canals from the Great Lakes to the Atlantic' (1900); etc.

Wismann, vis'män, Hermann von, German African explorer: b. Frankfurt-on-the-Oder 4 Sept. 1853, o. 15 July 1905. He entered the German army, reaching the rank of lieutenant in 1874, and crossed the African continent in the employ of the German African Society (1880-2). He commanded an expedition sent out by Leopold II., in 1884-5, and as imperial German commissioner, suppressed the Arab revolt under Bushiri, but failed in attempting to take two steamers to Lake Victoria via Nyassa and Tanganyika lakes in 1892. He was governor of German East Africa in 1895-6, and president of the Berlin Geographical Society in 1897. He published 'In the Interior of Africa' (3d ed. 1891); 'Under the German Flag across Africa' (1880-3); 'My Second Crossing of Equatorial Africa' (1891); 'Africa: Descriptions and Advice' (1895); etc.

Wistar, Caspar, American physician: b. Philadelphia, Pa., 13 Sept. 1761; d. there 22 Jan. 1818. He attended the medical department of the University of Pennsylvania in 1782, subsequently studied medicine at the University of Edinburgh, returning to the United States in 1787. He was professor of chemistry and the Institutes of Medicine at the College of Philadelphia 1789-92. In the latter year that institution was united with the medical department of the University of Pennsylvania, and he was there adjunct professor of anatomy, midwifery, and surgery 1792-1808; then becoming professor

WISTAR—WITCH-HAZEL

of anatomy and holding that chair till his death. He was the first to show that the posterior portion of the ethmoid bone was attached to the triangular bones. He opened his house once a week for meetings of students, travelers, scientists, and citizens, and these symposiums continued long after his death, and were known as the Wistar parties. Wistar became a member of the American Philosophical Society in 1767, and succeeded Thomas Jefferson as its president in 1815. He wrote 'A System of Anatomy for the Use of Students of Medicine.'

Wistar, Isaac Jones, American penologist: b. Philadelphia, Pa., 14 Nov. 1827; d. Claymont, Del., 18 Sept. 1905. He was educated at Haverford College, Pa., and served in the Civil War as brigadier-general of volunteers, U. S. A., 1862-5. He was president of the Academy of Natural Sciences of Philadelphia 1892-6, has been inspector of the Eastern penitentiary of Pennsylvania, was president of the State Board of Charities of Pennsylvania, and founded the Wistar Institute of Anatomy and Biology, named in honor of Caspar Wistar (q.v.).

Wistaria, a genus of leguminous climbers, named in honor of Caspar Wistar, an American anatomist (1761-1818), which contains several species, natives of China, Japan, and North America, the correct scientific name of which does not seem to be thoroughly settled. They are high-climbing, hardy shrubs, and have odd pinnate leaves, with entire leaflets, and large, terminal, pendulous racemes of papilionaceous flowers. These have large standards, and wings freed from the keel, which is incurved and obtuse and are usually purple or white in color. The fruits are coriaceous legumes, opening readily. Nearly all of the wistarias are cultivated for covering walls, verandas, trellises, etc. The Chinese wistaria (*W. chinensis*), which was introduced into England about 1816, is perhaps the best. It has profuse dense clusters of pea-shaped flowers, which are about a foot long, and bloom in May before the leaves appear and occasionally again in autumn. When grown over a trellis, the blossoms depend in great masses of blue. This vine is a rampant grower, and the flowering wood may be known by its short, jointed, antler-like growth, and absence of climbing spines.

Wistaria is a favorite plant of the Japanese, who have a variety (*W. chinensis*, var. *multi-juga*), with racemes a yard long, loosely flowered, and with small blossoms, which are fragrant, however. These they train about their houses and over trellises in greatest profusion. The American wistaria (*W. frutescens*) or kidney-bean tree, is not so vigorous as the Chinese species, and has slightly pubescent racemes, only about six inches long. It is found, when wild, climbing over trees at the edges of swamps from Virginia to Florida, and improves with cultivation.

Wistar, Annis Lee Furness, American translator: b. Philadelphia, Pa., 9 Oct. 1830; d. Philadelphia, Pa., 15 Nov. 1908. She was married to Dr. Caspar Wistar (d. 1888) in 1851. She made many translations of note, among them E. Marlitt's 'The Old Mamselle's Secret' (1868); 'Gold Else' (1868); 'The Countess Gisela' (1869); 'The Little Moorland

Princess' (1873), and 'The Second Wife' (1874); Wilhelmine von Hillern's 'Only a Girl' (1870); Hackländer's 'Enchanting and Enchanted' (1871); Volkhausen's 'Why Did He Not Die?' (1871); Von Auer's 'It Is the Fashion' (1872), and Fanny Lewald's 'Hulda; or, The Deliverer' (1874). Her translations were issued in a uniform edition of 30 volumes in 1888. With F. H. Hedge (q.v.) she published 'Metrical Translations and Poems' (1888).

Wister, Owen, American novelist, grandson of Frances Anne Kemble (q.v.): b. Philadelphia 14 July 1860. He was graduated from Harvard in 1882, studied law and was admitted to the Philadelphia bar in 1889, but from 1891 has devoted his attention to literature. He has been especially successful in his delineation of Western life and character and has published 'The Modern Swiss Family Robinson' (1883); 'The Dragon of Wantley: His Tail' (1892); 'Red Men and White' (1896); 'Lin McLean' (1896); 'The Jimmy John Boss and Other Stories' (1900); 'U. S. Grant, a Biography' (1900); 'The Virginian,' which has been widely popular and has been successfully dramatized (1902); 'Oliver Wendell Holmes' in 'American Men of Letters' series (1902); 'Benjamin Franklin' in 'English Men of Letters' series (1904); 'Lady Baltimore' (1906).

Witch, or Wych, Elm, the common broad-leaved elm (*Ulmus montanus*) of England and Scotland, which does not grow to so large dimensions as the field elm; nevertheless at Selborne, Gilbert White measured a witch elm which, seven feet from the ground, was eight feet in diameter. It is a tree of picturesque habit, and, unless grown in crowded masses, rarely produces a straight trunk. It has a wide, spreading head, often slanted to one side, and the branches begin near the base. These drooping branches lash neighboring trees unmercifully, and if they chance to rest on the ground readily strike root. The tree is easily increased by layers or by the abundant seeds. The timber of the witch elm is more durable than that of other English elms, but has their fine-grained, tough, and elastic qualities. It is very flexible when steamed, and is utilized for bent-wood work, frames in boat-building and bows; in olden times if the branches were forked, they served as divining-rods, perhaps because of the likeness in the broad, ovate leaves to that of the hazel, which is one of the so-called lightning plants. These plants are sacred to Thor, are considered to be an actual embodiment of lightning, and their forked branches (having, according to mythology, a resemblance to a lightning flash) are used as talismans to point out the hidden stores of gold or subterranean water.

Witch-hazel, a tall, sometimes arborescent shrub (*Hamamelis Virginiana*) of eastern American woodlands. It has a characteristic horizontal, straggling growth; as Thoreau says: 'Its spray, so jointed and angular, is not to be mistaken for any other.' Witch-hazel is one of the most difficult shrubs to eradicate from a clearing, as it has many diverging stems, so crooked and springy as to render axe-work unsuccessful. The bark is pale-gray, the leaves somewhat resembling the ovate foliage of

WITCH HILL—WITCHCRAFT

Corylus, are more or less oblique, and undulate-edged, not at all handsome, but turning to a beautiful clear yellow in autumn. No sooner have they fallen off, with the rest of the forest foliage, in October or November, than the witch-hazels reclothe themselves with a luminous vesture of filmy, feathery yellow, which turns out to be the long delayed blossoms—whether the earliest or the latest flowers of the year botanists can not decide. Individually, they are not conspicuous, having only four narrow, strap-shaped, golden petals, but are tufted on the twigs as to gild the bushes. Meanwhile the fruits, little blunt, horned woody capsules that have been slowly ripening since the previous fall, begin to gape, and by elastic fissuring, and incurving their walls, shoot their stony-hard, bullet-shaped, polished seeds far and wide. Twigs of this witch-hazel, so unorthodox in its season of blooming, and remotely resembling the hazelnut in foliage, were chosen as material for the forked divining-rods, which, twisting in the hand of the treasure-seeker, or well-digger, pointed downward and disclosed the site of subterranean water or gold. A much more practical use for witch-hazel has been found nowadays. An infusion of the leaves of witch-hazel in alcohol furnishes the familiar slightly astringent and tonic lotion for external inflammations known as "witch-hazel" or "hamamelis." Branches of witch-hazel thrown into the fire exhale the characteristic, peculiar odor of the lotion. Both the foliage and bark, moreover, contain much tannin. The witch-elm (q.v.) of England is also called witch-hazel.

Witch Hill, the name of a hill in Salem, Mass., so called because of the executions of witches which took place there in 1692. It is also known as Gallows Hill.

Witchcraft, supernatural power which persons were formerly supposed to obtain by entering into a compact with the devil. The compact was sometimes express, whether oral or written, when the witch abjured God and Christ, and dedicated herself wholly to the evil one; or only implied, when she actually engaged in his service, practised infernal arts, and renounced the sacraments of the Church. The express compact was supposed to be solemnly confirmed at a general meeting, at which the devil presided, and sometimes privately made by the witch signing the articles of agreement with her own blood, or by the devil writing her name in his "black book." The contract was sometimes of indefinite duration, at other times for a certain number of years. The witch was bound to be obedient to the devil in everything, while the other party to the act delivered to the witch an imp, or familiar spirit, to be ready at call and to do whatever was directed. He further engaged that they should want for nothing, and be able to assume whatever shape they pleased to visit and torment their enemies and accomplish their infernal ends. The belief in witchcraft appears to have existed in various forms among ancient nations, including the Hebrews; it prevails to-day among savage and semi-savage races, and is not extinct in civilized countries. It was always condemned by the Church, and in the 14th century the popes believed that they recognized in sorcery a prevalent and dangerous evil, and began to issue bulls against it. In the 15th century the Inqui-

sition took charge of the work of exterminating witches, and the close of that century, and the beginning of the 16th, witnessed thousands of executions in Germany, Italy, and other countries. France was slow to permit any general persecution of witches, and it was not until about the time of the break with Rome that the first formal enactment, of 1541, declared witchcraft to be a felony in England. From that time on, for more than a century, the burning of witches was kept up in England and Scotland, the statute of 1563 being the first regular enactment against the supposed crime in the latter country.

The Reformation was attended by, or rather, coincident with, an increased intensity of the witchcraft superstition, and its resulting horrors. Theologians of all creeds were equally believers in the reality of compacts with the devil, and regarded the persons who entered into such compacts as unfit to live. It is probable that the religious fervor aroused by controversy over disputed dogmas may have served to bring more vividly to the minds of clergy and laity alike their assumed obligation to obey the Scriptural injunction against witchcraft, and that, in this way, the Reformation may have promoted this form of persecution. Besides, the tribunals actively engaged in crushing out disbelief in the accepted creeds of their respective states, could readily devote any surplus energy and zeal to what seemed to them the related crime of witchcraft. From one end of Europe to the other executions of witches were of daily occurrence, and it is estimated that, from the time of the promulgation of the bull of Pope Innocent VIII. against sorcery, in 1484, until 1782, when the last judicial victim, a servant girl at Glarus, in German Switzerland, was executed, 300,000 women perished on this often imaginary charge. Some of the victims were probably poisoners, but very many of them were undoubtedly innocent of any wrong-doing whatever. Children of tender years were sometimes among the condemned.

Spanish America witnessed many executions on the charge of witchcraft, and it is stated on credible authority that as late as 20 Aug. 1877 five alleged witches were burned alive at San Jacinto, Mexico. This appears to have been more in the nature of a lynching than of an execution of a sentence of a competent court.

In England and Scotland, as already stated, the 17th century witnessed hideous scenes of witch-torture and extermination. The last victims in England were Mrs. Hicke and her daughter, nine years of age, executed in 1716, and the last in Scotland suffered in 1722. Prosecution for witchcraft was abolished both in England and in Scotland by 9 George II. (1736), which made all persons pretending to use the name punishable by imprisonment. By a subsequent act passed in the reign of George IV., they were made punishable as rogues and vagabonds.

All the American colonies had laws against witchcraft similar to those in England at the time, and from the first there were occasional trials and executions on that charge. The great Salem witchcraft delusion, with its attendant tragedies, occurred near the close of the 17th century and was largely due to excitement caused by the teachings and writings of Cotton Mather, the noted Puritan divine, who was a

strong believer in the superstition. The Salem witch frenzy broke out in the family of one Samuel Parris, a minister, but for whose instigation the delusion, with its accompanying sacrifice of innocent lives, could not have obtained the headway it did. A company of girls suddenly began to act mysteriously, bark like dogs, and scream at something unseen. An old Indian servant was accused of bewitching them. The excitement spread and impeachments multiplied. A special court was formed to try the accused, and as a result the jails rapidly filled, and many were condemned to death. It was unsafe to express a doubt of a prisoner's guilt. Fifty-five persons suffered torture, and 20 were executed before the delusion ended. Witches were supposed to be able, with the assistance of the devil, not only to foretell events, but to produce mice and vermin, to deprive men and animals, by touching them or merely breathing on them, of their natural powers, and to afflict them with diseases, to raise storms, etc., to change themselves into cats and other beasts, etc. General assemblies of witches, called "Witches' Sabbaths," were held yearly, or oftener, at which they appeared entirely naked, and besmeared with an ointment made from the bodies of unbaptized infants. To these meetings they were supposed to ride from great distances on broomsticks, poles, goats, hogs, or dogs, the devil taking the chair under the form of a goat. Here they did homage to their master, and offered him sacrifices of young children, etc., and practised all sorts of license till cock-crowing. Neophytes were introduced to the devil at these meetings, and received his mark on their bodies, in token that they had sold their souls to him. As before remarked, the belief in witchcraft still prevails in many parts of the world, and in some countries where pretended sorcerers exert a powerful influence, lives are often sacrificed as a result of their practices and in order that they may continue their nefarious work.

Witenagemot, wīt'-nā-gē-mōt', or **Witenagemote**, originally an assemblage of all the freemen of a tribe or state, among the Teutonic conquerors of southern Britain, but which, in the course of events, and without any special law, resolved itself into an assembly of the princes, aldermen, thanes, large landowners, and leading ecclesiastics. The witenagemot met once a year, or oftener, and had great power, electing a king in the event of disputed succession, approving the regular succession, if there was no dispute, passing upon the trial and punishment of high offenders, enacting laws, and acting as a grand inquest into public affairs. It passed out of existence with the Norman conquest, and the subsequent Parliament was a separate growth, and not a continuation of the Witenagemot. See **ENGLAND**.

Wither, with'ēr, or **Withers**, **George**, English poet and pamphleteer: b. Beantworth, near Alton, Hampshire, 11 June 1588; d. London a May 1677. He studied at Magdalen College, Oxford, was entered at Lincoln's Inn in 1615, devoted much attention to literature, and proved his skill in satiric verse by being thrown into the Marshalsea for his 'Abuses Stript and Whipt' (1613). While there imprisoned he wrote busily, and is said to have composed there several of his best poems, among them 'The

Shepherd's Hunting' (1615), a continuation of 'The Shepherd's Pipe' (1614) of William Browne. In 1621 some official persons thought reflections against the state and leading politicians were to be detected in 'Wither's Motto, Nec Habeo, Nec Careo, Nec Curo' (1621), and again the author was ordered to the Marshalsea, though soon liberated. After 1628 he wrote nothing, save 'Hallelujah' (1641), a collection of religious verse, that in critical estimation attained the rank of earlier work. He became a Puritan, and wrote largely for the furtherance of the political and religious cause with which he was identified. At the revolution, he recruited (1642) a troop of horse for Parliament, and was made captain and the commander of Farnham Castle. When taken by Royalists and in danger of capital punishment, he was released through the interference of Sir John Denham (q.v.), who protested that "so long as Wither lived he [Denham] would not be accounted the worst poet in England." He was promoted major, made a commissioner for the sale of the king's goods, and (1655) became a clerk in the statute-office of the court of chancery. For his 'Vox Vulgi,' a poem dissuading from the restoration which remained in MS. until printed by Macray in 'Anecdota Bodleyana' (1880), he was committed to Newgate in 1660, and imprisoned there until released in 1663 under bond for good behavior. 'Fragmenta Poetica' (1666; reprinted as 'Fragmenta Prophetica,' 1669) was his last work. For some time subsequent to his death he was considered a rimer of no merit, was omitted from collections of English poetry, and included in the 'Dunciad' as "wretched Withers." But Ellis praised him in 'Specimens of the Early English Poets' (1790), and others, including Sir S. E. Brydges by various reprints and Lamb by the essay 'The Poetical Works of George Wither' (Lamb's 'Works,' 1818) obtained for him suitable recognition. His reputation is based chiefly on his earlier work. The greater part of his writings was printed by the Spenser Society (20 pts., 1870-83). Consult besides the books already mentioned Ward's 'English Poets,' Vol. II. (1880).

Witherite, a mineral composed of barium carbonate mined extensively near Hexham, Northumberland, England. Usually found in massive condition though orthorhombic crystals do occur; hardness, 3 to 3.75; specific gravity, 4.29 to 4.35; lustre, vitreous; color, white, often yellowish or grayish; streak, white. Used in the manufacture of baryta for sugar refining, in plate-glass making, and in the adulteration of white lead and zinc white.

Witherspoon, **John**, American Presbyterian clergyman and college president: b. Yester, Haddingtonshire, Scotland, 5 Feb. 1722; d. near Princeton, N. J., 15 Sept. 1794. He was graduated from the University of Edinburgh in 1742, was licensed to preach the next year and was parish minister of Beith, 1745-57. He led a body of militia to the aid of the Pretender at Glasgow in 1745 and was captured at the battle of Falkirk, but was soon released. He was pastor at Paisley, 1757-68, and then accepted the presidency of the College of New Jersey (now Princeton College) in 1768. He was a delegate for six years from New Jersey to the Continental Congress; and a signer of the Declaration of Independence. He greatly increased the efficiency of the college and was a

WITHINGTON—WITTENBERG COLLEGE

noteworthy figure in the political as well as the educational affairs of his time. He wrote: 'Ecclesiastical Characteristics' (1753); 'Nature and Effects of the Stage' (1757); 'Essays on Important Subjects' (1764); 'Considerations on the Nature and Extent of the Legislative Authority of the British Parliament' (1774); etc. His collected works appeared in nine volumes in 1804.

Withington, wíth'ing-tón, England, a manufacturing town in Lancashire, three miles south of the centre of Manchester, in the parliamentary borough in which it is partly included. It contains modern churches and chapels, Lancashire Independent College, a public hall and library, and numerous residential villas. Pop. about 40,000.

Witte, wít'tē, Emanuel, Dutch painter: b. Alkmaar, Holland, 1607; d. Amsterdam 1692. He was a pupil of Van Alst, lived at Delft in 1642 to 1649, and in 1650 went to Amsterdam. His earlier paintings were mostly historical or portraits, but later he devoted some attention to interior decoration with which he was very successful. His works are found at the museums of Amsterdam, Rotterdam, Brussels, Berlin, Hamburg, and Weimar, also in the National Gallery at London, and in some private English galleries.

Witte, Pietro de, Dutch painter: b. Bruges 1548; d. Munich 1628. His general choice of subjects was confined to history, but it is not known under whom he studied in his native country before going to Italy, where he became an intimate friend of Giorgio Vasari, under whom he appears to have formed his style. When Vasari was employed to decorate the Vatican with frescoes De Witte became his favorite assistant, and grew almost completely Italianized in his artistic ideals. He painted equally well in fresco and oils, and was invited to Florence by the Grand Duke of Tuscany, and there executed some important works. His versatility is evidenced by the fact that when Maximilian, the elector of Bavaria, required the services of a designer of tapestry De Witte was commissioned to furnish the necessary cartoons. He was one of the Dutch painters of the Renaissance period who gave himself up entirely to the influence of foreign schools and spent but a short part of his life in the Netherlands. His principal works have been engraved by Jan Sadeler and other famous engravers of his day.

Witte, Sergei Yulievitch, Russian statesman: b. Tiflis 29 July 1849. He was graduated from the New Russian University, Odessa; and in 1877 entered the governmental railway service. He had charge of transporting troops on the Odessa Railway during the Russo-Turkish war, in 1879 was given a position on the South-western Railway, in 1886 became general manager of that road, and two years later chief of the railway department. In 1892 he was made minister of finance, and in this capacity he made several commercial treaties with Germany, aided the development of manufacturing industries, made the sale of alcohol a government monopoly, and established the gold standard. His policy aroused the opposition of wealthy bankers, and of all conservatives, and in 1903 he was removed from the office of minister of finance, but was appointed president of the committee of minis-

ters. In 1905 he, with Baron Rosen, satisfactorily arranged the Treaty of Portsmouth (q.v.), was created a Count, on 30 October was appointed premier but resigned 2 May 1906 and was appointed a member of the council. See *Russia, History*. He wrote 'Principles of Railway Tariffs' (1883); 'Friedrich List, the Economist' (1888).

Wittekind, wít'tē-kind, or **Widukind**, Saxon leader in the struggle with Charlemagne; d. about 807. He came of a noble Westphalian house, and first appears at the head of the Saxon expedition against the Westphalian fortress of Eresburg in 774. Charlemagne's return from Lombardy drove him across the Weser, and instead of submitting to the emperor at the Diet of Paderborn in 777 like many other Saxon leaders, renewing the revolt in 776, he fled to Jutland. He returned during Charlemagne's absence in Spain, laid waste the Rhineland and surprised and annihilated the Frankish army on the Süntelgebirge (782). The emperor retaliated by executing 4,500 Saxon prisoners, an action that aroused the entire Saxon race to arms. The battle of Detmold was decisive (783), but that of Osnabrück forced Wittekind to enter on negotiations, the issue was that in 785 he accepted baptism in the imperial camp at Attigny, in Champagne. The emperor, it is said, made him duke of the Saxons and lord of Engern, and from the castle of Bablonie, near Lübeck, he exercised a benignant sway till he fell in battle with Gerold, the Swabian duke. Various princely houses, as those of Brunswick and Sardinia, claim Wittekind for the founder of their line. The Emperor Charles IV. in 1377 placed a monument to him in the parish church at Enger, where he is supposed to have been buried, and in Menden, Westphalia, a monument was erected to him in 1812. Consult Didekamp, 'Widukind, der Sachsenführer nach Geschichte und Sage' (1877); Mombert, 'Charles the Great' (1888).

Wittenberg, wít'tēn-bērg, Ger. wít'tēn-bērg, Germany, a town of the province of Saxony, Prussia, on the Elbe, 45 miles southeast of Magdeburg. It was the home of the Reformation, and here Luther, while a university professor, nailed his 95 theses to the door of the Schlosskirche. The university in which he was professor was united to Halle in 1817. The principal buildings are the Schlosskirche, in which both Luther and Melancthon are buried; the Stadtkirche, where Luther and Melancthon preached; the remains of the Augustinian monastery, with Luther's apartments; the houses of Melancthon and Cranach; the town hall, the gymnasium, etc. Textiles, hosiery, leather, machinery, pottery, etc., are among its manufactures. Pop. about 20,000.

Wittenberg College, located at Springfield, Ohio. It was founded in 1845 under the auspices of the Lutheran Church in Ohio. Its organization includes a Preparatory School, a Collegiate Department, a Theological Seminary, a School of Oratory, a Conservatory of Music, and a School of Art. There is also a Summer School, designed chiefly for teachers, giving courses in pedagogical methods. The Collegiate Department confers the single bachelor's degree of A.B. for a four years' course. Women are admitted to all departments except the Theological Seminary; and there is also a special shorter collegiate course for young women.

WITTHAUS—WOFFORD COLLEGE

which leads to a diploma, but not to a degree. In 1910 the grounds and buildings were valued at \$500,000; a theological building was erected in 1902; the productive funds in 1910 amounted to \$600,000, the income to \$35,000; the library contained 17,000 volumes. The students numbered 703, and the faculty 35.

Witthaus, wíth'ows, Rudolph August, American toxicologist; b. New York 30 Aug. 1846. He was graduated from Columbia in 1867, and from the Medical Department of the University of New York in 1875, has since been professor of toxicology and chemistry at Cornell University, and held similar chairs in the universities of New York, Vermont, and Buffalo. He became noted as an expert in poisons in connection with many murder cases, and has published: 'Essentials of Chemistry' (1879); 'General Medical Chemistry' (1881); 'Manual of Chemistry' (1879); and 'Laboratory Guide in Urinalysis and Toxicology' (1886). He has edited 'Witthaus and Becker's Medical Jurisprudence' (4 vols.), for which he prepared the introduction, and Vol. IV. on 'Toxicology.'

Witwatersrand, wít-vá'ters-ránd ('White Waters Range,' colloquially 'The Rand'), Transvaal, South Africa, a low range of hills extending 25 miles either side of Johannesburg, since 1886 famous as one of the richest gold-mining districts in the world. See TRANSVAAL, GOLD-MINING IN THE.

Wizom, wík'sóm, Emma. See NEVADA, EMMA.

Wiyot. See WISHOSKAN.

Woad, wód, a cruciferous herb (*Isatis tinctoria*) which has been used for centuries in the countries of temperate Europe, as a dye-plant, yielding an indigo-blue color. The woad has entire foliage, the stem leaves being sagittate, and has large coriaceous pods. Cæsar tells us that the ancient Britons stained their bodies with woad, so as to give themselves a more formidable appearance in battle; and from Pliny we learn that their women, before engaging in certain religious rites, also covered their nude bodies with the dye. The plant was formerly much cultivated in England for the sake of its dye, which was extracted from its crushed and fermented leaves, but the stronger and finer blue produced by the indigo-plant (q.v.) finally superseded it, although at first the latter produced but a crude dye. Those who cultivated woad opposed the introduction of indigo, and the opposition to it became so pronounced that in England and other European countries royal edicts were issued forbidding its importation. These were repealed by the middle of the 18th century. Woad is now mixed in the vats with indigo juice, but is of use chiefly as a convenient material to induce fermentation, although it is said also to improve the color itself.

Woburn, wó'bérn, Mass., city in Middlesex County; on two lines of the Boston & Maine Railroad; five miles from tidewater and 10 miles northwest of Boston. It is well laid out and has many handsome residences. The chief manufactures are leather, chemicals, machinery, glue, and foundry products. The number of employees in the leather works alone is (1904) 2,500. In 1900 (government census) Woburn had 123 manufacturing establishments, capitalized for \$2,983,705. The salaries of 50

officials and clerks, in the manufacturing works, amounted to \$65,217, and the 1,596 wage-earners received annually \$757,670. The raw material used each year cost \$3,064,985, and the value of the finished products was \$4,450,566. The water-works are owned and operated by the city. There are 12 churches; a high school, established in 1852; public and parish elementary schools, and a free public library which contains about 43,000 volumes and a fine art collection. There are three banks. The Woburn Five Cent Savings Bank has deposits amounting to nearly \$2,000,000. The government is administered under a charter of 1898 which provides for a mayor and a council of 15 members. Seven of the members of the council are elected by wards and eight at large. There is also a board of public works, the mayor is president *ex officio*.

Woburn was settled in 1640 by seven families from Charlestown Church, Mass. It was first called Charlestown Village. In 1642 the town was incorporated, and in 1889 chartered as a city. Benjamin Thompson (q.v.) (Count Rumford) was born here in 1753. Pop. (1890) 13,499; (1900) 14,254; (1910) 15,308.

GEORGE A. HOMES,

Editor 'Woburn Journal.'

Woden, wó'dén. See ODIN.

Woffington, wó'fing-tón, Margaret or Peg, British actress; b. Dublin, Ireland, 18 Oct. 1720; d. Teddington 28 March 1760. She first appeared on the stage at 12 as Polly Peacham, with several other children, in 'The Beggar's Opera,' but her first appearance in a mature part was as Ophelia in Dublin in 1737. From 17 to 20 she played on the Dublin stage all manner of parts, from Ophelia to Sir Harry Wildair, and on 6 Nov. 1740 made her first appearance at Covent Garden as Sylvia in the 'Recruiting Officer.' She soon became a great success, the exquisite art of her male characters being especially remarkable. She kept the affection of the public till the tragic close of her career. On 3 May 1757 she broke down in playing Rosalind, and left the stage forever. Her character appears to advantage in Read's novel 'Peg Woffington,' and his play 'Masks and Faces.' Consult: Molloy, 'Life and Adventures of Peg Woffington' (1884); Daly, 'Woffington: a Tribute to the Actress and the Woman' (1888).

Wofford College, located at Spartanburg, S. C. It was founded in 1851 under the control of the South Carolina Conference of the Methodist Episcopal Church, South, in accordance with the will of Benjamin Wofford, a minister of that church, who left a legacy of \$100,000 to the conference for establishing a college. It was opened to students in 1854, and the sessions have never been entirely suspended, though during the Civil War the college suffered heavily, the endowment was rendered worthless, and full college work was not done. Since that time the college has been largely supported by the church, and the endowment partially restored, amounting in 1903-4 to \$26,000. Two preparatory schools have been established in connection with the college, the Wofford College Fitting School at Spartanburg, and the Carlisle Fitting School at Bamberg, S. C. The course in the former is three years; in the latter, four years. The Carlisle school is co-edu-

ational. The college studies are arranged in four groups, or courses, the classical, the language-scientific, the scientific, and the Latin or Greek-modern language; each group includes a certain number of electives. The degree of A.B. is conferred for the completion of any of these courses, and the degree of A.M. for graduate work. Instruction in methods of teaching and in school organization is included in the curriculum. Gymnasium work is required of all students. There are five loan funds and two scholarship funds. The students maintain two literary societies, membership in one of which is compulsory; and a Christian Association which has been in existence over 20 years, and exercises an important influence on student life. The college campus comprises 70 acres; the buildings include the main building, the John B. Cleveland Science Hall, Alumni Hall, Archer Hall (a dormitory), residence cottages, the Wilbur E. Burnett gymnasium, and the fitting school. The library in 1910 contained 25,000 volumes; the students at Spartanburg numbered 273, of whom about 175 were in the college.

Wohlgenuth, völ'gè-moot, Michael, German painter: b. Nuremberg 1434; d. there 1519. He was an eminent member of the Franconia school of German painting whose completest representative is Albert Dürer. The latter was indeed his pupil in the large studio or workshop where many branches of art were carried on by the master and a host of pupils and assistants. The occupations of this artistic association comprised altar-pieces, consisting of paintings, or wood carvings in high relief ablaze with color and gilt, such as abound in Spanish churches under the name of *retablos*; wood engraving, the blocks being cut from Wohlgenuth's designs, which were of supreme vigor and well adapted to the exigencies of printing from wood and easel paintings of portraits and history. Many paintings have been attributed to him which were evidently executed by the less skillful hands of pupils or assistants, but those whose authenticity is unquestionable are characterized by powerful drawing, rich and harmonious coloring and supreme delicacy of finish. His *retable* (1465), now in the Munich Gallery, is a remarkable masterpiece, and that which he furnished for the High Altar of Saint Mary at Zwickau gained for the painter much applause and the then princely sum of about \$3,558. Another work of the same kind is to be found in Nuremberg Museum, having been originally painted for the churches of the Austin Friars at Nuremberg; his last *retable* was executed for the church at Swabach (1508). His fidelity and grace as a portrait painter are acknowledged by critics, who recognize in his realistic vigor and conscientious mastery of detail the best features of contemporaneous German painting. Two of his paintings, 'Pilate Washing His Hands Before the People' and a 'Descent from the Cross,' are in the Royal Institution Gallery at Liverpool, but few works of this master are to be found elsewhere out of Germany.

Wojwode, woi'wôd, an old Slavonic name for a general, afterward used as a title of civil rank and authority. The princes of Wallachia and Moldavia were called *wojwodes* and this name was given in Poland to the governors of the provinces, a title abolished in 1832. In Serbia and Bulgaria the title of *wojwode* still lin-

gers with its original signification of 'leader in war.'

Wolcott, wül'kô't, or Wolcott, John ('*PARR PINDAR*'), English poet: b. Doddbrooke, Devonshire, May 1738; d. London 14 Jan. 1819. He studied medicine and in 1767 went to Jamaica as physician to the governor, Sir William Tre-lawney. He then took orders in the Church of England and was a curate in Jamaica, 1769-73. After spending the next 12 years as a physician in Cornwall he went to London, where his daring poetical satires involved him in many quarrels and brought him extended fame. So effective were his attacks on King George III. that the ministry silenced him with a pension of \$1,500 per annum. He was an art critic of taste and penetration far beyond his time; his yearly reviews in verse of the Academy exhibitions are much the best of his work, and still instructive. Among his satires are: 'Lyric Odes to the Royal Academicians' (1782-6); 'Bozzy and Piozzi' (1786); 'An Epistle to the Reviewers'; 'Peeps at St. James'; 'Royal Visits'; and 'The Lousiad' (1785-95). Consult Reiterer, 'Leben und Werke Peter Pindars' (1900).

Wolcott, Edward Oliver, American lawyer and politician: b. Longmeadow, Hampden County, Mass., 26 March 1848, d. Monte Carlo, Italy, 28 Feb. 1905. In 1862 he went to Cleveland, Ohio, with his family, and during the Civil War was enlisted with the 105th Ohio regiment for a few months. He entered Yale in 1866, but did not complete his course; and was graduated from the Harvard Law School in 1871. He then went to Colorado, where he established a law office in Georgetown, Clear Creek County; in 1876 was elected district attorney for the first judicial district of the State, and before the expiration of his term cleared the docket of all criminal cases. In 1878 he was elected to the State senate, where he became the Republican leader. In 1879 he was made attorney for the Denver & Rio Grande Railroad; settled in Denver, where he built up a large private practice; and in 1884 was appointed general counsel of the same road. In 1888 he was elected to the United States Senate, and re-elected in 1894. There he was known as an earnest advocate of bimetalism; in 1896, however, he refused to support the free-silver platform of the Democratic party, continued his affiliation with the Republican party; and in 1900 was president of the National Convention. In 1897 he was chairman of a commission appointed by President McKinley to investigate the attitude of the leading European governments toward international bimetalism. In 1903 he was again a candidate for election to the United States Senate, but was defeated by H. M. Teller (q.v.).

Wolcott, Oliver, American statesman and signer of the Declaration of Independence, son of Roger Wolcott (1679-1767) (q.v.): b. Windsor, Conn., 26 Nov. 1726; d. Litchfield 1 Dec. 1797. He was graduated at Yale College in 1757 and in the same year received a captain's commission from the governor of New York, and raised a company for the defense of the northern frontier, where he remained until the peace of Aix la Chapelle. In 1751 he was appointed sheriff of Litchfield County, Conn., and in 1774 a member of the State council. He was also chief judge of the court of common pleas, a judge of the probate court, and a major-

general of militia. In 1775 he was appointed one of the commissioners of Indian affairs for the northern department, whose duty was to secure the neutrality of the Indians. In 1776 he commanded the 14 Connecticut regiments raised to act with the army in New York, and in the same year took his seat in Congress. After the Declaration was signed he returned to the army, and was present at the battle of Saratoga, but continued to serve in Congress at intervals till 1783. He was lieutenant-governor of Connecticut 1786-96, when he was elected governor, which office he held at the time of his death. Consult Sanderson, 'Biographies of the Signers' (1820-7).

Wolcott, Oliver, American politician, son of the preceding: b. Litchfield, Conn., 11 Jan. 1760; d. New York 1 June 1833. He was graduated from Yale in 1778, and for a short time served as volunteer aide to his father in the Revolutionary War. After his admission to the bar in 1781 he was for several years in the employ of the financial department of the government of Connecticut and assisted Oliver Ellsworth in 1784 in settling the accounts between his State and the United States. In 1788-9 he was comptroller of the United States public accounts, auditor of the United States treasury 1789-91, comptroller 1791-5, and secretary of the national treasury 1795-1800, in succession to Alexander Hamilton. He was a judge of the United States circuit court 1801-2, and then removed to New York and was in mercantile business there till 1812. He aided his brother Frederick in building extensive factories at Wolcottville, Conn., and was governor of Connecticut 1818-27. His later years were spent in New York. He published several political pamphlets and in 1820 his papers were edited by Gibbs with the title 'Memoirs of the Administrations of Washington and John Adams.'

Wolcott, Roger, American colonial governor: b. Windsor, Conn., 4 Jan. 1679; d. East Windsor, Conn., 17 May 1767. At 12 he was apprenticed to a weaver, but by private study secured an education, and in 1711 was appointed commissary of the Connecticut colonial forces in the attack on Canada. In the subsequent French wars he was successively promoted till he attained the rank of major-general at the siege of Louisbourg in 1745. He was governor of the colony of Connecticut 1751-4 and had previously been repeatedly member of the assembly and of the council, judge of the county court and of the superior court, and deputy governor. He published in 1725 'Poetical Meditations, Being the Improvement of Some Vacant Hours'; and wrote a poem of 1,500 lines entitled 'A Brief Account of the Agency of the Honorable John Winthrop, Esq., in the Court of King Charles II., A.D. 1662,' in which he gives a description of the Pequot war. The latter was first printed in the collections of the Massachusetts Historical Society, and the original is among the manuscripts of the Connecticut Historical Society.

Wolcott, Roger, American lawyer and governor: b. Boston 13 July 1827; d. there 21 Dec. 1900. Graduated from Harvard University in 1870 and from the law-school of the university in 1874, he was admitted in the latter year to the bar, but subsequently practised little. In 1877-9 he was a member of the common

council of Boston, and in 1880-5 of the Massachusetts house of representatives, where he gained a considerable reputation by his oratory and his activity in constructive politics and the furtherance of good government. He was sent as a delegate to the State Republican convention in 1885, in 1887-9 was again a member of the Boston common council, and in 1891 was chosen first president of the newly-organized Republican Club of Massachusetts, in which post he rendered valuable service to his party. This was recognized by his nomination as lieutenant-governor. He was elected in 1893, served by re-election until 1896, and upon the death of Gov. F. T. Greenhalge in the latter year became acting governor. In November 1896 he was elected governor by the largest plurality ever given in the State to a candidate for the office. In 1897 and 1898 he was re-elected. He declined the ambassadorship to Italy in 1899.

Wolf, wülf, Edmund Jacob, American Lutheran clergyman: b. Rebersburg, Pa., 8 Dec. 1840; d. Gettysburg, Pa., 10 Jan. 1904. He was graduated at Pennsylvania College, Gettysburg, in 1863, and served for a time in the Union army. Subsequently he studied theology at Gettysburg Theological Seminary and also at Tübingen and Erlangen, Germany, and was ordained in the Lutheran Church in 1865. He became professor of New Testament exegesis and church history at the Theological Seminary, Gettysburg, in 1874. He published: 'Lutherans in America' (1869); the 10th volume of the 'Lutheran Commentary' (1897); 'Lectures on the Gospel Lessons' (1900); etc.; and had at various times edited the 'Lutheran Quarterly' and 'Lutheran World.'

Wolf, Emma, American novelist: b. San Francisco, Cal., 15 June 1865. She was educated in the schools of her native city, and early developed a bent for authorship. She has published: 'Other Things Being Equal' (1892); 'A Prodigal in Love' (1894); 'Joy of Life' (1896); 'Heirs of Yesterday' (1900).

Wolf, völf, Ferdinand, Austrian romance scholar: b. Vienna 8 Dec. 1796; d. there 18 Feb. 1866. He studied philosophy and jurisprudence at Grätz; received a position in the Royal Library at Vienna and took an active part in the foundation of the Academy of Sciences, of which he became secretary. Among his many publications, all characterized by research and critical acumen, are: 'Collection of Modern Castilian Rhymes' (1873); 'Historical Studies of Spanish and Portuguese National Literature' (1880); 'History of Brazilian Literature' (1883); etc. With C. Hofmann he edited a collection of the oldest Spanish romances and contributed frequently to the Vienna 'Jahrbücher der Literatur.'

Wolf, Friedrich August, German classical scholar: b. Haynrode, near Nordhausen, Prussia, 15 Feb. 1759; d. Marseilles, France, 8 Aug. 1824. He was educated at the gymnasium of Nordhausen and the University of Göttingen, and in 1782 was appointed rector of the Bürgerschule at Osterode in the Harz. The next year he was called as professor of philosophy and paediatrics to Halle, where he labored upward of 20 years with the highest enthusiasm for the cause of education. In 1793 appeared his 'Prolegomena in Homerum' (3d and 4th eds., 1872 and 1875). In this he contended that

the 'Iliad' and 'Odyssey' were not the work of one man, but of several Homeric rhapsodists (wand-bearing minstrels). The work in which he tried to maintain this statement created a profound sensation and has had the effect of permanently modifying the opinions of Homeric scholars as to the manner of the composition of the 'Iliad' and 'Odyssey.' (See HOMER.) From a literary point of view his labor has been of immense service. The University of Halle was suppressed in 1807, in the storm of the French invasion, and Wolf then removed to Berlin, where he entered the ministry of public instruction, but soon resigned that he might give himself to the work of academic teaching, which disappointment and ill-health compelled him to give up in 1824 when he went south on a voyage for the sake of his health, but did not long survive his arrival at Marseilles. Wolf's great work was the invention, or at least the bringing into prominence of a new instrument of education, namely, philology, which he defined as no meagre study of the forms of language but "a knowledge of human nature as exhibited in antiquity." Locke and Rousseau had founded a school of educational theory which they considered to be more in accordance with common sense and modern needs than the classical culture of the Renaissance. Wolf revived the mental discipline and scientific aim implied in the prosecution of classical studies. Consult: Pattison, 'Friedrich August Wolf' (in the 'North British Review' for June 1865); Wolf, 'Prolegomena in Homerum' (1795); Müller, 'Homersche Vorschule' (1836); Lachmann, 'Betrachtungen über Homers Ilias' (1865); Volkmann, 'Geschichte und Kritik der Wolf'schen Prolegomena' (1874); also the Homeric writings of Gladstone, Blackie, Paley, Heyman, and Geddes.

Wolf, wulf, Henry, American engraver: b. Eckwersheim, Alsace, 3 Aug. 1852. His artistic training was completed at Strasburg, and when he came to New York, about 1875, his ability soon made itself known. He exhibited at the Paris Salon in 1888 and 1895, winning a gold medal in the latter year; and at the World's Columbian Exposition of 1893 and the Paris Expositions of 1889 and 1900. His chief works are: 'Engravings Illustrating American Artist Series' and 'Gilbert Stuart Series of Women and Men' in the 'Century Magazine.'

Wolf, wölf, Hieronymus, German classical scholar: b. Göttingen 13 Aug. 1516; d. 8 Oct. 1590. From 1557 till his death he was director of a school at Augsburg. He was one of the foremost Greek scholars of his century and is held in remembrance for his carefully annotated editions, with Latin translations, of Isocrates (1570) and Demosthenes, as well as for editions of Byzantine historians and many other classical labors.

Wolf, Rudolf, Swiss astronomer: b. Faldanden, near Zürich, 7 July 1816; d. Zürich 6 Dec. 1893. He was teacher of mathematics and physics in the realschule at Berne, 1839-55; and director of the observatory there in 1847. He was also professor of astronomy in the Bern University in 1853; professor of astronomy in the Polytechnikum and director of the observatory at Zürich in 1855, and later professor of mathematics and astronomy in the university there. He was famous for his investigations

concerning the periodicity of sun spots and the accompanying magnetic variations, and wrote extensively on the history of science, especially astronomy. His 'Astronomical Miscellany,' 1856-93, is a well-known series of papers, and his 'History of Astronomy' (1877) is a standard work of reference.

Wolf, wulf, Simon, American lawyer and communal worker: b. Hinzweiler, Bavaria, 26 Oct. 1836. A graduate of Ohio Law College, Cleveland, Ohio, in 1861, he has since resided in Washington, D. C., where he served as recorder of deeds for the District of Columbia, 1869-78. In 1881-2 he was United States minister to Egypt. While prominent in social and benevolent circles in Washington, he is identified with Jewish progress in America, was a founder of the B'nai B'rith Orphan Asylum at Atlanta, Ga., and for many years president of the Board of Delegates on Civil and Religious Rights of the Union of American Hebrew Congregations. In addition to various monographs, he has published 'The American Jew as Patriot, Soldier, and Citizen' (1898).

Wolf, a river in Wisconsin; rises in the northeastern part of the State, flows generally south, passes through Pewaugan Lake, and enters the Fox River. Wolf River has been of great benefit in the development of the lumber industry in the northeastern part of the State. It is navigable for small steamers for about 150 miles.

Wolf, a typical wild species of the dog family (*Canidae*). So closely related are wolves to the domestic and other true dogs (q.v.) that zoologists have been unable to find any satisfactory structural differences. As the distinctions are purely specific and largely founded upon the habits and character of the fur, all of the wolves are customarily placed in the extensive genus *Canis* along with the dogs and jackals. Excepting some of the domesticated varieties of dogs, wolves are the largest members of the family, and normally they howl and do not bark as do the dogs and jackals. Their natural range is throughout North America and Eurasia, but no true wolves are found in the Southern hemisphere, where they are replaced by the smaller carrion-eating jackals and fox-dogs. As they inhabit indifferently mountain-tops, plains, and swamps, and are equally at home on the frozen Arctic shores and the tropical swamps of Mexico and India, they exhibit, as might be expected, a great range of variation. Generally they increase in size, vigor, and courage northward, and the fur becomes more shaggy and thicker. The species and varieties have never been very satisfactorily discriminated and many zoologists consider that the large northern woodland wolf of both continents is a single wide-ranging variable species. Certainly these active animals are free to cross between the Old and New worlds in the winter on the ice by way of Greenland or Alaska.

The American gray or timber wolf (*C. occidentalis*) when full-grown measures 5½ feet in length, whereof 18 inches belong to the tail; its height is 33 inches, and its weight over 100 pounds. The general aspect is that of a large dog, and, indeed, the domestic dogs of the Indians were partly derived from this species and some of the European varieties from the native wolf. They are lank, long-limbed creatures with

WOLF-FISH

erect ears and drooping, rather bushy tails; the hair of the neck is generally more or less elongated and erectile. The color is very variable, the prevailing tone being gray, more or less marked with black; and becomes paler in winter and more reddish in summer. Southward the colors deepen, leading to the black wolf (*C. ater*) of Florida, the red wolf (*C. rufus*) of Texas, and the dusky wolf (*C. nubilus*) of the central plains, while in the far North the Arctic wolf (*C. albus*) is nearly pure white with a black tail-tip. The gray wolf was formerly very abundant and troublesome in most parts of North America, but has more rapidly and completely succumbed to the march of civilization here than in Europe, and long since disappeared from even the forest-clad portions of the Eastern States. At the present time wolves are practically extinct in the country east of the Mississippi River, but still roam in large packs in the Northern and Western forests and wooded swamps, and are especially large and plentiful in Newfoundland and the Hudson Bay region. Owing to their activity and restless wandering habits small parties are likely to appear in the winter at places where none have been known for years. As the habits of all large wolves are essentially similar the following account of the European wolf (*C. lupus*), which has remained much more generally plentiful and troublesome than ours, will answer for the whole group:

Wolves inhabit a great variety of country, both hill and plain, especially thick forests and broken ground, with alternate morasses and dry patches, and in the South the steppes. They shelter in woods, marshes, canebrakes, and maize fields, roaming over wide areas, often suddenly appearing where none have been seen for years, and as quickly vanishing — nor is this wonderful when it is remembered that they will cover from 25 to 40 miles in a single night. In the neighborhood of dwellings they only appear after twilight, but in secluded places carry on their hunting all day. Their food varies according to the season, consisting in summer almost exclusively of wild animals — foxes, hedgehogs, mice, birds, reptiles, and even vegetables; of larger animals, elk and deer, while hares are soon exterminated where wolves abound. While readily associating and interbreeding with large domestic dogs which have run wild they frequently attack and devour house dogs and even weak or injured members of their own species. They follow herds of lemmings in their migrations, and will devour carrion with avidity; but they do not appear to attack man unless in large numbers or pressed by hunger. Accounts of such attacks in the latter part of winter are frequent in the European press and are occasionally reported from the woods of Minnesota, Michigan, and the Canadas. In winter they approach nearer to human habitations, doing much damage to flocks of sheep and poultry. When in packs they will attack horses and cattle. In the chase the wolf exhibits all the cunning of the fox, and in addition courage and the capability of hunting in packs. These will even divide in parties, one following the trail of the quarry, the other endeavoring to intercept its retreat. In mental qualities the wolf is in every respect the equal of the fox; his caution is so great that he regards every unfamiliar object with suspicion, will not pass through a door if he can leap

over the wall, and will not, unless famished, attack a tethered animal lest it should be the bait of a trap. When he sees himself captured his courage and ferocity at once forsake him.

In spring and summer wolves are solitary or in pairs, in the autumn in families, and in winter in packs. The pairing season is in December and January, when the males fight savagely together; those who are fortunate enough to secure a mate remain with her till the young are well grown. The young are born in burrows usually excavated by the wolves themselves, and during her confinement the female is fed by the male. The period of gestation is 63 days, and from three to nine (usually four to six) cubs are found in a litter; these are blind for 21 days, and are suckled for two months, but at the end of one month are able to eat half-digested flesh disgorged by the mother. They quit the parents in November or December, but many remain together six or eight months longer; they are full grown in three years, and live from 12 to 15 years. Wolves can readily be tamed when taken young, and then exhibit many of the characteristics of domestic dogs.

Notwithstanding the spread of civilization, the wolf is still widely distributed. Excluding thickly populated regions, it extends over almost the whole of Europe; but Russia and Scandinavia are the only parts where it now occurs in any large numbers. In Asia it is spread over all the continent to the borders of India and the plains of China.

Besides the American forms already mentioned many wolves inhabiting Europe and Asia have been described as species more or less distinct from *C. lupus*. Among these are *C. niger* and *C. langifer* of Tibet, *C. pallipes* of India, *C. hodophylus* of Japan, and *C. mexicanus* of Mexico. The Indian wolf (*C. pallipes*) is smaller and slighter than the typical form, with little or no under-fur; but undoubted examples of *C. lupus* differ as much from each other as this does from them. It inhabits the plains south of the Himalayas, but is rare west of the Indus. It does not hunt in large packs, but in numbers of six or eight at most. The superstition of the people prevents its destruction, for they imagine that its blood will diminish the fertility of the fields. It is seldom heard, not howling like the European wolf. It is remarkable even among wolves for speed and endurance.

A second well-marked species of *Canis* found in North America is the prairie wolf (*C. latrans*). (See *Coyotes*.)

In Africa and South America a number of species of hunting dogs belonging to *Canis* and related genera are known locally as wolves, but the name is not properly applicable. Still less should it be applied to the "native wolf" of the Tasmanians, which is a true marsupial (*Thylacinus cynocephalus*) of carnivorous habits and canine aspect.

Consult: Mivart, 'Monograph of the Canidae' (London 1890); Merriam, 'Revision of the Coyotes,' 'Proceedings,' Biological Society of Washington (1897); Baird, 'Mammals of North America' (Washington 1899).

Wolf-fish, a large voracious sea-fish (*Anarrhichas lupus*), allied to the blenny, and named from the wolfish appearance given it by its great interlocking front teeth, and from its disposition to fight hard for its life when caught.

WOLFBOBO — WOLFF

It may attain a length of four or five feet. The color is an olive-green above, marbled with brown on the head especially. The fish feeds on echinoderms, mollusks, and crustaceans. The flesh tastes like that of cod. Several other species are known in various parts of the world constituting the family *Anarrhichidae*.

Wolfboro, N. H., town in Carroll County; on Lake Winnepesaukee, and on the Boston & Maine Railroad; about 43 miles northeast of Concord. It contains five villages. It has marble and granite works, boot and shoe factories, woolen mills, carriage and wagon works, flour mill, and lumber works. The town has five churches, graded schools, Brewster Academy, and a public library. The bank has a capital of \$50,000. Pop. (1910) 2,224.

Wolfe, wulf, Charles, Irish poet: b. Dublin 14 Dec. 1791, d. Cove of Cork (now Queens-town) 21 Feb. 1823. He was graduated at Trinity College, Dublin, in 1814, was tutor there the next year, took orders in the English Church in 1817, and was curate of Donoughmore, Ireland. The poem which has secured his fame, 'Ode on the Burial of Sir John Moore,' was published in the 'Newry Telegraph' (1817). Wolfe was also the author of several other poems, and his 'Remains,' with a 'Brief Memoir,' were published in 1825.

Wolfe, James, English general: b. Westerham, Kent, 2 Jan. 1727; d. Quebec, Canada, 13 Sept. 1759. He was educated at Westerham and Greenwich, and in 1742 received an ensign's commission in a foot regiment. In 1743 he took part in the famous battle of Dettingen; in 1744 obtained his captaincy; and in 1745-6 was present at the battles of Falkirk and Culloden. In 1747 he was wounded, though not seriously, at the battle of Lawfeldt, and from 1749 to 1757 was engaged in garrison duty in Scotland and England. In the mismanaged expedition against Rochefort (1757) Wolfe acted as quartermaster-general and the only creditable movement in the affair was a night reconnaissance conducted by him which penetrated two miles into the enemy's country. His recommendation in favor of an immediate attack, and his offer to take the place with 500 men and three ships, were unheeded; but Pitt, becoming acquainted with the facts of the case, kept the young officer in view for some future enterprise. This occurred in the following year, when Wolfe was ordered to accompany the expedition under Amherst to Cape Breton, with the rank of brigadier-general. A brilliant success was obtained in the capture of the strong fortress of Louisbourg, after a seven weeks' siege, and he became popularly known as the 'Hero of Louisbourg.' Pitt was then planning the overthrow of the French dominion in North America by the capture of their chief stronghold, Quebec, and with the instinct of genius singled out Wolfe as the most promising young officer in the army, to command the expedition, notwithstanding many older officers might by virtue of seniority have claimed the honor. Wolfe was accordingly created a major-general, and on 26 June 1759, landed his forces on the Isle of Orleans, opposite Quebec. The system of defense adopted by his adversary, Montcalm, was such as to offer no point of advantage. The season during which operations could be continued rapidly advanced, but at last having dropped down the

river, and scaled the precipitous cliffs known as the Heights of Abraham at a point insufficiently guarded, at daybreak of 13 September Wolfe found himself on the Plains of Abraham, where, his supplies thus cut off, Montcalm had no choice but to give battle. After a short struggle the French were driven from the field in complete rout; Montcalm was one of the 500 killed; the capitulation of Quebec followed five days after; and its fall decided the fate of Canada. Wolfe died in the hour of victory. In person he led the right, till thrice wounded, he was carried to the rear. He lived to hear the cry, 'They run; see how they run!' and expired with the words, 'Now God be praised, I will die in peace.' His body was taken to England and buried in Greenwich Church, and a monument was erected to him in Westminster Abbey. Consult: Wright, 'Life of Major-General James Wolfe' (1864); Parkman, 'Wolfe and Montcalm' (1892); Bradley, 'Wolfe,' in 'English Men of Action' Series (1895); Allison, 'Memoir of Wolfe' in 'Twelve English Soldiers' Series.

Wolfe, Theodore Frelinghuysen, American author: b. Kenvil, N. J., 1847. He was graduated from the medical department of Columbia in 1868, and for several years practised his profession in Jersey City, N. J. He has published: 'Literary Shrines of American Authors' (1895); 'A Literary Pilgrimage Among Haunts of British Authors' (1896); 'Literary Haunts and Homes of American Authors' (1898); 'Literary Rambles at Home and Abroad' (1900).

Wolfe Island, Canada, at the northeast end of Lake Ontario, bisects the outlet of Saint Lawrence River, and is about 18 miles long, with a maximum width of seven miles, and an area of 34,806 acres. It belongs to Frontenac County, Ontario, is the largest of the famous Thousand Islands, and is opposite Cape Vincent, New York State. Its coast is indented with picturesque bays, it is well-wooded, and the surrounding waters abound with fish. Pop. about 2,000.

Wolfenbüttel, wölffen-büt-täl, Germany, a town of Brunswick, on the Ocker, seven miles south of Brunswick. One of the ancient churches contains many of the tombs of the princes of Brunswick. The old castle now accommodates a seminary for teachers and a theatre. The library opposite, built in 1723 in the form of the Pantheon at Rome, became famous for its literary wealth, and for the fact that Lessing (q.v.) was its librarian. It was Lessing who edited the 'Wolfenbüttel Fragments,' professedly from anonymous manuscripts under his charge, but really from the pen of his friend Reimarus (q.v.), which startled the theological world of Germany. The Pantheon building had become so rickety and dangerous that it had to be taken down, being superseded in 1887 by a handsome new edifice, which houses 300,000 volumes and 10,000 manuscripts. There are in the town manufactures of machines, copper goods, flax, cloth, corks, leather, preserves, tobacco, etc. The place is very ancient, and dates from 1046; it was besieged and taken in 1190 and 1542; and during the Thirty Years' war a battle was fought here in 1641. Pop. about 20,000.

Wolff, wölf, Albert, German sculptor: b. Neustrelitz, Mecklenburg, 14 Nov. 1814; d. Ber-

lin 20 June 1832. In 1831 he entered Rauch's studio in Berlin, and in 1844 was sent to Carrara to execute the sculptures for the terraces of the Sanssouci palace. Upon his return from a sojourn in Italy of nearly two years, he assisted Rauch in the completion of the latter's Frederick the Great memorial for Berlin. In 1849 he became a member of the Berlin Academy, in 1858 professor there, and in 1866 a member of its senate. He was three times the victor in competitions for equestrian statues—in 1861 for that of King Ernest August (Hanover), in 1875 for that of King Frederick William III. (Berlin), and in 1885 for that of Gen. Artigas (Montevideo). Among his further works are busts of German notabilities, including von Moltke; a decorative bronze group, 'The Lion-tamer,' for the Berlin Museum building; colossal statues of the 'Four Evangelists' for the Schlosskirche, Neustrelitz; and other portrait and ideal productions.

Wolff, Albert, French journalist: b. Cologne, Germany, 31 Dec. 1835; d. Paris 28 Dec. 1891. He studied at the University of Bonn, settled in Paris in 1857, where he became secretary to Alexandre Dumas, Père, and in 1859 began to contribute to the 'Gaulois,' 'Figaro,' 'Charivari,' etc. Some of these articles, collected in book form, were afterward published as 'Memoirs of the Boulevard,' (1866); 'The Two Emperors' (1871); 'Victorien Sardou and Uncle Sam' (1873); etc. He wrote also several novels and farces.

Wolff, Christian, German philosopher and mathematician: b. Breslau 24 Jan. 1679; d. Halle 9 April 1754. He studied at Jena theology, mathematics, and philosophy, paying particular attention to the writings of Descartes and Tschirnhausen, and writing an elucidatory commentary on the 'Medicina Mentis' of the latter, which circumstance was the occasion of an intimacy between him and Leibnitz. In 1707 he was called to Halle as professor of mathematics. By his rationalistic views he here incurred the hostility of certain theologians who denounced him and by an order from the government of Frederick William I. he was commanded (1723) to resign his office, leave Halle in 24 hours and the Prussian States in two days. But he was ultimately vindicated and in 1740 appointed by Frederick II. vice-chancellor and professor in the University of Halle. Three years later he was made chancellor of that university. The principal service rendered by Wolff to the progress of learning consisted in his persistent application of mathematical methods to the investigations of physical science. The decided rationalism which characterized his philosophical doctrine resulted in a popularization of the Leibnitzian teaching. While appropriating many of the conceptions of Leibnitz he controverted his monadology, and regarded the theory of pre-existent harmonies as a mere hypothesis, while he asserted the possible interaction of body and soul. He followed Kant's 'Critique of Pure Reason' in dividing philosophy into Ontology, Cosmology, Rational Psychology and Natural Theology. His collected works make up 22 volumes. Consult: Amserger, 'Christian Wolff's Verhältnisse zu Leibnitz' (1897); Lewes, 'Biographical History of Philosophy'; Watsche, 'Wolffs eigene Lebensbeschreibung' (1841).

Wolff, Emil, German sculptor: b. Berlin 2 March 1802; d. Rome, Italy, 29 Sept. 1879. He was a pupil of his uncle, Gottfried Schadow, and having gained a prize at the Royal Academy of Arts, went to Italy in 1824 as a pensioner of Frederick William III., and ever after resided in Rome. He held high rank among German sculptors, and executed many Greek mythological and genre statues which have been greatly admired. In portraiture busts of Niobuhr, Thorwaldsen, Winckelmann and Bunsen are among his masterpieces.

Wolff, wülf, Ger. wölf, Joseph, Anglo-German missionary: b. Weilersbach, near Bamberg, Germany, 1795; d. Isle Brewers, Somerset, 2 May 1862. He was the son of a rabbi, but became a Christian, taught Hebrew for a time at Frankfurt and Halle, studied at Munich, Weimar, and Vienna, and in 1815 went to Rome. He entered first the Collegio Romano, and in 1817 the college of the propaganda, intending to become a missionary. Dismissed for heresy in 1818, he went to England, joined the English Church, spent two years at Cambridge, studying oriental languages, preparatory to going as a missionary to the Jews in Palestine, and in April 1821 embarked for Gibraltar. After an extensive tour in the East he returned to England in 1826. In 1827, he married Lady Georgiana Walpole, a daughter of the Earl of Orford, and in April of the same year set out on another missionary tour, and at Jerusalem was poisoned by some bigoted Jews and narrowly escaped death. On his recovery he set out for Bokhara by way of Persia and on the journey encountered the plague, was repeatedly robbed, was taken prisoner and sold as a slave, but finally reached Bokhara. He spent some time in Abyssinia, acquired the Amharic language, and returned to England in 1834. In January 1836 he again visited Abyssinia, where he was worshipped by the natives as their new aboons or patriarch, visited the Rechabites of Yemen, met a party of Wahabees in the mountains of Arabia, who horsewhipped him because they could find nothing in the Arabic Bibles he had given them about Mohammed, and in August 1837 came to New York. Here he received deacon's orders in the Protestant Episcopal Church, visited the principal cities, preached before Congress, and in January 1838 returned to England. He next visited Dublin, received priest's orders, and held several curacies in England. He went again to Bokhara in 1843 in the employ of the English government to obtain the release of Colonel Stoddart or Captain Connolly, but was imprisoned and saved from death only by the efforts of the Persian ambassador. He then returned to England in 1845 and after this eventful career spent the rest of his life in charge of the secluded parish of Isle Brewers, Somerset. He published: 'Researches and Missionary Labors among Jews and Mohammedans' (1835); 'Journal of Missionary Labors' (1839); 'A Narrative of a Mission to Bokhara' (1845); 'Travels and Adventures,' an autobiography (1860); etc.

Wolff, wölf, Julius, German poet and novelist: b. Quedlinburg, in the Harz Mountains, 16 Sept. 1834. In 1869 he founded the 'Harz News,' and in 1870-1 served in the German army and won the Iron Cross. He then settled in Berlin and devoted himself to literary work.

His chief works are: 'Aus dem Felde,' war poems (1871); 'Tyll Eulenspiegel Redivivus' (1814, 23d ed. 1896); 'The Rat-catcher of Hameln' (1876); 'The Wild Huntsman' (1877); 'Tannhauser' (1880); 'Lurlei' (1880); 'Der fahrende Schüler' (1900); while among his novels may be cited 'Der Sulfmeister' (1883); 'Der Raubgraf' (1884); 'Die Hohkönigsburg' (1902). Consult Ruhemann, 'Julius Wolff und seine Dichtungen' (1886).

Wolff, Oskar Ludwig Bernhard, German improvisator and novelist: b. Altona, 26 July 1799; d. Jena 16 Sept. 1851. He studied medicine in Berlin and subsequently history and philosophy. He became professor of modern languages at Weimar, in 1826, and of modern languages and literature at Jena, in 1832. He published: 'Pictures and Songs' (1840); 'Natural History of the German Student' (1841); 'Bubbles and Dreams' (1844); 'The Minor Ills of Human Life' (1846); 'History of the Novel' (2d ed. 1850); etc., and edited: 'Treasury of National Poetry' (4th ed. 1853); 'Treasury of German Prose' (11th ed. 1875); 'The German People's Treasury of Poetry' (28th ed. 1884); etc.

Wolfhound, a dog kept and trained for the pursuit of wolves. The ancient Irish wolfhound, now extinct, was of two kinds. One was a tall shaggy, swift-running dog, somewhat like the modern Scottish deerhound; the other more nearly resembled a mastiff, and similar dogs have been known in Spain under the name of wolf dogs. The modern Russian wolfhound is the beautiful borzoi (q.v.).

Wolframite, a native tungstate of iron and manganese in varying proportions, having the formula $(Fe,Mn)WO_4$. It occurs in flat, monoclinic crystals, with eminent cleavage parallel with the clinopinacoid. It is brittle, has a hardness of 5 to 5.5 and a specific gravity of 7.2 to 7.5, or about that of iron. It has a sub-metallic lustre, while it is almost or quite opaque and its color and streak are black or nearly black. It is thus distinguished from the closely related mineral hübnerite. It usually occurs in quartz veins, frequently associated with cassiterite or scheelite. It is of considerable commercial importance as a source of tungsten, the ferro-tungsten used in making tungsten steel being derived from it. Its best-known localities are in Bohemia, Saxony, and England, but the recent increased demand for it has brought other localities into prominence, among which are those of New South Wales, Argentina, and Connecticut. Much so-called wolframite is really hübnerite.

Wolf's-bane. See **ACONITE**.

Wolgast, vól'gást, Germany, a town of Pomerania, Prussia, on the left bank of the Peene; four and a half miles from its influx into the Baltic, and 40 miles southeast of Stralsund by rail. Its harbor is shallow, and larger vessels load and unload on the Ruden, an island at the river mouth. Wolgast has the remains of an old castle, the ancestral seat of the Dukes of Pomerania. Its industries are weaving, boat building, and the manufacture of leather and tobacco. It has also an active trade in ships' stores. Wolgast, which was strongly fortified early in the 12th century, was destroyed in 1628 by Wallenstein, in 1630 by the Swedes, in 1637 by the Im-

perialists, and in 1638 again by the Swedes. In 1675 it was taken by the Great Elector, was plundered by the Russians in 1713, and by the Swedes again in 1715. But small remains now exist of its former fortifications. Pop. about 10,000.

Wollaston, wúl'as-tón, **William Hyde**, English chemist: b. East Dereham, Norfolk, 6 Aug. 1766; d. London 22 Dec. 1828. He was educated at Cambridge and was graduated in medicine in 1793. He practised as a physician in Bury Saint Edmunds and then removed to London, where he presently devoted himself to scientific research, becoming secretary of the Royal Society in 1806, and its president in 1820. He was the inventor of the goniometer, an instrument for measuring the angles of crystals, and the discoverer of palladium and rhodium, in 1803, and the malleability of platinum, for which latter discovery he received the medal of the Royal Society in 1820 and which brought him \$150,000.

Wollaston Lake, Canada, a lake of Athabasca, in the Northwest Territory. It is about 50 miles long and has its outlet in the Mackenzie River.

Wollaston Land, Canada, a region of Franklin territory, lying west of Victoria Land, in the Arctic Ocean.

Wollastonite, one of the pyroxene group of minerals, crystallizing, therefore, in the monoclinic system. Its crystals are usually tabular, to which fact its name "tabular spar" is due. Crystals are, however, rather rare, the common occurrences being compact or in aggregates of brittle fibres, having a splintery fracture. Its hardness is 4.5 to 5, and specific gravity 2.85. Its lustre is vitreous to pearly and its usual color is white or gray. Some localities yield specimens which show excellent triboluminescence. It is a calcium metasilicate, $CaSiO_3$. Its most important American localities are in northern New York. It was named in honor of the eminent English chemist, W. H. Wollaston.

Wollin, vól'lén', Germany, an island of Prussia at the mouth of the Oder; on the north side of the Great Haff; length, 20 miles; breadth from 3 to 10 miles. Fishing and cattle-rearing are the chief occupations. Pop. 14,000.

Wollastoncraft, wúl'stón-kraft, Mary. See **GODWIN**, MARY **WOLLSTONCRAFT**.

Wolseley, wúlz'li, Sir **Garnet Joseph**, 1st Viscount, British soldier: b. near Dublin 4 June 1833. He entered the army in 1852 as an ensign, served in the Burmese war of 1852-3, went through the Crimean campaign and was severely wounded before Sebastopol. For his services here he was made a member of the Legion of Honor, and in 1855 was advanced to the rank of captain. He saw active service in India during the Mutiny, from 1858 to 1860 was attached to the Bengal command, and took part in the brief China war of 1860, and in 1865 attained the rank of colonel. He was assistant quartermaster-general and deputy quartermaster-general in Canada 1867-70, and in the latter year led the successful Red River expedition against Louis Riel. On leaving Canada he received the appointment of assistant adjutant-general at headquarters, a post which he held till 1873. In the Ashanti war in 1873-4 his admirably planned march resulted in the capture of Kumasi, the

native capital, and led to the securing of British authority on the Gold Coast. In 1873 he went to Natal as imperial commissioner, in 1878 was promoted to the rank of lieutenant-general, and went to Cyprus in the capacity of high commissioner and commander-in-chief. Leaving Cyprus next year he was again sent to South Africa, this time as governor and high commissioner of Natal and the Transvaal in order to finish the Zulu war and check the advance of Secocoeni. On returning home in 1880 he was appointed quartermaster-general of the army, a post which he held till 1882, when he was advanced to the rank of general, and as commander-in-chief conducted the campaign in Egypt against Arabi Pasha, which ended in the utter defeat of the latter at Tel-el-Kebir. For this he was raised to the peerage as Baron Wolsey of Cairo and of Wolsey, in the county of Stafford. He commanded the Nile expedition of 1884-5, which was sent too late to relieve General Gordon in Khartum, and on his return was created Viscount Wolsey of Wolsey, and made a Knight of the Order of St. Patrick. In 1890 he was appointed to the command of the forces in Ireland, becoming at the same time privy-councillor of Ireland, and in 1895 succeeded the Duke of Cambridge in the post of commander-in-chief in the United Kingdom. He was succeeded in the latter post by Lord Roberts, on his return from South Africa in 1900. He has published: 'Narrative of the War with China in 1860' (1862); 'The Soldier's Pocket-Book for Field Service' (1869); 'The Life of John Churchill, Duke of Marlborough, to the Accession of Queen Anne' (1804); 'The Decline and Fall of Napoleon' (1805). Consult Low, 'Memoir of Sir Joseph Garnet Wolsey' (1878).

Wolsey, wul'si, Thomas, English statesman and cardinal: b. Ipswich, Suffolk, March 1471; d. Leicester 29 Nov. 1530. He was the son of a butcher and was sent to Magdalen College, Oxford, of which he became a bachelor at 15, and was elected fellow. Being appointed master of a grammar-school dependent on the college, he had three sons of the Marquis of Dorset under his care, which led that nobleman to present him to the living of Limington, in Somerset. He was afterward chaplain to the archbishop of Canterbury, then to one of the governors of Calais, and finally was recommended to Henry VII., who made him one of his own chaplains. Under Henry VIII. his progress in advancement was very rapid. In 1509 he was made dean of Lincoln; in 1510 became rector of Torrington; in 1511, canon of Windsor, registrar of the order of the Garter, and privy councillor; in 1513, dean of York and bishop of Tournay (being then in France); in 1514, bishop of Lincoln and then archbishop of York. In 1515 Pope Leo X. elevated him to the dignity of cardinal, and in the end of the same year Henry made him lord-chancellor. His nomination in 1518 to be the Pope's legate *à latere*, completed his ecclesiastical dignities, by exalting him above the Archbishop of Canterbury. At the time when the rivalry between the Emperor Charles V. and Francis I. rendered the friendship of Henry of great importance Wolsey was treated with the greatest respect by both sovereigns, receiving pensions from each, as well as a third from the Pope. He ultimately, however, favored the side of Charles,

who settled upon him the revenues of two bishoprics in Spain, and flattered him with hopes of the Papal chair, which induced him to involve Henry in a war with France. Insatiable in the pursuit of ecclesiastical emolument, in 1519 he gained the administration of the see of Bath and Wells, and the temporalities of the abbey of St. Albans, his revenues now nearly equaling those of the crown. Part of them he expended in pomp and ostentation, and part in laudable munificence for the advancement of learning. His love of splendor was signally displayed on the Field of the Cloth of Gold in June 1520; his love of learning in his foundation of several lectures, as well as the college of Christ Church at Oxford, and of a collegiate school at Ipswich. He built a palace for himself at Hampton Court, but this he in the end presented to the king. In 1522, on the death of Leo X., and again in 1523, on the death of Adrian VI., he failed to secure elevation to the papacy, and on both occasions attributed his failure to Charles V., to whom he ever afterward entertained a strong aversion. The critical affair of the divorce of Queen Catharine was one of the first steps to his fall. With Cardinal Campeggio he was appointed to determine the legitimacy of Henry's marriage with her, and lost the favor of the king by exposing himself to the suspicion of causing delays in the settlement of the question. He fell still more into disfavor by advising the king against marrying Anne Boleyn, and of course roused the hostility of Anne herself and her friends. Leading nobles deeming this a good occasion for contriving his ruin, caused him to be accused of having in the exercise of his duties of papal legate violated the statute of *præmunire* (1529), and he was convicted. The Dukes of Norfolk and Suffolk were sent to require the great seal from him, he was ordered to quit York Place, his palace in London, and retire to Esher, in the diocese of Winchester, and his lands, goods, and chattels were declared forfeited. Henry still assured him of his protection. Part of his revenues were restored to him, and he was even reinstated in the diocese of York. But Henry did not continue his protection long. Toward the close of the year 1530 he was arrested at his mansion of Cawood, in the diocese of York, whither he had retired, and was ordered to be conveyed to London on a charge of high treason. Illness and mental distress obliged him to stop at Leicester, where he was well received at the abbey and where he died a few days after. Shortly before his death he is said to have exclaimed to the officer appointed to conduct him, "Had I but served God as diligently as I have served my king, he would not have given me over in my gray hairs." There has been considerable disposition in later writers to vindicate the character of this minister; and it must not be forgotten that, in the reign of Henry VIII., who had broken his heart; of Mary, the daughter of the much-injured Catharine; and of Elizabeth, whose mother (Anne Boleyn) was the chief instrument of his downfall, scant justice could be expected to be rendered to the better traits of his mixed character. If he was loose in his morals, grasping in his ambition, and rapacious, he was liberal and even profuse toward his dependents, and in his patronage of letters. He was enlightened far beyond the period in which he lived. As a diplomatist it is

WOLVERHAMPTON—WOMAN'S SUFFRAGE

very difficult to say whether his abilities or industry were the most remarkable, and it is to him that England is indebted for the first notion of a vigorous police, and for a regular system in the administration of justice. Consult: 'Life' by Cavendish (1641); and 'Lives' by G. Howard (1824); C. Martin (1862); Williams, 'Lives of the English Cardinals' (1868); Brewer, 'Reign of Henry VIII.' (1884); Creighton, 'Cardinal Wolsey' (1888); Gasquet, 'The Eve of the Reformation' (1892); Gairdner, 'The Fall of Cardinal Wolsey' in 'Transactions of the Royal Historical Society' (1899); Taunton, 'Cardinal Wolsey' (1900); and Gairdner's article in the 'Dictionary of National Biography.'

Wolverhampton, wul-ver-hämp'ton, England, a manufacturing town, the "metropolis of the Black Country," is built on an eminence amid a network of railways and canals, 13 miles northwest of Birmingham, and 126 northwest of London. The town stands on the western edge of the great coal and iron mining district of South Staffordshire, so that the vicinity on the south and east is covered with collieries, ironstone mines, blast furnaces, forges, iron foundries, and rolling mills, while on the north and west there is pleasant green country. It was first called "Hamton," and then "Wulfrun-ismhamton," after Wulfruna, King Edgar's sister, had founded in 996 St. Peter's Church, which continued collegiate till 1846. Rebuilt during the 13th, 14th, and 15th centuries, and enlarged and elaborately restored. The church is a fine cruciform Gothic edifice, with several notable features and monuments. The other public buildings are all modern and include the town-hall, corn exchange, market-hall, agricultural hall, hospital, post-office, art gallery, drill-hall, etc. The free grammar-school, founded in 1512, occupies handsome new buildings of 1876; and there are also a blue-coat school (1710) and an orphanage (1850). In 1757 Wolverhampton was described as "a great manufacturing town in all sorts of toys, and particularly of locks in the greatest perfection; locks—some 2,000,000 yearly—are still its specialty. The other manufactures include tin plate, japanned goods, enameled hollow wares, edge tools, gas and water tubes, electro-plate, papier-maché, chemicals, etc. Pop. about 99,000.

Wolverine, Glutton, or Carcajou, a carnivorous mammal (*Gulo luscus*), of the weasel family (*mustelida*), but differing greatly in appearance from the light and slender weasels typical of that family. The wolverine is a short, thick, heavily built animal about 2½ feet long, whose short legs, sub-plantigrade feet, and short, bushy tail add to a decidedly bear-like aspect of body. On the body and especially on the tail the hair is long, coarse, and rough, blackish-brown with a pair of yellowish lateral bands meeting at the root of the tail above. The teeth are 38 in number and the molars are remarkable for their massiveness. The wolverine is a northern animal entering the United States only along the Canadian border, and even there very rare.

Apparently there is no distinction between the glutton of northern Europe and Asia and the American wolverine, and in both Old and New Worlds this brute is alike hated by woodsmen and trappers for its voracity, native meanness,

and cunning. It has the reputation of being the most powerful mammal of its size in existence, and in dogged courage is said to have no equal. Those who have had experience with it place it ahead of even the coyote in craftiness and the ingenuity which it exhibits in finding and robbing the stores of man and beast. It systematically follows the lines of traps set by fur hunters and robs them of both baits and captured animals; but is itself one of the most difficult of animals to take, and succeeds in repeatedly springing and robbing traps set for it, even when most cunningly concealed. Nor is its thieving confined to things edible; sometimes every portable article in a camp equipment will be carried away and hidden by a wolverine. It devours enormous quantities of food and its European name indicates that it is the type of greedy voracity. It lives on hares, squirrels, beavers, mice, foxes, all kinds of ground birds and their eggs, reptiles, insects, and even such large game as reindeer, which it is enabled to secure by its perseverance, great strength, and cunning. An expert tree-climber, the wolverine finds its most congenial home in the great northern forests, but its range extends beyond the tree line to the Arctic shores. Early spring is the mating season, and four or five young are born in June or July in a nest at the bottom of a burrow. The savage courage with which the female will defend her young is almost proverbial among trappers, who dread few animals so much as a mother wolverine with her family. Consult Coues, 'Fur-bearing Animals' (Washington 1877).

Wolverine State, a popular name for the State of Michigan, so called for its abounding in early days with wolverines.

Woman, Education of. See EDUCATION OF WOMEN.

Woman's Suffrage. The basic arguments for woman's suffrage, now an increasingly important factor both in this country and Europe, are three:

First. The natural rights of woman—that woman have as clear a title to the ballot as men have. It is claimed that women are governed, but without their consent.

Second. The need of woman's influence in politics to protect her own sex and to purify political action. Women cannot be adequately protected while men alone make the laws, either in business interests or in certain social and domestic rights that are now denied them. Her votes, it is also claimed, are needed in the interest of better government.

Third. The good results of woman's suffrage where already tried.

It is too early to state that the results prove all that is claimed for them, for analyses are not by any means complete; but there is no question about the progress of the movement and its constant invasion of new territory. It is perhaps attracting more attention in England than in America because of the "militant" character; but in this country the advance made, if more unobtrusive, is perhaps more real. A few figures may indicate something of the state of the movement in 1912.

Six States now grant suffrage to women on equal terms with men—Wyoming since 1869; Colorado since 1893; Utah and Idaho since 1896;

WOMAN'S CHRISTIAN TEMPERANCE UNION—WOMB

Washington 1910; and California 1912. Oregon, Nevada, Wisconsin and Kansas have agreed to submit the question to a vote of the people. School suffrage for women prevails in some form in 30 States. In several other States limited suffrage has been granted.

In Great Britain women can vote for all officers except members of Parliament. In Australia and New Zealand, the Isle of Man and Iceland women have full suffrage; in Norway they have tax-paying parliamentary suffrage; they have secured municipal suffrage in Denmark, Spain and many parts of Canada; in France and Cape Colony there are limited voting privileges for women.

Quite as significant is the changed attitude of the press as well as the mass of public opinion. There was no mistaking the respect with which the parade in New York on 4 May 1912 was treated nor the favorable impression which it made—"a sight which cannot but thrill the people of all other countries quite as much as it does Americans," remarked a great daily, and then it goes on to say, "If we are really to make genuine effort to wipe out special privilege, why not begin by giving votes to women and putting an end to the special privilege of votes for men only?" And the *New York Independent* adds, "It must now be apparent to all that this movement for liberty, equality and sorority will not end until all the women are enfranchised."

It is only fair to add that not all women by any means, are in favor of woman's suffrage, and in many States, including New York, Pennsylvania and Massachusetts, there are strong Anti-Suffrage Leagues.

Woman's Christian Temperance Union, a reform organization founded at Cleveland, Ohio, in 1874; it was the outcome of a woman's crusade against the liquor traffic in the Middle States from 1870 to 1873. In 1910 the "W. C. T. U.," as the organization is popularly called, had regular associations in every State and Territory, with over 10,000 local unions and a total membership of 600,000. An international association was founded in 1883 largely through the efforts of Frances E. Willard, and now has auxiliaries in 40 countries and provinces. The headquarters of the American association are at Evanston, Ill. The white ribbon is the general badge of the organization. The union has upward of 50 distinct departments of work, presided over by women experts in various lines. All the States except one have laws requiring the study of scientific temperance in the public schools, and all these laws were secured by the Woman's Christian Temperance Union; also the laws forbidding the sale of tobacco to minors. The first police matrons and most industrial homes for girls were secured through the efforts of this society, as were the refuges for erring women. Laws raising the age of consent and providing for better protection for women and girls have been enacted by many legislatures through the influence of the department for the promotion of social purity. See also TEMPERANCE; TEMPERANCE SOCIETIES.

Woman's College of Baltimore. This institution, situated in Baltimore, Md., was founded in 1884 by the Baltimore Conference of the Methodist Episcopal Church, as a memorial

of the centennial of the organization of that Church in the city of Baltimore, December 1784. The Board of Trustees was incorporated in January 1885 with the Rev. Bishop Edward G. Andrews as president. In April 1890 the charter was amended and the powers of the corporation were enlarged. Building was begun immediately after incorporation and the doors were opened to students in September 1898, under the presidency of William H. Hopkins, Ph.D. In 1890 Dr. Hopkins resigned the presidency to take the chair of Latin, and the Rev. John Franklin Goucher, LL.D., was made president. President Goucher, in addition to his services to the institution, has been a large benefactor. The principal building, named Goucher Hall, was his gift, and his total contribution amounts to nearly half a million.

The estimated value of the grounds, buildings, equipment and endowments is about a million and a half of dollars. Two buildings, one for instruction and one for residence, have been assigned to the use of the Girls' Latin School of Baltimore, which is preparatory to the College.

The college is organized with the usual departments. Direction and discipline are in the hands of a Board of Control composed of the heads of departments. The standards of entrance are represented by a high-school course of four years, containing Latin, German or French, English, rhetoric, composition and literature, history, algebra, plane geometry and a science with adequate laboratory facilities. The course of study is usually taken in four years. About one third of the work is required, the remainder is elective in groups. Graduation is conditioned upon the completion of sixty year-hours, whatever the elective group, and the degree of Bachelor of Arts is the only first degree bestowed. The degree of Master of Arts is bestowed upon the completion of additional studies demanding a year in residence or three years in absentia with yearly examinations. Marked attention is given to the hygienic and physical training of the students and the health record of the college has attracted attention. Discipline is liberal, interfering with freedom of the students only in so far as may seem necessary for the maintenance of institutional routine, the forming of healthful habits, the securing of conditions favorable for study and the furnishing of moral safeguards.

JOHN B. VAN MEYER,
Dean of the College.

Woman's Relief Corps, an organization created by the mothers, wives, daughters, and sisters of Union soldiers of the Civil War of 1861-5, for the purpose of aiding and assisting the Grand Army of the Republic, and to "perpetuate the memory of their heroic dead," to "extend needful aid to the widows and orphans," to "cherish and emulate the deeds of our army nurses." In 1910 there were 2,882 corps and 164,255 members.

Womb, The, and its Diseases. The womb or uterus is one of the generative organs of the female. In its cavity the impregnated ovum is received, retained, and supported during the development of the fetus, and from this cavity the child is expelled at the time of parturition. In the virgin, the womb is pear-shaped, flattened from before backward, and is

WOMBAT—WOMEN IN THE INDUSTRIES

about 3 inches in length. It is divided into body and neck. The fundus or upper extremity of the body is broad and convex, and is directed forward. From this portion the body gradually narrows to the neck, the lower rounded and constricted portion of the womb, which is directed downward and backward in the line of the axis of the inlet of the pelvis, and around its circumference is attached to the upper end of the vagina.

The womb is situated in the cavity of the pelvis, between the bladder and the rectum, and is retained in position by ligaments, which in a normal condition of the parts also allow free movements of the womb during respiration, muscular exercise, and change of posture. The ligaments are the two lateral or broad ligaments which pass from the sides of the womb to the lateral walls of the pelvis; the two round ligaments which are attached at the upper angles of the womb, one on each side, and pass out through the internal abdominal rings to end in the labia majora; the two anterior ligaments or folds of peritonæum between the neck of the womb and the bladder; and the two posterior ligaments or folds between the womb and the rectum. The womb is a muscular organ, consisting of bundles of unstriped muscular fibres, arranged in layers intermixed with areolar tissue, blood-vessels, lymphatics, and nerves. A serous coat derived from the peritonæum covers the posterior surface of the body of the womb and the upper three fourths of its anterior surface. The cavity of the womb is triangular and flattened from before backward, its base being toward the fundus, and is lined with mucous membrane, having ciliated epithelium at its upper portion. This mucous coat contains the uterine glands, and is continuous with the mucous membrane lining the vagina, and connects with the peritonæum through the orifices of the Fallopian tubes or oviducts, one orifice at each superior angle of the uterine cavity. The two Fallopian tubes (q.v.) are appendages of the uterus attached to its superior angles, and convey the ova from the ovaries (attached to the broad ligaments) to the cavity of the womb. At the inferior angle of this cavity is a small constricted opening, the internal orifice, which leads into the cavity of the cervix. At the vaginal extremity of the uterus is a transverse aperture, the os uteri or external orifice.

The womb is subject to cancerous, fibroid, fibrous, and cystic tumors and polyps, to inflammatory affections of the mucous lining and the parenchyma, such as endometritis and metritis of the neck or body of the uterus; to ulceration of the os and cervix uteri, and to displacement (prolapse or falling of the womb), versions, and flexions. The causes of endometritis are direct injuries (as from pessaries, chemical irritants, etc.), inflammation of the vagina, interference with the menstrual flow, etc.; of metritis, mechanical and other injuries, sudden suppression of the menstrual flow, endometritis, and morbid growths. Ulceration is usually a complication of endometritis. Among the causes are uterine displacements causing friction against the cervix, abuse of sexual intercourse, vaginal or uterine leucorrhœa, the use of pessaries, and injuries in parturition. Displacements of the uterus are quite common, and among their

causes are: (1) increase in weight of the uterus from inflammation or congestion, tumors, pregnancy, fluid retained in the cavity, etc.; (2) weakening of the uterine supports from rupture of the perinæum, loss of tone of vaginal walls, laxity of uterine ligaments, and degeneration of uterine tissue; (3) influences pressing the uterus out of place, such as tight clothing at the waist, the weight of heavy clothing on the abdomen, muscular efforts, such as lifting and straining, abdominal tumors, distended bladder, etc.; (4) traction on the uterus, from deposits of lymph in pelvic areolar tissue, cicatrices in vaginal walls, shortening of uterine ligaments, etc. Flexions of the uterus are bendings of it forward, backward, or to either side, known as anteversion, retroversion, etc. A prolapse is a falling or descent of the uterus into the pelvic cavity, or the prolapsed organ may protrude from the body at the vulvar orifice. The first form is known as incomplete prolapse, the latter as complete prolapse. The symptoms of uterine diseases include leucorrhœa, pain in the small of the back, dragging sensations, a feeling of weight and heaviness, interference with the functions of the bladder and rectum, dyspepsia, and despondency. See **EMBYOLOGY; MENSTRUATION; ONSTETICS; OVARY.**

Wombat, a burrowing marsupial of the phalanger family and genus *Phascologomya*, natives of Australia and Tasmania. The species most commonly known (*P. wombat*) is 2 to 3 feet long, with a very short tail, clumsy form, stout limbs, blunt muzzle and rough hair of variable tint. In their general form and actions the wombats resemble small bears, having a similar shuffling plantigrade walk; but they are even shorter in the legs and broader in the back than those animals. The dentition resembles that of rodents. They live on the ground and in burrows or holes among rocks, feeding on roots, grass, and other vegetable substances. They sleep in the day, seeking their food at night, and are usually gentle in their habits, though their large chisel-like incisors enable them to bite strongly if provoked. Wombats exhibit small intelligence, but are gentle, and capable of domestication to a limited extent. They are hunted for their flesh, which is highly esteemed, and is said to resemble pork.

Several species exist, besides the one above mentioned. *P. ursinus* is brownish gray, like the third species, the hairy-nosed wombat (*P. latifrons*), which differs from the other two in having smooth silky fur, a hairy muzzle, and large pointed ears. It inhabits southern Australia. The largest living wombat (*P. mitchelli*) is about three feet long, but remains of a large extinct genus (*Phascolonius*), which must have been nearly as large as a tapir, have been found in Queensland. Consult authorities mentioned under **MARSUPIALS**.

Wombwell, woom'wél, England, a town in the West Riding of Yorkshire, about five miles southeast of Barnsley, with extensive coal mines in the neighborhood.

Women in the Industries and Professions. In the United States the proportion of the women of the country who engage in gainful occupations has increased enormously in the last decade and is still largely on the increase. This percentage differs in the various States; in New England it rises almost to 30 per cent, while in the West it

WOMEN IN THE INDUSTRIES

is only from 10 to 15 per cent. These figures include all gainful occupations, from household and factory work to the higher professions.

According to the census of 1900, 1,031,760 women and 4,121,006 men were employed in manufacturing trades in the United States.

The increased facilities for women's professional training and the natural ambition and independence of the American woman have lured more and more women of intelligence into the higher branches of work. In commercial pursuits, such as clerking and stenography, over 500,000 women are employed; in industrial pursuits, 1,300,000; in the servant class, 2,095,000, and in agricultural work about 1,000,000. Of these last, a large proportion are negroes in the Southern States, working in the cotton fields. Under the heading of servants are included about 100,000 women who work in laundries.

Women in professional life hold a better position in the United States than in any other country. They are recognized in the various professions and stand, in cases where they have done good work, often on a level with men. Women lawyers plead in court with the same rights as men, and some few women lawyers have argued cases before Courts of Appeal. Women physicians are accorded the same rights as men, and are called in consultation and admitted as equals in surgical cases. In New York City one woman upheld her right to acquire the experience to be gained by doing ambulance duty and gained her point, that she had the same right as men to do such work. Women librarians are many and highly appreciated, and some few women preachers have been successful.

Among teachers many more women than men is the rule all over the world. Men receive higher pay than women for teaching, as a rule, but usually this is for what is considered a higher grade of work or a more difficult kind of teaching. Women principals receive the same pay as men in the same positions. On the whole the rule of "equal pay for equal work" is not considered to have been as yet fairly applied to the teacher's profession, however. The fact that men more often have some one besides themselves to support, and that the opposite is most frequently true of women, is apparently the main cause of this seeming injustice.

The professional women are to a great extent located in the large cities, as naturally are also those engaged in commercial pursuits. The industrial trades are mostly concentrated in Massachusetts, Connecticut, New York, New Jersey, Ohio, and Illinois, while there are some large cotton factories in the South. The agricultural women workers are scattered all through the country, but many of them are located, as above stated, in the South.

The average age at which girls go to work, including in the census all branches, is fourteen years. In parts of the South, children are still employed in mills, which keeps the average age low. The average age of working women in this country is twenty-two years. Of the great army of women workers, about two-thirds are under twenty-five years of age and one-half are under twenty-one years. Taking a census of all professions and industries, two-thirds of the women are single and one-third are married.

The proportion of married and single women in different branches of work varies greatly.

In the servant class, 79 per cent are single.

In manufacturing and mechanical work, 78 per cent are single.

Among dressmakers (of whom there are nearly 350,000), 69 per cent are single.

In commercial branches, 90 per cent are single.

In the professions, 87 per cent are single.

Young girls are employed in the following occupations, the proportion of girls under sixteen years being given:

Knitting mills	18 per cent
Silk mills	18 per cent
Paper box-making	16 per cent
Confectionery	15 per cent
Sweet shops	21 per cent
Shirts, collars, and cuffs	10 per cent

In all the textile trades the percentage of women employed varies from 49 per cent to 73 per cent in the different mills.

Bookbinders	52 per cent are women
Glove makers	65 per cent are women
Tobacco workers	67 per cent are women
Cornet makers	80 per cent are women
Artificial flower makers	84 per cent are women
Paper-box makers	86 per cent are women
Lace and embroidery makers ..	79 per cent are women
Shirt, collar, and cuff makers ..	74 per cent are women

The average wages for women over sixteen in the various trades and industries are from \$4 to \$6 a week while working, but in all trades there are slack seasons of varying length. The lowest wages seem to be paid to the tobacco and candy workers, while workers in rubber have a medium wage of \$7. This is according to the census of 1900.

In almost all cases it is found that for the same work women receive smaller pay than men do. The reasons for this are given by writers on economics, who have made a careful study of the subject, as "Because women cannot work so hard nor so well," "Because women can live on less than men can," and "Because it is more difficult for women to get wage-work, so they must take what work and what money they can get." One writer says that "Women do not on the average work so hard nor so well as men, so that if wages were paid with sole reference to quantity and quality of the product of labor women would get less. This inferiority in the net efficiency of women's labor is partly due to physical, partly to social causes." The result of careful investigation is the opinion—or conviction—that the work of women, in all trades where strength counts, is inferior, while there are some few branches of textile work and book-binding and, of course, other trades, such as dressmaking and millinery, in which the superior dexterity and finger-skill of the woman more than balance the inferiority in strength. In his book on "America's Working People," Charles Spahr speaks of mills in New England where women were preferred to men because of this dexterity, and for that reason the men were obliged to do the home work of the family—a condition he much deploras.

Hobson, in "The Evolution of Modern Capitalism," speaking of the textile trades in England—and, naturally, the same conclusions will apply to women in all countries—says: "Even when we take those kinds of work where skill seems least dependent upon physical force, men have generally some advantage in productivity, though a smaller one. There are cases in which this does not seem to be the case, as in the weav-

WOMEN IN THE INDUSTRIES

ing industries of Lancashire and part of Yorkshire, where women not merely receive the same piece wages, but earn weekly wages, which, after making allowances for sickness and irregularity, indicate that in quantity and quality of work they are upon a level with men.⁹

These, however, are not considered by students of the subject the sole causes of the comparative inefficiency of women. That "making allowances" quoted above is one key to the situation. That women do not, as a rule, go into their work with the same strength of purpose as men; that they are much more liable—the factory class of women, at least—to allow minor physical or social causes to make them irregular; that they more often than otherwise consider their work merely as a temporary bridge over hard times or the period of waiting until marriage makes it unnecessary,—these causes militate greatly against them as a class.

A large proportion of women in the industrial class marry young and are only working temporarily. In cases where conditions are different—in the professions or even in trades where careful training is necessary, where there is more room for pride in the work—the standard of efficiency among women is higher and there is a much nearer approach to equal pay for equal work. In America especially this is true, for, while the American young woman is not in any way averse to marriage, she does not to so great an extent consider it the aim and end of life as do her foreign cousins. More independence of spirit, fostered by the essentially American belief in the equality of the sexes, has given the average American girl the desire to be able, if necessary, to take care of herself.

More girls are trained to a profession, or at least to some possible means of livelihood, than was ever before the case. The woman who, when misfortune came, settled down to a dependent existence, looking to some male relative for support, is a thing of the past.

Statistics prove that women are more often absent from work owing to sickness and home demands than are men. That the former disadvantage under which their labor may be removed by physical training and proper exercise and by a higher standard of diet is the belief of physical culturists, and that the latter is merely a voluntary disadvantage in most cases is quite sure.

The average age at which women in the industrial class marry in America is twenty-two years, and many marry at twenty and twenty-one years, or even younger. With this prospect of early marriage the average woman has no interest in organization. It does not seem worth while to her to organize and make herself subject to union rules. Strikes might put her out of work for much of the short period of her life that she is planning to give to wage-work. This idea of matrimony in the scheme of life is, in some classes, so strong a factor that the girls choose their occupations with an eye to it. The opportunities of meeting young men and the social standing of the different trades or occupations count for much. Clerks in shops are considered most fortunate as to position, factory workers next (with certain manufacturers standing higher than others, this being usually determined by the rate of wages paid), and domestic labor lowest.

The large number of women workers in America is said by students to be due to the increased cost of necessities and the greater de-

mand for luxury in the scale of living—better homes, better clothing, better social opportunities. This increased demand gives work in the production of the articles demanded. But, on the other hand, the desire for luxuries and the rush to obtain them have their bad effect and do not show a tendency to improve the industrial position of women.

In 'The Evolution of Modern Capitalism' the author says that causes which may lead to increased employment and better pay for women are the growth of restrictions about hours, etc., imposed by the men's unions; the evolution of machinery suited to women's handling; the breakdown of prejudices excluding women from many occupations; improved transportation facilities, enabling women to take work at greater distances from home; the recognition by a growing number of women that matrimony is not the only career open to them, and that industry is more dignified than waiting.

On the other hand, women as a rule have only themselves to support. They need little, and in the stress of competition they take less wages than they should, because they need less than men. This keeps down the level of wages. "Women living at home will often work for a few shillings a week to spend in dress and amusements, utterly regardless of the fact that they may thus be setting the wage below the starvation point for those unfortunate competitors who are wholly dependent on their earnings for a living." This is said of English workers, and the same cause is working even more forcibly, perhaps, in the United States. Mrs. Van Vorst, in 'The Woman Who Toils,' claims to have found "a large proportion of girls working in factories who work merely for pin-money, or money for luxuries of dress and amusements." She says: "The men were all bread-winners; they worked because they needed the money to live; they supported entirely the woman—wife or mother—of the household who did not work. In many cases they contributed to the support of even the wage-earning females of the family; the woman who does not work when she does not need to work is provided for."

It is this writer's conclusion that there are two distinct classes of working women—those who must be self-supporting and those who work in factories in order to be more independent than at home, to meet the men and to amuse themselves and have money for dress.

In a report of a special committee appointed in New York to inquire into the condition of 100,000 families who were, in each instance, dependent on a woman's average earnings of sixty cents a day, it was stated that "the prevailing low wage, inadequate to the support of labor, is due to the fact that in the establishments employing woman labor, a great majority of the workers are only partly dependent on their earnings for a livelihood." Mrs. F. McD. Thompson, in commenting on this report, says: "So large a number as 100,000 women, by accident laboring under the necessity of earning a livelihood, were still outnumbered and had their wages fixed by the normal woman—the woman wholly or in part supported by others."

"The only industrial unit complicating the problem," Mrs. Van Vorst says, "is the girl who confessedly has all the money she needs but not all she wants."

These girls can afford to accept less than liv-

WOMEN IN THE INDUSTRIES

ing wages, and because of their independence can afford to stay away from work because of slight indisposition or a desire for amusement. Thus they give women as a class the reputation of being irregular and undependable.

Mrs. Van Vorst, as a method of removing this stumbling block from the path of the real worker, suggests the formation of classes in the industrial arts, where women who wish to work although they do not need the money may be taught. Thus their minds and tastes may be improved and at the same time they may be earning some money through the salability of their work. Lace-making, hand-weaving, embroidery, book-binding by hand, wood-carving, and such industries may be taught, and the work be carried on in their homes by the graduates of such classes, thus giving them occupation without competition with men or interference with the women who must work for living wages.

Such classes already exist at the Simmons School in Boston, and at Columbia University in New York, and Hull House in Chicago, and others are forming. Abroad, many women of wealth and influence, even royal women, have founded schools for such work among women. The lace-making schools especially are famous. All through the United States there has been, partially along this line of thought, a great revival of cottage industries. Men and women of means and artistic ability are fostering the revival of the old-time hand industries such as dyeing, hand-weaving of cloth, rug and carpet-making, basket-making, etc. Societies for increasing the knowledge of the often isolated home-workers and for encouraging them in improving their output, and also for the purpose of bringing them into touch with a market for their wares, have been started in all sections of the country, but noticeably in New England and through the mountain regions of the Southern States. Thus by those who appreciated the value of the hand-work which had so largely fallen into abeyance a market has been found for the work of these women so they can labor in their own homes and earn a good return for their labor.

Free employment agencies, under government control, have been organized in most of the cities of any size, and through these many of the old abuses, especially those connected with household work, have been mitigated. These employment agencies are instrumental also in helping men to find work at their trades, but they are most important to the women of the servant class, both native and foreign-born. The Bureau of Household Research in various cities have taken up the domestic service problem in many phases for careful study. In Boston and in other cities, training schools for house-workers have been established.

Along the industrial and commercial line, philanthropic and public-spirited women are striving to improve the working conditions of women. The Consumers' League, which has branches all over the country, has by influence and persuasive force made its rules of fair treatment for women a household word among people of the better class. Those who understand the principles for which this league is working—perfect sanitary conditions, fair wages, fair hours, justice and mercy—will buy only of houses which conform to these rules.

New York City, where the largest number of women are employed, is a fair test of the propor-

tion of women in various branches of industry. They are as follows:

In machine garment-making	46,000
In hand garment-making	15,000
In tobacco work	8,000
In printing trades	8,000
In confectionery and bakeries	4,000
In textile work	1,000
In artificial flowers, etc.	1,000
In boots and shoes	1,700
In furs and fur work	1,300
In cord and twine	1,300
In leather goods	1,000
Clerks, stenographers, etc.	25,000
In laundries	30,000

This is exclusive of the professions and household work, in which, of course, New York takes the lead also.

Factory conditions in America are, as a whole, good. They are said by experts to be ahead of the laws,—this because the cost of labor is so great here that economy is best served by giving the workers as good physical surroundings as possible. This applies to factories where women are employed as well as to those where there are only men.

The approximate number of working women in the leading States is computed as follows:

New York	679,845
Pennsylvania	451,337
Massachusetts	390,000
Illinois	294,600
Ohio	246,000
New Jersey	154,500
Missouri	154,515
Michigan	131,600
Minnesota	96,800
Wisconsin	116,000
Indiana	176,700
Maryland	88,000
Connecticut	88,000
California	87,000
Kansas	55,500
Rhode Island	52,000
Georgia	27,581

In England during the last half century the use of machinery has enormously increased, and apparently the number of employees has been proportionately reduced. The number of persons employed has really increased, but not in proportion to the increase in manufacturing, because of the added machinery which requires less hand-work. The machinery becomes, with each new improvement, more and more automatic, and male labor has been largely and rapidly displaced by female labor in some trades, especially the textile trades. In no other trade in England are women to any extent organized, but in the textile mills about 110,000 women are enrolled in the unions, while only 12,000 are enrolled of all other trades combined.

As to organization among women, the movement may be said to be well started, but as yet no great results have been accomplished. Of the 5,000,000 women workers, only about 100,000 are organized in America. The best results of the work of organizers is seen in Chicago. There, according to recent reports, 30,000 women are organized in labor unions alone and 30,000 more in unions with men. But this 60,000 represents only a small proportion of the 300,000 women engaged in gainful occupations in the State of Illinois, a large proportion of whom are located in Chicago. The unions are strong, and those which consist only of women are doing active work. There are many good organizers and speakers among the women, and the rank and file of the unions are loyal and earnest. In one

WOMEN, LEGAL AND POLITICAL STATUS

branch of garment-making, where much of the work has heretofore been done by women in their homes, often under most unsanitary conditions, the organizers have succeeded in convincing the women that the work could be done better and with better financial returns in shops and under recognized union conditions. These union women now refuse to work with young girls under sixteen years of age and refuse also to allow children of school age to be employed in any way during school hours.

The Woman's National Trade Union League, officered partly by women of the leisure class and partly by the actual workers, has branches in several of the large cities and is carrying on a vigorous campaign of organizing work and education. The League is sending out speakers to address women's club meetings, in order to persuade women of the leisure class to help their sisters of the working world to better their conditions.

ANNA P. PARREY,
of 'Harper's Bazar', New York.

Women, Legal and Political Status of. Of all the anomalies which the progress of civilization presents, none is more wonderful than the history of women. Long held as an article of barter and trade, considered even in our own time rather as something to be possessed than as capable of possessing, the sex has yet, in the persons of individuals, been beloved, honored, idealized, crowned, and worshipped. The Christian dispensation has made woman a partaker in the great things of human destiny. Modern democracy has found it impossible to exclude her from its benefits and dignities. Finally, in a country in which education has come to be recognized as the only safeguard of public institutions, the privileges of instruction have been fully secured to her, and the immunities of ignorance have ceased to be considered as her peculiar perquisite. This progress, slow in its inception, long continued to be almost imperceptible. We may even say that at the beginning of the 19th century the legal position of woman was one of passive endurance. In privileged circles and among good people this was not often nor generally realized; but where manners were rude and where the limitations of poverty were felt, wives, and daughters became painfully aware of their pitiful condition before the law. Mothers did not own their children, nor the very garments which they wore. Any money that a married woman could earn or inherit became the property of her husband, and could be taken to pay his debts. In most departments of labor, moreover, a discrimination was made against women workers, and in the few employments in which they competed with men they received for the same service a much smaller compensation. At the time referred to, and for years afterward, a married woman could neither make a will nor enter into a contract without her husband's consent. In the administration of the great interests of the community she had no part and no voice.

Mary Wollstonecraft, in the late 18th century, and Frances Wright, in the early 19th, began to agitate the theme of woman's rights. The expression became at once a synonym for all that is considered unlovely and unfeminine. The advocates of the new theory, few in num-

ber as they were, were forced into a position of social isolation, in which they were commonly supposed to seek the eccentricity which was the inevitable result of the treatment received by them at the hands of the community. After the great liberation brought in view by the teachings of Christianity, the woman-world owes its first emancipation to the Society of Friends, in which were proclaimed the spiritual equality of men and women, and the right of the latter to be recognized as teachers of religious truth. Accordingly, we find Lucretia Mott present at the memorable convention in Seneca Falls, N. Y., in 1848, the first convention held in this country for the consideration of the civil and political rights of women. In this meeting Elizabeth Cady Stanton took a prominent part. With her appeared Frederick Douglass, gifted with so just a notion of the nature of freedom as to regard it as a right of white women as well as of colored men.

The anti-slavery agitation, indeed, carried the woman question along with it in its progress. When its culmination was reached, the champions of the slave became, with few exceptions, the advocates of a freedom which should know no limits either of color or of sex. The exigencies of the Civil War brought numbers of educated women into close and sympathetic relations with each other. They found themselves constrained to act in concert for the relief of the soldiers, for field and hospital service, and for the providing of necessary comforts for the sick and wounded. From this wider outlook the women never went back. The awful experience, too, of the war suggested to them many questions not to be answered by the old methods of reasoning. Lucy Stone, a farmer's daughter, had by long and patient labor enabled herself to acquire a college education. Gifted with a pleasing presence, a beautiful voice, and great force of conviction, she turned easily from the labors against slavery and intemperance, in which she won her early laurels, to the new advocacy which was destined to metamorphose the position of woman throughout the civilized world. In her husband she found a congenial and faithful helpmate. The pair, at first resident in New Jersey, transferred their household belongings to the neighborhood of Boston, from which point they unweariedly visited every part of New England, and much of the far West, pleading everywhere, with eloquent tongues, for the civil and political enfranchisement of women. Then arose pleadings which voiced the complaint of many hearts. Reason, the supreme authority, became convinced. Women said: "It is not right that men should be the sole arbiters of our fortunes. We, as well as they, are guardians of the community. We, with them, must have a voice in its affairs."

A very important part of the advance now noticeable in the legal position of women in Massachusetts is due to the legislative hearings which have been granted to the petitioners for woman suffrage during a long period of years. These hearings naturally were occupied by the prime matters of debate. At the same time, the exposure made of the legal and economic injustice suffered by women did much to stimulate legislative action in their behalf. In the legal profession itself we had some important allies. One of the most efficient of these was the late Samuel E. Sewall, a man greatly be-

WOMEN, LEGAL AND POLITICAL STATUS

loved and honored in his day. This good friend devoted much time to the devising of bills for the amelioration of the legal condition of our sex. Among these I recall the following: A bill enabling a married woman to make a business contract with her husband; one allowing her to make such a will as she should see fit; one giving her a right to her own clothes; one securing to her the right to be buried in the burial-lot of her deceased husband; a bill for the abolition of the widow's quarantine, that is, of the law which forbids her to remain more than 40 days in the house of her deceased husband without payment of rent, the right of the husband in corresponding circumstances being without legal limit. An important measure was brought before the legislature of Massachusetts by the Home Club of East Boston, seconded by the New England Women's Club of Boston. This was a bill ordering that men who walk the streets of cities at night with evidently vicious purposes should be liable to arrest and penalty equally with women of like character and purpose. A very general interest was felt some years ago in Massachusetts regarding what is called the age of consent for young girls. This was first fixed in that State at 10 years, it has been gradually extended to 16 years, which limit was reached in 1893.

Connecticut has the credit of having been the first State which gave to married women the power to make a will. This power the State conferred by act of legislature in 1809. Ohio followed 26 years later, in 1835. In 1836, an endeavor was made by Ernestine L. Rose and Paulina Wright Davis to circulate in New York petitions for property rights for married women. They met with but little success, women and men alike deriding them. Mrs. Rose, however, addressed the legislature of Michigan, asking for the political enfranchisement of women. This is said to have been the first address given by a woman before a legislature. In the same year, Abraham Lincoln made a public declaration of his belief in the propriety of giving the franchise to women, an act which did not interfere with his election, some 24 years later, to the office of chief magistrate of the United States. In 1837, a National Female Anti-Slavery Association held a convention in the city of New York. This appears to have been an entirely new departure for the sex. Angelina Grimké, a Southern lady, who had freed her own slaves, was mobbed in Independence Hall, Philadelphia, for speaking in public against slavery. The Grimké sisters became well known as advocates both of negro emancipation and of the political rights of their own sex. Their labors and those of Abby Kelley Foster and others in behalf of women soon began to bear fruit. In the years that followed, the public conscience became more and more exercised regarding the rights that women should enjoy in a free country. Legislative hearings in their behalf multiplied, and State after State relaxed the rigor of its exclusions. In 1840, Texas gave married women the right to make a will. Alabama did likewise in 1843, Vermont in 1847. In 1848, the State of New York secured to its women the control of property. Pennsylvania added to this the power to make a will. In this year was formed the first local suffrage association, at South Bristol, N. Y.

In 1849, Virginia conceded to wives the right to make a will. Massachusetts gave both powers in 1855, Rhode Island in 1856, Maine in 1857, Wisconsin in 1859, Maryland in 1860. There remain only seven of our States in which women do not enjoy some control of their property.

It would seem that the leaven of a new faith had been working in the community from the early years of the 19th century. This leaven, as was natural, was generated in the minds of men and women eminent in the domain of literature and recognized as leaders in thought. Margaret Fuller, who was born at about this time, devoted the fulness of her remarkable powers to the advocacy of human rights, and pleaded earnestly for the enlargement of education and opportunity for her own sex. In 1852, Mrs. Stowe placed herself in the forefront of the battle against slavery, and revealed to the reading public a power not previously recognized in her sex,—that of setting whole communities aflame with indignation against one form of tyranny. In 1854, Florence Nightingale's energetic services in the Crimean war shed a new lustre upon the annals of her sex. In 1867, John Stuart Mill, eminent as a philosopher and political economist, pronounced in the English Parliament a memorable speech in favor of full suffrage for women.

To return briefly to the record of the States,—the vigorous young Territory of Wyoming, at the first session of its legislature, in 1869, granted full suffrage to women. When, 23 years later, the Territory was admitted to Statehood, its delegates insisted on maintaining in its constitution the right of women to suffrage, and, refusing to enter the Union upon any other terms, carried their point. Municipal suffrage was granted to the women of Kansas by act of legislature in 1887. Finally, but not, we hope, to conclude, Colorado in 1893, and Utah and Idaho in 1896, bestowed upon the women within their bounds suffrage full and equal to that exercised by men.

The new power of eloquence was soon displayed by women when they became persuaded that they had a cause to plead. The walls of public buildings all the country over rang with their appeals for a better administration of justice, a fairer distribution of the functions of society. Mrs. Stanton, the Rev. Antoinette Brown, Susan B. Anthony, Mrs. Mary A. Livermore, and other courageous women spoke in public for reform. Anna Dickinson electrified audiences with her stirring words. Frances Willard won great multitudes to the cause of temperance. Conventions and congresses of women were held, in which the burning questions of the day were discussed from the woman's point of view. Kansas, Wyoming, Iowa, Colorado, heard the new gospel of women's hope—heard and heeded.

The power of associated action among American women has been greatly promoted by an agency scarcely dreamed of 50 years ago,—that of the women's clubs. The time for these had come in the world's economy, and almost simultaneously in two of our leading cities appeared the New England Woman's Club of Boston and the New York Sorosis. Until that time the word "club" was commonly understood to indicate a place, more or less convenient and elegant, where the men could meet together for purposes of business, amusement, or friendly

WOMEN, NATIONAL COUNCIL OF—WOMEN'S CLUBS

intercourse. The first women's clubs were started with the view of affording their members a more sympathetic and profitable communion than that conceded by fashion. The work of these clubs was to be the study of important social questions and the earnest endeavor to promote their true solution. Their recreations were to be furnished from the resources of art and literature. One of them, the Association for the Advancement of Women, originally founded by the New York Sorosis, devoted its energies to the holding of an annual congress of women in various parts of the Union. Wherever those meetings were held numbers of women, usually held apart by personal affairs, came together to welcome the pilgrims who had journeyed from afar. The congress lasted three days, and its sessions were devoted to the discussion of the most important and timely topics. The welcome given to its members, sometimes rather dull and tardy, always warmed into grateful praise. Helpful groups of workers everywhere sprang up in its tracks. When, more than a score of years after its beginning, Sorosis issued a call for a convention of women's clubs, a multitude appeared at her bidding, and a federation of women's clubs was formed which now binds together in amity the women of our whole domain, from Maine to Louisiana, from Massachusetts to California. The results of this wide extension of intercourse between different regions of our country can hardly be overestimated. Under its influence, sectional differences lose their unfriendliness of aspect, and sympathetic accord in the pursuit of worthy objects oversweeps and harmonizes all petty and personal discords.

In the first half of the century there were some seven occupations open to women. The last report of the Commission of Labor enumerates 300 honest ways in which they may gain a livelihood. In the earlier period free speech was denied to women by the great power of public opinion. To-day, the honors and opportunities of the platform belong as fully to women as to their brothers. They are not only permitted, but urgently requested, to use their gift of eloquence in behalf of the most important questions which come before the mind of the community. The very thought of conceding to women a vote on any matter of public interest was derided as ridiculous and intolerable. They have now the right of school suffrage in 22 of our States. In four States full suffrage is secured to them; in one, municipal suffrage.

Although Massachusetts does not lead in the march of woman's political advancement, she has been a strong centre of influence in the progress of the sex. She was first to concede to women the right not only of voting in the election of the school boards, but also that of membership in that important body. The question of school suffrage was first brought forward in Boston by Abby W. May, and the New England Woman's Club, of which she was a beloved officer, was the arena in which were heard the first arguments on the subject. In this same club, one of the earliest formed in the country, many matters of public interest were presented to the consideration of a wide circle of intelligent women. Dress reform, public sanitation, improved dwellings for working people, the beneficent providing of country and seaside outings for the children of the poor—these

and other kindred topics were ably presented to the club, many of whose members became actively engaged in promoting the measures just spoken of. The present state of things leaves us much to hope and work for, but the end, albeit not attained, is yet well in sight.

JULIA WARD HOWE.

Women, National Council of, an annual council of women held in the United States, at which meetings all national societies organized for any purpose whatsoever come to hear what other national societies are doing on other lines. They counsel together as to any reform, or movement, in which all might co-operate. The council has a cabinet, and is fashioned on a plan similar to the Senate of the United States. It is self-supporting, with the aid of patrons. Twenty national societies are represented in the council; they aggregate a membership of 1,200,000 women, the largest representative organization in the world.

Women's Clubs, associations of women organized for purpose of study, recreation, or for the promotion of certain philanthropic or political ends. Organization among women in the United States has grown to enormous proportions. It is impossible to compute with any degree of accuracy the membership of women's clubs, outside the federated bodies. This result has all been accomplished in 55 years.

Suffrage Organizations.—In 1848 Elizabeth Cady Stanton and Lucretia Mott issued the first call for a national suffrage association. These two women presided and organized the association. It had been a disputed question whether any woman could, or would, be able to fill this important position, the decision ultimately being given in the affirmative, by the famous negro orator,—Frederick Douglass. Susan B. Anthony immediately joined the other two women, and from their united efforts, "Individual Clubs" were formed, until in 1903, the "Suffrage" and "Political Equality" clubs numbered 1,000, with an approximated membership of 25,000. Their aim as expressed in their platform being to "promote the educational, intellectual, legal and political equality of woman, especially the right of suffrage."

From authentic records it has lately been proven that in 1859 Miss Constance Faunt Lee Roy founded the Minerva, a Woman's Literary Club at New Harmony, Ind. But to Sorosis (q.v.) belongs the honor of being the first permanent women's club organized, and remaining in existence uninterruptedly to the present time.

Sorosis.—In 1867 the Press Club of New York gave a dinner to Charles Dickens. A number of women who were either actively engaged in literary work, or connected with it in some manner, asked if they could be present at the dinner. It was ruled that they could not, although eventually a compromise was arranged and a few women attended the dinner—in some irregular way, probably as spectators in the gallery. Saint Valentine's Eve 1868 found many of these same women present at the residence of Mrs. Charlotte Wilbour. All expressed their indignation regarding the Dickens Dinner incident, when some brave soul hazarded the question—"Why can not we have a club of our own?" This chance remark was greeted with hearty enthusiasm and instant acceptance, and led to an organization formed by

WOMEN'S CLUBS

32 venturesome women, which terminated in the "Mother Club," Sorosis. The priority of this club is disputed by the "Boston Woman's Club," formed about the same time, but the Boston organization admitted men either as honorary or complimentary members. There had been societies both philanthropic and charitable, usually auxiliary to some male society. Nor were the "Suffragists" all women in their formation. Sorosis was the first woman's club founded exclusively by and for women. The chairman or temporary president was Alice Cary, who presided at one meeting only. Succeeding her as temporary president was Jennie June Croly. It was in 1870 that the first duly balloted for and elected president was placed in office, Mrs. Charlotte Wilbour, who served for five consecutive years, and in 1903 was again elected president, after an interval of 28 years. Sorosis sent in 1873 "a little messenger" to prominent women throughout the whole world, calling together a "congress of women." This act received the commendation of thousands of women, including nearly all the reigning queens. This congress was held in New York at the Union Square Theatre, and formed an "Association for the Advancement of Women," which held congresses annually in various parts of the country, until it was superseded by the General Federation of Women's Clubs.

General Federation of Women's Clubs.—This organization was formed at a meeting called by Sorosis in New York, March 1889. On the same date Sorosis reached its majority, and celebrated its 21st birthday. The Federation was designed to bring in closer touch clubs from all over the country. Its by-laws read:

The General Federation shall consist of Women's Clubs, State Federations, Territorial Federations, National Societies, and kindred organizations, the two latter to be admitted on the basis of individual clubs. Its meetings shall take place every two years, beginning in 1892. The place and date of meeting shall be decided by the Board of Directors. The annual dues for clubs shall be at the rate of 10 cents per capita. The annual dues for State Federations shall be at the rate of 25 cents per club. The annual dues for each local Federation of Clubs shall be at the rate of \$1 per club. Dues shall be paid annually the first of May, beginning with 1900.

Soon after the formation of the General Federation, the different States began to agitate the question of State federations. The first one to organize being Maine, 4 Sept. 1892. The other States rapidly fell into line, until now the General Federation consists of 39 State federations. These State federations are in turn composed of 3,516 clubs with a total membership of 291,000. Beside this there is an independent list made up of 800 individual clubs with membership of 60,750, giving the General Federation a total representation of 251,750 women. Many of the clubs have also formal county and city federations, and there are councils of various sorts too numerous to specify. Federating has in fact become the order of the day.

State Organizations.—The clubs of Arizona are devoted to literature, household economics, philanthropy, art, music, forestry and manual training. In Arkansas the clubs belong to the departmental study class, the largest organizations being the *Æsthetic Club* and the *Co-operative Club* of Little Rock, and the *Pacaba* of Helena. The subjects occupying the clubs of California are California history and landmarks, libraries and "portfolios," civics, house-

hold economics, education, forestry, and the usual departmental work. The largest clubs are the California Club of San Francisco and the Oakland Club. In Connecticut the largest clubs are the Woman's Club of Ansonia (278 members) and the Woman's Club of Waterbury (250). In Florida eight of the clubs represent the village improvement idea. They have accomplished a large amount of work in building shell roads, planting shade trees and beautifying the cemeteries. The Palmetto Club of Daytona maintains a kindergarten and day nursery for negro children. The largest club is "The Woman's Club" of Jacksonville with 120 members. In Georgia the federation committees represent the following departments: Education, music, social service and reform, industries, arts and crafts, village improvement, law-library. The Federation owns one traveling library. The village improvement and garden committee has accomplished a great deal in beautifying the streets, parks, school buildings, cemeteries and driveways of the State. Illinois is next to New York in the total number of women represented in federated State Clubs. The largest membership is found in the Chicago Teachers' Club with 3,378 members, and Chicago Woman's Club, 916. A school of Domestic Arts and Science has been established in Chicago, as also cooking classes in the public schools and dress-making in the vacation schools. Art has been promoted throughout the State by means of eight traveling picture galleries of photographs. There are 225 traveling libraries which are loaned to clubs for a period of six months. Philanthropy has been active in the establishment of a colony for the 10,000 epileptics of the State. Indiana's largest clubs are the Progress Club of South Bend, the Woman's of Indianapolis, the Century and Over the Teacups of Greencastle. The Woman's Club of Greencastle is the oldest in the State, having been organized in 1874, but it does not belong to the State Federation. All the clubs belong to the department study class. In Iowa the Dubuque Woman's Club is the oldest club, having been formed in 1876. The most prominent is the Des Moines Woman's Club, with its membership of 335. The Iowa State federation claims the honor of being the first to join the General Federation. Clubs of Iowa belong to the departmental study class, their special lines of work being village improvement, art in public schools, domestic science, child study, and development of the library system. The Kansas State Social Science Federation was organized in 1895. The largest clubs are the Hutchinson Woman's Club with 150 members and the Leavenworth Art League, 108 maintaining an art school. The clubs are all working in the department study line and are divided up into many small district federations. The Ladies' Library Association of Independence supports a public library of 3,000 volumes. The Woman's Club of Central Kentucky, in Lexington, the Woman's Club of Louisville and the Louisville Alumnae Club are of equal prominence in Kentucky. The Woman's Emergency Club of Louisville has the largest membership, 3,000. The 46 clubs of the State are devoted to a variety of objects,—art, literature, economics, current events, history, education, civics, music, child study and philanthropy. Social settlement in the Kentucky Mountains is a most important club work. The Maine State Federation

WOMEN'S CLUBS

was organized September 1892, being the first State Federation formed. The largest club is the Literary Union of Portland 632 members, which has introduced manual training and cooking in the public schools. The federation has secured legislation favorable to forestry; also an appropriation for a chair of forestry in the University of Maine, and has established many libraries. All Maine clubs belong to the study class, with two exceptions, the Mount Holyoke Alumnae Association, and the Education Industrial Union of Saco. In Maryland the largest clubs are the Arundel and the Council of Jewish Women, both of Baltimore, and having 400 members each. Federation clubs have established traveling libraries and free kindergartens. There are four clubs formed of alumnae, one for mothers, others that represent village improvement, art, philanthropic and literary interests; a Teachers' Educational Union and a Press Association. Michigan has county and city federations. Her largest clubs are the Twentieth Century of Detroit, Ladies' Literary of Grand Rapids, Woman's League of Battle Creek, and Ladies' Library Association of Kalamazoo. In Minnesota the largest clubs are the Twentieth Century Club of Duluth, Improvement League, Ladies' Thursday Musical and Teachers' Club, all of Minneapolis; and the Saint Anthony's Park Association, Grade Teachers Association and Schubert Club, all of Saint Paul. The club known as the Territorial Pioneers, of the same city, has secured a State park or forest reserve of 12,000 acres, and 200,000 acres pine land to be cut under forestry regulations; and has a yearly appropriation from the State for a State art society, also an appropriation of \$6,000 yearly for a State traveling library. Of the Minnesota clubs, 188 can be classed as study clubs. In addition to those mentioned there are three clubs devoted to civics, the Women's Auxiliary to the State Horticultural Society and the Winnebago Woman's Club. The most prominent clubs of Missouri are: Wednesday Club, Sisseton; The Athenaeum, Kansas City; Woman's Club, Marshall; Tuesday Club, Saint Louis; Woman's Club, Boonville; Domestic Science Club, Chillicothe, Tuesday Club, Columbia; Women's Club, Hannibal; Emerson Club, Joplin, Runcie Club, Saint Joseph; Shakespeare Club, Lebanon; Sorosis, Sedalia; Ladies' Saturday Club, Springfield; Monday Club, Webster Groves. The clubs all belong to the departmental study class. Their special work is represented by a large number of traveling libraries, vacation schools and playgrounds, with one art exhibition gallery. In Nebraska the largest clubs are the Woman's Club of Omaha with 426 members, and the Woman's Club of Lincoln, 695. The clubs of Nebraska have built up many free libraries, both stationary and traveling, and have also successfully run the Pingree Seed Garden for supplying free seed to the poor. The clubs of this State belong to the miscellaneous study class. In New Hampshire the largest club membership is found in the Woman's of Concord with 275 members; Nashaway of Nashua, 200; and New Hampshire Audubon Society of Manchester, 200. The departmental study class includes nearly all clubs in the State. The New Jersey State Federation was organized in 1894. There are 96 clubs with a total membership of 10,000. Although the State of New York is exceeded by two other States in the

number of clubs, yet it leads in the total number of women represented, 30,000. The largest clubs are the Alumnae of the Normal College, New York, with 1,750 members, and Kings County Political Equality League of Brooklyn, 1,100. New York's clubs are greatly diversified in character. Alumnae and college associations number 22; clubs devoted to civics, including the Health Protective, 11; child study and mothers' clubs, 6; professional clubs, 7; suffrage and political equality clubs, 6; patriotic, 4; educational and industrial, 9; library, 2; hospital associations, 3; ethical culture, single tax, parliamentary, civil service, diet, kitchen, reform, prevention of cruelty to animals, one club each. There are three Republican clubs. The remainder are the usual departmental and study clubs. Special federative work has been directed toward establishing a State industrial school for girls. The North Dakota State Federation embraces 41 study clubs; total membership 800. The Pioneer Club of Grand Forks is the oldest in the State. The strongest clubs, numerically speaking, in the State of Ohio are Cincinnati Woman's Club, 384 members, Woman's Century, Dayton, 325; Woman's Educational, Toledo, 252; Cleveland Sorosis, 207. Excepting the Cincinnati Educational League, Dayton Kindergarten, and the Faculty Club of the Ohio Wesleyan University, the clubs of the State belong to the departmental study class. They have aided in establishing libraries of which there are nearly 1,000 Traveling Libraries alone, in procuring lectures and pictures for the public schools. Through co-operation they have accomplished the establishment of two State normal schools, as well as many cooking and vacation schools, and playgrounds. The clubs of Oregon are devoted to the interests of education, library, domestic service, legislation, civics. The largest club is the Council of Jewish Women; the oldest, the Thursday Afternoon Club, of Pendleton. In Pennsylvania the largest clubs are the Alumnae Association of Girls' High and Normal Schools, membership 16,000; New Century, 600; Civic Club, 600; all of Philadelphia. The clubs of the federation devoted to literature, libraries, civics, art, domestic science, music, woman's suffrage, education, press, religion and philanthropy, sanitation, free kindergarten, village improvement and study. The Rhode Island State Federation was organized in 1896. It has 17 clubs with a total membership of 1,487. In South Carolina the largest club is the Greenville Alumnae with 443 members. Forty clubs are devoted to such subjects as literature, art, music, history, libraries; four clubs represent kindergarten interests. There is a Civic Club at Charleston. There is one club for child study and one for charity. Among others are the Park Association, Hospital Association, Intercollegiate Club and Alumnae Club. The South Dakota State Federation, organized January 1900, has 30 clubs. The Round Table Club of Deadwood organized the circulating library, that has since become the Deadwood Public Library. Tennessee has 37 clubs, the largest being The Nineteenth Century Club of Memphis with 200 members, and the Oasoli Circle of Knoxville, which has the distinction of being the oldest club south of the Ohio River. The State Federation owns or controls 55 libraries. Texas has 77 clubs, two are devoted to civics and three to kindergartens. There are 70

WOMEN'S CLUBS

Study Clubs, a Public School Art League and a Schubert Choral. The largest clubs are the Woman's Club of San Antonio, and the Woman's Temple. Over \$2,000 has been raised as a loan fund to aid talented young women, whom poverty would otherwise debar, in taking a course at the State University. In Vermont there are 27 clubs. The largest is the Woman's Club of Saint Johnsbury with 216 members.

National Organizations.—The National Clubs are the Daughters of the American Revolution, Daughters of the Revolution, Society of the Colonial Daughters of the 17th Century, and United States Daughters of 1812, organized "To perpetuate among their descendants the memory of those brave and hardy men who assisted in establishing the Colonies of America, and imperilled their lives and interests in the various colonial wars from May 1607, to December, 1699"; "To perpetuate the memory of the spirit of the men and women who achieved American Independence, to commemorate the heroes of the War of 1812, and to foster true patriotism and to aid in securing for mankind all the blessings of liberty." The activities of National Societies include the acquisition and protection of historical spots and the erection of monuments; the encouragement of historical research, the preservation of documents and relics, etc. They also encourage the celebration of patriotic anniversaries, and innumerable fine monuments, bronze tablets, and other memorials, are constantly voicing the patient labor of those tireless descendants of our former heroes and martyrs.

Individual Clubs.—Women's clubs are greatly diversified in their aims. The larger number belong to the social and literary study class, having departments devoted to history, travel, literature, art, music, civics, household economics, current events and kindred subjects. Besides these there are many clubs of the "health protective" class which co-operate with the boards of health of different cities. To this class are allied the village improvement clubs, which are devoted to municipal improvement. There are the purely civic clubs as well, and those of household economics, orders that strive to awaken interest in scientific knowledge of foods, fuel, clothing and sanitation. Societies for the study of child nature, societies of industrial art, art clubs, music clubs, parliamentary clubs,—all belong to the study class. Alumni associations are formed from the graduates of colleges, institutes, academies and seminaries. "To unite graduates for their mutual benefit, to preserve the pleasant relations formed during college life, and advance the cause of education among women." Kindergarten clubs have furthered that good work. Library clubs have built up free libraries. In the South and West traveling libraries have been established, doing a tremendous work toward free education. Professional clubs include many associations of teachers, nurses, lawyers and women of other professions. Press clubs, for members of the literary profession are in all large cities, and are justly popular. The Professional Woman's League (q.v.) of New York, one of the strongest clubs of this class, was organized in December 1892 for the benefit of members of the dramatic, musical and literary professions. It is a distinctive society in that it loans money to its members when sickness or sudden calamity overtakes them. It earned great commendation by

producing the Woman's Exhibition in 1902. The membership is 500. The Kanatenah of Syracuse, N. Y., is a business club with social features. There are very many clubs of working women all devoted to improvement and the better education of members. To this class belong the educational and industrial unions. The Woman's Christian Temperance Union (q.v.) is a large active body, doing the work its name implies.

The International Sunshine Society, founded by Mrs. Cynthia Westover Alden, 1896, and incorporated 8 March 1900, has for its object: "To incite its members to the performance of kind and helpful deeds, and to thus bring the sunshine of happiness into the greatest possible number of hearts and homes." This is the largest individual club in the country, although it might be classed in the line of federations, as it has branches all over the United States, and a few in other parts of the world. The estimated membership is 250,000.

Negro Women's Clubs.—The National Association of Colored Women was organized in 1894. Its motto is "Lifting as we Climb." It numbers 165 clubs. The Northeastern Federation with 55 clubs, and the Southern Federation numbering 40 clubs, are active members of the national body, the balance being individual clubs. The association meets biennially.

State Federations.—In 1903 a circular letter was sent to the president of every State Federation. In several instances no replies have been received. Therefore failure of representation in this list of Federated clubs is due to the fault of the presidents of the omitted Federations:

State Federations	Date of organization	Number of clubs	Total number women represented
Arizona	1901	8	250
Arkansas	1897	74	3,150
California	1900	196	2,450
Colorado	1893	108	4,700
Connecticut	1897	31	3,094
Delaware	1898	72	1,100
District of Columbia	1894	12	7,000
Florida	1893	34	500
Georgia	1890	51	3,000
Illinois	1894	344	23,737
Indiana	1900	47	1,490
Iowa	1893	201	10,500
Kansas	1893	110	6,000
Kentucky	1894	46	4,719
Louisiana	1902	12	500
Maine	1892	104	4,223
Maryland	1900	29	2,700
Massachusetts	1894	185	23,000
Michigan	1893	140	15,000
Minnesota	1893	193	8,000
Missouri	1893	114	5,000
Nebraska	1894	108	4,000
New Hampshire	1893	62	4,091
New Jersey	1894	96	10,000
New York	1894	201	30,000
North Dakota	1897	41	800
Ohio	1894	301	11,000
Oklahoma and Indian Territories	1898	60	1,500
Oregon	1899	86	1,000
Pennsylvania	1893	122	12,000
Rhode Island	1893	17	1,487
South Carolina	1898	39	2,000
South Dakota	1900	30	650
Tennessee	1896	34	1,000
Texas	1897	77	4,200
Utah	1893	28	1,000
Vermont	1890	27	1,357
Washington	1896	65	1,400
Wisconsin	1896	150	3,500
Total		3,535	228,036

Mrs. Edwin Knowles,
Professional Woman's League, New York.

WOMEN'S CLUBS — WOOD

Women's Clubs, General Federation of, an organization incorporated in the United States in 1892, and composed of over 2,675 women's clubs, having a membership of 155,000 women in the United States and foreign countries. The purpose of the federation is declared in its articles of incorporation to be "to bring into communication with one another the various women's clubs throughout the world, that they may compare methods of work and become mutually helpful. Constitutions of clubs applying for membership should show that no sectarianism or political test is required, and, while the distinctively humanitarian movements may be recognized, their chief purpose is not philanthropic nor technical, but social, literary, artistic, or scientific culture." Meetings of the federation are held biennially. There are 37 State federations auxiliary to the General Federation, and 683 single clubs in 41 States. See **WOMEN'S CLUBS**.

Women's Home Missionary Society. See **METHODISM IN AMERICA**.

Women's Rights is the term applied to the claims, made on behalf of women, to a legal, political, educational, and social status equal to that of men. The modern movement in this direction dates from about 1848, having begun in the United States. Notwithstanding the ridicule which assailed its early advocates, the claims of women have been largely recognized in more recent legislation in Great Britain and British colonies, as well as in America. In 5 States of the Union, Colorado, Idaho, Utah, Wyoming and Washington, women have been admitted to the franchise, Washington having passed the amendment in 1910. The campaign for equal suffrage is being waged more quietly and successfully in this country than abroad, where much trouble has resulted, especially in Great Britain. See **WOMEN, LEGAL AND POLITICAL STATUS OF**.

Woo'chang, China. See **WU-CHANG**.

Wood, wüd, Alexander, Scottish physician: b. Cupar, Fife, 10 Dec. 1817; d. Edinburgh 26 Feb. 1884. He was graduated from Edinburgh University with the degree of M.D. in 1839, and shortly afterward became one of the medical officers at the Royal College Dispensary in Edinburgh. He was one of the most prominent members of the Royal College of Physicians and Surgeons there, being president of that organization in 1858-61, and representing it in the general medical college in 1858-74. His most important contribution to the practice of medicine was the introduction of the use of the hypodermic syringe for administering drugs; this he first brought into notice by the publication of a pamphlet in 1855, entitled 'New Method of Treating Neuralgia by the Direct Application of Opiates to the Painful Points.' In addition to the pamphlet mentioned he wrote 'What is Mesmerism' (1851); 'Smallpox in Scotland' (1860); 'Preliminary Education' (1868).

Wood, Anthony, English antiquary and biographer: b. Oxford 17 Dec. 1632; d. there 29 Nov. 1695. He was educated at Merton College, Oxford, and gave his life mainly to matters connected with the history of the university. His researches resulted in his 'History and Antiquities of the University of Oxford' (1674). It was written in English; but

as it was thought proper that it should appear in Latin for the information of foreigners, it was translated into that language under the inspection of Dr. Fell, and published at the Oxford Press, as 'Historia et Antiquitates Universitatis Oxoniensis.' Wood's 'Survey of the Antiquities of the City of Oxford' was edited by Clark in 1889-99. In 1691-2 appeared his 'Athenæ Oxonienses,' an account in English of the writers and bishops educated at Oxford from 1500 to 1690, but for his criticisms of the Earl of Clarendon in this work he was expelled from Oxford. The English edition of his first work appeared as 'History and Antiquities of the Colleges and Halls in the University of Oxford' (1786-90), and 'History and Antiquities of the University of Oxford' (1792-6). The Oxford Historical Society published an edition of his autobiography and diaries by Clark in 1891-1901.

Wood, De Volson, American engineer: b. Smyrna, N. Y., 1 June 1832; d. Hoboken, N. J., 27 June 1897. He was graduated from the Rensselaer Polytechnic Institute, Troy, N. Y., in 1857, was professor of civil engineering in the University of Michigan, 1857-72, professor of mathematics in the Stevens Institute of Technology at Hoboken, 1872-85, and from the last named date professor of engineering there. Among valuable inventions by him may be mentioned a steam pump, pneumatic rock drill, and an air compressor. He published: 'Resistance of Materials' (1871); 'Bridges and Roofs' (1873); 'Co-ordinate Geometry' (1879); 'Reaction Motors'; etc.

Wood, Edward Stickney, American chemist: b. Cambridge, Mass., 28 April 1846; d. Pocasset, Mass., 11 July 1905. He was graduated from Harvard in 1867 and obtained his medical degree in 1871. He was assistant professor of chemistry in the Medical School 1871-6, and full professor there from 1876. He has published a translation of Neubauer and Vogel's 'Analysis of Urine' (1879); and was an expert on all matters relating to poisons. After 1873 he has been chemist of the Massachusetts General Hospital.

Wood, Eliezer Derby, American soldier: b. New York 1783; d. Fort Erie, Ont., 13 Sept. 1814. He was graduated from West Point in 1806 and in the second war with England conducted the defense of Fort Meigs in 1813, and was brevetted major for gallantry. He participated in the battle of Niagara on Lundy's Lane, 26 July 1814, and was brevetted lieutenant-colonel. In the sortie of 13 September he fell at the head of his command. A monument to his memory was erected at West Point.

Wood, Ellen Price, English novelist, best known as Mrs. HENRY WOOD: b. Worcester 17 Jan. 1814, d. London 10 Feb. 1887. In 1834 she married Henry Wood, a member of a banking and shipping firm, and from then till 1836 lived in France. She began her literary career by contributing to 'Bentley's Miscellany' and the 'New Monthly Magazine,' and in the ingenuity of her plots excelled all her English contemporaries. Her books are not sensational in the ordinary acceptation of the term, and display beside remarkable constructive skill, not a little keen character drawing and descriptive power. They have been widely circulated both in this country and England and among them

WOOD

are: 'East Lynne' (1861), which has had an enormous success both as a book and a drama, and still continues as popular as ever; 'Mrs. Halliburton's Troubles' (1862); 'The Channings', which is a most entertaining study of schoolboy life (1862); 'The Shadow of Ashlydyat' (1863); 'A Life's Secret' (1867); 'Roland Yorke' (1869), a continuation of 'The Channings'; 'Dense Hollow' (1871); 'Within the Maze' (1872); 'Edina' (1876); 'Pomeroy Abbey' (1878); 'Court Netherleigh' (1881); 'The House of Halliwell' (1890); and the 'Johnnie Ludlow Stories' (1874-80). Consult 'Memorials' by her son (1894).

Wood, Sir Evelyn, English general: b. Cressing, Essex, 9 Feb. 1838. He was educated at Marlborough College and joined the navy in 1852. During the Crimean war he served in the Naval Brigade, and was severely wounded while carrying a scaling ladder to the redan. In 1855 he entered the army as cornet, in 1858 served in India as a brigade-major and gained the Victoria Cross for conspicuous valor, in 1860. In 1873 he served in the Ashantee war, and on his return from this campaign was called to the bar at the Middle Temple (1874). He served in the Zulu war of 1879 and was promoted to the rank of brigadier-general after his victory at Kambula. He was second in command of the British forces in the brief Transvaal war of 1881, and in 1882 went to Egypt as commander-in-chief or sirdar. In 1893 he became quartermaster-general to the forces, and held that position till his appointment in 1897 to the office of adjutant-general to the forces. He has published: 'The Crimea in 1854' (1894); 'Cavalry at Waterloo' (1896); 'Cavalry Achievements.' Consult 'Life' by Williams (1892).

Wood, Fernando, American politician: b. Philadelphia 14 June 1812; d. Washington, D. C., 14 Feb. 1881. In 1820 he removed to New York, where he was educated, and entered business as a shipping merchant. He early became identified with political organizations, and was active as campaign writer and orator. He was elected to Congress in 1840 on the Democratic ticket, serving one term. In 1850 he retired from business and in that year was the Tammany candidate for mayor of New York, but was defeated. As candidate of the same organization in 1854 he was elected mayor of New York, introduced various reforms and was re-elected in 1856 almost without opposition. Discussion in the organization led him and his followers to form a rival body called Mozart Hall. He was the unsuccessful candidate for mayor of this organization in 1858, but in 1860 was a third time elected mayor in opposition to both Republican and Tammany candidates. In 1861, when secession was under discussion, he recommended that New York should secede and become an independent city. He was elected to Congress in 1863 and 1867.

Wood, George, American author: b. Newburyport, Mass., 1799; d. Saratoga, N. Y., 24 Aug. 1870. He was clerk in the War Department (1819-22), and afterward chief of a division in the United States Treasury Department. He published: 'Peter Schlemihl in America' (1848); 'The Modern Pilgrim' (1855); 'Marrying Too Late' (1856); 'Future Life' (1858), republished as 'The Gate Wide Open.'

Wood, George Bacon, American physician: b. Greenwich, N. J., 13 March 1797; d. Philadelphia, Pa., 30 March 1870. He was graduated from the University of Pennsylvania in 1815 and from its medical department in 1818, and was professor of chemistry at the Philadelphia College of Pharmacy 1822-31, and of materia medica there 1831-5. He held the chair of materia medica at the University of Pennsylvania 1835-50, and of the theory and practice of medicine there 1850-60, endowing an auxiliary faculty of medicine in the university in 1865. He published 'Treatise on the Practice of Medicine' (1847); 'Therapeutics and Pharmacology' (1856); and with Franklin Bache prepared 'The Dispensatory of the United States' (1833, 17th ed. 1894).

Wood, Henry, American author: b. Barre, Vt., 16 Jan. 1834; d. 29 March 1909. He graduated from a commercial college in 1854 and published: 'Natural Law in the Business World' (1887); 'Edward Burton,' a novel (1890); 'God's Image in Man' (1892); 'Ideal Suggestions' (1893); 'The Political Economy of Humanism' (1901); 'The Symphony of Life' (1901); etc.

Wood, Mrs. Henry. See **WOOD, ELLEN PRICE.**

Wood, Horatio Curtis, American physician: b. Philadelphia, Pa., 13 Jan. 1841. He was graduated in medicine from the University of Pennsylvania in 1862, and was professor of medical botany there 1866-76, and clerical professor of diseases of the nervous system since the last named date. In addition to many professional papers he is the author of 'Thermic Fever' (1872); 'Physiological Therapeutics' (1874, 9th ed. 1894); 'A Study of Fever' (1875); 'Nervous Diseases and their Diagnosis' (1881); 'Syphilis of the Nervous System' (1889).

Wood, James Frederick, American Roman Catholic prelate: b. Philadelphia, Pa., 27 April 1813; d. there 20 June 1883. He was educated in England and on returning to the United States entered the banking business. In 1836 he went to Rome to study for the priesthood and after his ordination in 1844 became an assistant rector of the cathedral at Cincinnati, and afterward pastor of St. Patrick's Church. In 1857 he became bishop of Philadelphia, where he completed the magnificent cathedral in Logan Square. He also established at Overbrook the Seminary of St. Charles Borromeo. He was created archbishop in 1875. He was especially opposed to the introduction of political issues from other countries to the United States.

Wood, John George, English naturalist and Anglican clergyman: b. London 21 July 1827; d. Coventry, Warwickshire, 3 March 1889. He was graduated from Merton College, Oxford, in 1848, and took orders in the English Church. In 1856-62 he was chaplain to St. Bartholomew's Hospital, in 1858-63 a reader at Christ Church, Newgate Street, and for seven years from 1869 conducted the festivals of the Canterbury Diocesan Choral Union. During 1879-88 he delivered numerous lectures on natural history in Great Britain and America. His numerous works contributed very greatly to popularize natural history. Among them are: 'The Illustrated Natural History' (1851); 'Bees' (1853); 'Common Objects of the Sea-

WOOD

Shore' (1857); 'Common Objects of the Country' (1858); 'Routledge's Illustrated Natural History' (1859-63), his most important work; 'Common Objects of the Microscope' (1861); 'Our Garden Friends and Foes' (1863); 'Homes Without Hands' (1864-5); 'Common Shells of the Sea-Shore' (1865); 'Fresh and Salt Water Aquarium' (1868); 'Natural History of Man' (1868-70); 'Bible Animals' (1869-71); 'Insects at Home' (1871-2); 'Insects Abroad' (1874); 'Man and Beast: Here and Hereafter' (1874); 'Field Naturalist's Handbook' (1879-80); 'Half-Hours in Field and Forest' (1884); 'Half-Hours with a Naturalist' (1885); 'Romance of Animal Life' (1887). Consult 'Life' by his son (1890).

Wood, John Seymour, American lawyer: b. Attica, N. Y., 1 Oct. 1853. He was graduated at Yale in 1874 and at Columbia Law School. He was editor of the 'Bachelor of Arts Magazine' (1896-8), and has published: 'Gramercy Park: A Story of New York' (1892); 'A Daughter of Venice' (1892); 'College Days' (1895); 'A Coin of Vantage' (1896); 'Yale Yarns' (1897); 'An Old Bean, and Other Stories'; etc.

Wood, Leonard, American soldier and administrator: b. Winchester, N. H., 9 Oct. 1860. He was graduated at the Harvard Medical School in 1884, and in 1885 became a contract-surgeon in the United States army. In 1886, as first lieutenant and assistant surgeon, he served in the campaign against Geronimo. When the war with Spain began, in 1898, with Theodore Roosevelt, he organized the 'Rough Riders,' and was made colonel of the regiment, which he commanded at Las Guasimas. At the battle of San Juan Hill he led a brigade; was commissioned a brigadier-general of volunteers 8 July 1898; promoted major-general 8 December; and on 4 Feb. 1901 was made brigadier-general in the regular army. In July 1898, after the surrender of Santiago, he was placed in command of the city, and was military governor of Santiago until December 1899, when he succeeded Gen. Brooke as military governor of Cuba, and continued in that position until the withdrawal of the United States from the island in May 1902. In 1903 he was assigned to the command of a division of the army in the Philippines and made military commander and civil governor of the Sulu Archipelago. In the same year he was nominated for a major-generalship in the regular army. When he took charge in Santiago sanitary and social conditions throughout the province were bad beyond description, yellow fever and other infectious diseases being prevalent, food scarce, and demoralization general. By his vigorous administration he soon brought about marvellous improvement. Infectious material was destroyed, cleanliness secured, drainage and water supply provided, yellow fever quickly and, as is believed, permanently banished, the death-rate greatly lowered, order and efficient government established, and public schools introduced. When Gen. Wood ended his work in Cuba the schools numbered nearly 4,000, with as many teachers (mostly native), an enrolment of over 250,000, and a daily attendance of 140,000; and the reforms accomplished in Santiago had been extended to Havana and to other parts of the island. The laws were revised, the judiciary reorganized,

charities and corrections better administered, public works remodeled, police discipline secured, and fit election laws and methods adopted. The government of Gen. Wood was military only in name, and his sanitary, civil, and social reforms prepared the Cuban people for the orderly self-government which the island now enjoys.

After the nomination of Wood for major-general in the regular army a storm of protest was raised in the public press of the United States, mainly on the ground of his alleged want of military training and experience and that the promotion was made over the heads of veteran officers and through personal and political influence. Grave charges were also made against his conduct in Cuba, and when the question of his confirmation as major-general came before the Senate these were investigated by that body, and his nomination was finally confirmed. General Wood was in command of the division of the Philippines 1906-8 and since 1908 has commanded the department of the east, Consult: 'Cuba: Civil Report of Gen. Wood' (1901); his article, 'The Military Government of Cuba' in 'Annals of the American Academy of Political and Social Science,' Vol. XXI., No. 2 (1903); Baker, Gen. Leonard Wood, in 'McClure's Magazine,' Vol. XIV., pp. 368-79 (1900); and 'The Outlook,' 2 Jan. 1904, 'The Case of Gen. Wood.'

Wood, Thomas John, American soldier: b. Munfordville, Ky., 25 Sept. 1823; d. Dayton, Ohio, 25 Feb. 1906. He was graduated from West Point in 1845, served under Gen. Taylor in the Mexican War, and was on frontier duty in Texas 1849-55. At the outbreak of the Civil War he was promoted lieutenant-colonel in the Federal army, and later brigadier-general of volunteers. He commanded a division at Shiloh and Corinth and also at Chickamauga and Missionary Ridge, and for gallantry at the latter engagement was brevetted brigadier-general. He commanded the Fourth corps at Nashville and for his services there was brevetted major-general in 1865. In June 1868 he was retired from the service.

Wood, Thomas Waterman, American artist: b. Montpelier, Vt., 12 Nov. 1823; d. New York 1902. He studied art in Boston in 1848, afterward continuing his studies in Europe. In Düsseldorf he was the pupil of Hans Gude. He was well known as a portrait painter and for several years traveled about the country in this capacity, finally settling in New York in 1866. After removing to New York Mr. Wood devoted himself almost entirely to genre painting, in which he chose familiar subjects in American life. He became a member of the National Academy in 1871, and from 1878-87 was president of the American Water Color Society. He was president of the National Academy of Design from 1891 to 1899. He also was one of the founders of the New York Etching Club, and was a regular contributor to its exhibitions, most of his etching being after his own paintings. Three of Mr. Wood's paintings, 'The Contraband,' 'Recruit,' and 'Veteran,' exhibited at the Academy of Design in 1867, now are among the pictures at the Metropolitan Museum of Art. Many of his portraits are in the Chamber of Commerce col-

lection. During the last decade Mr. Wood visited Europe three times, copying the best masters in London, Paris, Saint Petersburg, and Cassel, giving especial attention to Rembrandt and Murillo. With these copies and with original works of his own he founded the Wood Art Museum in his native town.

Wood, Walter, English author: b. Bradford, Yorkshire, 10 March 1866. He was for 10 years attached to the staff of the *Yorkshire Daily Observer* and has published 'Barrack and Battlefield' (1897); 'Famous British Warships and Their Commanders' (1897); 'With the Flag at Sea' (1901); 'Wellington's Dispatches' (1902); etc.

Wood, Walter Abbot, American inventor: b. Mason, N. H., 23 Oct. 1815; d. Hoosick Falls, N. Y., 15 Jan. 1892. Having early given his attention to the improvement of farming implements, he in 1850 introduced the Mauny harvesting machine with original improvements. He continued to improve mowers and reapers and in 1884 disposed of 48,300 machines. His inventions were covered by about 30 patents, and he was awarded first prizes at the World's Fair in Paris in 1867, in Vienna in 1873, in Philadelphia in 1876, and in Paris in 1878.

Wood, William, English colonist in America: b. about 1580; d. Sandwich, Mass., 1639. He came to America in 1629, returned to England in 1633, but not long after again sailed for Massachusetts, where he settled first at Lynn, which he represented in the General Court in 1636, and afterward (1637) at Sandwich, of which he became town-clerk. In 1634 he published in London 'New England's Prospect,' the first printed account of Massachusetts. The perfect copies extant contain a map of the region. The prose narrative is interspersed with rimed descriptions of natural history. This curious work was reprinted in 1764 (Boston) and 1865 (also Boston; Prince Society).

Wood-Allen, Mary, American physician: b. Delta, Ohio, 19 Oct. 1841; d. 2 Jan. 1908. She was graduated at the Ohio Wesleyan University in 1861, and at the Medical Department of the University of Michigan in 1875. She practiced medicine for a time in Newark, N. J., and later removed to Ann Arbor, Mich. She published: 'Man Wonderful in House Beautiful' (1883); 'Teaching Truth' (1892); 'Child Confidence Rewarded' (1893); 'Marvels of Our Bodily Dwellings' (1896); 'Almost a Man' (1896); 'Almost a Woman' (1897); 'Baby's Firsts' (1898); 'What a Young Woman Ought to Know' (1898); 'What a Young Girl Ought to Know' (1897); 'Ideal Married Life' (1902); etc.

Wood. Wood is a more or less compact tissue which constitutes the part of the trunks, branches and roots of arborescent vegetable growth, lying between the bark and the soft sapwood next the bark, and the pith at the centre. The word "wood" is derived from the Anglo-Saxon *widu*, a tree. The outer layers, or sapwood, are called the alburnum. The inner solid wood is called the duramen. Timber is wood large enough for architectural uses, such as boards, planks, beams. The term hardwood is applied to such woods as mahogany and oak where the cells have thick walls and are closely packed together. Soft wood has large cells and

thin cell walls, such as white pine, cedar, poplar. It would seem in this century that wood is losing its importance as a material of construction. For framing, iron and steel seem to have dethroned wood; and even in furniture, iron has taken the place of wood in certain parts. Everything is iron or steel: a series of metal beams covered with plaster hidden from the eyes of the prying public as well as sheltered from fire; above this a good bed of plaster or poor, cementless, concrete; the builder "rests easy," the effect is good and satisfying, so we build iron floors. After a while, we invent new forms of framework. We cover the I-beams from which the floor arches spring, with terra cotta or plaster, leaving the large beams to show under the ceilings, wood seems to be banished. Iron is even supplanting the lath and plaster partitions, and expanded metal or wire-screen lath with channel or angle-iron stiffeners are used even in inexpensive construction. The wooden stagings and centerings with which the stone and iron structures are erected are almost as interesting as the structures themselves. Wood is elastic, comes back into place, and is easily worked. Wood is not imperishable, neither is iron. One reason

FIG. 1.

why wood is being used so little in construction is because it is not employed in a natural way: instead of leaving it natural, it is covered with plaster; often wood is used green when it should be seasoned. A practical way of getting at the quality of wood is to find its price in the market. For example, oak which would sell at \$110 per M. would be good enough for the best floor, while oak for furniture would be sold for half as much more.

The principal countries where wood has been generally used as building material are Switzerland, Norway and Japan. The chalets of Switzerland with their big overhanging roofs and flat balustrades with jig-sawed patterns, are well known. The wooden construction of Norway and Sweden has some resemblance to these. The Japanese wooden houses and temples are unique and show their artistic development. Vitruvius describes the woodwork of ancient Rome, but nearly all traces of it have disappeared. Caesar's bridge is well known to all students. The huge concrete and stone buildings of the Roman empire were built on wooden centering, which was as carefully constructed as if it were to be permanent itself. The half-timber work of the Middle Ages where the framing was made of heavy timbers was filled in between with plaster, making a very solid permanent construction. The ceilings of the churches of the Middle Ages were frequently worked out in timber and many of the Gothic churches had timber roofs, which followed out the feeling of the Gothic style. The shingle architecture of

the modern American country house, the old colonial buildings and the still earlier log cabins are good examples of what can be done with wood construction. The defects of timber are caused by splitting, knots, rot, sap-wood, warping. Timber should have a straight grain, should be well seasoned, and if not weather-seasoned, should be kiln-dried.

The development of the modern system of wood framing resembles strikingly the still more recent American methods of steel construction, as both are a veneer on a simple framework. Neither the country house nor the office building expresses its constructive features on the exterior. This, of course, has an economic cause: it is much easier to start the rough carpentry with the sill when the mason has completed his wall, and carry out all the rough framing and boarding with the knowledge that none will show as finished work; all the effort will tend to rapidity and strength. The exterior is then covered with shingles or clapboards, and the interior with lathing and plastering, leaving a finished plaster surface. Then follows the "joiner" or carpenter for the finished interior work, which is put in after the plastering is dry, and therefore is entirely separate in time and character from the rough framing.

Defects in Timber.—It is very important to

FIG. 2.

remove the sap-wood with care, for it constitutes a soft, spongy mass, containing fermentable sap, and allowing dampness to penetrate very easily; rot develops, and worms appear, and from the sap-wood, go through the whole substance. Lumber is piled or "stuck" after it is sawed with small sticks of wood between the pieces to allow a circulation of air, and allowed to remain for several months. For interior finish, the wood is generally seasoned, by artificial means, that is, "kiln-dried." The pieces are put in a room heated by steam to a temperature of about 150° F. and allowed to remain for several days or weeks until thoroughly dry.

Preservation of Timber.—Up to the present time, the greatest attention has been given to the preservation of railroad ties. The principal processes are those where either creosote or zinc chloride is used. Sometimes a combination is used. All French and English ties use the creosote process which gives them a life of 20 to 25 years. A recommended combination is 38 per cent dead oil of coal tar, 60 per cent resin melted, 2 per cent formaldehyde. Inject this after raising timber to 250° F.

Quarter-sawing.—This term is applied to a log cut lengthwise into quarters, so that the quarters can be cut into boards parallel to the radius 45 degrees between these cuts. These sections are so nearly in the plane of the medullary rays that they show the best grain, especially in oak, and boards cut in this way are less likely to warp and show little shrinkage. Often

the grain of wood which renders it weak, will give a good effect for paneling or veneering. In Fig. 1, plank A is quarter-sawed and will lie flat and will not splinter; plank B is poorly cut, being taken from one side of the log, as in Fig. 2 A. If the first board were taken directly through the centre of the log and the others parallel or perpendicular to it the grain would lie nearly parallel with the medullary rays as shown at B (Fig. 2). In Fig. 1, plank B is poorly laid, and would stand much better if laid with the heart or hollow side down as at Fig. 1, C.

Framing.—From the period of the first settlement of America, the cheapness of wood has made it the popular building material. The log-cabin was built of the logs cut when the early settlers cleared the land. Two sides were adzed off and the ends of the logs were notched so as to fit closely at the corners. The cracks were filled in with mud and the roof framed with small roughly worked rafters which were covered with split shingles. The advent of the saw-mill soon brought into use "dimension" lumber, rectangular in section, to be set so that its broadest side should take the strain. For example, 2-inch by 8-inch floorings 12 inches or 16 inches apart and strongly braced or "bridged" by small pieces nailed in between, took the place of 10-inch by 10-inch timbers which spanned the same space at greater intervals but necessitated the use of much more timber on account of their own size and also because of the larger amount of timber necessary for filling in between. This evolution has brought us to two methods of wood construction, the "full frame" and "balloon framing," the latter being used for small buildings, such as ordinary dwelling-houses, only.

Northern Pine (rare) (*Pinus sylvestris*) is also called Norway pine and Scotch fir, and is known in Great Britain as red or yellow deal. It is found in the northern parts of Europe, especially in Scandinavia on the mountains where there are large forests of these trees. Its color is warm with reddish tones. When first cut it is very resinous. It is one of the most useful pine woods and is strong, durable and easily worked. Its timber, which is used in both civil and naval architecture, is exported from Norway, Sweden, Prussia and Russia.

Canada Red Pine (*Pinus resinosa*).—This wood is sometimes called Norway pine. It takes the name of red pine from the color of its bark. The trees are found throughout Canada, but the best red pine is found in the northern parts of Wisconsin and Minnesota. The trees are sometimes 140 feet high. Its wood is tough, and has but few knots. It is used in construction of all kinds, flooring, piling, etc.

White Pine (*Pinus strobus*).—Also called Weymouth pine after Lord Weymouth, who planted it first in England in 1708. The trees are found in large forests in Canada and in the Great Lakes region. The wood is soft and easily worked, of a straight grain, of a light straw color and has but few knots. The tree is tall and effective, reaching sometimes 200 feet in height. It was formerly the most extensively used soft wood in America.

Yellow Pine (*Pinus mitis*) is also called short-leaved pine to distinguish it from the long-leaved Georgia pine. It is a native of the western and Southern States. West of the Mississippi its hard fine grain of wood is made into timber,

RADICAL SECTIONS OF TYPICAL WOODS

1. Yellow Willow. 2. Black Walnut. 3. White Cedar. 4. Sycamore. 5. White Oak. 6. Redwood. 7. Tulip Tree or Whitewood. 8. Black Ash. 9. White Spruce. 10. White Pine. 11. American Elm. 12. American Holly. 13. Wild Black Cherry. 14. White, or Canoe Birch. 15. Live Oak. 16. Silver Maple. 17. Shellbark Hickory. 18. American Beech. 19. Chestnut. 20. Yellow Locust.

WOOD ALCOHOL—WOOD-BORING BEETLES

but the timber is not so large as that of the Georgia pine.

Georgia Pine (*Pinus palustris*), known as the long-leaved or Georgia pine and as the turpentine tree. Its wood is coarse and owing to its having so much resin it is extremely difficult to work. The wood is used for coarse lumber, ship-building, heavy timber, and for obtaining tar, pitch, and turpentine.

Norway Spruce (*Picea excelsa*) is a tree which attains great height, often growing as high as 150 feet, and is a native of the northern parts of Europe and Asia. Its branches grow quite near to the ground as do all firs. This wood has many hard knots, which makes it very difficult to cut. It is used nevertheless for masts, spars, boards, etc. Large quantities are shipped from Russian ports and some of the best stock comes from Christiania.

American Spruce (*Picea nigra*), or black spruce, much resembles the Norway spruce except that its color is grayer and colder. It grows from 50 to 70 feet in height and is found in British America and northern parts of the United States. Its wood is light and strong and is much used in ship-building, and general rough framing.

Cedar, an evergreen tree of the coniferous genus. Its wood is soft and of a reddish brown color and sometimes has a very fragrant odor. It is used for chests and cigar boxes. There are three known species of cedar. The cedar of Lebanon is noted, of which there still remains a grove of some 400 trees.

Basswood (*Tilia americana*).—This wood is the American Linden or lime tree; it is also called bass. It is a yellow ochre in color and straight-grained. It does not wear very well but stains and polishes easily.

American Whitewood (*Liriodendron tulipifera*) is the whitish timber of the tulip tree, the wild cinnamon, basswood and Guiana plum trees. It grows in the Middle States. Its wood is of a pinkish gray color, very soft and of a smooth surface. It is used largely for sheathing. It is exported from New York and Philadelphia.

Birch American (*Betula lutea*), called also yellow birch. This wood has a smooth outer bark, close grain, moderately hard wood and is used for making furniture, for fuel and other purposes. The oil from its bark is used to give Russia leather its odor.

Ebony (*Diospyros ebenacea*) is the name given to a wood of a very dark color. It is very hard and heavy and often jet black and sinks if put into water. It takes a fine polish and is much used for high class cabinets, toilet sets, inlaying, making flutes, etc. It is a native of the flat parts of Ceylon. Its usual color is black, but the variety in Jamaica is green.

Beech (*Fagus*) is a large straight tree with beautiful thick foliage. Its height is from 50 to 70 feet. The bark has a smooth, hard surface and blue gray in color. Beech is not much used for building work, for it is not durable except when very wet or very dry. It warps but little and its hardness makes it well fitted for making a great variety of tools and for cabinet work.

Oregon Pine (*Pseudotsuga taxifolia*), known also as Oregon fir, Nootka fir and Douglas pine. Large forests of these trees grow in the western part of the United States and Alaska.

The following are different kinds of lumber which are used for different purposes:

Piles.—Oak, elm, beech, spruce. Posts set in the ground, hemlock, acacia.

Strong Construction.—Oak, teak, yellow or Georgia pine. Available in damp situations, oak, beech, elm, acacia, alder, chestnut. For large timbers, Oregon pine, Georgia pine, oak, bay mahogany, chestnut.

Floors.—Oak, maple, birch, beech, and rift Georgia pine are the best floors for hard wear; North Carolina pine for cheaper floors, and spruce floors where they are to be covered or painted. Oak, hard pine, teak will wear the longest.

Interior Finish and Panels.—Cypress, North Carolina pine, oak, mahogany, sycamore.

Window Sills.—Oak, white pine, mahogany.

Stair Treads.—Oak, hard pine, teak. For school interior finish, ash, hard pine, North Carolina pine.

Wood-boring Beetles, beetles which lay their eggs in or upon wood, into which the larvæ begin to bore immediately after hatching, and from which they derive their sole sustenance. Living upon this innutritious substance their growth is generally slow, and by the end of the several years spent in the larval condition they have often excavated extensive galleries which increase in diameter as the larvæ grow. The larvæ of many beetles feed upon dead or decaying wood only, and many of these may be considered useful to man, as they assist in reducing stumps and fallen limbs to a condition of vegetable mold. Others confine their attacks to the bark, and are seldom serious pests. Many species bore into sound wood either in the standing growing tree, in the dressed lumber, or even in the finished house or article of furniture. Such often commit incalculable damage. The families *Cerambycidae* and *Buprestidae* are notorious as comprising species almost exclusively of wood-boring habits, and those whose larvæ do not excavate wood burrow into roots or soft plant tissues. The *Cerambycidae* (q.v.), or longicorn beetles, include one of our largest beetles, the broad-necked priamus (*Prionus laticollis*), which

WOOD CARVING

reaches a length of nearly two inches and is unusually robust for the family; it is of a deep brown-black color, and the jaws are exceedingly stout. The great white larvæ are two or three inches long and bore into the roots of forest and orchard trees and blackberry plants. The latter are quickly killed and even large trees will succumb if the borers are abundant. They live three years. The apple-tree borer (*Saperda candida*) in the beetle state is brown with a conspicuous white stripe running the entire length of the body on each side above. It flies mostly at night during the early summer months and lays its eggs on the trunks of apple, quince and pear trees near the ground. The larva is cylindrical and very strongly annulated and when fully grown is an inch long. It lives three years, the first one being spent in the sap-wood, the others in the interior of the trunk. Its attacks are frequently fatal and the only effective measures are preventives. A strip of tin or wire gauze nailed to the tree trunk from the ground to a height of two feet will prevent most of the females from depositing their eggs. Another exceedingly serious pest is the locust-tree borer (*Cylindrus robinia*) which has habits similar to the last and which often riddles the trunks of locust-trees with its burrows, killing them in a few years. The beetles are very pretty, being dark velvety brown, with angulated cross-lines of yellow. They abound during the early autumn and feed upon the pollen of the goldenrods. Numerous closely related species attack other hardwood trees. A peculiar habit is possessed by the twig-girdler (*Oncideres cingulatus*) which in order to provide its larvæ with the dead wood upon which they feed cuts a deep circular trench around the twigs of hickory and other forest trees below the point at which its eggs have been deposited. The twig dies, falls to the ground, and the larva completes its span of life in security.

The species of *Buprestidae* (q.v.) differ greatly in appearance from the longicorns; but have similar habits. The larvæ are distinguishable by the greatly expanded prothoracic ring immediately following the head, which is very small and retractile. They are always footless. Although the buprestids nearly equal the longicorns in number of species, and exceed them in variety of forms those in our fauna are smaller and because of their plainer colors, much less conspicuous. Many of the tropical species, however, are of great size and brilliant colors, and some of their larvæ, which may exceed four inches in length, are eaten. A species very injurious to pear orchards is the sinuate borer (*Agrilus sinuatus*) whose extensive winding galleries in the cambium layer often almost completely sever the bark from the wood and kill the tree. The beetle is about half an inch long and both it and the larvæ are slender. Blackberry canes are often infested by another species (*Agrilus rubicollis*), the larvæ of which excavate irregular passages and cause the formation of gall-like enlargements. The species of *Chrysobothris* form excavations beneath the bark and in the sap-wood of various forest trees, and one species (*C. femorata*) is an orchard pest and another (*C. harrisii*) injures the white pine.

The true bark-borers mostly belong to a family, the *Scolytidae*, closely related to the weevils (q.v.). They form most elaborate bur-

rows on the inner-surface of the bark, consisting of numerous galleries radiating in all directions from a central chamber. (See *BARK-BEETLES*.)

In combating wood-boring beetles the method must be suited to the habits of the particular species, but in general all infected wood should be burned or the larvæ picked out and destroyed. Egg laying should be prevented as far as possible by painting the tree trunks with soap-suds, kerosene emulsion, or similar repellent. Woodpeckers perform a valuable service in the destruction of these larvæ.

Wood Carving, sculpture in wood, either in low relief or in the round. On the whole the grain and structure of wood make it more suitable for carving in relief than for large statues; some woods without much distinct grain can be carved almost as marble or stone; in other woods the artist must carefully adapt his design to the grain of the wood. Wood used for carving must be carefully seasoned and specially prepared; one method of seasoning it is to soak it, when newly cut, in running water, thus washing away all the sap, and then to dry out the water; an ancient method was to smoke it with wood smoke; still another method is to dry the wood in hot rooms, after pieces of paper have been glued on the ends to prevent the sap from drying out at the ends too rapidly. The woods most commonly used for carving are oak, chestnut, walnut; cedar in ancient times; sandalwood and other perfumed woods in the East; pine, fir, and similar soft woods; the last mentioned being especially fitted for carving on a large scale.

History.—Wood carving has occupied an important place in the early development of the fine arts in most nations; though it was almost unknown in Babylonia, Assyria, and Persia, it was common in Egypt in early times, in India, in China, and in Japan; and is now practised by many savage and semi-savage races. Particularly the Maori and Polynesian races use an abundance of wood carving, not only on the walls and beams of their dwellings, but also on their paddles, weapons, etc. Their representations of beasts and men are usually grotesque, but they also carve complicated geometrical figures, spirals, etc., of real beauty and freedom of design. The oldest example of wood carving which is now preserved is Egyptian, a life-size statue of a man known as the Sheikh-el-Beled, dating from 4000 B.C., which gives evidence of marked technical skill; several other smaller pieces of Egyptian carving are also preserved. No specimens of Greek and Roman wood carving have been preserved, but the classical writers leave no doubt that wood was used in the early days of art in both Greece and Rome, and many of the sacred statues were undoubtedly of this material. Wood carving reached its highest development in the Middle Ages. The best early specimens of mediæval carving are found in the Scandinavian countries, on several church doorways, dating from the 9th to the 13th centuries; these are carved on pine, and

WOOD DUCK—WOOD ENGRAVING

the designs consist mostly of interlacing scroll work, combined with figures. The art reached its highest point in France, Germany, England, and Italy in the 14th and 15th centuries. The best examples are found in the furnishing of churches, the pulpits, choir stalls, altar screens, etc. The most careful attention to detail, and artistic combination of figures, leaf and scroll work, combined with dignity of design, mark the best mediæval wood carving. Wood was used for the images of saints, and for effigies on tombs; and also for larger pieces of carving, such as roofs of churches and other edifices, often richly decorated with figures or foliage designs. In the Renaissance period wood carving was lavishly used in church decoration, choir stalls, confessionals, desks, and pulpits; in Italy ceilings were also elaborately carved; but the designs though elaborate and skilfully worked out, began to lose the dignity of the mediæval carvings, and to indicate a low ebb of taste. In modern times the art of wood carving has lost entirely its former importance. It is best developed among the Swiss peasants, where it is a regularly organized business; and is to some extent preserved among workmen in the provincial towns of France. In Switzerland it is used mostly for clocks, small articles of furniture, toilet articles, etc. In England and the United States wood carving has recently been revived to some extent as a valuable part of art training or of general manual training.

Wood Duck, or **Summer Duck**, the most beautiful of American ducks (*Aix sponsa*). The bill is very high at the base, shorter than the head; nail very large and much hooked; head crested; tail short, wedge-shaped. The head and crest are metallic green, glossed on the sides with purple; line through the eye; two bars on side of head meeting under the chin, and upper throat, white; lower neck and sides of tail purple, the former with triangular spots of white; lower parts white; sides yellowish banded with black and posteriorly with white; speculum bluish green, tipped with white; primaries silver white externally at tip; back uniform, with bronzed and green reflections; a white crescent in front of wings bordered with black; scapulae and inner tertials velvet black with violet gloss. In the female the back is more purplish, the sides of head and neck ashy, about the bill white, and lower neck brownish; the eyes are red. It is 19 inches long, and 29 in alar extent. In most parts the plumage is iridescent with changing metallic reflections.

Formerly the wood duck, one of the most characteristic birds of our fauna, was abundant and widely distributed through the wooded and watered portions of the United States and southern Canada, but as a result of an unwholy warfare it has become practically extinct over large areas. It is confined to fresh water, especially secluded ponds in woods. The flight is noiseless, very rapid, graceful, and as easy among the branches of trees as that of the wild pigeon. It breeds from April to June, according to latitude, the nest being made in the hollow of a tree, or in the deserted excavations of the woodpecker or squirrel, and usually in deep swamps, though often in the vicinity of houses, for they are not shy birds. The eggs are 6 to

15, 2 by 1½ inches, pale buff and greenish, smooth, and laid on dried plants and feathers. They are much attached to the breeding places. The young leap down, or are conveyed to the ground or water by their parents. The adults are excellent divers, and feed on acorns, nuts, grapes, berries, rice, insects, snails, tadpoles, and small fry. The chief enemies of the adults are minks, raccoons, and snakes, and many of the young are destroyed by snapping turtles, alligators, and predaceous fishes. It is easily domesticated and readily breeds in captivity. The only other species of the genus is the famous mandarin duck (q.v.) of China.

Consult Grinnell, 'American Duck Shooting' (New York 1902).

Wood Engraving. Wood engraving is especially distinguished from other methods of engraving in being a relief process. In the early days of the art the design was drawn on the block in simple outline and the work of the engraver was to cut away the rest of the wood, leaving the lines of the drawing in relief, which when inked could be made to give an impression in facsimile if a piece of paper were put over

St. Christopher, the earliest wood engraving—size of original 11½ x 8½. Date 1423.

the block and pressure applied to the back. In its modern practice which involves reproduction by tones or tints, the varying values of an original are obtained by the most delicate cutting of lines and dots and minute picks. Blacks are obtained by leaving the wood untouched, pure whites by cutting the wood entirely away. Before the discovery of a method by which drawings could be photographed directly on the wood the design had to be drawn in reverse on the block and the same size as the finished print. By the use of photography the drawing can be

WOOD ENGRAVING

made any size and the reduction made in transferring to the block.

If to the art of printing we owe an inestimable debt for bringing to us the record of the thought and history of all times, to the kindred and older art of the wood engraver we owe almost equal obligations. It gave to the common people the pictures by which they could be made to understand the purport of written and printed words. When and where the art of wood engraving was first invented and by whom

vention of printing, when books in manuscript only were the treasured possessions of the great monasteries, these prints were of inestimable value in the cause of popular religious education. From the very first wood engraving has been an art for the people. In the beginning serving religious purposes only it soon became a means of satire and comment upon the abuses of the clergy and a record of the manners and customs of the times.

In the early part of the 15th century many minds were striving toward the invention of a way to print from movable types. The idea came no doubt from the so-called block books. Many of the early prints bore the name of a saint or a short legend which was evidently cut on the block with the picture. From these legends it was a natural step to extend the text and add whole columns of type. The date and place of the earliest of these block books is a matter for conjecture, but they were known in the early part of the 15th century. One of the most widely discussed of these is the 'Biblia Pauperum,' or Poor Preacher's Bible, several editions of which are known. It is a small folio containing 40 pages printed on one side only in a pale brownish ink by means of rubbing on the back. Each page is divided into five compartments separated by pillars, suggesting the idea of church windows. The central panel shows a scene from the Gospels and on the sides are illustrations from the Old Testament bearing on the central design. There are also texts and Latin verses. Another block book that has given rise to much speculation is the 'Speculum

The Grief of Hannah, from the Cologne Bible, about 1475.

has long been a much discussed question. The earliest known examples date from the early part of the 15th century when in various parts of northern Europe, notably in Germany and the Netherlands, there existed various rude prints representing scenes from Scripture and the lives of the saints, evidently made from wood cuts. They were printed in a brown ink apparently by rubbing on the back of the paper with some blunt edged instrument and were often colored either by hand or with the use of a stencil.

One of the most famous of these, and the earliest dated print from a wood block is the famous Saint Christopher of 1423 found pasted in the cover of a manuscript discovered in the library of a convent in Swabia. It represents Saint Christopher wading across a stream with the infant Jesus on his shoulder. On the right bank a hermit is kneeling before his cell holding a lantern in his hand, on the left a peasant is climbing a steep hill on the way to his home. It is a rude cut without any regard for perspective, but the figure of Saint Christopher possesses a certain dignity, and the pictorial effect is such as would appeal to a primitive people. Many similar cuts were produced in the 15th and 16th centuries in the cities of Augsburg, Nuremberg, Ulm, Cologne and the Flemish cities. Conventional in design and often repeating again and again the same subjects, they were yet expressive of the mediæval religious conceptions and were no doubt highly effective in giving particular and comprehensible value to the biblical lessons they were intended to convey.

It has been contended by some authorities that wood engraving really began with the invention of playing cards, but no authentic records are available of their having been printed before 1423, the date of the Saint Christopher, and they appear to have been made with a stencil. The making of sacred prints very soon developed into a large business, and by the middle of the 15th century wood engraving was an established and widely familiar art. Coming before the in-

The Fall of Lucifer, from the Speculum Humanæ Salvationis.

Humanæ Salvationis,' or The Mirror of Human Salvation.' In this the text appears to have been printed from movable type in black ink on a press. Other famous block books are the 'Apocalypsis Sancti Johannis,' Visions of Saint John; 'Ars Moriendi,' The Art of Dying; 'Canticum Canticorum,' or a History of the Virgin prefigured in the Song of Solomon. All of

these are curiously and often grotesquely medieval, full of the symbolism and mysticism of primitive humanity. Rude as they are, though, they were preparing the way for something better.

With the advent of printing the block books were superseded and wood engraving became

In France wood engraving was early identified with printing. Religious books contained many curious and often beautiful illustrations. Those known as the 'Livres d'Heures' often contained many fine examples of carefully executed blocks in imitation of miniatures. Many of these early wood cuts served simply as an outline for the colorist, who often overlaid them with an entirely different design. The first really effective artistic use of the decorative border may be seen in these 'Livres d'Heures,' and some of them are notably quaint embodiments of scriptural ideas combined with others that are certainly not to be found in the sacred book.

England lagged behind other countries in her art development, and wood engraving was little known there before the publication of Caxton's 'Game and Playe of Chess,' published in 1476, and it is thought that the cuts in this were imported from Germany. In Italy the earliest wood engravings were either importations from Germany or were suggested by German originals. The most noted example of early Italian wood engraving is the 'Hypnerotomachia Poliphili,' or Dream of Poliphilo, written by a Venetian monk in 1467 and printed by the famous Aldus in 1499. The Italians developed a method of engraving in *chiaroscuro*, in imitation of painting, by the use of several blocks, each printed in a different color. The Germans also employed the same methods, but in a much cruder form.

With the advent of Albrecht Dürer wood engraving reached its highest attainment. First of all he was a great designer with a far-reaching and powerful imagination and a mind full of the new learning and spirit of the coming Reformation. He was the first fully to realize

The Ploughman, from the Dance of Death, by Holbein.

a handmaid of the greater art. Illustrations are to be found in many of the books of the early printers. (This is not the place to discuss the question of who was the first to use movable type and the subject has already been treated under the head of PRINTING.) The earliest wood engravings in a printed book with an authentic date appear in the *Psalter of Faust* and Scheffer published at Mentz in 1457. From Cologne, Mentz, Nuremberg, Ulm, Augsburg, Strasburg and Basel came many printed books illustrated with wood engravings.

The Bible was the book on which the early printers spent most of their energies. Numerous editions were published with illustrations. The most important of these was the famous Cologne Bible which appeared before 1475. Its 100 designs were, after the block books, the first illustrations of Scripture, and they showed more originality and invention than anything that had gone before. Many of the decorative borders of this Bible are in curious contrast to the sacred text. Next to the Bibles in interest in the study of wood engraving are the numerous chronicles and histories. These are records of legends and imaginary events and are illustrated with wood cuts dealing with the lives of the saints and the great happenings in local history. One of the best known of these chronicles is the one published at Nuremberg in 1493. It has over 2,000 cuts supposed to be the work of William Pleydenwurff and Michael Wohlgemuth, the latter a master of the great Dürer. The chief distinction of the Nuremberg Chronicle lies in the fact that in it for the first time wood cuts were printed in simple black and white. They were modern in this respect and in the use of cross hatching by which grays and blacks of varying intensity were obtained by engraving lines that crossed each other at different intervals.

The Savages of Calicut, from the Triumphal Procession, by Burgkmair.

the great possibilities of wood engraving, and by his influence it was raised to the dignity of a fine art. He is known chiefly by four great works. The first of them the 15 large drawings illustrating the Apocalypse of Saint John. Others are the 'Larger Passion of Our Lord,' 12 cuts, 'The Life of the Virgin,' 20 cuts, and the 'Smaller Passion of Our Lord,' 36 cuts.

Among Dürer's other famous works are the 'Car and Gate of Triumph' made for the Emperor Maximilian. Another great work celebrating the emperor's fame was Hans Burgkmair's magnificent 'Triumphal Procession,' etc.

A group of wood engravers known as the Little Masters, from the small size of their work, followed Dürer, but their work is of no special significance.

Hans Holbein ranks among the really great artists and wood engraving owes to him a still further advance. Holbein indeed might be well called the father of modern illustration. Among the first books he illustrated were the 'Utopia' of Sir Thomas Moore and the Biblical translations of Luther. He is best known, however, for his remarkable series of designs known as the 'Dance of Death,' a popular subject of mediæval times. In each of the 41 designs is a scene from common daily life expressed with a grim dramatic power and truth of drawing that are remarkable in a very high degree. Death spares neither the king nor the peasant, the praying nun nor the priest in the pulpit. Much of their success was due to the wonderfully accurate wood engraving of Hans Lützelburger, for in the hands of a less skilful engraver the originals would have lost much of their power. Holbein's designs for the Old Testament were also remarkable in many aspects, but they were more conventional in conception. After Holbein, wood-engraving as an art steadily declined.

Its revival, in a modern sense, began with the work of Thomas Bewick in England. To him we owe the great principle of the white line which did away with much of the old drudgery and gave the engravers more freedom in handling. In the old way where black lines crossed the little white lozenges between had to be laboriously cut away, Bewick simply gouged out with his graver a line and by varying the width and number, obtained his gradation of light and shade. He was the first also to use boxwood and the burin; the old wood engravers cut their designs on pear or apple tree boards with a knife. Bewick is best known by the drawings and engravings in his 'British Quadrupeds' and 'History of British Birds.' He was the founder of the modern British school which held for many years a distinguished place in modern illustrative art. Bewick's pupils, Nesbit and Luke Clennell; Robert Branson, John Thompson, the Dalzels, William Harvey, and W. J. Linton engraved the work of many distinguished English artists. In France and Germany wood engraving has maintained a distinct place in spite of process and some of it has been and still is of a very high order of merit. It is to America, however, that we must look for the greatest achievement in wood engraving. Our artists have carried it to a degree of perfection unparalleled anywhere else in the world. They have taken it out of the domain of a largely mechanical handicraft and given it almost the individuality that belongs to creative art. The first American wood engraver of distinction, Dr. Alexander Anderson, was a follower of Bewick. His work appears in many early American books. Joseph Alexander Adams was another early American wood engraver whose work was even more worthy of study. The notable wood engravings made for the Harper Bible published in 1843 were done under his supervision.

To the great English and American magazines we owe the incentive and the opportunity for the development of the best wood engraving. Even before a way was discovered by which drawings might be photographed on the block, American engravers had begun to show their capacity for interpreting the lines and tones of drawings with exceptional accuracy and originality. In some instances attempts were made to copy the qualities of brush marks and the textures of different mediums such as pencil and charcoal, etc., but this was only a passing phase of an attempt at superior cleverness. W. J. Linton who spent the later years of his life in America was a leader in the effort to make wood engraving more of an individual art, and though he was not always in full sympathy with the tendency toward a greater refinement of line and an effort that seemed to him to be leading away from the legitimate purposes of wood engraving, he was a very great power for good. J. G. Smithwick, long identified with the art department of 'Harper's,' and A. W. Drake, of 'Scribner's Monthly' and the 'Century,' did their full share in the development of the art. Frederick Juengling, J. P. Davis, Frank French, F. S. King, Wm. B. Closson, Henry Wolf, Thomas Cole, Thomas Johnson, Elbridge Kingsley, Gustav Krueh, William Muller and others are names identified with the highest attainment of American wood engraving. With the advent of process (see PHOTO-ENGRAVING) the demand for wood engraving has greatly diminished and its employment as a reproductive art is constantly decreasing. It is a beautiful art as exemplified by the best practitioners, remarkable for its brilliancy of effect in pure black and white, requiring the most delicate skill in its manual execution and a feeling and invention with respect to the correct interpretation of values and textures of a very high order.

With the passing of the men of to-day who have given wood engraving a place among the fine arts, it is likely that it will cease to be a field for further endeavor. There are no longer incentives for its study, and the time and artistic training necessary for any real accomplishment can be put to much better profit in other directions. Prints by famous engravers are already much sought by collectors, and the future historian of the art will probably end his record with the close of the 19th century and the beginning of the 20th.

More than to any other of the graphic arts are we indebted to wood engraving. It led the way to the invention of printing and has been the means of putting before the world a record of the progress of the greater arts of drawing and painting.

JAMES B. CARRINGTON,
Assistant Editor 'Scribner's Magazine.'

Wood-frog. See **FROG**.

Wood-ibis, a kind of stork (q.v.).

Wood-lark, a European lark (*Lullula ar-borea*) closely allied to the sky-lark (q.v.), but distinguished by its smaller size, shorter tail, a distinct light streak over the eyes and ears, and more distinct markings on the breast. It perches upon trees, and is found chiefly in fields near the borders of woods. Its flight is much less extensive and powerful than that of the sky-lark. The wood-lark often sings during the

WOOD-LOUSE—WOOD-SORREL

night, and on this account has been mistaken for the nightingale. "Its song" is described as "sweet and flute-like, more melancholy than that of the sky-lark, and is generally uttered from the top of some tree or else when the bird is on the wing. It rises to some height before commencing, then ascends, singing, higher and higher, throwing itself from side to side, hovers and floats in the air, and when the song is ended drops with closed wings to the ground again." It bears confinement well, singing sweetly in the cage, and even breeding easily there or in an aviary: hence it is constantly caught and kept. The nest is generally built under bushes. The eggs are five in number, of a dusky color, spotted with deep-brown spots.

Wood-louse, one of the little isopod crustaceans (see *Isopoda*) of the family *Omniscidae*, which abound underneath logs and in decaying stumps in the woods, and which, when touched, curl up for protection like armadillos. They are numerous and hardy, the sexes are distinct, and the young are hatched from the eggs in their full form, passing through no metamorphoses.

Wood-mouse, the red-backed mouse (q.v.). In England the long-tailed field-mouse (*Mus. sylvestris*) is so called.

Wood Nymph, a minor pagan divinity supposed to live in trees and woods. This is the common name, also, of the beautiful lepidopterous insects comprising the genus *Eudryas*.

Wood Oil, the name given in commerce to a resinous juice which exudes from various trees of eastern Asia. It has a fine aromatic color, and is used for a great variety of purposes; in medicine as a substitute for copaiba balsam; by sailors for paying the seams of a ship instead of tar; by painters as a varnish; also in the making of lithographic ink, etc. It is an excellent preservative of timber against the attacks of white-ants. It is strictly an oleo-resin, and is also known as gurun balsam.

Wood-pewee. See **PEWEE**.

Wood-pulp. There are three kinds used—ground wood, soda-process wood and sulphite-process wood; the latter two are not wood in either physical or chemical properties, but cellulose, similar to cotton-fibre in appearance and nature. (See **PAPER**; **PAPER INDUSTRY**.) The name of wood-pulp is generally understood as designating mechanically ground pulp as distinguished from chemical pulp, or cellulose. In the manufacture of mechanical wood-pulp a block of wood is put against the surface of a rapidly revolving grindstone by hydraulic or other pressure, a stream of water pouring down upon the stone carrying away the disintegrated fibres into a stuff-chest, where they are mixed with a percentage of sulphite or other cellulose, and are then ready to go on the paper machine to be converted into paper. Spruce principally, but also poplar and other soft woods are used in the manufacture of this pulp.

Ground wood was invented in Germany in 1847 by Kelter and perfected and patented by Henry Voelter, who constructed a machine which is in general use to-day. Mr. Albrecht Pagenstecher, of New York, bought and controlled the Voelter patent and introduced this industry into the United States in 1867-68, importing two machines, which were set up in Curtisville, Mass.

The introduction of this new process marked a new era in the manufacture of paper. It furnished a cheap and abundant raw material, simplified the former complicated methods of preparing stock for paper machines, and improved the quality of the paper made, besides cheapening the cost of production. Without wood-pulp it would be impossible to supply the demand for paper at the present day.

Wood-pulp was first sold at 8 cents per pound, but finally dropped to less than 1 cent per pound, and brought the price of newspaper from 14 cents in 1868 down to less than 2 cents per pound at the present time, making the one-cent newspaper of to-day possible.

The introduction of ground wood-pulp printing paper into rolls completely revolutionized modern methods of journalism. The absorbent quality of this wood-pulp paper made the modern rapid printing press practicable, eliminating the allowance for drying and limiting the printing speed only by the mechanical possibilities of the press, which were in no way dependent, as in the case of rag paper, upon the drying of each sheet. Such an improvement made immediate changes in the making and printing of newspaper, and as soon as the results of this new process became commercially practicable, the entire system of news gathering changed as well. It has since become possible for a paper, with the help of the modern type-setting machine, to get news into the streets within fifteen minutes after its receipt in the printing office.

The output of wood-pulp, which in 1868 was less than one ton per day from the only mill then in existence, has now increased to over 5,000 tons per day in 188 mills, requiring in its manufacture nearly 2,000,000 cords of wood annually, and the use of water-power amounting to about 400,000 horse-power.

The introduction of this new process was made under many difficulties, the greatest of which was to overcome the prejudice of paper-makers, who believed that rags were the only fit substance to make paper of, and considered wood-pulp as an adulteration or shoddy. At present every newspaper is composed largely of ground wood-pulp, with a small percentage of chemical fibre. Many book, wrapping and other papers also contain a large percentage of ground wood-pulp.

ALBRECHT PAGENSTECHER,
President Manufacturers Paper Company.

Wood-quail, or **Roulroul**. See **QUAIL**.

Wood-rat, a large rat-like wild mouse of the genus *Neotoma*, of which two species dwell in the forests of the southern half of the United States. The body is 8 or 9 inches long, and the tail nearly as long. The form resembles that of the white-footed mouse (*Microtus*), the animal being more slender and squirrel-like than are the true or house rats, from which this may always be distinguished by his hairy tail, softer fur, and much larger ears. The best known species is the Alleghany wood-rat (*N. pennsylvanica*), which is lead-color above, sprinkled with black hairs, which lightens to yellowish on the flanks and becomes pure white on the abdomen and feet. Consult Stone and Cram, "American Animals" (New York 1902).

Wood-robin, the wood-thrush (q.v.).

Wood-sorrel. See **SORREL**.

WOOD-THRUSH — WOOD-WORKING MACHINERY

Wood-thrush, or **Wood-robin**, the most familiar of North American spotted thrushes (*Hylochichia mustelina*), famous for the rich four-parted melody of its spring song. It is numerous in warm weather throughout the Eastern States and Canada, inhabiting the wild spaces as well as confidently approaching the house and roadside. Its nest is often built in a village shade-tree, or even in a garden bush, but more frequently among the forking twigs of an apple-tree; and it is to be distinguished from that of the robin by the absence of mud and the presence of many dead leaves, which always form the principal part of its foundation. The eggs are deep blue, smaller and less greenish than those of the robin. It soon becomes unsuspicious of the persons whom it is accustomed to see about the place and who do not disturb it, but is jealous of the attention of other birds, and defends its home with admirable vigor and

Wood-working Machinery includes the various machines employed to reduce the lumber cut in the forests into doors, sashes, moldings, etc., used for industrial purposes. They may be conveniently divided into four general classes—saws, which operate by rending or scission; planers, by which the work is accomplished by a paring action; lathes, in which the wood is turned or pared while being revolved; and grinders or abrading machines, which are generally employed as finishers, and accomplish the work through the medium of sand or emery. Saws are blades of steel with toothed edges and are used to divide metal, and stone, but the principal modern use of the saw is to divide wood. For saws used in metal-working see **METAL-WORKING MACHINERY**. The use of saws is of very ancient origin, and it is practically impossible to enumerate in detail their adaptations to various mechanical processes.

Gang Saw.

success. The song, which is heard most frequently and pleasingly toward sunset, is excelled by that of none of the more familiar Eastern birds either in musical quality or in sentiment. It is low, sweet, evenly modulated, and flute-like, yet has far-carrying power, and when heard at twilight across the fields, or from unseen recesses of the orchard, it brings to the mind a hymn chanted in praise of the serenity of the summer evening. This thrush is bright cinnamon above, brightest on the head; below white, with large rounded black spots forming lines down in front.

Wood-warbler, a book-name for the small and beautiful American birds of the family *Mniotiltidae* (see **WARBLER**); but the name is without special significance, as these birds are not more characteristic of woodland than of other places; nor than other warblers.

Among uncivilized peoples, saws were made of flakes of flint imbedded in wooden blades and held in place by means of bitumen. Later, among the ancients, bronze saws were used, but all modern saws are made of steel of the finest quality. The saw is practically an exaggeration of the knife, the edge of which, although presenting a smooth appearance to the unaided eye, shows an array of saw teeth when viewed under a microscope. Saws are of four general types—"straight," with flat blades and straight edges, reciprocating in action, and making a plain cut; "circular," with flat circular blades, and cutting at right angles to the motion which is continuous; "barrel," cylindrical in shape, and cutting parallel to the axis; and "band," endless ribbons of steel, toothed on one of the edges, and running over two pulleys, one above the other, with a continuous cutting motion parallel to the axis.

WOOD-WORKING MACHINERY

Any of them may be designed for cross-cutting or for ripping purposes. In the cross-cut saws the teeth are designed to cut at right angles to the fibre of the wood, while in the rip-saws the alternate teeth are bent outwardly or "set" so that they make a broader gash than the thickness of the blade and prevent binding or sticking. Saw teeth are made long or short, and pitched to cut one way or both ways, according to the kind and character of the timber to be sawn. The "pitch" of a tooth is the angular position of its point relative to the edge of the

increased rigidity is obtained only by an increase in thickness, which in turn results in the cutting of a wide gash, and a consequent increase in the kerf-waste or saw-dust. Therefore, the use of saws exceeding 72 inches in diameter is not considered economical. In operation, they are run at speeds ranging from 5,000 to 9,000 feet per minute, and are capable of cutting, on the average, about 80,000 superficial feet of lumber per day of 12 hours, as against 6,000 to 10,000 feet, by the straight saws. The wear on circular saws is very great, and the

Circular Saw, with Rack-feed.

blade, and it is determined by subtracting the angle of the back edge from that of the front edge of the tooth. The normal pitch is 60° , which is generally applicable to all saws, from those used in the largest sawmills to the smallest hand saws. The blade of the hand saw is broader at one end than at the other, and is provided with a wooden handle attached to the broader end. The largest straight saws are called "pit-saws," and were the earliest employed in the manufacture of lumber. They were operated by two men, one standing over the log and drawing upward, while another standing in the pit below followed with the downward or cutting stroke. The demand for larger quantities of sawmill products, developed the arrangements known as "gate," "gang," and "muley" saws, and later the "circular" saws, which were introduced in England about the close of the 18th century. The first patent was granted to Samuel Miller in 1777, but a general announcement of the principle appears to have been made by Brunel about 12 years later.

The circular saw is a disk of the finest steel, with teeth on its edge. At first only those of small diameter were used, such as the buzz-saw of the watchmaker, for minute work, and the ripping-saw of the carpenter shop and the planing mill; but now they are made in diameters ranging from 1 to 84 inches, and the larger sizes are used as the main saws of most of the larger sawmills. In the principal lumbering districts of the United States, they are usually 72 inches in diameter, while those employed on the Pacific coast often run up to a diameter of 8 feet. In design, the diameter of a circular saw is governed by its rigidity or the capacity to maintain a true plane of rotation during the process of cutting. This property decreases as the diameter increases, which is exactly the reverse of what is required. In-

teeth of the larger lumber saws require to be filed sharp three or four times during a day's work, which rapidly reduces the diameter of the saw, and seriously impairs its efficiency. To obviate this, the larger saws are often constructed with removable teeth which are inserted in slots in the periphery and held in place by wedging or by rivets, and as they wear

Band Saw.

out are easily replaced by new teeth, at a comparatively small expense. Barrel saws are metal cylinders shaped like a straight-sided barrel open at both ends, and with the edge of one end toothed. They are employed in manufacturing the staves for barrels, pails and tubs. Band

WOOD-WORKING MACHINERY

saws were invented about the beginning of the 19th century, and although their particular merits were known long before the circular saws came into general use, they were not adopted until the latter part of the century, owing to the difficulty of making saws capable of withstanding the severe service. But, with the manufacture of the finer grades of steel of greater tensile strength and elasticity, since 1885, they have been adopted in addition to the circular saws in many of the larger mills. They are made in sizes ranging from $\frac{1}{2}$ inch in width,

cut various ornamental designs for brackets, corner-pieces, clock-cases, etc.

Of saws used for special purposes, the segment saw used for cutting veneers, and the wire saw employed for cutting stone, are interesting as examples of the application of the tool for exactly opposite purposes. The segment saw is circular in shape, and is formed by bolting the segments of the blade, which are extremely thin, upon the outer edge of a strong cast-iron centre, which gives the required rigidity. The larger sizes range from 6 to 8 feet in diameter,

Planer, with Roller-feed.

used for ordinary shop-work, to from 6 to 8 inches in width, for the use of the larger lumber mills. In mode of operation, which is as that of a belt over two pulleys, they cut with a continuous motion, with the toothed edge always in the gash. Being made extremely thin, they are used for continuous and rapid cutting in planing mills and other wood-working plants, where the cuts are made in scrolls and curves, and require

and possess cutting edges so light, that they are capable of cutting veneers almost as thin as a sheet of paper. The wire saw, on the other hand, is a form of band saw, and consists of an endless strand of three steel wires which is kept moving upon the stone while sand and water are fed to it. The grains of sand are caught in the spaces between the wires and are dragged along, and by abrading the surface

Copying Lathe.

a very flexible blade. The thinness of the blade insures a much smaller kerf-waste than that resulting from the circular saw, and as installed in their larger forms in the lumber mills are capable of sawing an average of 40,000 feet of lumber per day. The saws commonly known as scroll saws and jig saws, are very narrow straight blades of steel, often as fine as $\frac{1}{16}$ of an inch in width, which are operated to give a reciprocating movement, and are employed to

result in cutting a groove. The wires are kept constantly pressed against the bottom of the groove by the aid of two pulleys, one on each end of the cut. When the cut is vertical, the pulleys are placed on suitable forms in small pits, and are so arranged that they can be fed downward by the means of screws. Planers are used to reduce lumber to exact dimensions by smoothing down the rough surfaces of the product of the sawmills. In the surface planer this

WOOD-WORKING MACHINERY

is accomplished by a series of revolving cutters which pare off shavings and leave the surface of the timber quite smooth. The cutters are very ingeniously arranged, and in many cases all four sides of the board or beam are planed down, and the tongue and groove cut in the edges, at one operation. The cutters may be so arranged as to produce curved surfaces by following a pattern, and are extensively used in the manufacture of moldings, panels, etc. To this class also belong the dove-tailing machines in which the cutters are arranged in gangs, similar to a gang of chisels, or revolve upon a vertical spindle. They cut out the tongues and spaces automatically. Wood-working lathes are similar in principle to those employed in metal-working. The piece of wood is held between the stocks of the machine and revolved rapidly, while a chisel or other tool is pressed against it and removes a shaving by a combined paring and severing action. By the use of various automatic duplicating attachments in conjunction with patterns, as in the case of the Blanchard lathe, in which patterns and blanks are revolved together, exact facsimiles are readily obtained, and the output of the machines greatly increased. Other machines involving the lathe principle, are the various kinds of borers, for drilling holes; tenoning machines and mortising machines, for making tenon joints and the mortises to receive the tenons; and gaging machines for cutting grooves. Abrading machines are of two kinds—those in which an endless belt coated with sand or emery is brought in contact with the work, generally of small dimensions; and those in which a drum similarly coated is employed to work down large surfaces. See also SAWS AND SAW-MAKING.

Practical Suggestions.—The very important place occupied by the circular and band saws among the various classes of wood-working machines demands a few practical suggestions and rules relative to their use, care, and management. The principal points to be observed in this connection are as follows:

Hanging the Saw.—Circular saws should always be hung upon the mandrel with the side marked "log side" next to the log on the mill, and should be perfectly plumb when the flanges have been screwed up. Thin saws and saws driven at high speed should be put up very open in order to allow the centre to pull through. These saws when hung on the mandrel may be concave or convex on the log side when at rest, but when running at the speed for which they are hammered they should straighten up and be flat on the log side. The difficulties resulting from too much crowning or dishing on the log side may be overcome by the use of suitable paper rings placed between the saw and the collars, so that when the saw is clamped between the flanges it will be brought to the proper position.

Lining the saw with the track.—The track should be solid, level, and straight, and should be put down by careful measurement so as to be from one-eighth to one-quarter of an inch further from the saw at its centre than at a distance of 20 feet from it. Some saws require more inclination toward the track than others in order to hold them to their work on

the log, and if the track is properly adjusted any small variations from the required inclination may be effected by means of the set screws on the box.

The *lead* or the holding of the saw to its work may be adjusted by its position to the track as already described, or by beveling on the back of the teeth. Assuming that the teeth are properly filed perfectly square in front, then bevel filing on the back of the teeth on the board side will lead the saw into the log, and bevel filing on the log side will lead it out of the log. A "snaky" or in and out lead indicates that the rim of the saw is too large for the centre and, therefore, requires to be opened out at the centre. This may be effected by running the saw warm at the centre by creating friction, by reducing the set or spread of the teeth, or by hammering between the centre and the rim.

Motion.—The motion of circular saws is one of the conditions which requires the most careful attention. The saw should always be run at a speed approximating as nearly as practicable to a periphery speed of 9,000 feet per minute, and it should be run at a uniform speed both in and out of the cut. Excessively high speeds generate heat in the saw and make it so touchy and limber that it will do good work only on light feed and while the teeth are in the best of condition; but, when the teeth have lost their sharp edge, the saw will dodge whenever it runs against the slightest obstacle. Speeds too low are also objectionable, but they do not produce such ruinous effects upon the saw. These difficulties may be partially remedied by the hammering of the saw, but it is impossible to overcome them completely by such means. The accompanying table gives the proper speed of circular saws of varying diameter. It is calculated on the basis of a periphery speed of 9,000 feet per minute. As a general rule, however, saws for portable mills are usually run at a speed of 450 revolutions per minute, and those for steam feed mills from 600 to 900 revolutions per minute.

TABLE OF SPEED OF CIRCULAR SAWS.

Diameter Inches.	Revolutions per Minute	Diameter Inches.	Revolutions per Minute
8	4,500	42	870
10	3,600	44	840
12	3,000	46	800
14	2,585	48	750

18	2,000	52	700
20	1,800	54	675
22	1,636	56	650
24	1,500	58	625
26	1,384	60	600
28	1,285	62	575
30	1,200	64	550
32	1,120	66	525
34	1,050	68	500
36	1,000	70	475
38	950	72	450
40	900		

The three following rules may be readily employed for calculating the speed of saws, pulleys, or drums.

1. To find the number of revolutions of the driven when its diameter is known

Multiply the diameter of the driver by its number of revolutions and divide the product by the diameter of the driven; the quotient will be the number of revolutions of the driven.

2. The diameter and revolutions of the driver

WOOD-WORKING MACHINERY

being given, to find the diameter of the driven, that shall make any given number of revolutions in the same time.

Multiply the diameter of the driver by its number of revolutions and divide the product by the number of revolutions of the driven; the quotient will be the diameter of the driven.

3. To find the size of the driver.

Multiply the diameter of the driven by the number of revolutions it is required to make, and divide the product by the number of revolutions of the driver; the quotient will be the size of the driver.

In the case of band saws the most important point requiring careful attention is the tension or the opening up or expanding of the centre of the blade so as to place the strain on the edges of the band. The tensioning of saws may be accomplished by the use of rolls, or by hammering, the last named method being preferable as the saws are liable to hold their shape much longer. The accompanying table shows the circles of tension for band saws of different widths and gauges. These figures give the saw as much tension as it will take and lie flat on the running-board, a condition which accords with the best practice.

It is often desirable that the toothed edge should be strained a little tighter than any other portion of the saw. This may be accomplished, and an uniform tension preserved by rolling or hammering the back of the saw to a curve showing about one-sixty-fourth of an inch rounding in five feet, and then tilting the upper wheel so that the saw has an uniform pressure across the blade. The strains usually put upon saws range from 5,000 to 12,000 pounds, and should be only sufficient to prevent slipping on the wheels. The

accompanying table gives the strains for band saws of different sizes and gauges.

Gauges.—In selecting a saw, the nature of the work for which it is required, and the power available to drive it, should always be taken into account. In this connection the first important point is the proper gauge. For mills of ordinary capacity and operating on a general line of work the most suitable saws are those measuring seven gauge at the centre and eight on the rim. If the timber is valuable, and the sawyer skillful, saws as light as eight by ten gauge may be used, but saws lighter than that are impracticable for use in ordinary mills. In large mills where the saving of time is more desirable than the saving of lumber, and consequently greater speed and feed are used, the most suitable saws are those of six and seven gauge, which are sufficiently heavy to stand up to the more severe service.

The second important point in the selection of a saw is the number of teeth. With high speed and the accompanying high feed, more work is required of the saw in a given time, and, therefore, it should have more teeth with which to do that work and to distribute the strain evenly. The number of teeth should depend not only on the thickness of the saw, but also on the character of the timber to be sawed and the speed and feed of the mill.

WILLIAM MOREY, JR., C. E.
Consulting Engineer, New York City.

Woodberry, wūd'bēr-ī, George Edward, American critic and poet: b. Beverly, Mass., 12 May 1855. He was graduated from Harvard in 1877, became professor of English in the University of Nebraska, in 1878-9 was on the 'Nation' staff, in 1879-80 was again at Nebraska, and subsequently, until 1891, was in active literary work, holding the literary editorship of the *Boston Post*, and contributing much to the 'Atlantic.' From 1891 until his resignation in 1904 he was successively professor of literature and of comparative literature (from 1899) in Columbia University. He became known as an

WOODBIDGE—WOODBURY

authoritative critic, and a poet of much distinction, and must be ranked among the most scholarly and important of the more recent American litterateurs. The titles of his works include: 'A History of Wood-Engraving' (1893); a very valuable 'Life' of Poe (1885); 'American Men of Letters'; 'The North Shore Watch, and Other Poems' (1890); 'Studies in Letters and Life' (1890); 'Makers of Literature' (1900); 'Nathaniel Hawthorne' (1902); 'American Men of Letters'; 'Collected Poems' (1903); and 'America in Literature' (1903). He also edited the poetical works of Shelley (1892); Poe's works (1894; with Stedman); Lamb's 'Essays of Elia' (1892); and Aubrey de Vere's 'Select Poems' (1894). He is also editor of the 'Journal of Comparative Philology.'

Woodbridge, William, American politician: b. Norwich, Conn., 20 Aug. 1780; d. 20 Oct. 1861. He removed with his father to Marietta, Ohio, in 1791, but studied law at Litchfield in his native State and in 1806 was admitted to the Ohio bar, becoming a member of the Ohio assembly the next year. A State senator, 1808-14, as well as county attorney, he was appointed secretary of Michigan Territory in 1814, was territorial delegate to Congress 1819-20, and judge of the supreme court of the territory 1828-32. In 1837 he became a State senator, was governor of Michigan, 1839-41, and a United States senator 1841-7.

Woodbridge, N. J., township, Middlesex County; on Staten Island Sound, and on the Central of New Jersey and the Pennsylvania R.R.'s; about 25 miles southwest of New York. It has regular steamer connection with New York. It has valuable deposits of fire-clay, and the chief industrial establishments are brick, tile, and drain pipe works. The township contains several villages. It has a high school, established in 1876, public and parish graded schools, and a public library. Pop. (1890) 4,665; (1900) 7,631; (1910) 8,948.

Woodburn, James Albert, American educator and historian: b. Bloomington, Ind., 30 Nov. 1856. He was graduated at the Indiana State University in 1876; taught in the preparatory department of that university from 1878 to 1886; from 1889 to 1890 was fellow in history at Johns Hopkins University; and since 1890, has been professor of American history in the University of Indiana. He has written 'Higher Education in Indiana' (1890); 'Causes of the American Revolution' in 'Johns Hopkins University Studies' (1891); 'The Historical Significance of the Missouri Compromise' in 'Reports of the American Historical Association' (1893); 'The American Republic and Its Government' (1903); 'Political Parties and Party Problems in the United States' (1903); the article 'United States—Political Events of the Civil War,' in the 'Encyclopedia Americana'; etc. He has also edited (with Prof. C. W. Hodgin) 'Select Orations of Burke and Webster' (1892); 'Lecky's 'American Revolution' (from Lecky's 'England in the Eighteenth Century'), with bibliography and notes; 'American Political History' (from Prof. Alexander Johnston's articles in Lalor's 'Cyclopedia of Political Science and United States History' 4 vols.); etc.

Woodbury, wūd'būr-ri, Daniel Phineas, American soldier and military engineer: b. New London, N. H., 16 Dec. 1812; d. Key West, Fla., 15 Aug. 1864. He was graduated from West Point in 1836 and was appointed second lieutenant of artillery. He was not long afterward transferred to the engineers and became first lieutenant in July 1838. After service to 1840 in constructing the Cumberland Road in Ohio, he took charge until 1847 of repairing works on the Atlantic coast. He was in charge of construction at Forts Kearny and Laramie, till 1850 and on the North Carolina coast till 1856. He became captain of engineers 1853, major 6 Aug. 1861, lieut.-col. Sept. and brigadier general of volunteers 19 March 1862. At the opening of the Civil War he was assigned for engineer duty in the Army of the Potomac and was active in planning the defenses of Washington. He controlled all the engineering operations in the siege of Yorktown and those before Richmond, and his prompt action at the battle of Fredericksburg in bridging the Rappahannock, won for him the brevet of brigadier-general in the regular army. While in command of the Key West district he died of yellow fever. He published 'Sustaining Walls' (1845); 'Theory of the Arch' (1858).

Woodbury, Isaac Baker, American musical editor: b. Beverly, Mass., 1819; d. 26 Oct. 1858. Having studied music for a year in Europe, he returned to the United States and taught music in the schools of Boston until his removal to New York in 1845. He then became editor of the 'Musical Review' and of the 'Musical Pioneer.' He is most widely known as the compiler of church-music books and glee-books, among which are 'Anthem Dulcimer' (1890); 'Liber Musicus' (1851); 'Millions Glee-book' (1853); 'Cultivation of the Voice without a Master'; 'Self-Instructor in Musical Composition and Thorough Bass'; 'Singing-School and Music-Teachers Companion'; 'Melodeon and Seraphine Instructor Book'; etc.

Woodbury, Levi, American jurist: b. Francetown, N. H., 22 Dec. 1789; d. Portsmouth, N. H., 7 Sept. 1851. He was graduated at Dartmouth in 1809, studied law, was admitted to the bar in 1812, and practised his profession at Francetown till 1816, when he was elected clerk of the State senate. In 1817 he was appointed a judge of the superior court, and in 1823 he was elected governor of New Hampshire, and in 1825 represented Portsmouth in the State legislature and became speaker of the House. He sat in the United States Senate 1825-31, and on the expiration of his term was elected in March 1831 to the State Senate, but declined the offer in order to accept that of secretary of the navy, to which he had been appointed by President Jackson. In July 1834 he was transferred to the office of secretary of the treasury, which he retained during the remainder of President Jackson's second term of office, and the whole of President Van Buren's administration, retiring on the inauguration of President Harrison 4 March 1841. During this period the post of chief justice of the superior court of New Hampshire was offered him, but was declined. In 1841 he was again returned to the United States Senate, but resigned in 1845 on account of his appointment as

WOODBURY—WOODCOCK

a justice of the Supreme Court, an office which he held till his death. He was a highly influential member of the Democratic party and at the time of his death was considered its most likely presidential candidate.

Woodbury, N. J., city, county-seat of Gloucester County; on the Delaware River, and on the West Jersey & Sea Shore (Pennsylvania) Railroad; eight miles south of Philadelphia. The chief industrial establishments are glass factory, chemical works, piano factory, and machine shops. Woodbury ships large quantities of fruit and vegetables. In 1900 (government census) the city had 81 manufacturing establishments capitalized for \$1,129,715. The value of the finished products, each year, was \$988,612. There are six churches, a high school, public and private schools, and a public library. The three banks have a combined capital of \$300,000. In 1903 the combined deposits amounted to \$1,243,000. Pop. (1890) 3,911; (1900) 4,087; (1910) 4,642.

Woodburytype Printing, a process for obtaining by means of photography a picture or illustration for press printing. This process was invented in 1901 by W. B. Woodbury, and is the only photo-mechanical one which, in the printing press, realizes the gradations of tone without grain or texture of any kind. The idea of the process emanated from the carbon print, in which the picture is formed in all its gradations by various thicknesses of pigmented gelatine, the shadows, representing the greatest thickness, being in relatively high relief, and the high lights the lowest. Mr. Woodbury conceived the idea of making an electrotype mold of a carbon picture, and using the mold so obtained as a printing surface by covering it over with warm pigmented gelatine, and by flat pressure attaching a sheet of paper to the pigment, so that when the gelatine jelly was set he could detach it from its mold and thus by repeating the operation obtain unlimited copies. This was practically the Woodburytype; but of course there were difficulties and imperfections, which the inventor quickly set to work to overcome. He found that a thick film of gelatine and bichromate, when exposed under a negative and washed, gave a very high, sharp relief; and he also found that when this relief was perfectly dry it possessed the property of being absolutely incompressible, in other words, it was as hard as steel, and could be used as a die. The relief film of gelatine was placed on a block of smooth, hardened steel, with raised edges, upon this was laid a sheet of type metal or lead about a quarter of an inch thick, and the arrangement was then placed under a hydraulic press capable of exerting a pressure of about 40 hundredweight to the square inch. The pressure forced the lead into the gelatine image with such accuracy that every shade and detail of the relief was impressed. The raised edges round the steel block prevented the metal from squeezing out, and on being detached, a mold in lead was obtained which could be used as a printing surface for thousands of copies. The seemingly delicate relief in gelatine was quite uninjured by this treatment, and would serve for any number of further pressed molds.

The printing press for these pictures is special, but quite simple. It is formed of a cast-iron base, on which is fitted a movable table

to hold the mold, which is bedded down on to it with gutta percha; over the table is a hinged lid, faced with plate-glass, with a lever attachment for giving the pressure. The printing ink is a solution of gelatine in a hot state to which a pigment is added to give any desired tint. In printing the lead mold is first oiled to prevent the gelatine sticking, and a pool of the warm ink is poured on to the middle of the mold; over this pool is laid a sheet of paper water-proofed with shellac, and the lid of the press is brought down over the whole, and pressure applied. The pressure squeezes out over the edges of the mold all superfluous ink, and all that is left is that retained in the graduated hollows and depressions of the lead mold; the warm ink sets in a few minutes, and on opening the press the paper support is removed with its gelatine copy of the molded picture firmly attached to it.

Woodcock, any of several birds, particularly certain snipe-like birds of the family *Scolopacidae*. The American woodcock, duck snipe, bog-sucker, big-headed snipe, mud snipe, etc., as this bird is variously named by gunners, is the *Philohela minor* of ornithologists. The body is full and robust, the wings short and rounded; the head and eyes very large, and the bill straight, tapering from the stout base, grooved for nearly the entire length and exceedingly sensitive at the end; there is practically no gape; the ear is situated beneath the eye; the legs are very short for a snipe, and the tibiae are fully feathered. The woodcock is 10 or 12 inches long and weighs from 7 to 9 ounces, the females being the larger. The colors are a soft harmonious blending of various shades of brown and gray, with black mottling above, nearly uniform pale brown below. Except that it invades Ontario and other southern provinces of Canada the woodcock seldom ventures beyond the limits of the eastern half of the United States at any season. In winter it migrates to the South Atlantic and Gulf States, but most of them breed in the central and northern States. Migration northward begins very early and many of the more hardy individuals reach the Middle and New England States in early March before the frost has left the ground. At such times, and also in the late fall, they secure their food, consisting of insects and their larvae, snails, etc., by turning over fallen leaves, but during the summer and whenever the ground is sufficiently soft they probe it with their long sensitive bills and with great skill extract the earthworms which constitute their chief food, and of which enormous quantities are consumed. They frequent bogs and swampy places along alder-grown streams, hillside springs, etc., during the summer; but in the autumn forsake these coverts for cornfields and the undergrowth of low woods, the surest indication of their presence being their perforations in the soft earth. Few birds are more uncertain in the choice of their feeding grounds, changing from high to low as the weather varies from wet to dry. Their solitary habits are no doubt the result of the character of their favorite food, to obtain which they not infrequently search city lawns after nightfall. As the large size of the eye suggests, the woodcock is crepuscular and nocturnal, the period of its greatest activity being in the hours immediately succeeding sunset and

WOODCHUCK—WOODEN WALL

preceding dawn, though, especially when moonlight, it may be abroad throughout the night. During the day it remains hidden in deep bogs and thickets, rising only when forced and then springing perpendicularly above the bushes it flies in an irregular course for a short distance and drops as suddenly to the ground and its concealment.

Mating takes place as soon as the sexes meet in the spring and is followed in April or even earlier by the building of a simple nest of leaves and grass in a dry and well concealed spot in a bog. Four or sometimes five buff or clay-colored eggs variously spotted with dark brown and lilac are laid, and after three weeks of incubation yield the fluffy, brownish-white young, which at once leave the nest led by the old birds to the feeding grounds. The love antics and nuptial flights of the male are curious and interesting. In the former he is a diminutive of a turkey cock; in the latter he mounts in the darkness of night on swift wing high in the air above a wet meadow, then falls like a shot with a whistling sound as the air rushes through his tail and wing-quills. He has also a simple whistling vocal note. The female especially is very solicitous in the care of her young and not only feigns injury in order to entice an intruder from their vicinity, but frequently has been observed to bear them one by one between her thighs to a place of safety. Later in the summer the members of a family scatter to feed singly in their home-bog and with the advance of fall seek the uplands as above described. With the coming of hard frosts most of the woodcock leave for the South and become concentrated in favorite bottoms along the lower Mississippi and other sections of the Gulf States. There and at this time the outrageous practice of fire-hunting is indulged in, chiefly by negroes and market hunters. One person bears a torch which lights the ground and confuses the birds which are often killed in great numbers by a second person with gun or club as they crouch confused on the ground. It is to this practice, as well as to the equally to be condemned spring and early summer shooting still permitted in some of the northern States, that the almost threatened extinction of this fine bird in many parts of the country is to be largely traced. Among natural enemies of the woodcock are minks, hawks, owls, red squirrels, cats, and snakes.

Next to the quail the woodcock is probably the most popular game bird of the eastern United States, and deservedly so, but its numbers have greatly decreased since about 1880. To save it all gunners should unite in abolishing spring and summer shooting and in restricting the great destruction which takes place in the Gulf States during the winter by the absolute prohibition of fire-hunting and similar barbarous methods. In every respect fall hunting is the most delightful sport, and the birds are then in the best condition for the table. Most gunners prefer a cocker or other spaniel for flushing the birds from thick coverts and much the same style of gun and ammunition as quail shooting requires. The successful woodcock shooter must be a quick and steady shot, for these birds are as changeable as the Wilson's snipe in their moods, and their coverts offer greater difficulties. When shooting in cornfields the gunner sometimes stands on an

elevated platform so that he can overlook the stalks among which his dogs are quartering.

The European woodcock, which occasionally occurs in this country, is a much larger bird and belongs to the genus *Scolopax*, which has long pointed wings, in which the outer primaries are neither much shortened nor attenuated. Its color is a brown of various shades, of darkest hue on the back, while the tail is black above, tipped with gray. Their habits are very similar to those of the American kind.

Consult: Lewis, 'American Sportsman' (Philadelphia 1868); Fisher, 'Yearbook,' United States Department of Agriculture for 1901.

Woodchuck, or Ground-hog, an American marmot (*Arctomys monas*), 18 to 24 inches long, grizzled above, and chestnut red below, the feet and tail blackish. It is found from Hudson Bay to South Carolina, and west to the neighborhood of the Rocky Mountains, several distinct sub-species and varieties appearing in this wide range. It digs deep holes in the fields, on sides of hills, or under rocks in the woods, in a slanting direction, at first upward to keep out the water, with several compartments, and usually with more than one entrance. It passes the winter in the burrow, in a dormant state. The digging is effected by the powerful fore feet, assisted by the teeth, the dirt being thrown backward under the belly and then kicked out by the widespread hind feet. The food consists of various plants, fruits, and vegetables; they are especially fond of red clover, often doing great mischief to this crop, and to gardens; another favorite food is celery.

Woodchucks feed chiefly during the early morning and late afternoon and spend most of the remaining time lying in the sun or sleeping in the nests at the bottom of their burrows. They become extremely fat and retire to hibernate on the first intimation of approaching winter and only appear after the snow is gone in the spring. A large brood of young is born in the spring or early summer and when a few months old they are forced to leave the burrow and to shift for themselves. The woodchuck is generally a bold and unsuspecting creature, but has alert senses and where much persecuted may become vigilant. When driven to bay it may fight with considerable courage and effectiveness. Its chief natural enemies are foxes and skunks, but the animal remains generally abundant in both cultivated regions and woodlands in the New England and Middle States. Consult Ingersoll, 'Wild Neighbors' (New York 1898).

Wooden Wall, the side of a ship; hence the ship itself. When Athens was in imminent danger from the Persians 483 a.c., during the invasion of Xerxes, the oracle at Delphi was consulted, and, intimating that the city and country were doomed to ruin, added that—when all was lost, a wooden wall should still shelter her citizens. The Athenian young men interpreted "a wooden wall" to signify ships; Themistocles, who had probably influenced the oracle to utter the prediction or counsel it had given, was of the same opinion; faith was put in the navy, and the result was the great victory of Salamis. It was from this incident that the expression, "The wooden walls of England," arose.

WOODFALL—WOODMEN FRATERNAL BENEFICIARY ORDERS

Woodfall, Henry Sampson, English printer and journalist: b. London 21 June 1739; d. there 12 Dec. 1805. From about 1758 until 1793, when he disposed of his interest and retired, he conducted the 'Public Advertiser,' among the contributors to which was Sir Philip Francis (q.v.). He printed the 'Letters of Junius' (see JUNIUS), which have been conjecturally assigned to Francis. Woodfall, however, is on record as stating that he definitely knew Francis "never wrote a line of Junius." After the Junius letter to the king had appeared in the 'Advertiser,' Woodfall was prosecuted for libel by the crown, but the verdict rendered was practically one of acquittal. In 1797 Woodfall was master of the Stationers' Company. The 'Advertiser' ceased to exist in 1795.

Woodford, Steward Lyndon, American diplomat: b. New York 3 Sept. 1835. He was graduated from Columbia in 1854 and admitted to the bar three years later, beginning practice in his native city in 1857. He served in the Federal army 1862-5, being at one period military commandant of Charleston and Savannah, and becoming brevet brigadier-general of volunteers. He was lieutenant-governor of New York 1866-8, but in 1870 as the Republican candidate for governor was defeated. A member of Congress 1873-5, and attorney for the southern district of New York 1877-83, he subsequently engaged in private practice, but was appointed minister to Spain in 1897, returning to the United States the next year on the opening of the Spanish-American War.

Woodhull, Alfred Alexander, American brigadier-general: b. Princeton, N. J., 13 Apr. 1837. He was graduated from Princeton, from which he received the degree of LL.D. also, and from the University of Pennsylvania as M.D. He served through the Civil War in various medical and surgical offices, and in March 1865 he was breveted captain, major and lieutenant-colonel "for faithful and meritorious services." He has since filled many other offices in the surgical department of the army, and by Act of 23 Apr. 1904 he was advanced to the rank of brigadier-general, retired. He lectured on personal hygiene and general sanitation at Princeton 1902-7, and has been the author of several medical works, especially 'Military Hygiene' (1890, 1898, 1904, 1909), and 'Personal Hygiene' (1906).

Woodhull, John Francis, American university professor: b. Westport, N. Y., 2 July 1857. He was graduated from Yale, studied at Johns Hopkins and received Ph.D. from Columbia. He was teacher and principal in secondary schools 1881-5; professor of natural sciences at the New York State Normal School, 1887; professor physical sciences, Teachers College, Columbia 1888—; member of the University Council of Columbia 1899-1902. He is a lecturer and author; some of his books being 'Physics' (1900); 'Simple Experiments in Chemistry' (1905); 'Physical Nature Study Library' (1906); 'Electricity and Its Everyday Uses' (1911).

Woodland, Cal., city, county-seat of Yolo County; on the Southern Pacific railroad; about 85 miles northeast of San Francisco, and 20 miles north of Sacramento. It is in an agricultural region, in which wheat and grapes are

among the chief products. Many sheep are raised in Yolo County. The chief industries are connected with raising and shipping grapes, manufacturing wine, and shipping wheat, fruit, barley, wool, and live stock. The educational institutions are Holy Rosary Academy (R. C.), Hesperian College (Disciples of Christ), opened in 1861, a high school established in 1895, graded elementary public and parish schools. The city has several banks with deposits amounting to about \$2,000,000. Pop. (1910) 3,187.

Woodland Area of the United States. Our forests now cover 550,000,000 acres, or about one-fourth of the United States. Forests publicly owned contain one-fifth of all timber standing. Forests privately owned contain at least four-fifths of the standing timber. The timber privately owned is not only four times that publicly owned, but it is generally more valuable. Forestry is now practised on 70 per cent of the forests publicly owned and on less than 1 per cent of the forests privately owned, or on only 18 per cent of the total area of forests. The original forests of the United States contained timber in quantity and variety far beyond that upon any other area of similar size in the world. They covered 850,000,000 acres, with a stand of not less than 5,200,000,000,000 board feet of merchantable timber, according to present standards of use. There were five great forest regions—the northern, the southern, the central, the Rocky Mountain and the Pacific. The present rate of cutting is three times the annual growth of the forests of the United States. The great pineries of the lake States are nearing exhaustion and great inroads have been made upon the supply of valuable timber throughout all parts of the country. The heavy demands for timber have been rapidly pushing the great centres of lumber industry toward the south and west. In 1900 the production of yellow pine lumber amounted to sixteen and one-quarter billion feet; the Douglas fir of the northwest held second place, with over four and three-quarters billion feet; while oak came third, with four and one-half billion feet. We take from our forests yearly, including waste in logging and in manufacture, 20,000,000,000 cubic feet of wood, valued at about \$1,250,000,000.

Woodmen Fraternal Beneficiary Orders. The Modern Woodmen of America is the largest and the Woodmen of the World is the second largest life insurance fraternity in the United States. The Modern Woodmen of America was originated at Lyons, Iowa, November 1882; the Woodmen of the World at Omaha, Neb., June 1890, by Joseph Cullen Root, who promulgated and promoted both Orders, serving as president of the Modern Woodmen of America until November 1890, and as president of the Woodmen of the World from its inception, being unanimously elected by both Orders, and his present term of office extending until June 1914.

Both Orders are secret beneficiary Orders, affording life insurance to the members thereof, the Modern Woodmen of America being what is known as a "current rate Order," and the Woodmen of the World, with higher monthly rates, has accumulated an Emergency Fund and surplus aggregating about \$15,000,000, on the first of January 1912. This Emergency Fund

WOODPECKER

is available when twelve monthly contributions from its members during any year are less than the mortuary losses incurred. In addition to the payment of death benefits, the maximum being \$3,000, a monument is erected to the memory of every deceased member at a cost of \$100, and on attaining 70 years of age, providing the member is totally, physically disabled by reason of old age, he receives one-tenth of the amount of the certificate or policy held each year until same is fully paid. Should he die in the interim, the unpaid balance goes to his designated devisee.

The Modern Woodmen pay to the designated beneficiary on the death of its members the amount designated in the certificate or policy held, the maximum being \$3,000. It has a membership of about 1,250,000.

The Woodmen of the World, Sovereign Jurisdiction, which includes all of the United States except the seven states on the Pacific coast, has a membership of about 600,000, 1 January 1912. Auxiliary Orders which have sprung from the Woodmen of the World and have coordinate fraternal relations therewith, are the Pacific Jurisdiction Woodmen of the World, having a membership of about 105,000, and the Canadian Order Woodmen of the World, having a membership of about 20,000. The Woodmen Circle and the Women of Woodcraft and the Companions of the Forest are also "off-shoots" of the Order and are composed principally of women, having an aggregate membership of about 160,000. Other Orders, known as the Columbian Woodmen and Southern Woodmen, which have no coordinate relations, have sprung from the Woodmen of the World.

The Royal Neighbors is the recognized women's auxiliary of the Modern Woodmen of America and has a membership of about 200,000.

The Modern Woodmen of America has paid about \$95,000,000 death losses. The Woodmen of the World has paid about \$65,000,000 in death losses, and has erected over 45,000 monuments to the memory of its deceased members since organization to the first of January 1912.

Joseph Cullen Root is the author of the rituals and ritualistic ceremonies of both parent Orders of Woodcraft, the first being based upon the ancient Roman forms of adoption of children and conferring of citizenship upon naturalized people, and the second on the three periods of life and the lesson taught in the biblical history of Joseph and his brethren.

The Modern Woodmen have recently established a sanatorium for treatment of tuberculosis, and the Woodmen of the World a home for their aged, decrepit and indigent members, and a sanatorium in the State of Texas for the treatment of tuberculosis.

The Orders of Woodcraft have been the most progressive of the life insurance fraternities.

The Sovereign Camp Woodmen of the World in 1912 erected an 18-story office building in Omaha, Neb., costing \$1,500,000, ground space 110 x 132 ft., the institution occupying the greater portion of the building for headquarters.

Woodpecker, a bird of the family *Picidae*, one of the most sharply defined families of birds which, with the related *Picumnidae* and *Tyrannidae* form the very natural order *Pici*. These birds have a unique type of bony palate

(saurognathous) especially characterized by the separation of the vomer into a pair of splint-bones, the fourth toe is reversed permanently so that it forms a pair with the hallux, which, however, is occasionally absent, and there are numerous other anatomical peculiarities. In addition the *Picidae* are distinguished by the acute, rigid and bristly character of the tips of the five well-developed pairs of tail-quills, the outer or sixth pair being rudimentary. In typical woodpeckers the head is large, the neck slender but very powerful, the bill stout, straight, chisel-pointed, and often strengthened by longitudinal ridges, the nostrils protected by a thick screen of bristly feathers, and the feet very powerful, with short stout tarsi, strongly hooked claws and rough scales. The tongue is remarkably well developed, being slender and flexible, with a barbed horny tip in most cases, and the horns extended upward over the head into the orbit or even penetrating into the upper mandible; and suitably provided with muscles for projecting it far beyond the tip of the bill. This arrangement is of the greatest value in enabling these birds to explore deep recesses for insects, and even to drag larvae from their burrows by means of the barbed tip and the adhesive secretion which the tongue receives from the greatly developed salivary glands.

The woodpeckers are a large group, 45 genera and 350 species having been enumerated in 1890. Except Australia, Madagascar, and certain groups of the Polynesian Islands they inhabit the forest-clad regions of the entire globe. By reason of their peculiar mode of life the great majority of species are confined to woodland districts, and they range from the seashore to the mountain heights. Although chiefly insectivorous, the peculiar source of their food, which consists to a great extent of the long-lived wood-boring larvae, makes them largely independent of seasons, and being hardy birds they are, with some exceptions, little migratory and are equally at home in far northern and tropical forests. However, possibly in correlation with the more numerous and larger wood-borers of the warm regions, they there reach the largest size and greatest numerical development. A few woodpeckers, like *Colaptes* (see *FLICKER*), robin-like, search for worms and insects on the ground, and these have weaker, slightly curved rounded bills, and smaller heads. Some as *Sphyrapicus* and its allies, drill the outer bark of rosaceous trees and lap the flowing sap with their bristle-brushed tongues or, like the red-head woodpecker, peck the ripest apples, green corn, and other sweet and succulent vegetables. But the great majority are strictly insectivorous and perform an invaluable service to human kind by their enormous destruction of a class of destructive insects which is largely beyond artificial attack. With the possible exception of the yellow-bellied woodpecker (*Sphyrapicus varius*), which may be considered doubtful, every species of woodpecker inhabiting the eastern United States is decidedly beneficial. In searching for insects woodpeckers usually begin at the very base of a tree trunk, move spirally upward supported by their strong feet and bracket-like tail, peering into every crevice, pausing occasionally to tap the bark and remain in an attitude of apparent intense listening, and move on. From time to time they peck the

WOODPECKER

work with hammer-like blows delivered with intense energy, which make the chips fly rapidly and soon expose the larva whose presence within had apparently been detected by the bird's keen sense of hearing. As soon as one tree is sufficiently explored they go to another, but often spend a long time searching and drilling in a decayed limb or stump much infested with insects. Woodpeckers have a very characteristic undulating or galloping flight which is seldom much protracted. Their nests are in holes drilled by themselves first horizontally then vertically downward and chambered in the usually partially decayed limb or bole of a tree or some suitable substitute. The eggs are always white with a highly polished porcelain-like surface, are usually numerous, and are deposited on a few wood chips at the bottom of the excavation. Woodpeckers are unmusical, their nuptial song being a loud harsh rattling cry or laugh, combined with a loud drumming on resonant branches. Except during the nesting season they are usually silent and solitary birds.

About one half of the known woodpeckers are American and 8 genera and 30 species and sub-species enter the United States, a number of racial forms being confined to the extreme Southwest. As their habits conform pretty closely to the account just given, only a few representative forms need be mentioned. The primate and crowning glory of our species is the magnificent ivory-billed woodpecker (*Campylorhynchus principalis*), the embodiment of all the highest attributes of woodpecker life and structure. (See IVORY-BILL.) A smaller, duller colored, but generally close counterpart of the ivory-bill is the pileated woodpecker (*Geopelia pileatus*), of similar habits and only less quickly affected by the destructive agencies of man. Its original range, however, was much wider, but it is now a generally very rare and wary inhabitant of the deep woods. It is about 17 inches long, the bill is black and the fourth toe is peculiar in being much shorter than the hallux. *Dryobates* includes numerous species of small and moderate size with the plumage variously striped and spotted with black and white, the males with a red head-patch which the females lack. Very familiar nearly resident species of the wood lot and orchard are the little downy and the larger hairy woodpeckers (*D. pubescens* and *D. villosus*). A more southern and woodland species is *D. borealis*, the red-cockaded woodpecker, while the West has *D. scalaris*, *D. nuttalli*, and *D. arizonae*. *Xenopus* contains the noteworthy *X. albolarvatus* which has a completely white head, while *Picoides* is still more noteworthy in the entire absence of the hallux. Two or three species of the three-toed woodpeckers (*P. arcticus*, *P. americanus*, etc.) inhabit the northern parts and western mountains of North America, and others occur in Eurasia. Besides the much divided black and white the plumage shows some yellow and brown. The remaining North American species are less typical in structure and habits. First of them is the handsome and well-known red-headed woodpecker (*Melanerpes erythrocephalus*), locally a common bird among old timber everywhere east of the Rocky Mountains, except in New England. Southward it is resident, northward migratory, and more a vegetarian than most woodpeckers, eating, besides insects, which it sometimes catches flying, nuts, berries,

green corn, and fruits, in search of which it haunts the orchard. The California woodpecker (*M. formicivorus*), as its name indicates, finds ants a favorite article of diet, but also eats fruits, nuts, and acorns, and has a remarkable habit of storing vast quantities of the latter in chinks and holes, often completely studding the boles of tall trees with acorns wedged in singly and sometimes using the space behind the cornices of houses for storage. Much speculation has been indulged in concerning this habit, but the fact is that these birds are migratory and but few of the acorns or the contained grubs thus stored are ever utilized for food. The eastern red-head stores up acorns less regularly. This genus also includes three other western species and the red-bellied woodpecker (*M. carolinus*) chiefly of the southeastern United States.

The sap-sucking habit and the peculiar structure of the tongue of *Sphyrapicus* have been alluded to above. The eastern species, the yellow-bellied woodpecker (*S. varius*), is the well-known sap-sucker (q.v.), whose rows of holes completely encircling the trunks of orchard trees are so familiar. This bird is a migrant, breeding only in the northern States and Canada. The plumage is much variegated with black and white, brown, yellow, and red, and is remarkable for its variability with sex, age, and season. In the West are *S. nuchalis*, *S. ruber*, and *S. thyroideus*. Finally, the genus *Colaptes* contains the handsome ground-woodpeckers or flickers (q.v.), which, while retaining much that is picine in structure and habit, in other respects depart widely. They subsist largely on berries, are more or less migratory and in addition to the ordinary woodpecker calls have many others, some of which are clear and musical. Their headquarters are in the southwestern United States and Mexico, where four species occur including the red-shafted flicker (*C. cafer*), and the gilded flicker (*C. chrysoides*). The eastern or yellow-shafted flicker (*Gaurax*) is one of the best known birds whose ubiquity and marked individuality are attested by the great variety of local names which it has received. In the middle Mississippi Valley and westward, where their ranges overlap, numerous examples combining the characters of *C. auratus* and *C. cafer* in every degree and supposed to be hybrids are found.

The Old World woodpeckers for the most part belong to the typical groups of genera, but three-toed woodpeckers are found in Europe and Asia and in the Malayan Islands, the latter being a peculiar crested genus (*Geopopocordes*). A ground woodpecker (*Geocolaptes olivaceus*) of South Africa is gregarious and remarkable from its habit of nesting, kingfisher-like, in holes in banks. The related wrynecks (*Ilygiidae*), confined to the Old World, have the general aspects of larks, with soft broadly webbed tail feathers, but their feet and other anatomical parts and their habits, as well, are those of the woodpeckers. However, they nest in natural holes in trees or banks and often seek their food on the ground. The *Picumnidae* have short tails with feathers of the ordinary structure. They are mostly diminutive insectivorous birds, chiefly confined to tropical America.

1862); Baird, Brewer and Ridgway, 'Land Birds of North America,' Vol. II. (Boston 1874); Coues, 'Key to North American Birds' (Boston 1903); Beal, 'Food of Woodpeckers.'

Woodrow, wud'rô, James, American Presbyterian clergyman and college president: b. Carlisle, England, 30 May 1808; d. Columbia, S. C., 17 Jan. 1907. He was graduated from Jefferson College, Canonsburg, Pa., in 1849, subsequently studied at the Lawrence Scientific School at Harvard, and at the University of Heidelberg. He was professor of natural science in Oglethorpe College, Ga., 1853-61, entered the Presbyterian ministry in 1860 and was Perkins professor in the Presbyterian Theological Seminary, Columbia, S. C., 1861-84. From 1891 to 1897 he was president of South Carolina College.

Woodruff, Willford, American Mormon leader: b. Northington (now Avon), Conn., 1 March 1807; d. Salt Lake City, Utah, 3 Sept. 1898. He adopted the Mormon faith in 1833 and in subsequent years made missionary tours to England, and in the eastern States. He was one of the Mormon emigrants to Salt Lake City; became one of the 12 apostles in 1839; and in 1887 was elected president of the Mormon Church. For 23 years he held a seat in the Utah Legislature.

Woods, Leonard, American Congregational clergyman: b. Princeton, Mass., 19 June 1774; d. Andover, Mass., 24 Aug. 1854. Graduated from Harvard in 1796, he studied theology at Somers, Conn., as a pupil of Dr. Charles Backus, in 1798 was ordained pastor of the church at Newbury, Mass., and upon the establishment of the Andover Theological Seminary in 1808 was made professor of Christian theology there. In 1846 he retired from the active duties of the chair. He was a strict Calvinist, well-versed in metaphysical studies, a clear and vigorous writer, and a champion of the New England theology against Ware, Buckminster, Channing, and other Unitarians. "He is emphatically," says H. P. Smith, "the 'judicious' divine of the later New England theology." He was prominent in the founding of the Temperance Society, the American Tract Society; and the Board of Commissioners of foreign missions. Among his works are: 'Letters to Unitarians' (1820); 'Lectures on the Inspiration of the Scriptures' (1829); 'Memoirs of American Missionaries' (1833); 'Examination of the Doctrine of Perfection' (1841); and 'Lectures on Church Government' (1843).

Woods, William Burnham, American jurist: b. Newark, Ohio, 3 Aug. 1824; d. Washington, D. C., 14 May 1887. He was graduated at Yale in 1845, was admitted to the Ohio bar in 1847 and mayor of his native city 1856-7. In the last named year he was elected to the Ohio legislature and chosen speaker, at the outbreak of the Civil War entered the Union army as lieutenant-colonel of the 76th Ohio regiment; and was promoted brevet major-general. At the close of the war he took up his residence in Alabama, was chosen chancellor of that State in 1868, appointed circuit judge of the 5th District in 1870, and in 1880 became an associate justice of the United States Supreme Court.

Wood's Holl, or Wood's Hole, Mass., in the town of Falmouth (q.v.), in Barnstable

County; on Buzzards Bay, and on the New York, New Haven & Hartford railroad. It has a large, deep harbor, and is widely known as the location of a station with a marine laboratory of the United States Fish Commission.

Woodstock, Canada, city and port of entry, county-seat of Oxford County, Ontario, on the River Thames and Cedar Creek, and on the Grand Trunk and Canadian Pacific railways; 49 miles southwest of Hamilton, 29 miles northeast of London. It has a large trade in grain, produce, and manufactured articles. The industries include manufactures of foundry and machine-shop products, bicycles, organs and pianos, wire mattresses, furniture, carriages, woollens, flour, etc. Woodstock is the seat of Woodstock College (Baptist), and has banks and daily and weekly newspapers; lighted by electricity, has good water and sewerage systems. Pop. about 10,000.

Woodstock, Conn., town in Windham County; about 40 miles northeast of Hartford and five miles northwest of Putnam. It contains six villages. The town is in an agricultural and stock-raising region. The chief industrial establishments are creameries and cotton twine factories. It has Woodstock Academy, graded schools, and a public library. Woodstock belonged to Massachusetts when it was incorporated in 1690. In 1749 it was annexed to Connecticut. Pop. (1910) 1,849.

Woodstock, Ill., city, county-seat of McHenry County; on the Chicago & Northwestern railroad; about 50 miles northwest of Chicago and 30 miles east of Rockford. It is in an agricultural and dairying section. It has flour and lumber mills, creamery, pickle, and canning works. The principal public buildings are the county court-house, city-hall, and business blocks. It has six churches, Todd Seminary for boys, a high school, established in 1867, public elementary schools, and a public library. The three banks have a capital of \$85,000, and the deposits amount to approximately \$650,000. Pop. (1910) 4,331.

Woodstock, Vt., town, county-seat of Windsor County; on the Ottaguechee River, and on the Woodstock railroad; 38 miles south of Montpelier. It is in an agricultural and dairying region, and contains four villages. The chief industrial establishments are butter and cheese factories, sash, door, and blind factories, flour and lumber mills. Other manufactures are hay-rakes, sleighs, wagons, carriages, butter tubs, and cheese boxes. The town has six churches, graded grammar and elementary schools, and the Norman Williams Public Library, founded in 1885. There are two banks; the national bank has a capital of \$150,000. In 1903 the savings bank had deposits amounting to \$1,215,650. Pop. (1910) 2,545.

Woodstock, Va., town, county-seat of Shenandoah County; on the north branch of the Shenandoah River, and on the Baltimore & Ohio railroad; about 95 miles west of Washington, D. C., and 155 miles northwest of Richmond. It was founded in 1762. It is in an agricultural and stock-raising region, and its industries are connected chiefly with farm and dairy products and the marketing of live-stock. It has eight churches, and graded schools for both races. There are (1903) one national bank, one private

bank, and one loan and trust company. Pop. 1,200.

Woodstock, a novel by Sir Walter Scott, published in 1826. It is an English tale of the time of Cromwell; the events occurring in the year 1652, immediately after the battle of Worcester. The scene is laid chiefly in the Royal Park and Manor of Woodstock.

Woodward, Calvin Milton, American educator. b. Fitchburg, Mass., 25 Aug. 1837. He was graduated at Harvard University in 1860; was principal of Brown High School, Newburyport, Mass., 1860-5. During one year of the Civil War he was captain Co. A, 48th Massachusetts Volunteers, serving in Louisiana. In 1865 he was called to the Washington University, Saint Louis; elected professor of mathematics and applied sciences 1870; dean of School of Engineering 1871-96, and founder and director of the Saint Louis Manual Training School since its organization in 1879. Dr. Woodward's service to the cause of education has been marked by great devotion and by equally great success, especially along practical lines. He served as a member of the Saint Louis School Board 1877-9 and again since 1897; regent Missouri State University 1891-7; fellow and vice-president of the American Association for the Advancement of Science 1903 and 1904; president of the Society for the Promotion of Engineering Education; member of the Saint Louis Academy of Science; past president Saint Louis Engineers' Club; was re-elected dean of the School of Engineering and Architecture July 1901. He is well known as a lecturer on Manual Training. Received the degree of Doctor of Philosophy from Washington University in 1883. He has contributed many valuable articles to educational and scientific journals (see article SAINT LOUIS in this encyclopedia) and has written: 'History of the Saint Louis Bridge' (1881); 'The Manual Training-School' (1887); 'Manual Training in Education' (1890); etc.

Woodward, Robert Simpson, American astronomer, physicist and mathematician: b. 21 July 1849 at Rochester, Mich. He was graduated with the degree of C.E. at University of Michigan 1872 and was appointed assistant engineer United States Lake Survey. During 1882-4 he served as assistant astronomer to the United States Transit of Venus Commission; from 1884-90 he was astronomer, geographer and chief geographer to the United States Geological Survey, became assistant in the United States Coast and Geodetic Survey in 1890, and served for three years. From 1893-1905 he was professor of mechanics and mathematical physics at Columbia University and from 1895 to 1905 was dean of the faculty of pure science. In 1905 he became president of Carnegie Institution, Washington, D. C.

Dr. Woodward was president of the American Mathematical Society 1898-1900, American Association for the Advancement of Science 1900-1, New York Academy of Sciences 1900-2. In 1892 he received the degree of doctor of philosophy from the University of Michigan, and in 1904 the degree of doctor of laws from the University of Wisconsin. Dr. Woodward has published many papers and addresses on astronomy, geodesy, mathematics and other scientific subjects. (See article EARTH in this encyclopedia.) He has written 'Smithsonian

Geographical Tables' (1894); 'Higher Mathematics—a Text Book for Classical and Engineering Colleges' (1896 with Mansfield Merriam); etc.

Woodworth, wüd'wérth, Samuel, American author and editor: b. Scituate, Mass., 13 Jan. 1785; d. New York 9 Dec. 1842. He received a limited education in his native town, and was apprenticed in Boston to Benjamin Russell, editor and publisher of the 'Columbian Centinel.' After the expiration of his indentures he published for a brief period at New Haven, Conn., the weekly 'Belles-Lettres Repository,' engaged in other literary pursuits, in which he continued with more or less success until the close of his life. He was one of the founders in 1823, in conjunction with George P. Morris, of the 'New York Mirror,' from which he withdrew within a year. Among his writings were a number of dramatic pieces, and 'Champions of Freedom' (1816), but his reputation rests principally upon his songs and miscellaneous poems, one of which, 'The Old Oaken Bucket,' obtained a wide popularity. His collected poems were published, with a memoir by G. P. Morris, in 1861.

Woof. See WEAVING.

Wool, wål, John Ellis, American general: b. Newburgh, N. Y., 20 Feb. 1789; d. Troy, N. Y., 10 Nov. 1869. He was in early life proprietor of a bookstore in Troy, and his property being consumed by fire, he turned to the law, but his studies were interrupted by the war with Great Britain in 1812, when he became captain in the 13th infantry. He distinguished himself at Queenstown Heights, Plattsburg, and Beekmantown, and in 1816 was appointed inspector-general of the northern division; in 1818 lieutenant-colonel; in 1821 inspector-general of the whole army; and in 1826 brevet brigadier-general for 10 years' faithful service. In 1832 the government sent him to Europe to examine the military systems of some of the principal nations. In 1836 he was charged with removing the Cherokee Indians to Arkansas; and in 1838, during the Canadian difficulties, made a reconnaissance through the wilds of northern Maine, with a view to the defense of the frontier. He was appointed brigadier-general, 25 June 1841, and at the commencement of the Mexican War was ordered to the West to organize the volunteers, 30 May 1846, and in less than six weeks despatched to the seat of war 12,000 troops fully armed and equipped. He selected the ground on which was fought the battle of Buena Vista 23 Feb. 1847, commanded in the early part of the action, and for his conduct on this occasion was brevetted a major-general in 1848. After his return home in July 1848, he commanded the eastern military division, with headquarters at Troy, until October 1853, when he was placed at the head of the department of the East, with his headquarters at Baltimore. From 1854 to 1857 he was in command of the department of the Pacific and of the Eastern department again 1857-60. When civil war was imminent toward the close of 1860, he offered his services to the government, and after the attack upon Fort Sumter went to New York to organize, equip, and send to Washington the first regiments of volunteers. In August he was sent to Fortress Monroe as commander of the department of Virginia, and from that post led an expedition

CALVIN MILTON WOODWARD.

WOOL-GRASS — WOOLF

which occupied Norfolk, 10 May 1862. He was promoted to be full major-general in the regular army, 16 May 1862 and the next year was placed on the retired list.

Wool-grass, a rush. See **SCIAPUS**.

Wool, Manufacture of. Among the ancients wool was the staple material for clothing and was used before either flax or cotton. The ancient Greeks manufactured wool into goods of special excellence. The making of woollen cloth was introduced into England by the Romans. In the 18th century Yorkshire became the great wool centre of Great Britain.

Modern Process.—In making woollen cloth the essential processes, as carried on in modern factories, are: (1) the stapling of the raw wool. In this process the stapler or sorter works at a table covered with wire netting, through which the dirt falls while the various qualities of wool are being separated. The wool is then ready to be put through the (2) scouring machine, where it passes on an endless apron into an oblong vat, which contains a steaming soapy solution. Here it is carried forward gently by means of rakes until it is thoroughly soaked and cleansed. After this it is taken to the (3) drying framework of wire netting, under which are situated steam-heated pipes. A fan-blast drives the heated air upwards through the wet wool, which lies on the wire netting, until it is all equally

form of yarn, is now fit for (8) weaving into woollen cloth. (See **WEAVING**.) When it is taken out of the loom the cloth is washed, to free it from oil and other impurities, and also beaten while it lies in the water by wooden hammers moved by machinery, while it is again dyed if found necessary. After it has been scoured in water mixed with fuller's earth, the cloth undergoes a process of (9) teasing and shearing (see **TRASSI**), in which the pile or nap is first raised, and then cut to the proper length by machines. When this is done it is (10) steamed and pressed between polished iron plates in a hydraulic press.

Worsted.—In the manufacture of worsted yarn the long-staple wool fibres are brought as far as possible into a parallel condition by processes called gilling and combing. The wool, in a damp condition, is passed through a series of "gill boxes," in which steel gills or combs separate and straighten the fibres until, from the last box, it issues in a long sliver. In this condition it is run through a delicate combing machine. From the combing machine it is delivered in the condition of a fine sliver technically called top, and after being further attenuated by a process of roving the thread is spun into yarn on what is called a throstle-frame.

Statistics.—The United States census reports of wool manufacture, by decades, from 1880 to 1910, show the following:

	1880	1890	1900	1910
Number of factories.....	2,330	1,693	1,414	913
Capital.....	\$143,512,778	\$245,866,743	\$320,179,749	\$418,465,000
Value of product.....	\$38,035,686	\$70,587,511	\$96,990,484	\$19,826,000

dried. When necessary this is the point in the process when it is "dyed in the wool." It is then ready for the (4) willeying or teasing machine, which consists of a revolving drum furnished with hooked teeth, close above which are set cylinders with hooked teeth moving in a contrary direction. The wool is fed in upon the drum, which whirls with great speed; and between the two sets of teeth working in opposite directions it is disentangled, torn, and cast out in fine, free fibres. With some classes of wool it is also necessary, at this stage, to remove soda and burrs by steeping them in a solution of sulphuric acid, or passing them through a burring machine, by which the burrs are extracted. The wool is now dry and brittle; and before submitting it to the process (5) of carding, it is sprinkled with oil and well beaten with staves in order to give it suppleness. This process of carding is accomplished by a series of three delicate and complex machines called a scribbler, an intermediate, and a finisher. These machines have various intricate cylinders and rollers, studded with teeth and working in opposite directions, over which the wool is passed until it is torn, interblended, and finally delivered from the finisher in a continuous flat lap. It is then cut into strips and passed (6) to the condensing machine, which rubs the strip into a soft, loose cord or sliver technically called a "slubbing." The wool is now ready for (7) spinning into yarn, and this is accomplished in a wool-spinning mule, which draws and twists the sliver into the required thinness, the process being essentially the same as in cotton-spinning. The wool, which has thus been brought into the

In total value of products Massachusetts led in 1900, with a product valued at \$81,041,537; Pennsylvania was second with \$71,878,503. No other State approached these two. Rhode Island was third in rank, with a product somewhat less than half that of Massachusetts, followed by New York, with a product not quite half that of Pennsylvania. New Jersey, Maine, and Connecticut were very close together, with but little over \$1,000,000 difference in the value of their products. New Hampshire was eighth, with products of \$7,624,062. Vermont had \$2,572,046, and Tennessee \$1,517,194. These 10 States were the producers of nearly 70 per cent of the total wool manufactured in the United States. The total amount paid in wages in 1900 was \$57,933,817, divided as follows: To men, \$36,412,872; to women, \$19,549,423; to children, \$1,971,522. In 1890 the total amount was \$54,339,775, of which \$33,702,231 was paid to men, \$18,883,174 to women, and \$1,754,370 to children.

Wool-sorters' Disease. See **ANTHRAX**.

Woolens Bill, in American history, a tariff bill introduced into Congress in 1816. It provided for the general reduction of tariff on woollen and cotton goods. The bill was supported by Clay, Calhoun, and Lowndes, and opposed by Daniel Webster and John Randolph. The bill passed the House by a vote of 88 to 54 and the Senate by 25 to 7. It became a law 27 April 1816. See **TARIFF**; **UNITED STATES — TARIFF IN THE**.

Woolf, wulf, Albert Edward, American chemist and inventor, son of Edward Woolf (q.v.). He was educated in the College of the

City of New York. Among his discoveries are the antiseptic and medical properties of sea-water combined with the electric current; the use of peroxide of hydrogen to bleach black ostrich feathers white, and also its employment as an antiseptic.

Woolf, Benjamin Edward, son of Edward Woolf (q.v.), American dramatist and musician: b. London 16 Feb. 1836; d. Boston, Mass., 7 Feb. 1901. Coming to New York in childhood with his parents, he early displayed a passion for music and was carefully trained by his father, with such results that in later days he became the leader of orchestras in Boston, Philadelphia, and New Orleans. He settled in Boston, where he was dramatic critic for the 'Saturday Evening Gazette' 1871-93, a post which he quitted for a similar one on the Boston Herald. He was an industrial musical composer, writing many overtures, quintets, and trios, besides plays and operettas. His most successful comedy was 'The Mighty Dollar,' while his operetta, 'The Doctor of Alcantara,' was a favorite in its time.

Woolf, Edward, American musician: b. London, England, September 1803; d. New York 14 March 1882. In 1839 he came to New York, where his musical genius was soon recognized not only as teacher and composer, but also as orchestral leader. His excessive shyness and modesty kept him in the background and prevented his securing the position intellectually his due. He was the author of many novels that appeared in the early years of 'The Jewish Messenger,' such as 'The Jewess of Toledo'; 'The Vicomte D'Arblay'; and 'Judith of Bohemia.'

Woolf, Michael Angelo, American artist, son of Edward Woolf (q.v.): b. London, England, 1837; d. New York 4 March 1899. Brought to New York in his babyhood, he early evinced a love for art and studied wood engraving for seven years. In the early sixties he was an illustrator for 'Yankee Notions,' then a popular journal, and was on the stage for a time, returning finally to art, and going to Munich and Paris to study painting. On resuming his work in New York, his first drawing of a ragged newsboy for a paper called 'The Pick' elicited such comment that he began the series of street caricatures on which rests his fame. These reveal his humanity as well as artistic insight.

Woolf, Philip, American physician and novelist, son of Edward Woolf (q.v.): b. New York 7 Feb. 1848; d. 1903. He was graduated from the Medical College of Bellevue Hospital in 1868, and was for some time editor of the Boston 'Saturday Evening Gazette.' His novels include: 'Who is Guilty?' 'The Trail of the Serpent'; 'Satan's Mirror'; 'Three Women and a Dead Man'; 'Goldenrod and Aster.'

Woollett, wul'et, William, English engraver: b. Maidstone, Kent, 1735; d. London 23 May 1785. His family originally came from Holland, and he was instructed in his art by an engraver named John Tinney. He engraved historical subjects and portraits, but was most successful in landscapes, in which he exhibited such varied excellences as, in the opinion of Longhi, to entitle him to be considered 'the marvel and the example for all contemporary engravers and for those of the present time.'

His foregrounds are vigorous and solid, and his aerial perspective wonderfully clear and true, while he treats water, the crux of the engraver, with supreme success. His masterpieces are his 'Niobe' and other plates after pictures by Richard Wilson, and the 'Death of Wolfe' and the 'Battle of La Hogue' after West. He was the first who conceived and embodied in practice the idea of uniting in one plate the three methods of engraving, by aqua fortis, the burin, and the dry needle. His genuine plates are estimated at 123, but impressions are exceedingly rare and valuable, as he permitted no imperfect prints to be struck off. Consult Fagan, 'Catalogue Raisonné of the Engraved Works of William Woollett' (1885).

Woolley, wul'ei, Celia Parker, American Unitarian minister: b. Toledo, Ohio, 14 June 1848. Graduated from Coldwater Female Seminary, in 1868 she was married to J. H. Woolley, and in 1876 removed to Chicago. She was pastor of the Unitarian Church, Geneva, Ill., for three years, and of the Independent Liberal Church, Chicago (1896-8), since when she has been active as a lecturer and in the work of women's clubs. She is the author of the novels 'Love and Theology' (1887), republished as 'Rachel Armstrong, or, Love and Theology'; 'A Girl Graduate' (1889); 'Roger Hunt' (1893); 'The Western Slope' (1903).

Woolley, John Granville, American prohibitionist: b. Collinsville, Ohio, 15 Feb. 1850. Graduated from the Ohio Wesleyan Seminary in 1871, he was admitted to the bar of the Illinois supreme court in 1873, became city attorney of Paris, Ill., in 1875, and prosecuting attorney in Minneapolis in 1881. At one period addicted to intemperance, he began lecturing against it in 1888, and has lectured to many audiences on this theme at home and abroad. He has been editor of 'The New Voice,' a prohibition organ, since 1899, and was the Presidential candidate for the Prohibition party in 1900, receiving a vote of 208,914. He has published: 'Seed'; 'The Sower'; 'Civilization by Faith'; 'The Christian Citizen'; 'The Lion Hunter.'

Woolman, John, American Quaker preacher: b. Northampton, Burlington County, N. J., August 1720; d. York, England, 7 Oct. 1772. In 1741 he became a speaker in the meetings of the Society of Friends. He was at this time a bookkeeper in a mercantile house, but subsequently learned the tailor's trade. In 1746, in company with Isaac Andrews, he made his first itinerant tour in some of the back settlements of Virginia, and from that time continued at intervals to visit the societies of Friends in the different portions of the colonies. In 1763 he visited the Indians on the Susquehanna. He both spoke and wrote much against slavery. His best-known work is the posthumous 'Journal of John Woolman's Life and Travels in the Service of the Gospel' (1775), which Whittier edited, with an introduction, in 1871. Woolman's simple and candid style has been highly praised by Charles Lamb, Crabb Robinson, and others. Among his other writings are: 'Some Considerations on the Keeping of Negroes' (1753; Part II., 1762); 'Considerations' on various topics (1768); and 'Serious Considerations' (1773). In 1774-5 a collective edition of his works appeared. Consult Whittier's sketch in the above-mentioned edition of the 'Journal.'

Woolner, Thomas, English sculptor and poet: b. Hadleigh, Suffolk, 17 Dec. 1825; d. London 7 Oct. 1892. At 12 he was placed in the studio of William Behnes, in 1842 entered the schools of the Royal Academy, and in the following year his first work, 'Eleanor Sucking the Poison from the Arm of Prince Edward,' was exhibited. His first work to attract attention was 'The Death of Boadicea' (1844), and this success was followed by 'Alastor' (1846); 'Puck' (1847); 'Titania and Her Indian Boy' (1848); and 'Eros and Euphrosyne' (1848). About 1850 he was associated with Rossetti and the other artists who formed the 'Pre-Raphaelite Brotherhood,' in founding the short-lived but famous periodical called 'The Germ.' His contributions, which were in verse, were collected and published, with additions, under the name 'My Beautiful Lady' (1863). Woolner visited Australia in 1852, and one of his first works on his return was a life-size statue of Lord Bacon for the Oxford Museum. Among his more important works are: 'Elaine with the Shield of Sir Lancelot'; 'In Memoriam' (1870); 'Guinevere' (1872); 'Lady Godiva' (1876); portrait busts of Carlyle, Tennyson, Darwin, Newman, Gladstone, Kingsley, and Dickens, and statues of Lord Macaulay for Trinity College, Cambridge (1866), Sir Bartle Frere for Bombay (1872), Dr. Whewell for Trinity College, Cambridge (1873), Lord Lawrence for Calcutta (1875), J. S. Mill for the Thames Embankment (1878), Captain Cook for Sydney (1879), Sir Stamford Raffles for Singapore (1887), and Lord Palmerston for Palace Yard, Westminster. He became a Royal Academician in 1874, and for a time was professor of sculpture in the Academy. His fame as a sculptor has overshadowed his reputation as a poet, but 'Pygmalion' (1881), 'Silenus' (1884), 'Tiresias' (1886), and 'Poems' (1887) give him honorable rank among the minor poets of his time. Consult Garnett, in 'Dictionary of National Biography.'

Woolsey, wul'sal, Sarah Chauncey ('**Susan Coolidge**'), American author, niece of T. D. Woolsey (q.v.): b. Cleveland, Ohio, 1845; d. Newport, R. I., 9 April 1905. As 'Susan Coolidge' she was a popular writer for children, but also wrote for their elders 'Verses' (1880); 'A Short History of Philadelphia' (1887). Among her books for young people were: 'The New Year's Bargain' (1871); 'What Katy Did' (1872); 'A Guernsey Lily' (1881); 'A Little Country Girl' (1885). She also edited 'The Diary and Letters of Mrs. Deane' (1878); 'The Diary and Letters of Frances Burney, Madame D'Arbly' (1880).

Woolsey, Theodore Dwight, American college president and scholar: b. New York 31 Oct. 1801; d. New Haven, Conn., 1 July 1889. He was graduated at Yale College in 1820; studied law in Philadelphia and theology at Princeton, was tutor at Yale 1823-5, and was licensed to preach in 1825. After studying abroad (1827-30) he was professor of Greek at Yale 1831-46, and president of the college 1846-71. In 1871-81 he was chairman of the American company of revisers of the New Testament. Besides editions of Greek plays—the 'Alcestis' of Euripides (1833), the 'Antigone' (1835), and 'Electra' (1837) of Sophocles, the 'Prometheus' of Plato (1837), as well as the 'Gor-

gias' of Plato (1842)—his works include an 'Introduction to the Study of International Law' (1860, 5th ed., 1879); 'Essays on Divorce and Divorce Legislation' (1869); 'Political Science; or the State Theoretically and Practically Considered' (1877); 'Religion of the Past and of the Future' (1871); 'Communism and Socialism' (1880). He also edited Lieber's 'Civil Liberty and Self-Government' (1871) and his 'Manual of Political Ethics' (1871). He was one of the founders of the 'New Englander,' to which he often contributed, one of the regents of the Smithsonian Institution, and at one period president of the American Oriental Association.

Woolsey, Theodore Salisbury, American professor of international law, son of T. D. Woolsey (q.v.): b. New Haven, Conn., 22 Oct. 1852. He was graduated from Yale in 1872, became instructor in international law at Yale in 1877, and since 1878 has been full professor there. He has published 'America's Foreign Policy' (1872); and edited Pomeroy's 'International Law' (1886); and the 6th edition of Woolsey's 'International Law' (1891). He was also associate editor of Johnson's 'Universal Cyclopedia' (1892-5).

Woolson, wul'son, Abba Louisa Gould, American lecturer and author: b. Windham, Maine, 30 April 1838. She has lectured extensively on literary, social, historical, and dramatic subjects, and was the founder and honorary president of the Castilian Club of Boston. She has published 'Women in American Society' (1873); 'Browsing among Books' (1881); 'George Eliot and Her Heroines' (1886); 'Dress Reform' (1874).

Woolson, Constance Fenimore, American author: b. Claremont, N. H., 5 March 1848; d. Venice, Italy, 24 Jan. 1894. Educated in Cleveland, Ohio, and New York, she resided in Ohio, then in Florida and other Southern States, and finally abroad, chiefly in Italy. Her first story published in a secular magazine—contributions to Episcopalian periodicals had preceded it—was 'The Happy Valley' in 'Harper's Monthly' (1870). In this much of her subsequent work appeared. Many poems were printed from time to time, but these were never collected. Her reputation was based on works in fiction, the volumes being 'The Old Stone House' (1873); 'Castle Nowhere: Lake Country Sketches' (1875); 'Rodman the Keeper' (1880); 'Anne' (1882); 'For the Major' (1883); 'East Angels' (1886); 'Jupiter Lights' (1889); 'Horace Chase' (1894); and 'The Front Yard, and Other Italian Stories' (1895). Their background is generally American, preferably the Lake region or the South; and when it shifts to Europe is less skilfully treated. They were highly praised by Stedman and other critics for equal freedom in presenting diverse types and conformity to high literary standards.

Woolston, wul'ston, Thomas, English deist: b. Northampton 1669; d. London 31 Jan. 1731. He was educated at Sidney Sussex College, Cambridge, became a fellow, and took orders in the English Church. He made a careful study of Origen and in 1705 published the 'Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revived.' He maintained in this work that Moses was an allegorical personage, and his history typical

WOOLWICH — WOOSTER

of that of Christ. In 1721 he published 'The Moderator between the Infidel and the Apostate,' dialogues tending to show that the Gospel miracles by themselves could not prove Christ to be the Messiah. This work occasioned great scandal, and it was only through the intervention of Whiston that the author escaped a prosecution. In 1721 his college deprived him of his fellowship. The views set forth in his last work Woolston developed more fully in 'The Moderator between an Infidel and an Apostate' (1725). His famous series of six 'Discourses on the Miracles of Christ' appeared 1727-9, with two 'Defences' in 1729 and 1730. He was indicted for blasphemy in consequence of the publication of this work and was imprisoned. His collected works with 'Life' appeared in five volumes (1833).

Woolwich, wŭl'ch, England, a former town of Kent, now a metropolitan borough of London, on the right bank of the Thames, eight miles below London Bridge. It has many ancient, together with a number of handsome modern houses, an old church (restored 1894), other places of worship, a town-hall, and several charitable endowments. It owes its importance to the royal arsenal, which occupies an area of above 350 acres, and is one of the most complete and magnificent establishments of the kind in the world, with extensive forges, foundries, and workshops of various kinds in which the newest types of machinery are employed for the manufacture of immense quantities of warlike stores which are kept in suitable magazines and store-houses. In the Rotunda there is a fine historical collection of arms and other interesting objects. A large garrison is stationed at Woolwich, which is the headquarters of the royal artillery; and there are various barracks, a military and a naval hospital, etc. On the edge of Woolwich Common, a fine large open area, are the handsome buildings of the Royal Military Academy (see MILITARY SCHOOLS); and the Royal Ordnance College is also at Woolwich. At North Woolwich, on the opposite side of the river, to which runs a free steam ferry, many houses and extensive factories, especially of telegraph cables, have recently sprung up. Pop. of metropolitan borough about 130,000.

Woonsocket, wŭn-sŭk'ŕt, R. I., city in Providence County; on the Blackstone River, and on the New York, New Haven & Hartford (two branches) railroad; about 15 miles northwest of Providence and 37 miles southwest of Boston. It has electric lines extending to all the near-by towns. The river here is spanned by a bridge which cost originally \$300,000. It has three parks and the county fair grounds. It is a well-known manufacturing city. In 1909 (government census) there were 130 manufacturing establishments, capitalized for \$27,700,000, and in which were 11,245 wage-earners, to whom were paid annually \$5,676,000. The total cost of raw material used annually was \$16,762,000 and the value of the finished products was \$68,219,000. The chief manufactures were cotton goods, foundry and machine-shop products, worsted goods, and hosiery and knit goods, each of which had an annual output valued at more than \$1,000,000. Other manufactures are carved and turned wood, wagons, carriages, woolen goods, machinery, and furniture.

The educational institutions are a high school,

established in 1857; Sacred Heart College (R. C.), for young men; Saint Ann's Academy (R. C.) for girls and young women, public and parish schools, the Harris Institute Library containing about 16,000 volumes. There are nine banks and trust companies. In 1903 the Woonsocket Institute for Savings had deposits amounting to \$4,800,000; and the Producers Saving Bank had \$1,415,570. The city owns and operates the water-works.

Woonsocket is a consolidation of several factory villages. The first village called Woonsocket is not included in the limits of the present city. The city was set off in 1867 from the town of Cumberland; in 1871 a part of Smithfield was annexed, and 13 June 1888 the city was incorporated. Pop. (1890) 20,830; (1900) 28,204; (1910) 38,125. Consult Richardson, 'History of Woonsocket.'

Woorari, or Woorara. See CURARI.

Wooster, wŭs'tŕ, David, American Revolutionary general: b. Stratford, Conn., 2 March 1710; d. Danbury, Conn., 2 May 1777. He was graduated at Yale College in 1738; and in 1739, when the war broke out between England and Spain, entered the provincial army as lieutenant, and was subsequently made captain of a vessel built and equipped by the colony for the defense of its coasts. In 1745 he participated in the expedition against Louisburg, and went in command of a cartel ship to England, where he was made a captain in the regular service under Sir William Pepperell. In the French war which ended in 1763 he was commissioned by the governor of Connecticut as colonel, and subsequently as brigadier-general, and served during the whole war. In April 1775 he was one of the members of the assembly of Connecticut who concerted the plan for the seizure of Ticonderoga; and when the continental army was organized he was appointed one of the eight brigadier-generals. He was engaged in the expedition into Canada, where after the death of Gen. Montgomery he for a time held the chief command. He resigned and returned to Connecticut, and was major-general of the militia when Tryon invaded that province for the purpose of destroying the military stores at Danbury. He attacked Tryon's rear guard 27 April 1777, and while rallying his men was mortally wounded. On 17 June Congress voted that a monument should be erected to his memory, but no steps were taken to have the resolution carried into effect, and his neglected grave was not identified until 1854, on 27 April of which year the corner-stone of a monument to his memory was laid, by act of the legislature of Connecticut. The town of Wooster, Ohio, was named in his honor.

Wooster, Ohio, city, county-seat of Wayne County; on the Killbuck Creek, and on the Pennsylvania and the Baltimore & Ohio R.R.'s; about 30 miles southwest of Cleveland. It is in an agricultural and stock-raising region. It has manufactories of flour, furniture, doors, sash, and blinds, boilers, engines, mill-gearing, and brick. There are two national banks having a combined capital of \$200,000, and one private bank. The educational institutions are Wooster University, the Ohio Agricultural Experiment Station, a high school, public elementary schools, and two libraries. Pop. (1890) 5,001; (1900) 6,063; (1910) 6,136.

Worcester, Walter, Dean Conant, American educator: b. Thetford, Vt., 1 Oct. 1866. He was graduated at the University of Michigan in 1889, having previously accompanied the Steere scientific expedition to the Philippine Islands in 1887-9. He was instructor in animal morphology at the University of Michigan 1893-6, becoming assistant professor in the last-named year. In 1890-2 he again traveled in the Philippines, with F. S. Bourns, in a tour known as 'The Menage Scientific Expedition,' and in January 1899 was appointed one of the United States commissioners to the islands to investigate and report on conditions there. He has published: 'Preliminary Notes on Birds and Mammals collected by the Menage Scientific Expedition to the Philippine Islands' (1894); 'Contributions to Philippine Ornithology' (1898); 'The Philippine Islands and their People' (1898).

Worcester, Edward Somerset, 2d Marquis of, English inventor: b. Raglan Castle, Monmouthshire, 1601; d. 3 April 1667. He engaged in the service of Charles I. during the civil war, and was employed by the king to act for him in Ireland; but when his errand was discovered he was treated with duplicity by Charles, and retired to France in 1648. Returning to England in 1652 he was imprisoned in the Tower 1652-4, and his estates were sequestered, but after the Restoration he recovered most of these. He afterward spent his time in retirement, and in the cultivation of natural philosophy and mechanics. In 1663 he published a book entitled 'Century of the Names and Scantlings of Inventions as I can call to mind to have been Tried and Perfected,' in which he first gave a description of the uses and effects of an engine for 'driving up water by fire'; and afterward published a small pamphlet, called 'An Exact and True Definition of the most Stupendous Water-commanding Engine, invented by the Marquis of Worcester.' In neither of these does he give any statement of the mode of constructing his engine; but, from his description and account of its effects, it may be inferred that its action depended on the condensation as well as the elastic force of the steam. (See *STEAM-ENGINE*.) Consult Dirck, 'Life, Times, and Scientific Labors of the Second Marquis of Worcester' (1865); Dirck, 'Worcesteriana' (1865).

Worcester, Edwin Dean, American railway official: b. Albany, N. Y., 19 Nov. 1828; d. New York 13 June 1904. He studied law, and followed various pursuits, but entered railroad-ing in 1853, when he became a member of the accounting department of the New York Central railway. He laid out, opened, and managed the books of this company when there were no precedents in the United States for the organization of large railways, and the present accounting system of railways in this country is largely the development of his work. Subsequently he became successively treasurer and secretary of the company; in 1873 secretary and treasurer of the Lake Shore & Michigan Southern, in 1883 its vice-president; and in 1878 secretary of the Michigan Central, in 1883 its vice-president. From 1883 he was also secretary, or treasurer, or both, in 15 other companies.

Worcester, Joseph Emerson, American lexicographer: b. Bedford, N. H., 24 Aug. 1784;

d. Cambridge, Mass., 27 Oct. 1865. He was graduated from Yale in 1811, and from 1819 resided in Cambridge, Mass., busily preparing and publishing books. Among his earlier works, compiled with much accuracy and excellent condensation, were: 'A Geographical Dictionary' (1817), of which an enlarged edition appeared in 1843; a 'Gazetteer of the United States' (1818); and 'Outlines of Scripture Geography' (1828). His first effort in English lexicography was an edition of 'Johnson's English Dictionary, as Improved by Todd and Abridged by Chambers, with Walker's Pronouncing Dictionary Combined' (1828). In 1829 he prepared an abridgment of Webster's 'American Dictionary'; and in 1830 published his 'Comprehensive Pronouncing and Explanatory Dictionary.' After collecting philological works in Europe in 1830-1, he edited the 'American Almanac' in 1831-43, and in 1846 published the 'Universal and Critical Dictionary of the English Language.' His chief work, 'A Dictionary of the English Language,' appeared in 1860, being the first work of the sort to employ illustrations. For this many collaborators were employed, particularly for the definition of technical terms. The chief point of difference between the work of Webster and that of Worcester was that the latter sought to present the language as it was, while Webster endeavored to exhibit it improved as he thought it should be. Essentially the same scheme, that of Worcester, is now observed by each. By many Worcester has been preferred to Webster for its pronunciations.

Worcester, Noah, American theologian: b. Hollis, N. H., 25 Nov. 1758; d. Brighton, Mass., 31 Oct. 1837. He was a fifer in the Continental army in 1775, and entered the service again for a short time as file-major in 1777. In 1786 he was licensed to preach by a Congregational association, and in 1787 ordained pastor of the church in Thornton, N. H., where he had held local offices and been elected representative to the General Court. In 1802 he was employed as the first missionary of the New Hampshire Missionary Society, and in that capacity traveled and preached widely in the northern portion of the State. In 1810 he removed to Salisbury, and took charge of the congregation, and in 1813 settled at Brighton, Mass. His work on the doctrine of the Trinity, entitled 'Bible News of the Father, Son, and Holy Ghost' (1810), soon became the subject of severe animadversion, the Hopkinton association, of which he was a member, passing a formal sentence of condemnation against the book. From 1813 to 1818 he edited 'The Christian Disciple,' a periodical published in Boston, and in 1814 published his tract, 'A Solemn Review of the Custom of War,' once well known, and translated into several languages. Shortly after this the Massachusetts peace society was formed, and in 1819 he commenced 'The Friend of Peace,' which continued in quarterly numbers for 10 years, nearly the whole of it being written by himself. In 1829 he published 'The Atoning Sacrifice a Display of Love, not of Wrath,' in 1831, 'The Causes and Evils of Contention among Christians'; and in 1833, 'Last Thoughts on Important Subjects.' Among his further writings is a 'Respectful Address to the Trinitarian Clergy' (1812). Consult the 'Memoirs' by Ware (1844).

WORCESTER

Worcester, England, (1) A city, the capital of Worcestershire, situated in a beautiful vale on the eastern bank of the Severn, 103 miles north-northwest of London. The cathedral is a noble specimen of Gothic simplicity. It was first erected by Ethelred, king of Mercia, in 680, and a later edifice was burned down and rebuilt in the beginning of the 13th century. It was restored in 1857-74. It is 394 feet long, 78 feet wide, and 68 feet high, and the tower, which rises from the intersection of the nave and aisles to the altitude of 170 feet, is ornamented at the corners by lofty pinnacles. It contains many handsome monuments and sculptures. There are about 20 other handsome places of worship, such as Holy Trinity, Saint Nicholas, Saint Andrews, Saint Helena, etc. Among other buildings are the shire-hall, guildhall, Victoria Institute (library, museum, etc.), corn-exchange, the hop and fruit market, museum of natural history, two grammar-schools, several charitable institutions, etc. Worcester is the chief seat of the English leather glove trade, has celebrated porcelain-works, "Worcester sauce" works, vinegar-works, chemical and manure works, foundries, railway signal works, carriage factories, and other works. Its trade in hops is extensive. There are municipal electric lighting works, and a service of electric trams. The most remarkable event here was the victory of the English army, under Cromwell, over the Scotch in the cause of Charles II., in 1651. Pop. about 50,000. (2) An inland county bounded on the north by Salop and Stafford, on the west by Hereford, on the south by Gloucester, and on the east by Warwick; with some separated portions, enclosed by the counties of Gloucester and Warwick. The area is 739.7 square miles. The surface, generally level or gently undulating, has some extensive and beautiful vales, the principal of which, that of the Severn, is 30 miles long, and one quarter to a mile broad. On the southwest are the fine Malvern Hills, the loftiest of which is 1,444 feet above sea-level. The soil, composed chiefly of clay and loam, is of great fertility. The principal crops are wheat, barley, oats, beans, pease, turnips, and hops. The orchards are celebrated for their apples and cider. The vales consist of meadows and rich pastures. The sheep are of the Leicester breed. Coal is found in the north and northwest; the brine springs at Droitwich and Stoke Prior supply immense quantities of salt; iron is found with the coal, and the manufacture of iron and steel, and of hardware, is extensive; carpets and rugs are made at Kidderminster; and porcelain, gloves, and other articles at Worcester. Pop. about 362,000.

Worcester, Mass., city, one of the county-seats of Worcester County; on the Blackstone River, and on the New York, N. H. & H., the Boston & M., and the New York Central R.R.'s; 44 miles west of Boston and 45 miles northwest of Providence. Electric railways extend to all the near-by towns and to Boston. The city was begun in a valley, but it now occupies a number of the surrounding hills; the average elevation above sea-level is 500 feet.

Industries.—Worcester is noted for the number and variety of its manufacturing establishments. In 1909 (government census) the city had 580 manufactures, capitalized for \$64,639,000, and employing 31,404 officials, clerks and

wage-earners to whom were paid annually \$19,464,000, an increase of nearly \$5,000,000 in 10 years. The raw material used each year cost \$42,601,000, and the value of the finished products was \$77,148,000. The 90 foundries and machine-shops in 1900 had an output valued at \$8,492,686. The 11 boot and shoe factories had productions valued at \$1,610,605; the products of the 5 envelope establishments amounted to \$1,150,802; the 11 wirework factories, including wire rope and cable, produced annually goods to the amount of \$1,531,047; and the 11 woolen goods mills had an annual output valued at \$1,553,297. There were 34 additional industries, each one of which had finished products amounting annually to over \$100,000. Some of these industries are the manufacturing of worsted goods, machinery, printing and publishing products, musical instruments, marble and stone products, lumber products, leather goods, women's clothing (factory products), men's clothing (factory products), and food products.

Buildings and Municipal Improvements.—The principal public buildings are the government building, court-house, city-hall, State armory, Mechanics' Hall, the Young Men's Christian Association and the Young Women's Christian Association buildings, buildings of the Women's Clubs, the State Mutual Assurance Company, several charitable institutions, the religious and educational institutions, and the Union Station. The area is 32 square miles, including the hill country and the lakes within the city limits. There are 10 public parks, having a combined area of 400 acres; Lake Park has 110 acres and Elm Park 86 acres. The system of waterworks cost, originally, \$3,670,000; there are about 200 miles of mains. The sewer system covers about 170 miles, and cost \$5,341,534. The city is divided into eight wards, which diverge from the centre of the city like the spokes of a wheel. The principal business streets run north and south.

Churches, Charitable, and Educational Institutions.—There are over 100 church organizations, having about 85 edifices. The denominations rank, according to the number of their buildings, as follows: Congregationalist, 18; Baptist, 16; Methodist Episcopal, 12; Roman Catholic, 12; Protestant Episcopal, 5; Unitarian, 4, and others 1 or 2 each. The hospitals are the Washburn Memorial Hospital, for women and children; the City Hospital, Homoeopathic Hospital, Saint Vincent's and Saint Francis' hospitals. Other institutions are the State Insane Asylum, the State Odd Fellows' Home, Saint Ann's Orphan Asylum, Saint Vincent's Home for the Aged, Saint Francis' Home for the Aged, Our Lady of Mercy orphanage, a home for the friendless, and a number of private hospitals. The educational institutions are Clark University, a post-graduate school for original research, opened in 1889; College of the Holy Cross (R. C.), opened in 1843; the Bancroft School; Highland Military Academy (P. E.); Kimball's School for Girls; Saint John's School (R. C.); Worcester Academy; Becker's Business College; Worcester Polytechnic Institute; Hinman's Business College; a State normal school; three public high schools; the classical opened in 1845, the English high school, and the evening high school, public and parish elementary schools, the Free Public Library containing about 140,000 volumes, two anti-tubercular

societies, historical and literary societies, and several school libraries.

Banks and Finances.—In 1903 Worcester had 16 banks. The exchanges at the United States clearing-house for the year ending 30 Sept. 1901 amounted to \$74,397,774. The deposits (1903) were in five banks over \$1,000,000 and less than \$2,000,000; in two banks over \$2,000,000 and less than \$3,000,000; in three banks over \$7,000,000 and less than \$10,000,000, and in one bank \$17,396,260. The municipal expenditures for maintenance and operation are about \$3,300,000. The chief items of expense are as follows: schools, \$552,300; streets, \$536,000; fire department, \$194,500; police department, \$153,500; charity department, \$79,000; public library, \$51,000.

Government.—The government is vested in a mayor, whose term of office is one year; a board of councilmen, 24 members, three from each ward; and a board of aldermen, nine members elected at large. The two boards constitute the city council, who have power to accept or reject the mayor's appointments. The council elects the heads of the departments.

History.—A settlement was made here in 1673-4, called Quansagumog Plantations. The Indians were hostile to the settlers from the first; but at the beginning of King Philip's war, their hostility increased and the whites abandoned the settlement. Another attempt to found a settlement was made in 1684, but after a few years the Indians forced the whites to again leave. The second time the place was named Worcester on account of Worcester in England having been the home of some of the settlers. In 1713 the permanent settlement was made. In 1722 Worcester was incorporated; and chartered as a city in 1848. Isaac Thomas, a publisher, moved from Boston to Worcester in 1775, and until about 1800 the town was among the leading publishing places in the country.

Population.—The city ranks second in the State in population. Since 1850 it has grown rapidly. Beginning with 1800 the Federal census returns have given the following: (1800) 2,411; (1820) 2,962; (1850) 17,049; (1870) 41,405; (1880) 58,291; (1890) 84,655; (1900) 118,421; (1910 census) 145,086. Consult: Rice, 'Worcester in 1898'; Hurd, 'History of Worcester County.'

Worcester, South Africa, a town of Cape Colony, 60 miles northeast of Cape Town, 109 miles by rail through Paarl and Tulbagh. The town is regularly laid out, the streets being planted with trees. It is well supplied with water from the Hex River. The vine is extensively cultivated in the neighborhood, and brandy and wine are made in considerable quantity. ^{Pop.} 6,000.

Worcester College, Oxford, England, originally called Gloucester Hall, was founded in 1714 by Sir Thomas Cookes of Bentley, Worcestershire, for a provost, six fellows, and six scholars. Under the statutes of 1882 Worcester College consists of a provost, 9 or 10 fellows, and 19 scholars. There are a number of exhibitions, two of which are connected with the Charterhouse School, and three with Bromsgrove School.

Worcester Polytechnic Institute, a technical school located at Worcester, Mass. It was

founded by a gift of \$100,000 from John Boynton of Tempieton; was chartered in 1865, and opened to students in 1868. Since that time its resources have been largely increased both by private benefactions and State donations. Though one of the earliest schools of the kind in the United States, it has in every way kept pace with the progress in scientific and technical education, and is recognized as one of the leading American technical schools. From the time of its organization, laboratory and shop work has been a distinctive feature of its work; it was one of the first schools to emphasize the importance of laboratory methods, and the first in the United States to establish a workshop as an essential part of the training in mechanical engineering. The Institute offers five courses of four years each leading to the degree of B.S.; these are mechanical, civil, and electrical engineering, chemistry and general science. English, political science, French or German, and mathematics are included in all courses; the work of the Freshman year is practically the same for all courses; with the Sophomore year the special work of each course begins. The work of the junior and senior years of the general science course is largely elective; otherwise the courses are practically all required. Graduate courses are provided leading to the degrees of M.S., D.S., M.E., C.E., and E.E. The students maintain a Christian Association, chapters of several Greek letter fraternities, and an Athletic Association. The institute publishes a bi-monthly 'Journal,' containing original articles on technical and scientific subjects by the alumni and faculty, and news of the institute and general scientific progress. The institute campus comprises 12 acres on a slight elevation in the northwestern part of the city; it slopes on the north to Institute Park. The buildings on this campus are Boynton Hall, the Washburn Shops (machine and forge), the Salisbury Laboratories (chemistry, physics, and electrical engineering), the engineering laboratories (mechanical engineering), the power laboratory, the foundry, and the high potentials laboratory; the institute also owns Newton Hall, a dormitory a short distance from the campus, and a hydraulics laboratory at Chaffins, five miles distant. The laboratories and shops are all excellently equipped; the library in 1904 contained 9,100 volumes besides departmental libraries; the Worcester Free Public Library, and the library of the American Antiquarian Society are also open to students. Free tuition is given to 40 Massachusetts students in consideration of which the institute receives an annual State appropriation. The students in 1910 numbered 524; the total number of graduates was 1,420.

Worde, wórd, Wynkyn de, English printer and stationer: b. Alsace late 15th century; d. London about 1534. His name was properly Jan van Wynkyn, de Worde being a place-name referring to Worth in Alsace. He probably went to England with Caxton from Bruges in 1476, and later was an apprentice in Caxton's printing-office, in which he established himself in 1491. He printed between 700 and 800 works, which are known through fragments or at least one complete copy. This is thought to be not more than half his work. Among the books printed by him were Higden's 'Polychronicon' (1495), in which occurs the first specimen of music-type;

Wakefield's 'Oratio' (1524), in which Italic type was first used in England; and Trevisa's rendering of Bartholomaeus Anglicus' 'De Proprietatibus Rerum' (1406).

Worden, wór'dn, John Lorkner, American naval officer: b. Ossining, Westchester County, N. Y., 12 March 1818; d. Washington, D. C., 18 Oct. 1897. He was appointed a midshipman in the navy in 1834. At the beginning of the Civil War he was captured by the Confederates but after seven months was exchanged and was subsequently ordered to the command of the Monitor, which left New York 6 March 1862. He arrived at Hampden Roads on the evening of the 8th, after the iron-clad Merrimac had destroyed the wooden frigates Cumberland and Congress. On the morning of the 9th a memorable battle was fought by the Merrimac and Monitor, the former of which was partly disabled and abandoned the fight, after several violent collisions with the Monitor. Promoted commander in 1862 and captain in 1863, he commanded the iron-clad Montauk in the operations against Fort Sumter in April of that year. In June 1868 he was promoted commodore, and in 1873 rear-admiral. He was superintendent of the Naval Academy at Annapolis in 1870-4; commander-in-chief of the European squadron in 1875-7; and was retired in 1886.

Wordsworth, wérdz'wérth, Charles, Scottish prelate, son of Christopher Wordsworth (1774-1846) (q.v.): b. Lambeth 22 Aug. 1806; d. Saint Andrews, Scotland, 5 Dec. 1892. He was educated at Harrow and Christ Church, Oxford, and, becoming a private tutor, had Gladstone and Manning as pupils. From 1835 to 1846 he was second master at Winchester School, and from 1846 to 1854 was the first warden of Trinity College, Glenalmond, Perthshire. He was elected bishop of Saint Andrews, Dunkeld, and Dunblane in 1852, and was a prominent figure in the ecclesiastical life of Scotland, being filled with an earnest desire to heal the dissensions between the different churches, and pave the way for their reunion. Besides volumes of sermons, discourses, etc., he published a widely-used 'Greek Grammar' (written in Latin) (1839); 'Shakespeare's Knowledge and Use of the Bible' (1864, 4th ed. 1892); 'Annals of My Early Life' (1891). Consult: 'Annals of My Life' (1893), edited by Hodgson; and 'The Episcopate of Charles Wordsworth' (1899) by John Wordsworth.

Wordsworth, Christopher, English Anglican clergyman, youngest brother of William Wordsworth (q.v.): b. Cockermouth, Cumberland, 9 June 1774; d. Buxted, Sussex, 2 Feb. 1846. He was educated at Hawkshead grammar school, and Trinity College, Cambridge, and was elected a fellow of his college in 1798. He held various livings in the Church, and was master of Trinity College 1820-41. He published: 'Ecclesiastical Biography' (1810); 'Sermons on Various Subjects' (1814); 'Christian Institutions,' a series of discourses and tracts (1836); 'Who Wrote Eikon Basilike?' (1824-5); etc.

Wordsworth, Christopher, English Anglican prelate, son of the preceding: b. Lambeth 30 Oct. 1807; d. Harewood, Yorkshire, 21 March 1885. He was educated at Winchester and at Trinity College, Cambridge, and from 1836 to 1844 was head master of Harrow School. He

then became canon of Westminster, and after being made archdeacon of Westminster in 1865 was appointed bishop of Lincoln in 1868. He was the author of writings connected with classical, theological, or ecclesiastical subjects, among which are: 'Athens and Attica' (1836); 'Greece: Pictorial, Descriptive, and Historical' (1839); an edition of 'Theocritus' (1844; fuller one, 1877); 'Memoirs of William Wordsworth' (1851); 'Saint Hippolytus and the Church of Rome in the 3d Century' (1853); 'The New Testament in the Original Greek' (1856-60); 'The Old Testament in the Authorized Version,' with notes and introduction (1864-71); 'A Church History to the Council of Chalcedon, 451 A.D.' (1881-3). Consult 'Life' by his daughter Elizabeth and J. H. Overton (1888).

Wordsworth, Christopher, English Anglican clergyman and scholar, second son of Bishop Christopher Wordsworth (q.v.): b. Westminster 26 March 1848. He was educated at Trinity College, Cambridge, in 1870-88 was a fellow and tutor of Peterhouse College, and in 1877 was appointed rector of Galston, in Rutland. In 1886 he became a prebendary of Lincoln cathedral, and in 1889 rector of Tynemouth, Dorset. Since 1897 he has been rector of St. Peter's, Marlborough. His published works comprise: 'University Society in the 18th Century' (1874); 'Scholae Academicæ' (1877); 'Breviarium ad Usum Sarum' (1879-86), edited with F. Procter; 'Pontificale Ecclesiae S. Andree' (edited 1885); 'Lincoln Cathedral Statutes' (1892-7), edited with H. Bradshaw; 'Coronation of King Charles I.' (1892-4); 'Medieval Services' (1898); etc.

Wordsworth, Dorothy, English writer: b. Cockermouth 25 Dec. 1771; d. Grasmere 25 Jan. 1855. She was the only sister of the poet, and was a woman of remarkable mental powers, who described country life with keen observation and much literary skill. Besides her 'Recollections of a Tour in Scotland' (1874) other journals and letters of hers have been published, the MSS. having been finally collected by Knight in 1897. Her mind was latterly clouded. Consult Lee, 'Dorothy Wordsworth' (1886; new ed. 1894).

Wordsworth, Elizabeth, English educator, daughter of Bishop Christopher Wordsworth (q.v.): b. Harrow 1840. She is principal of Lady Margaret Hall, Oxford, and has published: 'Illustrations of the Creed' (1880); 'Illustrations of the Decalogue' (1893); 'Life of Bishop Christopher Wordsworth' (1888); 'Saint Christopher and Other Poems' (1890); 'The Snow Garden and Other Stories' (1895).

Wordsworth, John, English Anglican prelate, eldest son of Bishop Christopher Wordsworth (q.v.): b. Harrow 21 Sept. 1843. He was educated at New College, Oxford, was ordained deacon in 1867, and in 1868 became an assistant master in Wellington College. In 1870 he was made prebendary of Lincoln, and in 1883-5 was Oriel professor of the interpretation of Holy Scripture, fellow of Oriel, and canon of Rochester. He was Bampton lecturer in 1881 and in 1885 became bishop of Salisbury. His chief publications are: 'Fragments and Specimens of Early Latin' (1874); 'University Sermons of Gospel Subjects' (1878); 'The One Religion' (1881, Bampton Lectures); 'Old

WORDSWORTH

Latin Biblical Texts' (1883-6), with Sanday and White; 'The Holy Communion' (1891); 'Novum Testamentum Latine, secundum editionem S. Hieronymi' (1898); 'The Episcopate of Charles Wordsworth' (1899); 'Teaching of the Church of England for Information of Eastern Christians' (1900); 'The Ministry of Grace' (1901). Died 16 Aug. 19.

Wordsworth, William, English poet: b. Cockermouth, Cumberland, 7 April 1770; d. Rydal Mount, Westmoreland, 23 April 1850. He was the second son of John Wordsworth, attorney-at-law, who was descended from a Yorkshire family dating back to the Norman Conquest. His mother, Anne Cookson, belonged to an ancient family of Crackanorpes, who had lived in Westmoreland from the times of Edward III. He was educated at Hawkshead Grammar School and at Saint John's College, Cambridge, where he entered in 1787, taking his B.A. degree in January 1791. In the summer vacation of 1790 he went to the Continent with Robert Jones, a fellow-collegian, starting, as he says, "staff in hand, without knapsacks, each his necessaries tied up in a pocket handkerchief, with about 20 pounds apiece in our pockets." They spent most of the time in walking through Switzerland.

He left Cambridge with no definite plans for the future. He did not feel himself, as he said afterward, "good enough for the church," and had no inclination to the law. He had studied military history with much interest, and at one time thought of going into the army, but on reflection gave up the plan. He finally went to London, where he lived for a time on a small allowance with no special aim or employment. In November 1791, he went to France, with the idea of spending the winter and learning French, but, becoming interested in the revolutionary politics of the period, remained in the country until October 1792, when his friends, fearing for his safety, stopped his funds, and he reluctantly returned to England.

He soon began to turn his attention to literary work. He had written verse in his school days, at first as a task imposed by his master, the subject assigned being "The Summer Vacation," to which of his own accord he added a poem on "The Return to School." This was before he was 15, for in 1785 he was called upon to write verses in commemoration of the second centennial anniversary of the founding of the school. These, he says, "were much admired—far more than they deserved—for they were but a tame imitation of Pope's versification, and a little in his style." His first publication was in 1792 (not 1793, as generally stated), a thin quarto entitled "An Evening Walk—an Epistle in Verse addressed to a Young Lady from the Lakes of the North of England. By W. Wordsworth, B.A., of Saint John's College, Cambridge." This was followed, the same year, by "Descriptive Sketches in Verse, taken from a Pedestrian Tour in the Italian, Grison, Swiss, and Savoyard Alps." The books attracted little attention, and sold very slowly; but they led to the friendship between Wordsworth and Coleridge, which proved to be a lifelong intimacy. Coleridge says in his "Biographia Literaria": "During the last year of my residence at Cambridge I became acquainted with Mr. Wordsworth's 'Descriptive Sketches,' and seldom, if

ever, was the emergence of an original poetic genius above the literary horizon more evidently announced." Wordsworth himself did not estimate these early poems very highly. In a letter to a friend at the time he says: "It was with great reluctance that I sent those two little works into the world in so imperfect a state. But as I had done nothing by which to distinguish myself at the university, I thought these little things might show that I could do something. They have been treated with unmerited contempt by some of the periodicals, and others have spoken of them in higher terms than they deserved."

In the latter part of 1794 Wordsworth received a legacy of £500 from a young friend, Rainey Calvert, son of the steward of the duke of Norfolk, who owned large estates in Cumberland. They had long been very intimate when Calvert was attacked by consumption, and Wordsworth was his devoted companion and nurse until his death. The poet now felt that he could make a home for himself and his only sister, with whom, the next autumn (1795), he settled down in a cottage at Racedown in Dorsetshire. In July, 1797, they moved to Alfoxden, in Somersetshire, in order to be near Coleridge at Netherstowey. Here Wordsworth added to his income by taking a young son of Basil Montague as pupil; and here he wrote many of the poems included in the "Lyrical Ballads," published in the autumn of 1798 by Mr. Joseph Cottle of Bristol, who had been rash enough to pay 30 guineas (about \$450) for the copyright. The volume contained Coleridge's "Ancient Mariner," which he and Wordsworth had planned together, and to which the latter had contributed a few lines; together with Wordsworth's "Idiot Boy," "We are Seven," and 20 other poems. Among these were the famous lines on "Tintern Abbey," which were written just before the book appeared. Five hundred copies were issued, but most of them were afterward sold to a London bookseller at a sacrifice. When Cottle gave up business soon afterward, his copyrights were transferred to Mr. Longman of London, and in the estimation of their value the "Lyrical Ballads" were put down as "worth nothing." Cottle therefore asked that the copyright might be given back to him, and, the request being granted, he made a present of it to the authors, who both lived to see it become a piece of really valuable literary property. It is not easy to imagine a book containing "The Ancient Mariner" and the "Tintern Abbey" reckoned absolutely worthless, from a commercial point of view, only about a century ago.

Immediately after the publication of the "Lyrical Ballads," Wordsworth, his sister, and Coleridge sailed for Hamburg, with a view of perfecting their acquaintance with the German language by a winter at Goslar. During the four months spent in that dull and dismal town, in a particularly cold and disagreeable season, Wordsworth wrote some of his best and most characteristic poems, full of the loveliness of English rural scenery and life. Coleridge traveled independently of his friends a part of the time they were abroad, but the three made excursions together in the rural districts of Germany, and had some unpleasant experiences. Sometimes they found it difficult to obtain food and shelter in the wretched inns of the country.

WORDSWORTH

In one instance, as Coleridge records, they were actually driven out of doors and had to spend the night in the fields. But they met with no worse misadventures than these, and the Wordsworths got safely back to England in the spring of 1799.

The poet was always fond of travel, and in later years frequently indulged in it both in the British Isles and on the Continent. In August 1802, he went to France again, and in 1803 and 1814 visited Scotland. In 1820 he went with his wife and sister through Switzerland and Italy. In 1823 he traveled in Holland, in 1824 in North Wales, in 1828 in Belgium with Coleridge, and in 1829 in Ireland with his friend Marshall. In 1831 he and his daughter visited Scott at Abbotsford. In 1833 he made another tour in Scotland, and in 1837 a long one in Italy with Crabbe Robinson. In all these journeys he found more or less material and inspiration for his poems.

After his return to England in 1799 he and his sister decided to settle down in their ancestral Lake Country, and soon took a small cottage at Grasmere. Here and in the immediate vicinity the remainder of their lives, except for the occasional journeys abroad, was passed in domestic and poetic seclusion, with few important incidents to disturb the calm current of the lapsing years. In 1802 the poet married Mary Hutchinson, whom he had known from childhood and with whom he had attended the same "dame's school" at Penrith, where his boyhood was partly spent with his mother's parents. After his marriage he and his wife continued to reside with his sister at Grasmere, and there three of his children were born. From 1808 to 1813 the family lived in the same neighborhood in two other houses, and then removed to Rydal Mount, a few miles distant, which was the poet's home for 37 happy years. There, among his native lakes and hills, he died in his eighty-first year.

In his early manhood the poet's resources were very slender, but his tastes were simple and he made what he had suffice for his needs. He and his sister managed to live for six or seven years on about \$500 a year. Later he came into possession of a little property, and later still was appointed stamp-distributor for Cumberland and Westmoreland, an office worth \$500 a year, the duties of which were mostly discharged by a clerk, leaving the poet leisure for his literary pursuits. In 1803 he became acquainted with Sir George Beaumont, a descendant of the dramatist and a cultivated man, who presented him with a beautiful piece of land at Applethwaite, near Skiddaw, hoping that he might be induced to settle there, but he could not make up his mind to leave his chosen home at Grasmere. His friendship with Beaumont remained unbroken until the death of the latter in 1827.

Wordsworth retained the stamp-collectorship until 1842, when it was transferred to his second son. A more lucrative office, the collectorship of Whitehaven, was offered him, but he declined it, being unwilling to exchange his secluded life at Rydal "for riches and a load of care." In 1843, he was made poet-laureate on the death of Southey. He declined the honor at first as imposing duties which at his advanced age he hesitated to undertake; but he finally accepted it, at the personal solicitation of Sir Robert Peel, who assured him that nothing "should be re-

quired of him," adding that the appointment was "a tribute of respect justly due to the first of living poets," that "the queen entirely approved of the nomination," and that there was "one unanimous feeling on the part of all who had heard of the proposal that there could not be a question about the selection."

In 1800 a second edition of 'Lyrical Ballads,' with other poems, was published, and others appeared in 1802 and 1805. Meanwhile the poet had made few friends and many and bitter enemies. The issue of two more volumes of 'Poems' in 1807 led to a fresh onslaught upon the author, who persisted in writing verse after the autocratic 'Edinburgh Review' had given judgment against him. Jeffrey, in noticing the new volumes in the 'Review,' remarked: "Even in the worst of these productions there are, no doubt, occasional little touches of delicate feeling and original fancy; but these are quite lost and obscured in the mass of childishness and simplicity with which they are incorporated." Such was the high critical verdict upon a collection of poems that included the 'Ode to Duty,' the 'Sonnets dedicated to Liberty,' 'The Happy Warrior,' the exquisite lines, "She was a Phantom of Delight," etc., and the sublime 'Ode on the Intimations of Immortality.' Eight years elapsed before another edition of the poems was printed; and the year previous (1814) Wordsworth had published 'The Excursion.' Five hundred copies of this sufficed to supply the demand for six years. The new poem was savagely treated by Jeffrey, who boasted that he had "crushed 'The Excursion.'" Southey remarked: "He might as well seat himself on Skiddaw, and fancy that he crushed the mountain." Jeffrey began his crushing criticism with "This will never do," and went on to pronounce the poem "longer, weaker, and tamer than any of Mr. Wordsworth's other productions"; but though he and his fellow reviewers prevented the sale of the poem, they could not kill it, in spite of its obvious faults.

Other volumes were brought out by the undismayed poet in 1815 ('The White Doe of Rylstone'), in 1819, 1820, and 1822, and all were condemned by the 'Edinburgh Review' as they appeared, but the reaction had now begun among the critical authorities, and henceforth Wordsworth had powerful defenders in literary circles. "War was no longer waged against his poems, but rather concerning them." It was, however, a long fight yet before their rightful position was accorded them by the general consent of the contending parties. De Quincey has well summed up the matter thus: "From 1800 to 1820 the poetry of Wordsworth was trodden under foot; from 1820 to 1830 it was militant; from 1830 and onward it has been triumphant." And the triumph was complete. There were still those who could see little to admire in the meditative measures of the Cumberland recluse, but the general verdict was in his favor, and his place among the great poets of our literature was secure beyond dispute. Honors, too, were conferred upon him. In 1839 he received the degree of D.C.L. from Oxford University; and the enthusiasm of the audience on the occasion was such as had never been known except upon the visits of the Duke of Wellington. One who was present says: "Scarcely had his name been pronounced than from 3,000 voices at once there

WORK—WORKHOUSE

broke forth a burst of applause, echoed and taken up again when it seemed about to die away, and that thrice repeated." The poet no doubt went through the ceremony with his wonted calmness and composure; but it was none the less significant as a tribute to the man and a testimonial that he had fairly won the laurel crown. A few years later, as we have seen, he received the further honors of a government pension and the laureate ship.

Wordsworth's famous theory of poetic art was first set forth in the preface to the second edition of the *'Lyrical Ballads'* (1800), and more at length subsequently in prefaces and appendixes. He took the ground that not only might the poet draw his subjects from common life, but he might treat of them in the language of common life. "I have proposed to myself," he says, "to imitate and, as far as is possible, to adopt the very language of men. . . . I have taken as much pains to avoid what is usually called poetic diction as others ordinarily take to produce it." And again he asserts that "there neither is, nor can be, any essential difference between the language of prose and metrical composition." But his theory was the result of his rebellion against the highly artificial style of Pope and his school, and, like many reformers, he was at first inclined to go too far in the opposite direction. He himself admitted this later by giving up the puerile style in which many of his earlier poems were written, and adopting a more elevated diction, and also by changing some of the most prosaic expressions in those early poems. To take a single brief example of these emendations, in *'The Thorn,'* one of the *'Lyrical Ballads,'* as printed in 1798 and 1815, we have this arithmetical statement:

And to the left, three yards beyond,
You see a little muddy pond
Of water never dry.
I've measured it from side to side,
The three feet long and two feet wide.

Crabbe Robinson told Wordsworth that "he dared not read these lines aloud in company." "They ought to be liked," was the poet's reply; but he nevertheless modified the last two lines in 1820, so that now they read:

Though but of compass small, and bare
To thirsty suns and parching air.

Wordsworth was much gratified at the comparatively early appreciation of his works in this country. The *'Lyrical Ballads'* were reprinted at Philadelphia in 1802, and an edition of his poems in four volumes appeared in Boston in 1824. A complete edition was brought out (Philadelphia 1837) by Prof. Henry Reed, with whom the poet interchanged many letters. In one of these he says: "The acknowledgments which I receive from the vast continent of America are among the most grateful that reach me." Reed's edition was revised and enlarged in 1851. In 1854, a Boston edition in 7 vols. was published, with a biographical introduction (though without his name) by James Russell Lowell. Thirty years later (1884) when Lowell was minister to England, he was made president of the Wordsworth Society, and in the closing words of an address on that occasion he thus aptly and admirably expressed what we may call the "true mission" of the poet:

"As in Catholic countries men go for a time into retreat from the importunate dissonances

of life to collect their better selves again by communion with things that are heavenly and therefore eternal, so this Chartreuse of Wordsworth, dedicated to the Genius of Solitude, will allure to its imperturbable calm the finer natures and the more highly tempered intellects of every generation, so long as man has any intuition of what is most sacred in his own emotions and sympathies, or of whatever in outward nature is the most capable of awakening them and making them operative, whether to console or strengthen. And over the entrance gate to that purifying seclusion shall be inscribed,

Minds innocent and quiet take
This for a hermitage."

The best editions of Wordsworth's poems are Prof. Edward Dowden's (1892) and Prof. William Knight's (1896; a great improvement on his edition of 1882-6). Macmillan's one-volume edition of 1888, with introduction by John Morley, is the next best. Of the *'Selections from Wordsworth'* the best are Matthew Arnold's (London 1879) and the one compiled by Knight and other members of the Wordsworth Society (London 1881). Among the criticisms on the poet those in Principal Shairp's *'Studies in Poetry and Philosophy'* (1876) and his *'Aspects of Poetry'* (1881), and in Stopford Brooke's *'Theology of the English Poets'* (pp. 93-286 being devoted to Wordsworth) may be commended; also the volume entitled *'Wordsworthiana'* (1889), a selection from the papers of the society, including the presidential addresses of Matthew Arnold, Lord Houghton, Lord Selborne, and Mr. Lowell. The society was formed in 1880 and was kept up for seven years. The meetings were held for two years at Grasmere and afterward in London. Beginning as a small semi-private club, it had increased in 1886 to 344 members. The most complete biography of Wordsworth is that by his nephew, Christopher Wordsworth (2 vols. 1851); but the briefer one in *'English Men of Letters,'* by F. W. H. Myers (1881) is, on the whole, to be preferred. Consult also: E. Lee, *'Dorothy Wordsworth'* (1886); Legouis, *'La Jeunesse de William Wordsworth'* (1896). The poet's prose works were collected by the Rev. A. B. Grosart in 1876, and another edition was published by Knight in 1896. W. J. ROLFE,

Author of 'Life of Shakespeare.'

Work, Henry Clay, American song writer and inventor: b. Middletown, Conn., 1 Oct. 1832; d. Hartford, Conn., 8 June 1884. He was a printer for a time, but studied harmony and became widely popular during the Civil War period by his songs, such as *'Kingdom Comin'*; *'Wake Nicodemus'*; *'Babylon is Fallen'*; and *'Marching Through Georgia.'* He wrote also temperance songs, which had a wide circulation, among them, *'Father, Dear Father, Come Home with Me Now'*; and sentimental melodies like *'My Grandfather's Clock'* and *'Lily Dale.'* Among inventions by him were a rotary engine and a knitting machine.

Work, in mechanics. See **ENERGY; MECHANICS.**

Workhouse, in the United States, a correctional prison for petty offenders. In England the poor-house is called a "workhouse." Workhouses appear to have been correctional originally in England also and were first erected as

WORKINGMEN'S ASSOCIATION—WORKSHOP TERMS

the reign of Charles II. in order to compel rogues and vagabonds to work for a living. Act 9, Charles I., ch. vii., entitled the churchwardens or overseers of the poor, with consent of the majority of the inhabitants to establish workhouses for lodging and maintaining the poor, and made various arrangements for union of parishes for this purpose. By 34 and 35 Victoria, ch. cviii., the guardians of every union are bound to provide casual wards, with such fittings as the poor-law board consider necessary, for the accommodation of the casual poor. Every workhouse has to keep a register of religious creeds, and also a register of persons under 16, hired out as servants or apprentices, whom the relieving officer must visit twice a year to inquire into their food and treatment. The inmates of workhouses are not allowed to go out and in at pleasure, and the able-bodied are compelled to work when required. In suitable situations they are often employed in field labor. Married persons are separated unless both are above 60 years of age. Drunkenness, misconduct, or refusal to work, exposes to the penalty of imprisonment with hard labor. The workhouses, after being under the control of the poor-law board, were placed under the local government board in 1891.

In Scotland the legal designation of homes provided for the accommodation of the poor is poor-houses, as in America, the designation "asylum for the poor" being also used in the United States. See CHARITIES, PUBLIC.

Workingmen's Association, International. See INTERNATIONAL WORKINGMEN'S ASSOCIATION; SOCIALISM.

Workingmen's Clubs, organizations for educational and social purposes composed of workingmen, but having none of the benefit or industrial features of the trade-union. In the United States they are not numerous, and where they exist are organized by those interested in philanthropic work for the benefit of workingmen, and are usually largely educational. In Europe, however, clubs are often formed by the workingmen themselves, and are sometimes political, usually socialistic, and sometimes purely social; there are also numerous philanthropic clubs, especially in England, organized generally under church auspices. These are both social and educational.

Workington, wér'king-tón, England, a seaport and manufacturing town in Cumberland, near the mouth of the Derwent, which enters the Solway Firth 33 miles from Carlisle. It has a good harbor furnished with a break-water, and provided with docks. The municipal borough, incorporated 1888, does not include the whole of the previously existing urban district. The town is of importance from its industrial establishments, which comprise large iron-smelting works and works for steel rails, iron plates, etc.; it has a ship-building yard and collieries, and carries on a considerable shipping trade.

Workingwomen's Clubs, organizations for educational and social purposes for workingwomen. The formation of these clubs was begun in Boston in 1890, and they are now numerous throughout the United States; there is a National League of Workingwomen's Clubs; and several State leagues. These clubs have

been organized on the initiative of women outside the working class, and include in their membership both workingwomen and "women of leisure"; one of their great benefits is the promotion of understanding and sympathy between these two classes. The clubs are entirely self-governing, all members being on an equal footing and having equal share in the management. They are also self-supporting by means of moderate fees and the proceeds of entertainments. The club rooms furnish the workingwomen with a place of recreation with pleasant surroundings, and the social feature is emphasized, but the educational side is not neglected; public questions are discussed, and instruction in domestic science, stenography, etc., is given. In some cases the clubs have been instrumental in obtaining reforms in industrial conditions for women; the Massachusetts State League, for instance, was largely influential in establishing the eight-hour day in Boston department stores. See WOMEN IN THE INDUSTRIES.

Workshop Regulations. See FACTORIES AND FACTORY INSPECTION; FACTORY ECONOMICS; CHILD-LABOR; LABOR LEGISLATION; etc.

Workshop Terms. The following list of mechanical terms includes a selected number of the most significant terms and phrases commonly used in workshops to briefly define the various methods, processes, and special operations usually required in the execution of a general line of shopwork, either in wood or metal.

For information relative to similar terms specifically applied to the making and handling of hand and machine tools; to the construction of engines and machines, etc., consult articles under the titles **BOILER TERMS**; **ELECTRICAL TERMS**; **ENGINE**; **ENGINEERING AND STRUCTURAL TERMS**; **FOUNDRY AND FORGE SHOP TERMS**; **LOCOMOTIVE, DESIGN AND CONSTRUCTION OF THE MODERN**; **MECHANICAL TERMS**; **TOOLS**; and **VALVES AND VALVE TERMS**; in this Encyclopedia.

ABOUT SLEDGE.—To deliver heavy blows with a sledge hammer by swinging it through large arc, as distinguished from "Up Hand," meaning the delivering of light blows by swinging the hammer through small arc, or by the use of a lighter hammer.

ABRASION.—The act of wearing away by grinding instead of cutting. It is effected by the use of emery wheels and other forms of grindstones, when cutting tools cannot be used on account of the hardness of the material worked upon, or where the action of such tools would be too slow, or tend to produce inaccurate results.

ADJUSTABLE.—Applied to the peculiar construction of a machine which permits of the regulation of the positions of its various parts as may be required for the execution of different kinds of work.

ALIGNMENT.—The linear accuracy or coincidence of the centres of the fast and loose pulleys of a lathe. Also, the axial continuity of shafting, and of shaft bearings in general.

ANNULAR.—Ring shaped. A term extensively used as a prefix to other terms to designate various forms of gears, valves, valve seatings, engines, etc.

ASBORING.—The shouldering back of a flat bearing face to receive the washers and nuts of the attachment bolts.

ASSEMBLING.—The putting together of the parts of a machine preparatory to the final work of fitting and adjusting. It is especially applicable in cases where such parts are made in great numbers by machinery, and are designed to be interchangeable.

AUTOGENOUS SOLDERING.—The joining of pieces of metal by fusing their contact surfaces, and without the use of solder.

BABBITTING.—The process of lining bearings with Babbitt's metal, or with white metal.

BACKING-OFF.—The cutting away of the "leaving" portion of a screw tap so as to allow the "entering"

WORKSHOP TERMS

- portion to work more freely. It effects a reduction in the friction between the sides of the tapped hole and the portions of the tap which do not cut.
- BACKING-OUT.**—The withdrawing of a tap or die after the thread has been cut.
- BACK.**—Signifies that a dimension is very slightly less than a definite size. So slightly, that the difference cannot be detected by rule measurement, and may be determined only by calipers, that is, a difference less than $\frac{1}{64}$ of an inch.
- BARREN.**—Iron work which has been coated with a film of magnetic oxide by the "Barff" process, to prevent it from rusting.
- BEADING.**—The edge of a sheet of metal thickened or turned over to stiffen and strengthen it. A fillet or strip curved around the edge of a casting to strengthen it, or for ornamental purposes. The semicircular termination of the spigot end of a pipe.
- BEAUMONTAGE.**—A shop term applied to any compound used for filling up holes for purposes of concealment. As prepared for filling up blow-holes in castings, it consists of beeswax, resin, lamp-black and iron borings.
- BENCH WORK.**—Work executed at the bench or vice as distinguished from lathe work, the work of the fitter, or that of the erector.
- BEND.**—The curved part of a pipe by which its axial direction is changed. A bend ought to be of as large a radius as possible in order to reduce the friction of the liquids conveyed by them. They are known as quarter bends, eighth-bends, and sixteenth-bends, having angles of 90° , 45° , and $22\frac{1}{2}^\circ$, respectively.
- BLACK WORK.**—Machine work which has not been machined or polished.
- BLANK.**—A piece of metal specially prepared to be subsequently shaped or ground to some particular form. Blank bolts are the rough forgings of the bolts before the screw threads have been cut.
- BLASTING-OFF.**—Signifies the determination of a definite tempering heat by the flashing point of a grime, fat or oil, into which the article to be tempered is dipped.
- BORING.**—The making or finishing of circular holes of comparatively large diameter, in metal or wood, by the use of tools having one cutting edge only, as distinguished from drilling, which signifies the making of small holes with tools having two cutting edges.
- BRASS BORINGS.**—The borings and turnings of brass castings which are collected in shops. They are separated from the iron borings by the use of magnets, and are then remelted.
- BRASS FITTING.**—A special branch of work involving the later stages of the manufacture of brass cocks, lubricators, valves, and other similar engine and pump fittings. It combines the operations of turning, milling, grinding, and burnishing.
- BRASSING.**—The joining of metallic surfaces by the use of an interposed film of bracing metal, an alloy of 88 parts of copper to two parts of tin. The joints to be braced are first cleaned and bound with wire. Then they are subjected to the action of a clear fire, sprinkled with borax, and heated until the alloy is melted. This process is also known as hard soldering. The proportion of copper in the alloy should be as high as possible, so as to prevent the use of a brazing temperature that would melt the surfaces being braced.
- BROUZE WORK.**—Those parts of a machine which are polished, either to reduce the friction of the bearing parts, or for the purpose of ornamentation. The brightening is accomplished by means of machine centers, or by abrasion.
- BRANCHING.**—The enlarging, smoothing, and turning of drilled holes by the use of a branch or reamer. Branches are sometimes called rose reamers. They are made of various sectional forms, their cutting angles ranging from 90° to 120° .
- BUCKLE.**—Localized inequalities in plates of wood or metal caused by unequal strains and stresses. Buckling is produced in timber by the presence of moisture, by dryness, or by unevenness of grain. In metals, it is caused by unequal stresses set up by variations in density, quality, or in the rate of cooling.
- BURRING.**—Polishing by means of leather and emery, or other abrasive powder.
- BURNISH OR BURNISHING.**—To polish one metallic surface by rubbing with another. Also, to envelope a body by the bending over of a metallic ring around its edges. It is sometimes erroneously applied to the process of buffing.
- BURN.**—The raised and undetached edge of metal turned over when a metal plate is subjected to shearing, or when it is subjected to punching, drilling, or cutting operations in general. Also called burr edge.
- BUSH.**—The internal cylindrical lining of a bearing. Bushes are made of gun metal, or of some kind of anti-friction metal, and are used, either for purposes of economy, or for convenience. In the former case, an inferior metal is lined with one more expensive, thus reducing the total cost, and in the latter case in order to permit of their being replaced when worn out, without replacing the main casting. A bush is undivided, thus being distinguished from a brass, which is divided.
- BUSHING.**—The fitting or driving in of bushes into their seatings.
- BUTT MEASUREMENT.**—The taking of measurements by means of a rule placed against the part measured, as distinguished from measurements taken by the use of transmits, calipers, compasses or dividers.
- CAMBER.**—The amount of curvature given to an initial bar or structure.
- CHAMFER.**—A bevel imparted to edges otherwise rectangular, such as the bevels of nuts, and the rounding ends of bolts.
- CHATTER.**—Caused in machine work by a lack of rigidity in the cutting tools.
- CHIPPING.**—The removal of minute particles of metal from the faces or from the edges of metal work when the amount of metal required to be removed is too large to be accomplished by the use of the file alone.
- CHUCKING.**—The method of attaching lathe work to the various chucks of a lathe.
- CLEARANCE.**—Signifies the amount of space, open or free, between the contiguous parts of a machine. Wheel clearance is the space between contiguous teeth. In the case of brasses, it is the space between their flanges and the collars upon their shafts.
- CLEARANCE ANGLE.**—The angle formed between the face of a cutting tool and the face of the material operated upon. The maintenance of the proper angle is very necessary to prevent the setting-up of undue friction or grinding action between the tool and the work. This angle varies from about 3° in some metal working tools, to about 25° in wood working planes. Also called the angle of relief.
- CLEARING HOLE.**—A hole full to the specified size, so that a turned stud or bolt of the same nominal diameter will pass freely yet closely through it. It is used in opposition to the term tapping hole.
- CLOSING-UP.**—The burring over of a rivet head, either by hand or by hydraulic pressure. The closing-up length required in hand riveting is $\frac{1}{4}$ times the diameter for snap head and conical rivets, once the diameter for countersunk rivets, and about $\frac{1}{4}$ to $\frac{1}{2}$ inch more than the diameter for machine riveting. The term also signifies the covering up of the top box or cope of a foundry mold preparatory to casting.
- CONING.**—The tapering of the running edges of the wheels of railway cars, cranes and turntable rollers. When a train runs around a curve, the wheels are thrown outwards by centrifugal force, and the inner and outer wheels describe arcs of unequal length. By coning, the outer wheels are enabled to run on their greater, and the inner wheels on their lesser diameters, thus compensating for the difference in the arcs described by the wheels, by the difference in the diameters of the wheels.
- COUNTERSINK.**—A hole recessed conically with a countersink, or with a rose bit, or with drills, so that the head of a screw or rivet will lie level with the surface of the material into which it is fitted.
- CROSS CUTTING.**—The removal of material in a transverse direction by the action of a chisel or saw.
- CROW'S FOOT.**—The marks made thus \angle on drawings to indicate the points between which a dimension or measurement is given.
- CUT.**—The removal of a shaving from a piece of work in a lathe, or in a planing, boring, or other similar machine.
- DASSING-ON.**—Applied to the making of butt joints which are strengthened with dowels or stub-in pieces, as in the case of the spoke ends of railway car wheels.
- DEAD SIZE.**—Signifies a finished dimension. It is the opposite of a rough dimension, and is the exact size or length without any allowances whatever for contingencies or for machining.
- DEBurring.**—The hollowing-out of the surface of a disc or wheel so as to render it stronger or more elastic.
- DRAW FILE.**—The polishing of a metallic surface with a file moved transversely of the direction of its own longitudinal axis so that the cutting action of the teeth is very slight. Sometimes called "poker filing."
- DRAWING-DOWN.**—The thinning down of forged work by the use of hammers, fullers and slaters. The dimensions may be reduced all around equally or

WORKSHOP TERMS

- reduced in one direction and increased in the other.
- DRAWING-IN or HITCHING.**—When a cutting tool cuts to a greater depth than that intended for it to cut. Usually due to the improper form of the tool; to an unsuitable cutting angle, or to the improper position of the cutting point relatively to the shank.
- DRAWING-ON.**—Signifies the method by which wheels, pulleys, etc., are attached to their axles or shafts when they are too large to be driven on by a hammer. As commonly applied, long bolts the heads of which are held in a massive cross attached to one end of the axle, pass on the outside of the wheel, or through it between the arms, and the tightening of their nuts against a washer plate placed across the face of the wheel, pulls the wheel into the proper position on the shaft. Hydraulic presses are also used for this purpose.
- DRAFTING.**—The shaping and enlarging of holes by the use of a drift. Also applied to the adjusting of overlapping rivet holes into alignment with each other.
- DRIVING FIT.**—The fit of a bush, a spindle, or of a shaft, when it is driven by the blows of a hammer into the hole bored for its reception.
- DRIVING-HOME.**—The driving of a wheel, shaft, or any other part of a machine to its final and permanent position.
- DRIVING-IN.**—The merging of a hollow radius with a plane surface, as distinguished from the meeting of abrupt angles.
- EAR.**—A lug or projection upon a casting designed for the reception of a bolt or other attachment.
- END MEASUREMENT.**—Measurements taken with a caliper or micrometer gauge. They are very much more accurate than line measurements.
- ERECTING.**—The final building up of machines in readiness for working. The work is accomplished by the "erector," to whom all the work of the turners, planers, slotters, drillers, and fitters is brought, ready to be put together with little or no adjustment being required of them.
- FINALE.**—The recessed part of any piece of work designed for the reception of a dowel or stud.
- FILLET.**—A term of many meanings, and loosely applied to the hollow or to the curves given to the otherwise angular parts of the inner sides of castings; also to a great variety of moldings, beadings, flanges, chipping strips, and to any thin strips employed to give strength, or for ornamental purposes.
- FIT.**—Any thin wafer-like expansion of metal that occurs on the side or edge of a larger portion, such as those on the joints of castings, and on the edges of forgings pressed in dies.
- FINGER.**—A narrow projection of metal used as a guide in various kinds of metal work.
- FITTER.**—A working mechanical engineer whose duty consists of the work of putting together machine or engine parts after they have passed through the hands of the turners, planers, drillers, etc.
- FITTING.**—In a broad sense it defines the duties of the fitter, but in a limited sense it signifies the working-up and finishing by hand of the smaller pieces of metal work which cannot be accomplished by machines.
- FIXED CENTRE.**—A centre, the position of which is localized in space, as distinguished from a movable centre.
- FLUSH.**—The parts of a machine are said to be flush when their surfaces are on the same level.
- FORGING.**—The making of forged or smith's work, and also applied to the work produced by a smith.
- FOURING.**—A class of work turned out on special lathes by means of broad cutting tools, the faces of which correspond exactly to the sections of the pieces to be cut. The value of the method lies in its capacity to produce irregular contours, curved and otherwise, by the use of single tools which ordinarily would require the use of several tools, thereby rendering the attainment of uniformity in many kinds of work practically impossible, or economically difficult. The method is extensively applied to the work of brass finishers and cycle makers.
- FRATTING.**—The abrasion of a cutting tool when it is sharpened on an oil stone.
- FRONTING.**—A finish put upon the exposed surfaces of machine parts for ornamental purposes only. It is effected by scraping with a scraper, or with a small piece of oil stone, a series of the lightest of cuts or scrapings upon the surface of the metal. These cuts are inflicted at different crossing angles from which the light is reflected and produce a very beautiful effect.
- FOUL.**—The term signifies that a dimension is slightly larger than it ought to be, but only so slightly that the excess may be measured only by calipers rather than by rule measurement. When applied to an eccentric, it refers to that part of the obverse which is situated at the greatest distance from the crank-shaft upon which it is fixed.
- GEAR.**—A term widely applied to a great variety of arrangements of toothed wheels, valve motions, pump work, hoisting tackle, ropes, etc. Gearing is a synonymous term, but it is specifically applicable to gear wheels, and also to the driving in and the working of the wooden cogs of mortise wheels.
- GLAZING.**—As used in the workshop, it signifies the filling up of the interstices of the surface of a grindstone, or of an emery wheel, with the minute particles of metal detached by the process of grinding; giving the surface a smooth and polished appearance, and reducing its cutting quality. It is primarily caused either by an insufficient supply of water; by the grinding of material unsuitable to the nature of the stone or wheel; or by the grinding of so broad a surface that the abraded particles of metal are imprisoned by it and are squeezed between the rigid particles composing the grinder.
- GRINDING-IN.**—The process of bringing the bearing surfaces of cylindrical cocks and plugs to an exact fit by the use of emery powder.
- GUMMING.**—The tendency of lubricating oils to become thick and sticky.
- HACKING.**—The dressing-off of the projections on the face of a grindstone which has become so uneven that the effective use of the ordinary pointed grinding tool is rendered very difficult. It is accomplished by means of a chisel-shaped, cross-paired hammer called a hack-hammer, the chief projections being reduced by a series of cross hackings, or chequered cuts.
- HANDING.**—Making symmetrical work right and left hand respectively, and the changing of patterns from right to left hand, and from left to right hand.
- HOLD-UP.**—A common term that expresses the capacity of a piece of wood or metal to finish to a given size.
- IRON TURNING.**—It is the most important branch of mechanical work, and includes all the various kinds of turning connected with the production of all circular bearing parts, and all revolving and close fitting work which has to be turned in power driven, slide rest lathes.
- JACKING-UP.**—The elevating of masses of machinery and heavy structures by means of jacks. Also the planing of the rough outsides of boards with a jack plane.
- JAW.**—A roughed-up or barbed projection of metal produced by sicking underneath, or in front of it, with a cold chisel, or by casting.
- JOINTING.**—The joining together of iron pipes, sockets, etc. The jointing of iron pipes is effected with red lead and boiled oil when the flanges are brought together, while that of sockets is effected with melted lead, with a gasket, or with rubber rings. Hydraulic jointing is accomplished with sal-ammoniac and iron borings. Piston joints for hydraulic work are made of leather pressed into the shape of a cup, while piston joints for steam work are made with metal expansion rings.
- JUMPING-UP.**—The knocking down of the end of a bar of iron upon the anvil so as to thicken the heated portion.
- KEEP.**—The width of the cut produced by the teeth of a saw. It depends upon the amount of set given to the teeth.
- KINK.**—The sharp bend or angle given to a piece of metal by a blow or a strain. It is also applied to the knotting of the links of a chain.
- KNOCKING.**—The noise caused in a pump when the motion for suction and delivery are reversed, and is due to the absence of an air vessel, or one of sufficient area.
- KROTTING.**—A compound, either of shellac and methylated spirit, or of red lead and glue, used for filling-in or covering knots to prevent the absorption of oil paint.
- LAP.**—A body of lead, tin, brass, or other soft metal employed to hold or support the emery or pumice stone used in the grinding of surfaces of hardened steel, chilled iron, and other substances too hard to be attacked with ordinary tools. The character and shape of the lap depends upon the nature of the work performed. Usually the outline of the lap is made similar to that of the work. Lead is used for the commonest grades of work, tin for better grades, and brass for the finest grades. The term is also applied to the extent to which the plates pass over each other in the making of rivet joints, and to a single turn of a rope or chain around the barrel or drum of a hoisting machine.
- LAPPING.**—The polishing and truing up of spindles and circular bearing parts in general, by the use of laps of lead or other material.

WORKSHOP TERMS

- LATHING WORK.**—Work commonly accomplished in the lathe. It embraces practically all kinds of mechanical work accomplished by turning operations.
- LATHING-OUT.**—The marking out of work to full size.
- LAT IN.**—Signifies the sinking in of one portion of wood or metal into another, as in the case of rapping plates which are let in to the patterns, and brass rings let in to sluice cock faces, etc.
- LINING UP.**—The introduction of packing pieces under bearings to compensate for wear.
- MACHINING.**—A general term applied to the operations of turning, planing, shaping, boring, etc., performed on metal work by machines.
- MACHETING.**—The process of separating particles of iron from those of brass and copper turnings by the use of a magnet, prior to remelting.
- MALL.**—A stud or dowel that fits into a recess formed for its reception, in a particular piece of work.
- MANDREL or MANDRIL.**—In a general sense it is applicable to any cylindrical rod of metal. Specifically it is applied to the revolving spindle used for chucking lathe work on; to the spindle of a circular saw; and to the round rod upon which the cuts made by a smith are finished to shape.
- MARKING OUT.**—The workman who marks out the centres and the working lines of metal work preparatory to the operations of the machinists and the fitters.
- METAL SPINNING.**—The process by which light articles made of malleable metal are formed into circular and other shapes by means of pressure applied to them while they are rapidly rotated in a lathe.
- MILLING.**—The method of forming metal into various shapes by means of tools or cutters slowly revolved in milling machines. A greater variety of surface contours can be produced more rapidly and accurately by milling than by the ordinary planing and shaping operations in which single cutting tools are employed. The great value of the method is its capability to produce an indefinite number of articles or machine parts exactly similar in outline, and of uniform size.
- MISAL.**—Lines or edges which meet at an angle of 45° with each other as in the case of any two adjoining sides of a picture frame.
- MORTISE.**—A joint in timber work formed by a recess cut in one piece, and a corresponding tenon in the other.
- MOUNTING.**—The chucking of lathe work.
- MOVABLE CENTRES or MOVABLE POINTS.**—The movable centres of the rods in parallel motions.
- NICKING.**—The cutting of a shallow V-shaped groove around a pipe, or across a bar of metal so that it may be broken by a blow at that particular point.
- OPENING-OUT.**—The enlarging of the diameter of a hole by means of a broach or reamer.
- OUT or TRUTH.**—Signifies inaccuracy in work or materials, such as a sabbled piece of lathe work, or a winding piece of wood or metal.
- OUT AND OUT, or OVER-ALL.**—Signifies an outside dimension taken to its utmost extent.
- OVERHAULING.**—In a general sense it is loosely applied to the examination of machines and machine parts, preparatory to the making of repairs. Specifically, it signifies the pulling down of the stock of a housing chain.
- PATTERN WORK.**—The making of patterns for purposes of casting, turning, milling, etc.
- PLANING.**—The beating over or the smoothing over of a metallic surface with the plane or smaller end of a hammer head.
- PIPE BENDING.**—When metal pipes are bent, any buckling or wrinkling in the inner curve is prevented by filling the pipe with melted resin or some fusible alloy, which tends to preserve its circular form during the process of bending, and which is subsequently melted out of the pipe at the completion of the process. When wrought iron pipes are bent hot, sand is usually employed as a filling instead of an alloy which would be melted by the heat.
- PIPE CONNECTIONS.**—The various parts used in making the joints of pipes, such as bends, tees, unions, elbows, nipples, thimbles, etc.
- PLANING.**—The removal of material from plane or flat surfaces by the use of cutting tools. In the case of small wood work, hand planes are employed; but, in the case of wood work in large quantities or sizes, and in metal work, the operations are performed by the use of planing machines.
- PLANISHING.**—The smoothing and polishing of metallic surfaces by hammering, or by rolling, instead of by cutting or by abrasion. Shafting is very often planished instead of turned. Planishing hammers used on sheet metal are capable of delivering blows at the rate of three hundred blows per minute.
- PLAY.**—The freedom of movement, within definite limits, allowed in bearing or working parts, to prevent their jamming by heating, or by oscillation.
- PLUMB.**—In a vertical position, as indicated by the position of a weighted cord hanging at rest.
- PLY.**—Signifies a fold, a twist, or a single thickness of a material such as wire gauze, or cotton belting. In the latter case, the terms two-ply, three-ply, and four-ply, indicate that the belting is made up of two, three, or four single thicknesses of the material. The term also signifies to bend.
- POSS FIT.**—The fit of adjoining parts which is a little tighter than a sliding fit. It is provided for the purpose of allowing such parts to be pressed together by hydraulic pressure.
- PRISING.**—The turning of a wheel around its axle with a crowbar. Sometimes called "barring."
- PUNCHING.**—The making of holes through metal plates by a punching machine, as distinguished from the making of holes by drilling.
- RAISED WORK.**—Metal work which is produced by being hammered into the required outline.
- RAISING.**—The production of raised work in curved outlines in sheet metal by hammering.
- REAPPA.**—Red lead mixed with oil, and used in the fitting of metal surfaces by the processes of scraping and filing.
- RED LEAD.**—The red oxide of lead. Mixed with boiled oil, or with boiled oil and white lead, it is used in making steam joints, mixed to the consistency of a thin cream paste, it is used for checking the accuracy of contact surfaces during the operations of fitting, the color being transferred from the surface that has been finished to the highest portions of the surface to which the finished surface is being fitted.
- RIVET.**—A double-headed, solid, bolt-like fastening, used for securing metal plates together, when they are subjected to shearing and not to tensile strains. They are made of soft iron, superior in quality to that of the plates, and are pressed into form in dies while red hot. They hold partly by the grip due to contraction on cooling, and partly by the frictional resistance of the plates to slipping.
- RIVETING.**—The forming of the rivet heads in place. The rivets are first heated to a red heat, then they are placed in the rivet holes in the plates, and the tail turned over or clenched by the blows of a hammer. This operation is commonly called closing-up. Large rivets are usually closed-up when red hot, and small rivets when cold, but, if the length between the heads is more than four inches, the heads formed on hot rivets are liable to be broken off by the contraction of the metal when it cools. Rivets of that length and over ought to be closed-up cold. Riveting is accomplished either by the use of hand hammers and hand riveting-sets, which close up and form the tails of the rivets, or by hydraulic pressure. In machine riveting, the closing-up and the forming of the tail are performed in one operation.
- ROUGHING-DOWN or ROUGHING.**—The removal of the outer skin or scale, and the larger bulk of the material from a piece of work preparatory to the more accurate shaping with finishing cuts.
- RULE MEASUREMENTS.**—The taking of all ordinary dimensions with a rule where the character of the work does not require the exactness which can be attained only by the use of calipers, trammels, gauges, and micrometer gauges.
- RUNTING-OUT.**—In boring operations, it signifies the slipping away of the drill from the centre in which it was started. It is caused in various ways, such as the carelessness in the initial centering, the improper setting of the work; the influence of inequalities on the surface of the work; or the bad form of the drill itself.
- RUSTING.**—The coating of bright iron or steel surfaces, such as those of iron patterns, with rust so that they will take shellac varnish without the risk of peeling off. Rusting is accomplished very quickly by coating the iron with a solution of sal-ammoniac, or with a weak solution of hydrochloric acid, and allowing it to dry.
- RYMENDING or REAMING.**—The enlarging of holes, already punched or drilled, by the use of a reamer or reamer. By this method, holes which have been roughly drilled, or those in which ridges have been left by the drill, are smoothed down and made truer, holes which have been punched or drilled in plates, and which do not correspond exactly, are corrected by clamping the plates together and passing the reamer through both of them at once; and punched holes in the immediate vicinity of which local tension has been set up by the punching operations, are relieved of that strain by reaming them about 1-16 of an inch larger in diameter.

WORKSHOP—WORLD

SCALING.—The taking of measurements or dimensions by means of a scale from drawings made full or actual size, or from those upon which the dimensions are not given in figures.

SCRAPING.—A method by which approximately plane surfaces are produced by means of scrapers. Also used in the exact fitting of bearing surfaces, and in the removal of marks or grooves left by the cutting processes. It is a mechanical operation by which the most perfect results in the fitting of contact surfaces are obtained. See *Red Lead*.

SCRIBING.—Marking out with a scribe on rough pieces of wood or metal, the outline of the shape or pattern to which such pieces are to be worked by the subsequent operations. A timber scribe is a steel tool pointed at one end for scratching, and knife-shaped at the other end for cutting. A metal fitter's scribe is pointed at both ends, one being straight for top scribing, and the other curved for marking underneath work.

SET WORK.—Regular work or that which is repeated many times or perpetually in a workshop. It is also applied to any class of work which is made a specialty by a manufacturing concern. In such cases it is accomplished by the minute subdivision of labor and piece work, and is therefore made better and cheaper by such firms; but it tends to develop a very one-sided class of workmen, undoubtedly good in their special line though rather inferior in all other branches of shop work.

SHRINKING-ON.—The fixing or clamping of wheel tires; the securing of the jackets of built-up guns over the central tube, etc., by expanding the wheel or jacket, as the case may be, by means of heat, then placing it in the desired position, and allowing it to grip or tighten on the receiving part by the shrinkage caused by cooling.

SHUTTING.—The welding together of joints in wrought iron or steel.

SLACK FIT.—A term usually employed to denote a bad fit, or the fit of machine parts in contact, which have more play than is sufficient or desirable for their easy movement.

SLIP PRINCIPLE.—A principle of construction upon which the adjacent moving parts of a machine are so fitted to one another with guides or guiding strips, that they can slide or move over each other in one direction only. It is a principle which is applied in one way or another in the construction of all kinds of modern machine tools.

SLIDING FIT.—When cylindrical or plane surfaces move over each other freely, but without any perceptible slackness. The difference of $\frac{1}{10,000}$ th of an inch is equivalent to the difference between a sliding and a slack fit.

SOLDERING.—The joining of two pieces of metal by means of another metal or an alloy. Soft soldering is accomplished by means of the various alloys of lead and tin; while hard soldering or brazing is effected by the use of the alloys of copper and tin. Clean surfaces are essential to effective soldering. In soft soldering a copper bit is used to fuse the alloy, in hard soldering the metal parts are held together by means of binding wire, and the molten alloy allowed to run in between them.

SPINNING.—See *Metal Spinning*.

SQUARING-UP.—A term applied to various methods by which the faces of work are brought into a square position with each other by the use of planes, files, and machine cutters; or to the setting of faces already squared, against the face of a surface plate or marking-off table, preparatory to the scribing of lines and distances.

SWAGING.—The drawing down of wrought metal to a definite form with or without the use of swage tools. It is the reverse of up-setting.

SWEATING OR SWEATING-ON.—The soldering of metallic surfaces without the aid of a copper bit. After being thoroughly cleaned the surfaces are heated and covered with a film of solder. Then they are brought together and heated until the solder flows and unites them. The method is often employed to hold together temporarily various kinds of work which has to be turned or shaped, and which could not be conveniently held in any other manner. The subsequent separation of the parts is easily accomplished by the aid of heat.

TAKING-UP.—A general term which signifies the making of adjustments for wear. Specifically, it denotes the closing up of strap ends of connecting rods, the cone bearings of lathes, compensating collars, etc., and signifies the smooth working of bearing and moving parts, rather than the tightening of parts which are either bolted or wedged together.

TURNING.—The working or cutting of metals with ordinary cutting tools as distinguished from the shaping of surfaces by grinding.

TRAMMELLING-OFF.—The measuring of important dimensions, lengths and centres with trammels. In shopwork, it is the only method recognised as correct, rule measurement being inadmissible.

TRIAL AND ERROR.—A method commonly employed in the workshop to obtain correct work in the construction of mechanisms or in the making of tools. The most accurate results are obtained as follows: When a piece of work has been produced as accurately as possible by the use of a particular set of tools, or by a particular method of construction, some other set of tools, or some other method of construction is resorted to for the detection of the errors left uncorrected by the tools or method previously employed. The production of surface plates and straight edges, and the centring of work in a lathe with chalk, are cases in point.

TAVING-UP.—The straight and accurate planing of wooden surfaces, out of winding and at right angles with each other.

TURNING.—The fashioning of wood and metal work to circular forms in a lathe. It is accomplished either by hand tools, or by power-driven machine tools.

UP-HAND OR UP-HAND SLEDGE.—The delivering of light blows with a smith's sledge-hammer in light work, or the use of a light hammer for that purpose.

WILLIAM MORSE, JR., C. E.

Consulting Mechanical Engineer, New York.

Workop, England, a town of Nottinghamshire, on the Ryton and the Chesterfield Canal; 16 miles east-southeast of Sheffield. It lies near the northern extremity of Sherwood Forest, in a district known as the "Dukery," from the number of ducal seats. Its parish church, dating from 1103, was an ancient Norman abbey church. There are manufactures of agricultural implements, mill machinery, chemicals, etc., and there are iron and brass foundries. Pop. about 18,000.

World, The. Tables showing the total area, number of inhabitants, and density of population of each of the principal divisions of the world's land surface, also the area and density of population of each of the republics and European dependencies in the Western hemisphere, based upon the important work of Alexander Supan, 'Petermann's Mittheilungen, Ergänzungsheft' (Nr. 146, Gotha: 31 March 1904).

The grand total of the earth's population, as shown in this most recent computation, is 1,503,300,000; the total area of the seven divisions or groups, which include all of its continents and islands, is 144,110,600 square kilometres; and the average density of population is 10 persons to one square kilometre. The distribution (re-arranged and condensed with a view to giving prominence to the facts which are of special interest to our readers) is as follows:

	Sq. kilom.	Population to 1 sq. kilom.	Inhabit.
North America (including West India, Mexico, Central America and Panama)	20,817,700	103,714,000	5
South America	17,744,000	38,482,000	2
Europe	9,783,500	323,264,000	40
Asia	44,179,400	819,556,000	18
Africa	29,810,200	148,799,000	5
Australia and Polynesia	8,951,800	6,482,000	0.7
Polar lands (including the Arctic islands, Greenland, Iceland, the Spitzbergen group, Franz-Josef-Land, etc., and the Antarctic mainland and islands)	12,273,000	92,000	...

The total area of the American continents and islands is 38,562,600 square kilometres, and their total population 144,106,000, distributed as follows:

WORLD—WORLD'S COLUMBIAN EXPOSITION

	Sq. kilom.	Inhabitants per sq. kilom.

The total population of Latin-America, if we include in that designation all countries and islands directly south or southeast of the United States, excepting parts of the British and Dutch possessions, is approximately 63,000,000. For the population of each of the foregoing Latin-American political divisions, and area of each in square miles, with explanation of the uncertainty that exists as to the exact figures, see separate titles; also *ACR.*

Revised by MARRION WILCOX.

World, Armament of the. See *ARMAMENT OF THE WORLD.*

World-English, the name given by Prof. A. Melville Bell to a proposed new phonetic system of spelling the English language, so as to render its acquirement by foreigners more easy, and to make it available for international use.

World's Columbian Exposition, an international exposition held in Chicago, Ill., in 1893, to celebrate the 400th anniversary of the discovery of America by Columbus.

History.—The fitness of some special celebration of the discovery of America had been recognized and the question agitated several years before the bill providing for a Columbian Exposition was introduced in Congress in 1889. Several cities urged their claims for the site of the exposition; chief among them were New York, Chicago, Washington, and Saint Louis; Chicago was finally chosen as the site, and the bill passed and approved 25 April 1890. The organization of the fair was placed under the charge of an Illinois corporation previously organized, and the World's Columbian Commission, a national commission consisting of delegates appointed two from each State and Territory,

two from the District of Columbia, and eight at large. Harlow N. Higginbotham was president of the former, and Thomas W. Palmer of the latter; George R. Davis was appointed director-general. Exposition headquarters were established in Chicago in January 1891. A Department of Publicity and Promotion was established, and a Board of Lady Managers with Mrs. Potter Palmer at its head, and a World's Congress Auxiliary with C. C. Bonner as president were organized. The work of construction was placed under the charge of a Bureau of Construction of which Daniel H. Burnham was chief; work was begun on the first building in July 1891. On 23 Oct. 1892 the buildings were formally dedicated by the Vice-President of the United States; the dedication ceremony, which was attended by 130,000 people, was held in the Manufactures and Liberal Arts Building. The exposition was formally opened 1 May 1893 by President Cleveland; at the moment when he declared the fair open the flags of the various nations were unfurled, the electric fountains turned on, and the statue of "The Republic" unveiled. The attendance at the fair increased toward the close; the days showing the largest attendance were 9 October, Chicago Day, and 4 July, American Independence Day; the average daily attendance was 172,712. The exposition was formally closed 30 October; preparations had been made for elaborate closing ceremonies, but the assassination of Mayor Harrison of Chicago two days previous prevented the carrying out of the proposed programme.

Financial.—The bill providing for the exposition required the city of Chicago to raise \$10,000,000 toward the expenses; later Congress provided for the gift of a special mintage of \$2,500,000 in souvenir half-dollars, the exposition authorities also issued \$5,000,000 worth of debenture bonds; about \$3,000,000 additional were received from other miscellaneous sources, so that about \$20,000,000 was available before the opening; the total expenditures for the fair were over \$31,000,000, and the profits about \$1,850,000. The United States Government appropriated \$2,250,000 to its exhibits, the States \$6,060,350, the foreign governments \$5,830,000, and over \$350,000 was invested in the Midway Plaisance.

Buildings and Principal Exhibits.—The site chosen for the exposition was Jackson Park, a portion of the South Park system of Chicago; it covered 666 acres and extended about two miles along the shore of Lake Michigan. There were about 130 buildings erected; the more important were built of the material called "staff," a composition of plaster of Paris and jute fibre, which produced the general effect of white marble, hence the exposition grounds became generally known as the White City. One channel from the lake led into a pond in the southern part of the grounds, and north of this another channel led into a long basin; this second channel passed underneath a handsome bridge and colonnade. The basin was joined by an artificial canal to the lagoon, a small lake, containing Wooded Island. About the basin and lagoon the principal buildings were grouped. The space about the basin was known as the Court of Honor. The Manufactures and Liberal Arts Building faced the lake near the eastern end of the basin; this was the largest building ever constructed for an exposition; it cov-

WORLD'S COMMERCE

ered nearly 31 acres; the main roof was of iron and glass. At the head of the basin was the Administration Building, with its gilded dome; near this were the Agricultural Building, Machinery Hall, and the Electrical and Mining Building. On the west of the lagoon were the Transportation Building and Horticultural Hall, and on the east the Government Building, with a large dome 150 feet high; at the northwestern end of the lagoon was the Woman's Building, and at the northeastern end the Fisheries Building. Still further to the north were the State buildings, many of the foreign nations' exhibits, and the Fine Arts Building. The Fine Arts Building was an example of purely classical architecture; it was entered by four richly ornamented portals. The State and foreign nations' buildings were in many cases copies of some characteristic historic building or type; as, for example, Virginia's building was modeled on Washington's Mount Vernon home, Massachusetts' was a copy of John Hancock's house; England's represented a manor house of the time of Henry VIII., and Spain's the convent of La Rabida. In the southern part of the grounds was the Forestry Building, built in the rustic style; the columns supporting the roof being made of tree trunks furnished by the different nations and the States and Territories of the United States. Near the Forestry Building were a number of the small exhibits, the Krupp exhibit, dairy, etc. The Manufactures and Liberal Arts Building included in its exhibit everything related to engineering, architecture, publishing, technical and domestic arts, together with education, the professions, music, and the drama. The Fine Arts exhibit included many masterpieces of painting and sculpture, the Woman's Building contained a collection representing woman's work in all lines of activity; the Transportation Building's collection represented all modes of transportation from the most primitive to the most complete modern inventions of ocean steamers and locomotives; and the exhibits of the other special departments of human industry showed most excellently the progress of the race in each special industry. The architectural effect of the buildings was enhanced at night by the use of electric lights outlining the buildings, search lights, and the electric fountains playing in changing colors.

Special Features.—Among the special features of the exposition the Midway Plaisance was perhaps most interesting; on this were represented the villages of different nations and peoples, including the Irish village, the Japanese village, the Japanese bazaar, the Samoan and Dahomey villages, etc.; here also were the "Street of Cairo," and the various amusement features; and the Ferris wheel, 250 feet in diameter, carrying 36 coaches. Other special exhibitions of interest outside the main buildings were the reproduction of the cliff dwellers' buildings at Battle Rock Mountain, Colo.; the models of Columbus' three caravels, of the Viking ship, and of a modern United States battleship. Another interesting feature of the exposition was the numerous world's congresses held on the grounds under the auspices of the World's Congress Auxiliary. These congresses discussed the leading phases of professional, scientific, economic, educational and religious thought; the World's Parliament of Religions probably attracted the most general attention.

World's Commerce. The commercial status of each nation in the world is properly judged by the total value of its exports year by year, compared with those of other nations. On this basis the United Kingdom leads. The value of each nation commercially to the other nations rests upon the total imports. In this respect Great Britain leads, with Germany second and the United States third. Were it not for its protective tariff the United States, with its gigantic, heavily-consuming home market, would lead and lead immeasurably, to the detriment of its manufacturers, merchants, farmers and wage-earners alike. Expressed in round millions the exporting and importing rank of each nation in the world, with the share of the United States therein, is shown to be as follows, quoting the Statistical Abstract of the United States, 1909:

WORLD'S SILK INDUSTRY

Except for some trifling fractions of value the Statistical Abstract shows that America is not doing business either way with Bulgaria, French East Indies, Siam, Servia, Persia, Paraguay, Rumania, Korea, the German colonies or Bolivia. The American trade with Norway is included in the figures for Sweden, and that with Finland forms part of the small totals of our exports to and our imports from that empire. The total commerce of the United States with Russia was only \$14,000,000 of her \$697,000,000 total foreign commerce, while with Japan we did \$62,000,000 (four and one half times as much as with Russia), of her \$774,000,000 total foreign trade. In other words, the United States did not share in \$683,000,000 Russian business, while Japan did only \$212,000,000 outside of us. That is more than three to one in favor of Japan in its prospective value tons as buyer and seller. See **COMMERCE**.

World's Silk Industry, The. The French French silk experts estimate the production of raw silk in the world at 70,000,000 pounds, with a valuation of \$475,000,000 annually in finished goods. At best, however, the estimates are arbitrary, on account of the inability of the best informed to determine with accuracy the raw silk production in the Oriental countries. In Asia, as in Europe, the coarser and inferior silks are kept at home; America, which is now the largest purchasing silk market in the world, uses only the finest and best. What may be called "country silk" is reeled in households and by primitive methods and is suited only for hand-loom and the cheapest labor and the cheapest fabrics. The silk production of China, Japan, India, Tonquin, and Annam is estimated as 32,000,000 pounds. Possibly one half of this may not improperly be classed as "country silk." A percentage of "country silk" is also raised and used in Italy, the Caucasus, Brutia, Syria, Persia, and Turkestan. It is only in the countries where labor is low-priced that these inferior silks can be manipulated to advantage in the manufacturing processes. By "country silk" is meant raw silk not usually classed as suitable for export, and though some of it is shipped to Europe for manufacturing the cheapest grades of silk, it cuts no figure in the American market.

France.—Power loom weaving was not introduced in France until after the successful experiments in Switzerland. The beginning of the precedence of Lyons was first attained in the 16th century. By that time the industry had concentrated there. Earlier silk-making had flourished at Avignon under the patronage of the popes; then the manufacture was divided and was equally recognized at Tours (1480), Paris, Nîmes, and Lyons (1520); finally the latter place drew to itself the chief importance. Here were used the best Italian and Spanish raw silks, and soon the large purchases made by Germany and the Netherlands gave great impetus to the industry in France. Lyons gained in prosperity over the other French towns, because, for one reason, it was exceptionally well favored by its geographical position. The four annual fairs held at Lyons drew people from remote distances, merchants, manufacturers, travelers, and Italians who established themselves there in silk-weaving colonies. In 1600 the town had a couple of thousand looms. Before the Edict of Nantes (1685) there were 18,000 looms. From 5,000 in 1701 the number increased to

15,000 in 1785. Later came the Revolution and the looms decreased again to about 5,000. Then the times mended, and France and Lyons began slowly to recover their prestige in the manufacture of silk. A count in 1873 showed 110,000 hand looms at Lyons and the country within a radius of 40 miles. In 1887 the increase had resulted in 145,000 looms; and the product, 400,000,000 francs or \$80,000,000, represented two thirds of the output of France. The remaining third was divided between Saint Etienne, Saint Chamond (the ribbon centres), Paris, Nîmes, Tours, and Calais. The year 1865 is fixed as the apogee of prosperity at Lyons. Previous to that period there had been a great and constant demand from the United States. As soon as Switzerland, Germany, and the United States began to make some distinctive showing in silk manufacture, it was understood in France that competition had arisen to reduce the cost of the production. Progress in the construction of machinery permitted these countries to produce equally well similar goods, and destroyed the personal superiority of the workman. Customs barriers were also raised against the Lyons trade. Fashion, giving vogue to low-priced goods that could easily be produced, moreover, paralyzed a portion of the Lyons manufacture. It is enumerated that it became essential to produce "stuffs the most simple" and also goods mixed with cotton and woolen. Dyeing in the piece was undertaken. Tulle and crepe had been the only products woven in the raw. During the 30 years though, from 1870 to 1900, every kind of plain and figured weave was tried in France in raw silk. The art of the dyer and finisher, it is asserted, was carried forward to perfection. The power loom was also introduced; and a low price in production was sought in the delicacy of the raw silk used, together with the rapidity of the loom. The number of power or "mechanical looms" in 1873 was only 7,000; but in seven years these increased to 20,000. In 1894 they numbered 25,000 and in 1900, 30,638. The production of mixed silks, which was about 30,000,000 francs before 1870, rose to 60,000,000 in 1878, to 160,000,000 in 1890. It is pointed out that the manufacturers at Lyons, with an extraordinary suppleness, equaled by the rapidity of execution the mobility of the fashions. They passed from plain to figured goods, from the costly to the low-priced, from all silk weaves to silk mixed with cotton and wool. These articles varied without limit, taffetas, satins, velvets, plushes, poplins, foulards, laces, silks for linings, umbrellas, figured silks for upholstery, and passementeries. One of the secrets of strength, it is said, was in the division of labor. Every manufacturer, and all the succession of operatives whom they employed, concentrated their attention on one species of weave and stuck to it with the best results.

From the very beginning of 1861, when the silk duties in England were removed by its free trade policy, the French silk manufacturers greatly profited by sending their goods in large consignments across the Channel. English consumers were seduced by the novelty of the goods, and were influenced by the Parisian modes.

France, with its competitors, has the advantage of getting its inspiration from the world.

WORLD'S SILK INDUSTRY

It sends its products to every market in Europe, to Asia, Africa, and America. Its success is displayed by the figures of exportation of silks which fluctuate between 250,000,000 and 350,000,000 francs, according to the price of silk in the raw and following the nature, low or advanced, of the goods required for consumption. France absorbs a great part of the silk raised by Asia for the commerce of the West. In 1890 it employed 4,500,000 kilograms of raw silk and 800,000 kilograms of waste silk. In 1900 its consumption of raw silk was 400,000 kilograms less. Following are the figures of the Lyons production, and the exports and imports for all France in 1900:

amounted in value to \$20,000,000 annually. Half of this output was taken by the continent. At Crefeld, where, in 1883, there were 39,463 hand looms and 1,467 power looms, the manufacture is more varied. About half the looms in those days, though, were devoted to velvets and plushes. Cotton played a great part in the manufacture. It was estimated that Crefeld made use of 2,200,000 pounds of cotton, 8,000,000 pounds of schappe or spun silk, and 8,800,000 pounds of reeled silk. The growing industry in the United States in the manufacture of velvets has decreased the output at Crefeld very noticeably in the last few years. From one half to two thirds of all the silk goods manufactured

Value of franc in United States currency 19.3 cents.

The exports of silk goods from France have greatly fallen off since 1870. In that year they were 134,352,872 francs, to the United States alone, and to all countries 485,093,505 francs. In 1870 France exported plain silk dress goods alone to the value of over 350,000,000 francs.

Additional silk production in France in 1900 amounted to 85,000,000 francs, ribbons at St. Etienne, and 110,000,000 francs, laces and novelties at Calais, Le Nord and Paris.

Germany is next in importance to France in silk manufacture in Europe. The silk industry was established in Germany first at Berlin. The workmen were French, going from France about 1685. After 20 years, however, there were not more than 1,000 looms. Later, in order to take advantage of the cheap labor offered elsewhere, the Berlin manufacturers went to Crefeld, Elberfeld, Barmen, Weiser, and Ronsdorf. These places became the centres of the industry. They began to make a specialty first of velvets and next of ribbons and piece goods of mixed materials. The total of the looms in 1844 was estimated to be 25,000. After a decade the increase made them number about 42,000. In 1873 they counted 87,000. The product in 1844 amounted to about \$18,000,000, or 72,000,000 marks. That value had been raised in 1873 to 180,000,000 marks, or \$45,000,000. Three fifths of the product was then in velvets and plushes. When 15 more years had come and gone there were in 1887, at Elberfeld, Barmen, Ronsdorf, and the Grand Duchy of Baden 30,000 looms, making goods, chiefly ribbons, for export that

at Crefeld, of whatever sort, are for export, chiefly to England and the United States. The loom equipment in 1901 at that manufacturing centre was 11,939 power looms and 6,293 hand looms. The table on the following page gives the figures of silk production (piece goods and velvets) in Crefeld, and the exports and imports for all Germany in 1900.

Switzerland.—In Switzerland, the first silk power loom weaving on the continent on the factory system was inaugurated by the Schwarzenbachs at Adliswil. It was in 1860 that the industrial experiment was successfully tried by waterpower. The enterprise of the Schwarzenbachs finally enlarged the plant, but there are many difficulties in introducing new methods in silk weaving. It will be remembered that Vaucanson was set upon by rival weavers at Lyons in 1744, and soundly beaten for his temerity in introducing a new system of weaving. Among the familiar difficulties that formerly had to be overcome in the successful introduction of labor saving mechanisms may be mentioned: (1) The natural or inherent prejudice by the "operative-

Value of mark in United States currency 23.8 cents.

In southern Germany there are 3,692 power looms, which, being operated by Swiss ownership, are commercially known as "Swiss Production." The value of this production in 1900 was 17,600,000 marks. There are also a number of silk establishments making gloves, knit goods, laces and passementerie in Saxony, and umbrella silks in other parts of Germany, concerning whose statistics and production no reliable information is available. The silk ribbon industry at Elberfeld and Barmen is likewise for the same reason not included in foregoing figures.

class against any and all new systems. (2) The natural longing in favor of the old ways or customs. (3) The slow advance in educating operatives. (4) The unwillingness of operatives to favor a factory system, which through systematized control and discipline enables the same operative to work a far less number of hours and for better pay than was possible under the individual or independent system. These prejudices were very strong 40 years ago in all countries. In England the male operatives rose *en masse* against the introduction of steam power in the mills and factories. On the continent no woman could withstand the opprobrium of being called a "factory girl." Even in progressive Switzerland progress was at first very slow in familiarizing the population with the new method of weaving. Switzerland depends considerably on America for a market. Like the industry in Germany, the silk making in Switzerland is the result of a few looms scattered here and there in the country at the end of the 18th century. The operatives combined agriculture with weaving. The centres of the production finally became Zürich and Basel, the latter devoted to ribbons. In 1811, Zürich possessed 7,000 looms, producing silks valued at \$1,000,000; in 1830, the return was 9,000 looms; in 1839, 15,000; in 1855 the number of looms had

risen to 25,000; in 1872, to 27,000; in 1883, about 30,000 were scattered in the canton of Zürich and the neighboring cantons of Zug, Schwyz, and Unterwalden. Thereafter the number of hand looms began to decrease, and the number of power or mechanical looms to increase. There were in 1871 only 920 mechanical looms; but that number was increased in 1881 to 3,151, and to 4,129 in 1885. Since then the progress has been constant. In 1891 they numbered 7,173, in 1895, 9,609, and in 1900, 13,326. Of this number 11,163 were employed on plain and twilled weaves, 2,133 on Jacquard weaves, and 30 were velvet looms. There were also 8,563 power looms in factories beyond the Swiss frontier, but working for Swiss firms. The number of hand looms in Switzerland had decreased in 1900 to 19,544, and 2,300 additional were in factories beyond the Swiss frontier, but working for Swiss firms. A total of 46,619 persons were employed in 1900, 24,816 being employed in the hand-weaving branch (but many of these do not weave during the summer months), and 15,475 in the power-weaving branch. About 4,000 persons are employed in the throwing mills, 2,000 in silk dyeing, 322 in silk finishing and 43 in "conditioning" houses. The raw materials consumed in 1900 were 2,566,379 pounds of raw silk, 26,506 pounds of

WORLD'S SILK INDUSTRY

"schappe" or spun silk, 920,233 pounds of cotton yarns, and 8,085 pounds of wool and other yarns.

In 1900 the exportation of silk piece goods from Switzerland was \$20,000,000. The consumers are the English, French, Americans, and Germans; about \$730,000 worth goes to Austria. Belgium and Holland together take \$650,000. At Basel the production of ribbons amounted in value in 1846 to 20,000,000 francs; in 1857, to 45,000,000; in 1862, 31,000,000; in 1872, to 65,000,000, or \$13,000,000. Later the production presented considerable variation, and the fall was often to 30,000,000 francs a year, due to the growth of the manufacture of ribbons in the United States. But the annual production in Switzerland of broad goods, ribbons, and laces reached a value in 1900 of about \$38,000,000. The exports of silk piece goods from Switzerland have shown a constant increase since 1890, with the exception of 1893-4, which was a bad year for the silk industry in all countries. The increase in the exports since 1890 has been 37 per cent. Swiss silk manufacturers concede that 95 per cent of their production is for export. The following table shows in detail the production, exports, and imports of silk piece goods in 1900:

Genoa; and at Turin the manufacture includes a variety of goods. Sicily is devoted chiefly to the manufacture of ribbons. At the beginning of the 17th century there were several weaving shops as well as a few velvet looms in Como, but it took about 150 years more before there was an improvement worth mentioning in the silk industry. In the province of Como alone in 1900 there were 32 manufacturers with 3,965 power looms; in the province of Milan, 7 manufacturers with 3,360 power looms, and in other provinces of northern Italy 5 manufacturers with 795 power looms. The total Italian output annually was reckoned in 1901 the equivalent of about \$14,000,000, the loom equipment of Italy being 8,400 power looms and 11,000 hand looms. The indicated imports and exports of silk piece goods, etc., in 1901, are shown on the following page. The value of the exports average \$6.00 per pound, and the value of the imports \$7.00 per pound. The exports of silk fabrics from Italy to Great Britain have greatly increased in recent years, having more than doubled since 1897, and quadrupled in quantity since 1895. It is evident likewise that the Italians are able to manufacture more successfully, as their silk goods exports to all countries were

Value of franc in United States currency 19.3 cents.
At Basel, in addition, about 80,000,000 francs worth of ribbons are now produced annually, Great Britain being the largest consumer.

Italy.—It is estimated that Italy now employs about 1,500,000 persons in her sericulture. The average yield of raw silk is about 10,000,000 pounds reeled from Italian cocoons, and another 2,000,000 pounds adding the reeling of imported cocoons. The value of the silk crop at the prices of the past few years averages \$45,000,000 to \$50,000,000. About 80 per cent of the output is exported to supply the silk manufacturers of France, Switzerland, Germany, Russia, England, and the United States, the remainder being consumed in the silk industry at home. In Italy, once the land of the gorgeous velvets of Genoa, the damasks and brocades of mediæval Sicily, Venice, and Florence, the centre now is at Como. Velvets are still made, however, in

165 per cent greater in quantity in 1901 than in 1895, and but 150 per cent greater in value.

Great Britain.—The earliest historical notice known to us of the silk manufacture in England is contained in an Act of Parliament passed in 1363, during the reign of Edward III., making exception to certain restrictions named in the act against merchants, shopkeepers, and manufacturers in favor of certain employments, silk being one of the number. In 1454, during the reign of Henry VI. a law was passed protecting the silk women of London against the importation of narrow silk fabrics, such as ribbons, fringes, trimmings, and embroideries. In 1463 a further act prohibited the importation of laces, ribbons, silk, fringes, and similar goods.

Value of franc and lira in United States currency, 19.3 cents.
There is a considerable interchange of silk (thrown and raw weaves), from Italy to France, Switzerland and Germany, to be dyed and finished and returned again.

The weaving of plain and figured silks is attributed to the Flemish, who settled in the country in the 16th century. The silk industry of England was greatly benefited by the revocation of the Edict of Nantes, it being estimated that 70,000 Huguenots, many of whom had been engaged in the fabrication of silks in France, sought refuge in England. There was a time, during the first half of the 19th century, when England gave every promise of becoming a very formidable rival of the silk industry in France. About 1800, the annual consumption of raw and thrown silk in England was given as 900,000 pounds, says an English writer in the 'National Review,' evidently thoroughly familiar with the facts he discusses. This quantity had increased in 1812 to 1,110,000 pounds; and by 1823 had doubled that amount. Coventry then had 7,000 working looms; Leek, 300 or 400; London, 24,000 hand looms; Macclesfield, 5,000; and Manchester probably 20,000. But internal dissensions began; disputes between weavers and masters were followed by strikes and consequent distress. The supply of silk goods was inadequate, and the demand led to wholesale smuggling. In 1826 the duties on raw and thrown silk were greatly reduced and

foreign silks were allowed to be imported at an ad valorem duty of 30 per cent. Affairs were more prosperous for awhile. The imports of raw silk rose steadily from 22,741 bales in 1830 to 112,757 bales in 1857. Meantime, in 1846, the duties on imported silk fabrics were still further reduced to 15 per cent, and the duties on raw and thrown silk were abolished. In 1852, agitation had begun for the repeal of the duties on French silks; and 27 of the silk firms of Manchester and the neighborhood memorialized the government to repeal "not partially and gradually" but "totally and immediately" the duties. Those manufacturers were prepared to meet the consequences whatever they might be; and they maintained that they were fully equal to the competition which would ensue. "Those 27 firms," the writer declares from whom these statements are taken, "have gone one and all out of existence, and from 1860, when the duties were wholly removed, the silk trade of England has suffered a painful decline. Instead of 24,000 looms in London there may be now (in 1894) 1,200; instead of 60,000 operatives, there are something under 4,000; and these figures express also the state of the trade at Manchester and Middleton combined. In 1845 there were

WORLD'S SILK INDUSTRY

850 looms in Derby; now there are 150. In 1860 there were 8,886 ribbon looms in Coventry; now there are less than 1,500. In 1851 the population of Coventry was 86,801; in 1881 it was 46,000. At Macclesfield from 1841 to 1851 there were 5,000 to 6,000 looms, which number in 30 years was reduced by one half. In Congleton in 1859 there were 40 silk throwsters, and now there are less than a dozen. This decline in manufactures is only too well corroborated by the decline in the imports of raw silk for manufacturing purposes.* The total valuation of the annual import of manufactured silk from European countries in 1853 was £2,000,000, and in 1854 £2,225,000, the supply being chiefly from France. After the duty was removed by the Cobden Free Trade Act of 1860 the import rose in 1861 to £6,000,000, and in 1863 to £6,639,115. Ten years later it stood at £10,065,378. In 1894 the total value of imported silk goods footed up to over £12,000,000. In 1899 it had reached £16,109,583. The Cobden Act dispersed the silk makers of England. Very many came to the United States. They came from Spitalfields, Coventry, Macclesfield, and Manchester. During 15 years the English manufacture sustained vigorously the struggle in spite of the constant encroachment of the importation. For France alone the importation of silks, which under the regime of prohibition was valued at 5,000,000 francs, and in 1832 represented 35,000,000, next attained more than 100,000,000. During the Franco-Prussian war in 1870 the English manufacturers made some slight headway, which was lost again in 1873. Although societies have been organized, technical schools opened, and all sorts of concerted efforts are still making to get back the lost industry, no headway has thus far been observed in undoing the damage inflicted by the free trade triumph. In 1902 England appears as the greatest consumer of French silks of any foreign country. The statistics of the industry are as follows:

GREAT BRITAIN.

Number of persons employed in the silk industry decennially, from 1851 to 1901.

Year	Males	Females	Total
1851	53,936	76,787	130,723
1861	43,732	72,588	116,320
1866	39,225	53,738	82,963
1871	22,205	42,630	64,835
1891	10,098	26,937	39,035

Silk dyers, machinists, and many others whose trade depends on silk are not included in these returns, or the numbers would be much larger.

GREAT BRITAIN.

Comparative table of Board of Trade returns for imports of raw, thrown and waste silk, and manufactured silk goods—1858-60 and 1900-3.

Imports		1858	1859	1860
Raw (lbs.)		6,277,576	9,030,891	9,176,647
Thrown (lbs.)		358,269	327,462	224,335
Waste (cwts.)		16,765	20,808	17,435
Goods (value)		£2,111,819	£2,655,357	£3,246,119

	1900	1901	1902	1903
Raw (lbs.)	1,413,320	1,322,840	1,252,848	†1,109,930
Thrown and spun	664,641	624,059	302,964	662,677
Waste (cwts.)	60,720	48,162	53,732	66,782
Goods (value)	£14,281,250	£12,030,321	£12,416,400	£12,663,771

*There were probably no imports of spun silk at this date.
†Lowest import of raw silk since 1816.

The annual production of silk goods in Great Britain now is estimated to be about £3,000,000 or \$15,000,000. To illustrate in part the exchange of silk fabrics between the principal silk manufacturing countries of the continent and England in 1900 the following tabulation is presented:

Great Britain, imports from	1900	Great Britain, exports to
115,111,000 fcs.	France	10,262,000 fcs.
48,426,162 fcs.	Switzerland	not known
41,127,000 fcs.	Germany	2,464,800
*26,989,620 fcs.	Italy	not known
231,653,782 fcs.		

*Value estimated. The reported quantity is 385,566 kilograms of fabrics.

The value of Great Britain's export of dutiable silks, chiefly spun silk, to the United States in 1900 was \$2,534,946, and in 1903 \$1,864,001.

Austria-Hungary.—Seven eighths of the silk produced in Austria is for home consumption. The production in 1900 was 80,000,000 kronen, the exports 9,892,000 kronen, and the imports 25,990,000 kronen. Value of krone in United States currency, 20.3 cents.

Russia possesses modern silk establishments at Moscow, and the annual output of the empire (in Europe) is about \$21,000,000 in value. A special feature is the weaving of gold and silver tissues, together with brocades, for sacerdotal use and for traffic with Central Asia.

Spain produces silk goods valued at \$4,000,000 on an average. The establishments are in Barcelona, Valencia, and Grenada.

Portugal, Belgium, and Sweden, each and severally, produce a few silk goods. The total values of their products present, however, no consideration of evident importance in the world's production.

Asia and the East.—Like much else in the region of the most remote civilization, silk fabrication is left to please the imagination with its history and its modern condition. With the Turk in particular, both in Europe and in Asia, the manufactured product of silk appears to be quite an unknown quantity. He uses most of it himself. His looms are primitive and the designs are very oriental. It is not easy to estimate the amount of silk goods produced. There are no statistics given under official authority which can be obtained. The annual imports of silk fabrics are about \$3,000,000. The domestic production is possibly one half that amount.

India.—The silk industry of India is known chiefly by the foulards, or corahs, sent to Eu-

WORLD'S SILK INDUSTRY

rope. Benares and its district form the most important centre of the manufacture, though silk is made in nearly all the provinces of India. The industry is largely for domestic consumption; and, it should be added, less goods are produced at a low price than formerly, because the population has adopted the use of cottons and woollens made in England. Silks have become more exclusively for the rich. The manufacture in India of silk mixed with other stuffs is said to be considerable.

In British India great attention has been given in recent years to raising native or Tussah silk. The most improved reeling processes and highly skilled reellers are employed, but the ex-

port output cuts no commercial figure of importance at this writing outside of about 600,000 pounds annually to England, France, and Italy.

China.—In all the villages of the great empire there are dense populations composed of artisans and agricultural laborers. With these the weaving of silk in the household has been practised from generation to generation. No official statistics are collected of their products. In 1883 it was estimated that the number of looms should be at least reckoned at 350,000, and the product at 300,000,000 francs, or \$60,000,000. The exports include taffetas, foulards, satins, serges, and crepes; but it was reported, after the sacking of the summer palace

WORM-EATING WARBLER—WORMELEY

of the emperor during the war in 1894, that the Chinese manufacture of silks and velvets was displayed in a way not familiar to the European. The best of everything had been retained within the empire. It was estimated in 1902, that the Chinese silk industry consumes annually about 18,600,000 pounds of raw silk, or say 55 per cent of the estimated production by China. This estimate would indicate a probable annual value of production of silk stuffs in China of \$70,000,000 or upward.

Japan.—In Japan silk factories are established in many provinces. The greatest number are in Kioto, in the province of Yamashiro, notable for taffetas, brocades, and crepes. Next in rank is Kiriu in the province of Joshu, Gunma prefecture. Published statistics in 1900 stated that there were 382,000 hand looms employed in the several textile industries in Japan. Among these, though details are not given, it was estimated the silk looms numbered 40,000. Half of the output was attributed to Kioto, and one quarter to Kiriu. Like Italy, Japan devotes more attention to raising silk than to manufacturing the raw product. In December 1902 an estimate placed the production of Japan at 16,093,580 pounds, and the domestic consumption at 6,613,800 pounds, or say 41 per cent of the production. According to the returns of the Department of Agriculture and Commerce of Japan in 1903, the raw silk production of Japan in 1902 was 10,940,169 kin (1,3225 pounds), say 14,468,373 pounds. The amount reported as exported was 8,697,706 kin, showing a domestic consumption of say 3,000,000 pounds in that year. Undoubtedly there is a considerable quantity of waste silk entering into the production of silk tissues in Japan, for the reported production of silk tissues in 1902 amounts to 76,941,003 yen, say \$38,316,619. The output of production of silk tissues in the four largest weaving dis-

tricts amounted in 1902 to \$23,591,880. The exports of silk tissues in the same year amounted to \$15,627,653. We must therefore conclude that the reported production of raw silk, and of noshi waste, etc., are understated in the accompanying official reports, for the reason that the actual production is beyond the reach of the statistical authorities of Japan. The latest returns regarding the silk trade of Japan, production, exports, and imports, are appended.

See SILK, MANUFACTURE OF.

FRANKLIN ALLEN, C. P. A.,
Secretary Silk Association of America.

Worm-eating Warbler, a small, ground-keeping warbler (q.v.) of the United States (*Helmitheros vermivorus*), breeding commonly in the woods of the eastern part, and migrating in winter to Central America. It is $5\frac{1}{2}$ inches long, olive-green above, yellowish-white below, the distinguishing specific mark being three black stripes on the buffy crown. Its song is a faint thrill, heard most often in hilly woodlands, where the bird hunts for caterpillars and similar food among the lower branches of the bushes or upon the ground. Its nest is constructed with great skill in some little natural cavity of a hillside, and is cleverly hidden under an arch of twigs and old leaves, so disposed as to well conceal the white, red-speckled eggs. The mother uses the trick common to so many ground-building birds, of feigning lameness, fluttering ahead of the intruder in a frantic attempt to draw him away from the nesting-place in vain pursuit of herself.

Worm-seed, the flower-heads of certain species of *Artemisia* (q.v.) used as a vermifuge. See also ERYSIMUM; GOOSEFOOT.

Worm-shell, one of the curiously uncoiled and distorted gastropod mollusks of the marine family *Vermetidae*, whose shells might easily be mistaken for the tubes of annelids, such as *Serpula*. They are free and spiral in early life, and crawl about like ordinary gastropods, but they afterward settle down and become attached to stones, etc., for the remainder of their lives. The animals are worm-like, with a short proboscis, horny jaws and radula, and two short tentacles. When they become stationary the foot, being of no further use as a locomotive organ, becomes modified into an organ of attachment, and the shell stretches out irregularly. The species are not numerous and occur mainly within the tropics.

Wormeley, werm'li, Katharine Prescott, American author and translator; b. Ipswich, England, 14 Jan. 1830; d. 4 Aug. 1908. She was the daughter of an English rear admiral and a niece of Commodore Edward Preble of the American navy, and came to the United States in girlhood. She was engaged in the relief of Union soldiers during the Civil War and was connected with the United States Sanitary Commission. She was widely known as a translator of Honoré de Balzac's novels in 40 volumes (1883-97); of Molière in 6 vols. (1892); and of the Duc de Saint-Simon's 'Memoirs' (1898-1901); and wrote 'Letters from Headquarters during the Peninsular Campaign' (1862); 'The Other Side of War' (1888); 'Life of Balzac'; 'The United States Sanitary Commis'n' (1863).

SUMMARY OF WORLD'S PRODUCTION AND CONSUMPTION OF RAW SILK FOR THE YEAR 1902:

COUNTRIES	Production Pounds	Consumption Pounds
Europe —France	1,543,220	8,618,400
Italy	9,726,695	2,204,600
Switzerland	110,230	3,417,130
Spain	180,777	440,900
Austria	449,736	1,598,335
Hungary	233,529
Russia and Caucasia	881,840	3,086,440
Bulgaria, Servia, Rumania	194,005
Greece and Crete	133,276	33,069
Salonica, Adriatic	440,920
Germany	6,172,880
England	1,763,680
Asia —United States	10,802,540
Brutia	881,840	110,230

WORMS—WORT

Worms, vörms, Germany, a town of Hesse-Darmstadt, on the Rhine, nine miles northwest of Mannheim. The town is irregularly built and has remains of its mediæval walls and ramparts. Its principal building is the cathedral, completed and consecrated in 1101, a noble Romanesque structure with four elegant towers, two domes, a double choir, and a flamboyant 15th century Gothic portal. The interior is 357 feet long, 87 feet wide, across the transepts 117 feet, and is very imposing from its grand simplicity. On the north side of the cathedral is the site of the Bischofshof or episcopal palace, the seat of the celebrated Diet of Worms in April 1521. It was destroyed by the French in 1689, and again in 1794. On its massive red sandstone substructure the Heil'sche Haus has been erected in the rich Renaissance style. The restored church of Saint Martin, and the Church of Saint Paul secularized as a museum, are also of notable ecclesiastical architecture. Outside the town stands the Liebfrauenkirche (dating from the 15th century), which gives its name to the Liebfrauenmilch, a much-esteemed wine grown in the vicinity. The finest monument in Worms is that to Luther, erected from Rietschel's designs in 1868 at a cost of \$85,000. Worms is a considerable river port with a good harbor and an active shipping trade. The principal industries of Worms are the manufacture of patent leather, tobacco, beer, soap, and amber wares. Worms is one of the most historical towns of Germany. It was known to the Romans as Borbetomagus, and later as Augusta Vangionum, the capital of the Vangiones. It was destroyed by Attila and rebuilt by Chlodwig in 486. After the partition of the empire among the sons of Ludwig the Pious, Worms became a German free town under the protection of the Elector of the Palatinate. Already in 1255 it belonged to the Confederation of Rhenish towns, and it contained in the time of Frederick Barbarossa 70,000 inhabitants. It was the seat of many Imperial Diets, most famous that under Karl V., which Luther made memorable to the world. In 1632 the suburbs of the town were leveled by the Swedish Colonel Haubold, and in 1689 the town itself was ruthlessly destroyed by Melac and the young Duc de Créquy under the orders of Louis XIV. In September 1792 part of it was leveled by the French under Custine; at the peace of Lunéville in 1801 it was given to France. The peace of Paris in 1814 gave it back to Germany, and the Vienna Congress in 1815 to Hesse-Darmstadt.

Worms, any of many elongated jointed animals; the term has no more definite signification or limits than has Vermes (q.v.). Examples of what may most properly be called worms are earthworms, leeches, marine annelids, and the parasitic flatworms, roundworms, etc., especially such as infest the intestinal tract. These are described elsewhere, under their names. See also PARASITES.

Worm'wood, a perennial herb (*Artemisia absinthium*) of the order Compositæ. It is a native of Europe and northern Asia, whence it has been introduced into other countries by way of gardens in which it was formerly cultivated for domestic medicine. The plant grows about three feet tall, is spreading, bears silky, pinnatifid leaves and yellow flowers in heads

arranged in racemes. All parts of the plant are intensely bitter, on which account they, the leaves especially, have been used for flavoring drinks. Wormwood is cultivated to some extent for the manufacture of absinthe (q.v.), of which it forms one of the most important ingredients and which is named from it. See ARTEMISIA.

Wor'num, Ralph Nicholson, English art critic: b. Thornton, Northumberland, 29 Dec. 1812; d. Hampstead, Middlesex, 15 Sept. 1877. He was educated at University College, London, and between 1834 and 1839 studied painting and the fine arts in the principal continental cities. Having practised portrait painting for some years in London, he devoted himself principally to the literature of his profession. In 1848 was appointed lecturer on ornamental art in the government schools of design, and in 1852 librarian and keeper of casts in the department of art into which they were constituted. In 1855 he was made keeper and secretary of the National Gallery. He published 'History of Painting, Ancient and Modern' (1847); 'Epochs of Painting' (1860); 'Analysis of Ornament' (1856); 'Life and Works of Hans Holbein' (1867).

Woronsoff, vör'ön-zof, Michael Semenovitch, PRINCE, Russian statesman and general: b. Moscow 17 May 1782; d. Odessa 18 Nov. 1856. He was educated in England, where his father was Russian ambassador, entered the Russian army in 1801, served against the Turks, and distinguished himself in the war with France. He was severely wounded at Borodino and commanded the cavalry at the battle of Leipzig in October 1813. Ten years later he was named governor of New Russia and Bessarabia, and in 1844 governor of the Caucasus. He carried on the war with the mountain tribes, and took Shamyl's stronghold, Dargo, 18 July 1845.

Worship, the act of paying divine honors to the Supreme Being; or the reverence or homage paid to Him in religious exercises, consisting in adoration, confession, prayer, thanksgiving, and the like. The homage paid to idols or false gods by pagans; idolatry of inferiors. Obsequious or submissive respect; unbounded admiration; as, hero worship. Also a title used in Great Britain and some British colonies in addressing certain magistrates. See RELIGION.

Worsted, wust'éd or wúr'stéd, are varieties of woolen yarn or thread, spun from long-staple wool which has been combed, and which in the spinning is twisted harder than ordinary. It is knit or woven into stockings, carpets, etc. The name is derived from Worsted, a village in Norfolk, where it is supposed to have been first manufactured. See TEXTILE INDUSTRIES, AMERICAN.

Wort, the saccharine liquid obtained by the action of malt on a mixture of water and crushed barley, corn, or other grain, the whole being known as the "mash." The water extracts the maltose and dextrine from the malt and allows the diastase to act on the starch of the grain, changing it also to maltose and dextrine. The pectase of the malt at the same time changes the grain proteids to soluble peptones. Care must be taken of the temperature and the dilution of the mash in order to obtain the best results. Worts are of various kinds, depending

WORTH—WOTTON

on the grain used and the temperature given it. Some are fermented to beer, ale, porter, and like beverages, while other forms are fermented to a mash that is distilled for alcohol or whiskey.

Worth, wérth, Charles Frederick, Anglo-French dressmaker: b. Bourne, Lincolnshire, England, 1825; d. Paris 11 March 1895. Removing to Paris in 1846, he started there an establishment for the making of fashionable costumes. He was eminently successful as a designer and his establishment in the Rue de la Paix became the leading emporium of fashion for Europe and the United States, employing 1,200 persons.

Worth, William Jenkins, American general: b. Hudson County, N. Y., 1 March 1794; d. San Antonio, Texas, 7 May 1849. He received an ordinary education, and when the War of 1812 broke out enlisted as a private soldier, rising to the rank of captain in 1815. He was instructor of infantry tactics and commander of cadets at West Point 1820-8 and in 1838 became colonel of the 8th infantry. In 1840 he was sent to serve in the war against the Florida Indians, and in 1841 took the chief command. He was successful in repeated and severe conflicts with the savages, whereby the war was brought to a close, and in August 1842 was brevetted a brigadier-general for gallantry and distinguished services. In the war with Mexico, at the battle of Monterey 23 Sept. 1846, he bore a very important part. As it was impossible to communicate with the commander-in-chief, Worth was obliged to act independently throughout the battle. He carried the forts commanding his line of approach, stormed the bishop's palace, and had fought his way through the streets nearly to the great plaza, when the town capitulated to Taylor, approaching from the other side. For these achievements Worth was brevetted a major-general, and received a sword from Congress. He was also distinguished at Cerro Gordo, Puebla, Churubusco, Molino del Rey, and at the storming of the City of Mexico. A monument was erected to his memory by the city of New York, at the junction of 5th Avenue and Broadway, where his remains are interred.

Worth, William Scott, American general: b. Albany, N. Y., 6 Jan. 1840; d. Clifton, S. I., 16 Oct. 1904. Entering the Union army as 2d lieutenant in 1861, he became captain in 1866; lieutenant-colonel of the 13th infantry in 1894, and colonel in September 1898. He accompanied the army to Cuba, and during the assault on San Juan Hill, 1 July 1898, was severely wounded. He was promoted brigadier-general, U. S. A., in the following November, and was retired a week later.

Wörth, wért, Germany, a village in Alsace, at the confluence of the Sauerbach and Sulzbach rivers, 10 miles southwest of Weissenburg. It is celebrated as the place where the French on 6 Aug. 1870 met their first great defeat in the Franco-German war (q.v.).

Worthen, wér'then, William Ezra, American civil engineer: b. Amesbury, Mass., 14 March 1819; d. New York 2 April 1897. After graduation from Harvard in 1838, he began the practice of civil engineering, and until 1848 was employed chiefly with surveys connected with the Boston water-supply, and in other hydraulic works. He designed and constructed several

mills in Lowell, in 1849 began architectural work in New York, was made engineer of the New York & New Haven railway, and in 1854 its vice-president. After 1854 he was busily employed as a practising and consulting engineer, being frequently retained as an expert in matters relating to the planning, construction, or improvement of sewage and water systems. He was chief engineer of the first rapid transit commission of New York, and in 1890-1 chief engineer of the Chicago main drainage canal. In 1887 he was president of the American Society of Civil Engineers. Besides official reports, he published: 'Cyclopædia of Drawing' (1857); 'First Lessons in Mechanics' (1862); and 'Rudimentary Drawing for Schools' (1863).

Worthing, wér'thing, England, a watering-place in Sussex, 12 miles west of Brighton; with good streets, handsome terraces, crescents, and villas, splendid hotels, baths, smooth sands, a beautiful esplanade, libraries, a literary institution, reading-rooms, and assembly-rooms. Fruit-growing is an important industry of the town.

Worthington, wér'thing tón, George, American Protestant Episcopal bishop: b. Lenox, Mass., 14 Oct. 1840; d. Mentone, Fr. 7 June 1908. He was graduated from Hobart College in 1860 and from the General Theological Seminary in 1863. He was rector of St. John's Church, Detroit, 1868-85, and was consecrated bishop of Nebraska in 1885.

Worthington, Henry Rosalter, American inventor: b. New York 17 Dec. 1817; d. Tarrytown, N. Y., 17 Dec. 1880. In 1840 he began a series of experiments with steam for the propulsion of canal boats, soon afterward devised a small steam pump to be used in the maintenance of the water supply in the engine boiler, and in 1841 patented an independent feed pump which developed into the direct-acting steam pump that he patented in 1849. Subsequently he built in Savannah, Ga., the first direct-acting compound-engine ever used in waterworks; invented the duplex pump, and devised various improvements in steam and hydraulic machinery.

Worthington, Minn., village, county-seat of Nobles County; on the Burlington, C. R. & N. and the Chicago, M., St. P. & O. R.R.'s; nearly 100 miles northeast of Sioux City, Ia. It is in an agricultural section. It has flour mills, grain elevator, stock-yards, and machine shops. The three banks have a combined capital of \$125,000. The village has a high school established in 1883, and a public library. Pop. (1910) 2,385.

Wotton, wót'ón, Sir Henry, English diplomat and poet: b. Boughton Malherbe, Kent, 30 March 1568; d. Eton December 1639. He was educated at Oxford, and having studied civil law under an eminent Italian professor, became proficient in the Italian language. He visited all the principal countries of the Continent 1589-97, and on his return was secretary to the Earl of Essex. On the fall of that nobleman he went to Florence, where he composed a treatise, printed after his death, entitled 'The State of Christendom'. The Grand Duke of Tuscany having intercepted some letters disclosing a plot to take away the life of James, king of Scotland, engaged Wotton to carry secret intelligence of it to that prince. This service he ably per-

WOUFFE'S BOTTLE—WOUND

formed in the character of an Italian, and when James came to the English crown he sent for Wotton, knighted him, and in 1604 employed him as an ambassador to the Republic of Venice. As Wotton passed through Augsburg, being desired to write in an album, he wrote in Latin that "an ambassador is a good man, sent to lie abroad for the good of his country." This innocent sally was represented as a state maxim sanctioned by the religion of the king of England. James, who thought nothing relative either to king-craft or state-craft a subject for wit, was highly displeased; and on his return Wotton had to make humble apology. At length he recovered the royal favor, and was restored to his former post at Venice (1616-19). Other missions followed, and in 1624 he was made provost of Eton College. The first-fruits of his leisure were his 'Elements of Architecture.' A collection of miscellanies was published after his death entitled 'Reliquie Wottonianæ.' This collection includes several poems by Wotton, of which two, 'The Character of a Happy Life' and 'On His Mistress, the Queen of Bohemia,' are among the finest lyrics in the English language. Consult 'Lives' by Isaac Walton (1651) and A. W. Ward (1899).

Woulfe's Bottle, in chemistry, a bottle devised by a London chemist, Peter Woulfe (1806). It has two or more separate necks and is used by chemists when it is necessary to have more than one glass tube leading into or from the bottle.

Wound, in surgery, a solution of continuity of any tissue or soft part of the body. Wounds are divided by writers on surgery into several kinds, the distinctions being founded either upon the sort of weapon with which the injury has been inflicted; upon the circumstance of a venomous matter having been introduced into the part; or upon the nature of the wounded parts themselves, and the particular situation of the wound. Hence we have cuts, incisions, or incised wounds, which are produced by sharp-edged instruments, and are generally free from all contusion and laceration. The fibres and texture of the wounded part have suffered no other injury but their mere division; and there is, consequently, less tendency to inflammation, suppurating, gangrene, and other bad consequences than in the generality of other species of wounds. Another class of wounds are stabs, or punctured wounds, made by the thrusts of pointed weapons, as bayonets, lances, swords, daggers, etc., and also by the accidental and forcible introduction of considerable thorns, nails, etc., into the flesh. These wounds frequently penetrate to a great depth so as to injure large blood-vessels, viscera, and other organs of importance; and as they are generally inflicted with much violence the parts suffer more injury than what would result from their simple division. Many instruments by which punctured wounds are made increase in diameter from the point, and when they penetrate far they force the fibres asunder like a wedge, and cause serious stretching and contusion. Bayonet wounds of the very soft parts are ordinarily followed by violent inflammation, tumefaction, large abscesses, fever, delirium, etc. A third description of wounds are the contused and lacerated, which strictly comprehend, together with a variety of cases produced by the violent

application of hard, blunt, obtuse bodies to the soft parts, all those common injuries called gunshot wounds (q.v.). Many bites rank also as contused and lacerated wounds. In short, every solution of continuity which is suddenly produced in the soft parts by a blunt instrument or weapon which has neither a sharp point nor edge must be a contused, lacerated wound.

Poisoned wounds are those which are complicated with the introduction of a venomous matter or fluid into the part. Such are the stings and bites of a variety of insects, and the surgeon, in the dissection of putrid bodies, or in handling instruments infected with any venomous matter, is exposed to the danger of poisoned wounds from cuts. The most dangerous, however, of this class of wounds occur from the bites of the viper, the rattlesnake, etc., or from those of rabid animals. (See *HYDROPHOBIA*.) Wounds may likewise be universally referred to two other general classes, the simple and complicated. A wound is called simple when it occurs in a healthy subject, has been produced by a clean, sharp-edged instrument, and is unattended with any serious symptoms. A wound, on the contrary, is said to be complicated when the state of the system, of the wounded part, or the wound itself, indicates the necessity for more complex treatment than the simple reunion of the cut surfaces. The differences of complicated wounds must therefore be very numerous, as they depend upon many incidental circumstances, the principal of which, however, are hemorrhage, nervous symptoms, contusion, the unfavorable shape of the injury, the discharge or extravasation of certain fluids, indicating the injury of particular bowels or vessels, etc. All large or deep wounds are attended with more or less of symptomatic fever, which usually comes on at a period varying from 16 to 36 hours after the infliction of the injury, and is generally of the inflammatory, but sometimes of an asthenic character. The liability to gangrene is also a formidable danger to be guarded against in the treatment of complex wounds.

In incised wounds the first thing to be attended to is to stop the hemorrhage. This is usually accomplished by simply bringing the edges of the wound together; but if any of the larger blood-vessels have been injured, pressing the trunk by means of a bandage or tourniquet will be necessary; and should this not succeed, the vessels must be secured with ligatures. Next, care should be taken that all extraneous substances are removed from the wound. Then the edges of the wound are to be brought together, and retained either by straps of adhesive plaster, or in some situations by one or two stitches. Generally such wounds heal very quickly, without any suppurating, "by first intention." When, however, this is not the case, and suppurating comes on, all attempts to procure union by first intention should be abandoned, the plasters and bandages removed, poultices and warm dressings used to remove inflammation, and afterward healing ointment applied. Lacerated and contused wounds require to be similarly treated; but they heal less kindly, and suppurating almost always takes place. The swelling and inflammatory symptoms which commonly attend contused wounds are to be diminished by cooling lotions or emollient poultices. Punctured wounds are dangerous from their depth;

WOUWERMAN — WRANGEL

and the internal effusion of serum and blood which usually attends them. They are frequently also followed by severe inflammation and suppuration. The same general principles apply in this case, too. Sometimes it may be necessary to enlarge the wound a little, so as to remove the stretching of the parts, and to lessen the inflammation; leeches and fomentations are often required. In poisoned wounds free incisions, and even amputation may often be necessary.

Wouwerman, wow'vër-măn, Philips, a Dutch painter: b. Haarlem 1620; d. there 19 May 1668. He was instructed by his father, an indifferent artist, and by Wynants of Haarlem, in which city his life was passed. According to the commonly received account, his reputation as a painter during his life was small. After his death his pictures rose immensely in value, and he is now one of the most esteemed painters of the Dutch school. In consequence, it is said, of the disgust with which this neglect inspired him, he destroyed before his death all the studies he had made during his life, from fear that his son might be induced by the possession of them to become a painter. His subjects consist for the most part of roadside scenes and hunting or battle pieces, and it is commonly believed that he never painted a picture without a white or gray horse as a conspicuous object. His technical qualities are of a high order, and his skies, foregrounds, and foliage are executed in the best style of his school. He left upward of 800 carefully finished pictures. Those offered for sale always fetch high prices, and in 1892 his 'Halt of a Sporting Party' was sold for \$18,375. The best collection of his works is in the Royal Gallery of Dresden. There are also fine examples in the Louvre, and in Munich, Vienna, St. Petersburg, Amsterdam, The Hague, Rotterdam, etc.

Wrack, or **Sea-wrack**, a name applied to sea-weeds of various species, which, having been uprooted during storms, are carried to shore and there left by the tide. Wrack, when reduced to ashes, furnishes an alkali known as kelp, employed in the manufacture of glass and soap; it is now, however, little used for that purpose, having been supplanted by barilla (q.v.). The alkali of sea-weeds supplies the chemical substance iodine (q.v.). The salt contained in wrack makes it of value as a fertilizer, and it is largely gathered as such in some agricultural districts. From portions of the Japanese coast it is exported to the interior of China, where salt is not abundant.

Wrangel, vräng'ël, or **Wrangell**, Ferdinand Petrovitch, Baron, Russian naval officer and explorer: b. Livonia 9 Jan. 1795; d. Dorpat 6 June 1870. He studied at the Naval Academy, St. Petersburg, and in 1820-4 directed a Polar expedition to explore the coast of eastern Siberia and the region north of Asiatic Russia. By sledge-journeys undertaken in 1822 and 1823 he reached lat. 72° 3' N., but he found no trace of the reported land for which he was searching. This was discovered by G. W. De Long (q.v.) in 1867, and is now known as Wrangel Land (q.v.), though taken possession of for the United States as "New Columbia" by Hooper in 1881. In 1829-34 Wrangel was governor-general of Russian America, and in 1840-9 director of the Russian-American Company. He

attained vice-admiral's rank in the navy. In 1855-8 he was acting minister of marine, and subsequently a councillor of state. He opposed the sale of Russian America to the United States. His account of his Polar expedition appeared in Russian in 1841. An account in German was prepared from Wrangel's journals (1839), and of this an English translation was made by Sabine, 'Wrangell's Expedition to the Polar Sea' (1840). Consult Von Engelhardt, 'Ferdinand von Wrangel und seine Reise' (1885).

Wrangel, Friedrich Heinrich Ernst, Count, German soldier: b. Stettin 13 April 1784; d. Berlin 1 Nov. 1877. He became ensign in a Prussian regiment of dragoons in 1796, took part in the campaigns of defense against Napoleon, and rose to be successively colonel (1815), major-general (1823), and lieutenant-general (1838). At the outbreak of the war of 1848-50 with Denmark he was made general of cavalry and commander of the allied forces in Schleswig-Holstein. Victorious at Schleswig (23 April 1848), he entered Jutland, but withdrew in September from the chief command, and later quelled the insurrection in Berlin. In 1856 he was promoted field-marshal. He was appointed generalissimo in the war of 1864 with Denmark, but retired after the storming of the lines of Düppel (18 April).

Wrangel, Karl Gustaf von, Count, Swedish general: b. Skokloster, on Lake Maelar, 13 Dec. 1613; d. Isle of Rugen 24 June 1675. He accompanied Gustavus Adolphus in his expedition to Germany, and at the battle of Lützen, in 1632, rendered great services after the fall of the king. In 1641 he was one of the major-generals who commanded the Swedish forces until the arrival of Torstenson, and under him participated in the campaign in Germany, and the famous march to Holstein. After the death of Flemming in 1644 he received the supreme command of the Swedish fleet, and obtained over the Danish fleet a great naval victory on 13 October, between the islands of Femern and Laaland. In 1646 he succeeded Torstenson as commander-in-chief of the Swedish army, effected a junction at Giessen with the French forces under Turenne, with whom he crossed the Main and besieged Augsburg, which, however, was relieved by the Austrian army. In 1648 the Swedes and French defeated the Austrians and Bavarians near Zusmarshausen, but retired before the army of Piccolomini. Wrangel commanded under Charles X. in the campaigns in Poland (1655) and Denmark (1657-9), and in 1674 led an army of 16,000 men into the electorate of Brandenburg.

Wrangel (räng'gël) Land, or **New Columbia**, an island in lat. 71° N., and lon. 180° W.; in the Arctic Ocean; about 100 miles off the coast of Siberia and 300 miles from the coast of Alaska. It is about 75 miles long and 20 miles wide. It consists chiefly of bare rocks which rise to a height of 2,000 feet. At the base and in places near the shore line there is some vegetation. The first mention of an island in this locality was made about 1810, and in 1821 Ferdinand Baron Wrangel (q.v.), the Russian explorer, commanded an expedition in search of this land. Long, the American explorer, sighted the island in 1867, and Hooper, also an American, visited it in 1881, and took posses-

sion of it for the United States. He named the island New Columbia.

Wrangell, Alaska, village, on Wrangell Island, near the mouth of the Stikine River; about 170 miles southeast of Juneau, and 120 southeast of Sitka. A settlement was made here by Russians in 1833. It is a trading post for fish and furs. It has a hatchery, salmon canneries, and storehouses. It is a distributing centre for mining camps and interior trading post. Pop. about 900.

Wrangler, Senior, a term applied in the University of Cambridge, England, to the undergraduate who passes the best public mathematical examination for the bachelor's degree. The candidates for honors are arranged in order of merit in three lists or classes, of which the highest is called that of wranglers, the next that of senior optimes, and the lowest that of junior optimes—the whole constituting what is known as the mathematical tripos. Hence the senior wrangler, or the highest in the list of wranglers, is the most distinguished mathematician of the year.

Wrasse, a fish of the family *Labridæ* (q.v.).

Wrattislaw, rät's-lā, Arthur Henry, English scholar: b. England of Bohemian parentage about 1822; d. 1892. He was graduated from Cambridge in 1844, was headmaster of Felstead grammar school 1849-57, and of that at Bury St. Edmunds 1857-79, and was vicar of Manorbier, Pembrokeshire, Wales, 1879-87. He was the leading Slavonic scholar of his day in England, and among the important of his publications are: 'Lyro Czecho-Slavonska' (1849); 'The Queen's Court MSS. with Other Ancient Bohemian Poems' (1852); 'Life, Legend, and Canonization of St. John Nepomuk' (1873); 'Native Literature of Bohemia in the 14th Century' (1878); 'Sixty Folk Tales from Slavonic Sources' (1889).

Wraxall, rāk'sal, Sir Nathaniel William, English historian: b. Bristol 8 April 1751; d. Dover, Kent, 7 Nov. 1831. He was in the East Indian Civil Service 1769-72, and during the course of some seven years of foreign travel was a confidential agent of Queen Caroline Matilda of Denmark to her brother George III. (1774-5). He published 'Cursory Remarks Made in a Tour' (1775); 'Memoirs of the Valois Kings' (1777); 'History of France from Henry III. to Louis XIV.' (1795); 'Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna' (1799), and the famous 'Historical Memoirs of My Own Time, from 1772 to 1784' (1815). For a libel in the last on Count Woronzov, Russian envoy to England, Wraxall was fined \$2,500 and sentenced to six months' imprisonment. He is an amusing writer, but his veracity has been many times questioned. He sat in Parliament for 14 years from 1780 and was knighted in 1813. Consult his 'Posthumous Memoirs,' continued from 1784 to 1790 (1836).

Wray, John. See RAY, JOHN.

Wreck, the destruction of a ship by being driven ashore, dashed against rocks, foundered by stress of weather, or the like; shipwreck (q.v.).

Wreck of the Grosvenor, The, a story by William Clark Russell, published in 1874. This tale of the British merchant marine is notable among sea novels for its fidelity to the life por-

trayed. The chief value of the book lies in its dealing in a plain, straightforward manner, and without exaggeration, with some of the most glaring evils of the mercantile marine. Events like those recorded in its pages are familiar to every man who sailed the seas during the middle and even the latter part of the 19th century, and they show to what an extent the power given by the law may be abused when placed in the hands of ignorant and brutal officers. 'The Wreck of the Grosvenor' is said to have been a powerful factor in reforming the laws relating to the merchant seamen in Great Britain.

Wreckage, in navigation, is usually understood to mean any ship or goods driven ashore or found floating at sea in a deserted or unmanageable condition. In law, wreckage is defined as such articles of value as are cast upon land by the sea, and includes jetsam, flotsam, ligan, and derelict. In most countries any person found stealing or destroying any wreck is chargeable with felony; and a person proved to be in possession of shipwrecked goods, or who offers such goods for sale, may be fined or imprisoned.

Wrede, vrä'dé, Karl Philipp, Prince, Bavarian field-marshal: b. Heidelberg 29 April 1767; d. Ellingen, Bavaria, 12 Dec. 1838. He was educated at the University of Heidelberg in his 25th year, became assessor to the high court of Heidelberg, and on the outbreak of war between France and Austria civil commissary for the palatinate in the Austrian army. He not only discharged the functions of this office for five years, but took part in the military operations, and in 1795 became a colonel. On 3 Dec. 1800 he was engaged in the battle of Hohenlinden, where he had the rank of major-general, and after the battle covered the retreat of the defeated Austrian army. He was appointed to the chief command of all the Bavarian forces in the field in 1805, and in the campaign of that year, owing to the Franco-Bavarian alliance, fought on the side of his former foes. He participated in the battle of Wagram (6 July 1809), his services on this occasion being rewarded with the grade of field-marshal and the title of count. In 1812 he accompanied Napoleon in his fatal Russian campaign as commander of the Bavarian cavalry, and in October 1813, after Bavaria had been detached from the French alliance, at the head of 170,000 men, attempted to cut off the retreat of Napoleon, who had been defeated at Leipsic, but was defeated at Hanau. In 1816 he was created a prince, and the estate of Ellingen conferred upon him.

Wren, rēn, Sir Christopher, English architect: b. East Knoyle, Wiltshire, 20 Oct. 1632; d. Hampton Court, Berkshire, 25 Feb. 1723. He entered as a student at Wadham College, Oxford, in 1646, having previously given proofs of genius by the invention of astronomical and pneumatic instruments. In 1647 he wrote a treatise on spherical trigonometry upon a new plan, and the following year composed an algebraical tract on the Julian period. He was one of the earliest members of the Philosophical Society at Oxford, which was the origin of the Royal Society, after the institution of which, in 1663, he was elected a fellow, and distinguished himself by his activity in promoting the

objects of that institution. In 1657 he was appointed professor of astronomy at Gresham College, but, being nominated to the Savilian professorship of astronomy at Oxford, resigned the former office, and in 1661 returned to the university. He received a commission, in 1663, to prepare designs for the restoration of St. Paul's Cathedral, then the largest Gothic edifice in the kingdom. While his designs were under consideration the cathedral was destroyed by the fire of 1666, and Wren had now an opportunity for signalizing his talents by the erection of an entirely new structure. In 1668 he succeeded to the office of surveyor of works, resigned his Savilian professorship in 1673, in 1674 received the honor of knighthood; and in the following year the foundation of the new cathedral was laid. In 1680 he was chosen president of the Royal Society. In 1683 he was appointed architect and one of the commissioners of Chelsea College; and the following year controller of the works at Windsor Castle. He was elected member of Parliament for Plympton in 1685, and to his public trusts were added, in 1698, that of commissioner for the repair of Westminster Abbey, and, in 1699, that of architect of Greenwich Hospital. In 1700 he represented in Parliament the boroughs of Weymouth and Melcombe Regis. In 1708 he was made one of the commissioners for the erection of 50 new churches in and near the city of London. After having long been the highest ornament of his profession he was, in 1714, deprived of the surveyorship of the royal works from political motives. He was then in the 85th year of his life, the remainder of which was devoted to scientific pursuits and the study of the Scriptures. His remains were interred under the choir of St. Paul's Cathedral; and over the choir entrance was placed the following inscription (since removed to another part of the church):

Subtus conditor
Hujus Ecclesiae et Urbis Conditor,
Christ. Wren;
Qui vixit Annos ultra nonaginta,
Non sibi sed Remo publico.
Lector, si Monumentum quaeris,
Circumspice.

(Beneath is laid the builder of this church and city, who lived above ninety years, not for himself but for the public good. Reader, if thou seekest his monument, look around.)

The edifices constructed by Wren were principally public, including a royal hunting seat at Winchester, and the modern part of the palace at Hampton Court. Some of the most remarkable of his buildings, besides St. Paul's, are the monument on Fish Street Hill, the theatre at Oxford, the library at Trinity College, Cambridge; the hospitals of Chelsea and Greenwich; the church of St. Stephen's, Walbrook; those of St. Mary-le-Bow, St. Michael, Cornhill, and St. Bride, Fleet Street; and the great campanile of Christ Church, Oxford. The Royal Exchange and Custom-house, since destroyed by fire and re-erected, were among his works. As an architect he possessed an inexhaustible fertility of invention combined with good natural taste and profound knowledge of the principles of his art. His talents were particularly adapted to ecclesiastical architecture, but in his palaces and private houses he sometimes achieved monotonous results, as at Hampton Court. The interior of the church of St. Stephen's, Walbrook, which has been considered as his *chef-d'œuvre*, exhibits a deviation from common

forms equally ingenious and beautiful, and St. Paul's Cathedral may be fairly reckoned among the most magnificent productions of architectural genius. Yet the works of Wren have not passed without censure. Even in St. Paul's, while the grandeur of the whole work is admitted, many faults, and especially waste of interior space, are charged against him. Consult: 'Parentalia, or Memoirs of the Family of the Wrens' (1750); Elmes, 'Sir Christopher Wren and His Times' (1823); Clayton, 'Churches of Sir Christopher Wren' (1848); Milman, 'Annals of St. Paul's Cathedral' (1868); 'Life' by Phillimore (1883); Loftie, 'Inigo Jones and Wren' (1893); Marshall, 'Under the Dome of St. Paul's' (1899); Dimock, 'Handbook of St. Paul's Cathedral' (1900).

Wren, a family (*Troglodytidae*) of passerine birds, having a slender, slightly curved, and pointed bill, with the exposed nostrils partly concealed by a scale, the wings very short and rounded, with nine well developed and the first short primaries, the tail short, and often carried erect; the legs are robust and rather long. They are abundant in the neotropical region, less common in the nearctic, and only a few occur in the Old World in Europe, Asia, and Sumatra, those of the latter region being more or less aberrant. The known species exceed 100 and are arranged in about 15 genera, several of which are confined to tropical America. North America has six genera and 14 species. Closely related to the wrens are the mocking thrushes, which some ornithologists place in the same family, and the creepers (*Certhiidae*). The wrens are plain little birds usually clothed in modest browns and seldom exhibiting bright colors or very conspicuous markings. They are insectivorous and mostly migratory, though particular species may inhabit either warm or cold regions. Their haunts are mostly brush piles, tangled roots, stone walls and similar places, where they pry into every nook and cranny; they enter holes and reappear in another place in very mouse-like fashion; and are altogether very sprightly little creatures. Their songs are wonderfully loud and vehement for such small birds, but differ characteristically for each species. Although the nests vary greatly in their location, which is most often a hole of some sort, they are always more or less spherical in construction. Few passerine birds are more prolific, the eggs numbering from 5 to 10, and many of the species producing several broods.

Few birds are more familiar in the United States than the house-wren (*Troglodytes aëdon*). It is about five inches long. The color is very uniform, reddish brown above, barred with dusky, and pale fulvous white below. It often builds its nest near houses, and in boxes prepared for it or in any convenient hole. The nests are made to fill the boxes; and to effect this a large mass of heterogeneous materials is sometimes collected. From six to eight eggs constitute a brood and two or three broods are produced in a summer. The eggs are so thickly spotted with brown that they appear to be almost uniformly colored. The song is extremely rapid and vivacious as though the performer were overflowing with good spirits. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the bluebird and swallows, and taking possession of the boxes

WRESTLING—WRIGHT

which they have appropriated for their nests. It even attacks cats when they approach its nests and vigorously scolds all intruders.

The winter wren (*T. hyemalis*) is our smallest species of wren, only about four inches long, and the ridiculous little tail is usually cocked straight up into the air. Above, the color is a rich dark brown; below it is much lighter, both regions prettily barred. The typical form inhabits most of eastern North America, the Canadas, and northernmost United States during the summer and the rest during the winter. Except in the higher mountains, it is known in the New England and Middle States only in the latter season. It is a silent, secretive bird of the winter brush-heap and roadside, but withal bold and saucy and prone to state its opinion of intruders. The summer song is said to be powerful and musical, and the nest to be placed in a hole in a log or root near the ground. The eggs are white, spotted with reddish brown.

Of the genus *Citrothorus*, or marsh-wrens, we have three species, of which one (*C. meriame*) is a Florida form. See MARSH-WREN.

Thryothorus comprises the mocking wrens, of which *T. ludovicianus*, the great Carolina wren, is the best known Eastern species, and the largest of the wrens of this region. It is six inches long, of which the tail is $2\frac{1}{2}$ inches, about equaling the wings. It is nearly uniform bright reddish brown above with yellowish white under parts, a conspicuous white superciliary streak, and the wings and tail cross-banded with black. It lives east of the plains, but is more abundant South and scarcely gets northward beyond Pennsylvania, in which region, however, it is becoming more plentiful of late years. It inhabits deserted buildings, old mills, and shrubbery in secluded spots and builds its nest in crannies in such places, laying six or more white eggs speckled with various shades of brown. The loud clear whistled song is very characteristic and as this bird is scarcely migratory is heard in winter as well as summer in the neighborhood of Philadelphia. This bird also mimics the notes of others. Bewick's wren (*T. bewickii*) is a related species very abundant in the interior southward, while a number of other species and subspecies of the same genus are found in the West and Southwest. In the latter region also, as well as in Mexico and southward, occur several large wrens which have broad spreading tails composed of somewhat cuneate feathers. Among these are the cactus wrens (q.v.), which build purse-shaped nests in bushes in the desert regions of Texas, California, etc., and the rock-wrens and cañon-wrens (q.v.) which live and nest in rocky places. They have loud ringing songs. In Europe are several species of *Troglodytes*, of which the beloved common or jenny wren (*T. parvulus*) is found in all parts of Europe, and in Morocco and Algeria, and in Asia Minor and northern Persia. In central Asia it is represented by *T. pallidus*, in Iceland and the Faroes by *T. borealis*, and in Norway by *T. bergensis*. In England the vernacular name wren is also applied to various species of warblers, and elsewhere to other small birds.

Consult: Baird, Brewer, and Ridgway, 'Land Birds of North America' (Boston 1874); Sharpe, 'Catalogue Bird of the British Museum,' Vol. VI. (London 1881).

Wrestling, the most ancient form of athletic exercise, and at one time the favorite pastime of the Greeks. The Olympic Games (q.v.), the great festival of the Greeks, which were instituted for the exhibition of various trials of strength and skill, included races on foot, and with horses and chariots, contests in leaping, throwing, boxing, and wrestling. One of the great objects of the old classical wrestlers was to make every attack with elegance and grace under certain laws of a most intricate nature, and the game is described by Plutarch as the hardest working form of athletics. In Devon and Cornwall, England, wrestling on the catch-hold principle still finds favor. In Lancashire they adopt a catch-as-catch-can style; while in Cumberland and Westmoreland the ancient back-hold system continues to hold its own. In the United States and Australia, in Germany, France, and Japan, ground wrestling, which is the most objectionable of all known methods, is the most popular. This system has been dignified by the title of Græco-Roman wrestling. The Græco-Roman style is practically the same as the French method, and consists of a struggle on the ground till one or other of the combatants is compelled through sheer exhaustion to give in; indeed, such a contest is simply an exhibition of brute strength. On commencing, the wrestlers take hold from the head and not lower than the waist, when both roll on the ground, and then the actual struggle begins. Tripping, which is the very essence of the game, is not allowed; therefore weight and strength are the only factors in the contest, which terminates when one of the combatants has been placed on both shoulders. Wrestling has recently become popular in Japan and India. The Japanese have adopted the Græco-Roman style, and receive handsome rewards at the conclusion of their contests. The Jap wrestlers, who are a most formidable class of men, before entering the arena adorn themselves with a certain kind of paint, with a huge belt round the waist and their enormous calves encased in stout leggings. The Indians, on the other hand, wrestle in bathing costume, and in a match only contest one bout, and one shoulder on the ground is deemed a fall.

Wrexham, *reks'am*, North Wales, a market-town in the county of Denbigh, 12 miles south of Chester, in a district containing coal, lead, and iron. It is a station on the Great Western and Great Central railways, and has several churches and other places of worship, schools, guildhall, infirmary, barracks, market-halls, public baths, electricity-works, free library, etc. The restored parish church, dedicated to St. Giles, was erected in the reign of Henry VII. There are in the town large breweries, tanneries, etc.

Wright, *rit*, Albert Allen, American geologist: b. Oberlin, Ohio, 27 April 1846; d. there 2 April 1905. He was graduated from Oberlin College in 1865, in 1872 and 1882 was attached to the Ohio Geological Survey, and was professor of geology and zoology at Oberlin from 1874.

Wright, Arthur Williams, American physician: b. Lebanon, Conn., 8 Sept. 1836. He was graduated from Yale in 1859, studied law and was admitted to the bar, but did not practice, and was a tutor in Latin at Yale 1863-6, and

WRIGHT

in physics 1866-8. He afterward studied at Heidelberg and Berlin, was professor of physics and chemistry at Williams College 1869-72, of molecular physics and chemistry at Yale 1875-87 and of experimental physics there since 1887. From 1885 he has been in charge of the Sloane physical laboratory at Yale. He has published numerous professional papers, is a fellow of the Royal Astronomical Society of Great Britain and a member of various other learned societies.

Wright, Carroll Davidson, American statistician and sociologist: b. Dumbarton, N. H., 28 July 1840; d. Worcester, Mass., 20 Feb. 1909. After studying law, he enlisted in the 14th New Hampshire volunteers at the outbreak of the Civil War, and in 1864 became its colonel. In 1865 he was admitted to the bar at Keene, N. H., in 1867 began practice at Boston, in 1873-3 was a member of the Massachusetts senate, and in 1873-88 chief of the Massachusetts bureau of labor statistics. He was appointed national commissioner of labor in 1885, and he continued in this office for some time after his election as president of the collegiate department of Clark University (Worcester, Mass.) in 1902. In 1895 he became honorary professor of social economics in the Columbian University (Washington, D. C.), and delivered lectures in numerous institutions. He was chosen president of the American Statistical Association, in 1902 chairman of the section on social and economic science in the American Association for the Advancement of Science and vice-president of the association, and in 1903 president. He was recorder of the commission appointed by the President to arbitrate in connection with the anthracite coal strike in the fall of 1902. In 1906 the order of SS. Maurizio e Lazzaro was conferred upon him by the King of Italy in recognition of his services as political economist. Besides numerous contributions to periodicals, he has written 'The Industrial Evolution of the United States' (1895); and 'Outlines of Practical Sociology' (1899).

Wright, Charles Henry Hamilton, Irish Anglican clergyman: b. Dublin 9 March 1836. He was graduated from Trinity College, Dublin, in 1857, was Bampton lecturer at Oxford in 1878, Donnellan lecturer at Dublin 1880, Grinfield lecturer on the Septuagint at Oxford 1893-7, and vicar of St. John's, Liverpool, 1891-8. Among his numerous publications are: 'Fragments and Specimens of Early Latin' (1874); 'The One Religion' (1881); 'Biblical Essays' (1885); 'Roman Catholicism in the Light of Scripture,' 2d ed. (1897); 'The Intermediate State and Prayers for the Dead' (1900); 'Genuine Writings of Saint Patrick with Life' (1902).

Wright, Fanny. See D'ARBUSMONT, FRANCES.

Wright, Eliza, American abolitionist expert: b. South Canaan, Conn., 12 Feb. 1804; d. Medford, Mass., 21 Nov. 1885. He was graduated at Yale in 1886, was professor of mathematics in Western Reserve College in 1829-33, and became identified with the anti-slavery movement in the last named year. He then removed to New York, where he edited 'Human Rights' (1834-5) and the 'Quarterly Anti-Slavery Magazine' (1837-8), and was at the same time secretary of the Anti-Slavery Society. Removing to Boston in 1838 he there

edited the 'Massachusetts Abolitionist,' the 'Daily Chronotype' (1845), and 'The Commonwealth,' its successor (1850). He published 'Savings Banks Life Insurance' (1873); 'The Politics and Mysteries of Life Insurance' (1873), etc.; and was (1858-66) insurance commissioner of Massachusetts. He wrote an introduction to Whittier's poems (1844); and published a translation in verse of 'La Fontaine's Fables' (1859).

Wright, George Frederick, American educator and geologist: b. Whitelaw, N. Y., 22 Jan. 1838. He was educated at Oberlin College and Theological Seminary, and held Congregational pastorates at Bakersville, Vt., 1862-72, and Andover, Mass., 1872-81. He was professor of New Testament literature in Oberlin College 1881-92, and of the harmony of science and revelation since the last named year. He was connected with the United States Geological Survey 1884-92. His works include: 'The Logic of Christian Evidence' (1880); 'Studies in Science and Religion' (1882); 'The Relation of Death to Probation' (1882); 'The Glacial Boundary in Ohio, Indiana, and Kentucky' (1884); 'The Divine Authority of the Bible' (1884); 'The Ice Age in North America'; 'Man and the Glacial Period'; 'Aspects of Christian Evidences' (1898); 'Asiatic Russia' (1902), etc. He has edited the 'Bibliotheca Sacra' since 1884.

Wright, Horatio Gouverneur, American military officer: b. Clinton, Conn., 6 March 1820; d. Washington, D. C., 2 July 1899. He was graduated at West Point in 1841, was superintending engineer of the building of Fort Jackson at Tortugas, Fla. (1846-56); lighthouse engineer in Florida (1852-3); and assistant to the chief of engineers in Washington (1856-61). He was active throughout the Civil War, became brigadier-general of volunteers in September 1861, and took command of the Department of Ohio in August 1862. He commanded a division at the battle of the Wilderness, a corps at Spotsylvania Court House and Cold Harbor, 3 June; served as major-general at the battle of Opequan Creek, 19 Sept. 1864, and contributed to the decisive victory at Cedar Creek, 19 Oct. 1864. He was brevetted major-general in the United States army for his services at the capture of Petersburg, 13 March 1865, and was mustered out of the volunteer service 1 Sept. 1866. He then returned to regular army duty as lieutenant-colonel of engineers, becoming brigadier-general and chief of engineers 30 June 1879, retiring 6 March 1884.

Wright, John Henry, American classical scholar: b. Urumyah, Persia, 4 Feb. 1852. He was graduated from Dartmouth in 1873, and studied at Leipzig 1876-8. He was associate professor of Greek at Dartmouth 1878-86, professor of classical philology at Johns Hopkins 1886-7, and since 1887 professor of Greek at Harvard and dean of the graduate school from 1895. He has been editor-in-chief of the 'American Journal of Archaeology' from 1897, and has edited several important works.

Wright, John Vines, American jurist: b. Purdy, Tenn., 23 June 1828. He was admitted to the bar in 1852 and was a member of Congress in 1855-61. During the Civil War he served in the Confederate army, first as captain and later as colonel of the 13th Tennessee regi-

WRIGHT

ment; until elected to the Confederate Congress, in which body he remained till the fall of the Confederacy in 1865. He then became a judge of the circuit court and afterward chancellor and judge of the Tennessee supreme court. In 1880-90 he was chairman of the Northwest Indian Commission and concluded many treaties with Indians. He was defeated for governor of Tennessee in 1880. Died 12 June 1908.

Wright, Joseph, American artist: b. Bordentown, N. J., 16 July 1756; d. New York 1793. He obtained his art education in England and Paris, in 1783 returned to America, and in that year painted a portrait of Washington. Subsequently he executed another for the Comte de Solms, and still later a miniature profile. Among his other portraits were those of Jay and Madison. In 1792 he was made first draughtsman and die-sinker in the mint newly established at Philadelphia. He was the designer of the first coins and medals struck by the national government.

Wright, Joseph, English philologist: b. 31 Oct. 1855. From 1891 to 1901 he was deputy-professor of comparative philology in the University of Oxford, and in 1901 was made professor. Among his publications are a rendering of Brugmann's 'Grundriss der vergleichenden Grammatik der Indogermanischen Sprachen,' Vol. I.; text-books of Middle and Old High German, and a grammar of the dialect of Windhill in the West Riding of Yorkshire. But he is known for his 'English Dialect Dictionary,' begun in 1896, and announced to be completed in 1905. This is of much value to the special student.

Wright, Julia McNair, American author: b. Oswego, N. Y., 1 May 1840; d. Philadelphia, Pa., 2 Sept. 1903. She was married in 1859 to Rev. W. J. Wright and published numerous temperance and anti-Roman Catholic stories, among which were 'Almost a Nun'; 'Priest and Nun'; 'The Gospel in the Riviera'; 'The Heir of Athole.'

Wright, Luke E., American lawyer and administrator: b. Memphis, Tenn., 1847. He studied law, was admitted to the bar, and began the practice of his profession at Memphis, where he soon attained a leading rank among the lawyers of the city. In 1878 he was one of the most active in the relief work during the yellow fever scourge; and in 1880-8 was attorney-general of the State. In politics he has been affiliated with the Democratic party, but in 1896 supported the Gold Democrats. In 1900 he was appointed a member of the Philippine Commission; and on the organization of civil government in the Philippines was placed at the head of the department of commerce and police, and shortly afterward was appointed to the newly created office of vice-governor. He was thus acting governor during Governor Taft's absence in 1902; and in 1903, when Taft was appointed secretary of war, he was appointed governor-general of the Philippines. He was American ambassador to Japan 1906-7, and became Secretary of War, July 1908.

Wright, Mabel Osgood, American writer on nature, daughter of Samuel Osgood (1812-80) (q. v.); New York 1859. She was married in 1884 to J. O. Wright and has made her home in Fairfield, Conn. She has edited 'Bird

Lore,' with F. M. Chapman, and has published 'The Friendship of Nature,' a series of outdoor studies (1894); 'Birdcraft,' a book on New England birds (1895); 'Tommy-Anne: A Natural History Story' (1896); 'Citizen Bird,' a book for beginners (1897); 'The Dream Fox Story Book' (1900); 'The Flowers and Ferns in Their Haunts' (1901); 'Dogtown' (1902); 'The Garden, You and I' (1906); 'Gray Lady and the Birds' (1907); etc.

Wright, Marcus Joseph, American soldier, brother of J. V. Wright (q. v.): b. Purdy, Tenn., 5 June 1831. He studied law, was admitted to the bar and practised his profession in Memphis till the outbreak of the Civil War, when he entered the Confederate army as lieutenant-colonel of a Tennessee regiment. He was promoted brigadier-general in 1862 and was wounded at Shiloh. He has written 'Life of Gen. Winfield Scott' in 'Great Commander' series (1894); 'Life of Governor William Blount'; etc. Since 1878 he has been agent of the War Department for collections of military records.

Wright, Mary Tappan, American novelist: b. Steubenville, Ohio, December 1851. She was a daughter of Eli Tappan, a president of Kenyon College, and in 1879 was married to John Henry Wright (q. v.). Her work in fiction, which displays much keen characterization and charm of style, includes: 'A Truce and Other Stories' (1893); 'Aliens' (1902); 'The Test' (1904).

Wright, Silas, American statesman: b. Amherst, Mass., 24 May 1795; d. Canton, N. Y., 27 Aug. 1847. He was graduated at Middlebury College, Vt., in 1815, studied law, was admitted to the bar in 1819, and established himself as an attorney at Canton. In 1823 he entered the State senate, where he steadily opposed the political advancement of De Witt Clinton, which he regarded as dangerous to the Democratic party, of which throughout his life he was a firm adherent. He sat in Congress 1827-9, and there advocated and voted for the protective tariff of 1828. He also voted for the appointment of a committee to inquire into the expediency of abolishing slavery and the slave trade in the District of Columbia. He was comptroller of New York 1829-33, and a United States senator 1833-44. He supported Clay's compromise bill in 1833; voted against receiving a petition for abolishing slavery in the District of Columbia, and in favor of excluding from the mails all "printed matter calculated to excite the prejudices of the Southern States in regard to the question of slavery"; voted for the tariff of 1842, though most of his political associates in the senate voted against it; and voted for the annexation of Texas to the Union. In 1844, against his will, he was nominated by his party to be governor of New York, and was elected. President Polk offered him the office of secretary of the treasury in 1845, but he declined it, as he had previously declined a seat on the supreme bench. As governor he vetoed a bill appropriating money for works on the canals, on the ground that the effect of the bill was to resume the enlargement of the canals, which had been suspended by law in 1842, out of regard for the financial safety of the State; recommended legislation against the anti-renters, and on occasion of disturbances produced by them in Delaware County in 1845

WRIGHT — WRIGHTSVILLE

proclaimed the county to be in a state of insurrection and called out a military force. Nominated for re-election in 1846, he was defeated by the Whig candidate. When the application of the Wilmot proviso to the territories obtained from Mexico was under discussion, Wright emphatically declared that the arms and the money of the Union ought never to be used to acquire territory then free for the purpose of planting slavery upon it. On the expiration of his term as governor he returned to his farm at Canton. Consult 'Lives' by Jenkins (1847); Hammond (1848); Gillet (1874).

Wright, Thomas, English antiquary: b. Tenbury, Shropshire, 23 April 1810; d. Chelsea, London, 23 Dec. 1877. He was graduated at Trinity College, Cambridge, settled in London, and devoted himself to the study of English history, literature, and antiquities. He was one of the founders of the Camden Society, and of the British Archaeological Association, whose journal he edited 1843-50. Of the Percy Society and the Shakespeare Society he was also an active member, and in 1842 he was chosen a corresponding member of the French Academy of Inscriptions. He edited a great number of rare works connected with Early English literature and history which have been published in England by the societies above mentioned, and also published 'Queen Elizabeth and Her Times' (1838); 'Essays on the Literature, Popular Superstitions, and History of England in the Middle Ages' (1846); 'Narrative of Sorcery and Magic' (1851); 'The Celt, the Roman, and the Saxon' (1852, 5th ed. 1890); 'Wanderings of an Antiquary' (1854); 'The History of Ireland' (1857); 'Dictionary of Obsolete and Provincial English' (1858); 'History of France' (1858-60); 'Essays on Archaeological Subjects' (1861); 'Manners and Sentiments in English During the Middle Ages' (1862); 'History of Caricature and the Grotesque' (1865); 'Womankind in Western Europe' (1869).

Wright, Thomas, English biographer: b. Olney, Buckinghamshire, 16 May 1859. He was educated at Baxton College, Forest Gate, and is now (1904) principal of the Cowper School at Olney. He is the founder of the Cowper Society and has published 'The Town of Cowper' (1886); the novels 'The Chalice of Carden' (1889); 'The Blue Firedrake' (1892); and 'The Mystery of St. Dunstan's' (1892); 'Life of William Cowper,' the standard biography of the poet (1892); 'Life of Daniel Defoe' (1894); 'The Correspondence of William Cowper' (1900); 'Go, or How to Succeed in Life' (1902); etc.

Wright, William Aldis, English scholar: b. 1836. He was a contributor to Smith's 'Dictionary of the Bible' (1860-3), secretary to the Old Testament Revision Company in 1870-85, and from 1868, the year of its establishment, editor of the 'Journal of Philology'. In 1888 he became vice-master of Trinity College, Cambridge. With W. G. Clark (q.v.), he collaborated on the 'Cambridge Shakespeare' (1863-6) and the 'Globe' edition of Shakespeare's complete works (1864). Among his other publications are editions of the 'Letters and Literary Remains of Edward Fitz-Gerald' (1889); of the 'Facsimile MSS of Milton's Minor Poems' (1899); 'Fitz-Gerald's Miscellanies' (1900); 'More Letters of Edward Fitz-Gerald' (1901);

'Literary Remains of Edward Fitz-Gerald' (1902-3); and 'Milton's Poetical Works' (1903).

Wright, William Burnet, American Presbyterian clergyman: b. Cincinnati, Ohio, 15 April 1838. He was graduated from Dartmouth in 1857, was four years pastor of the South Congregational Church, Chicago; 20 years pastor of the Berkeley Street Church, Boston, and three of the First Congregational Church, New Britain, Conn., and subsequently of the Lafayette Avenue Presbyterian Church, Buffalo, prior to 1901. He has published 'Ancient Cities from the Dawn to the Daylight' (1887); 'The World to Come' (1887); 'Master and Men' or 'The Sermon on the Mountain Practised on the Plain' (1894).

Wrightia, an apocynaceous genus of small trees and shrubs, with long loose branches, named after William Wright (1740-1827), a Scotch botanist resident in Jamaica. The flowers are salver-shaped, white, yellow, or red, usually in terminal cymes, and have a short corolla-tube, five or more scales at the throat, and an exerted cone of sagittate anthers. *W. tinctoria* is a small tree, a native of Burma and Southern India. The wood resembles ivory in its hard, close grain, and exquisite whiteness, and like that of other species of the genus, is used for small articles of turnery. The tree is also known as ivory-tree, Pala, and palay. The seeds are said to be used in dyeing, and the leaves, with the seeds of *Cassia tora*, yield a blue dye known as pala-indigo, but inferior to the genuine indigo. *W. tomentosa*, a small, deciduous tree, growing in India and Burma, has a yellow juice, which, mixed with water, produces a permanent yellow dye. It is used by the Nepalese to stop bleeding, and the bark is given as an antidote to snakebite. *W. antidysenterica*, a small tree found in India and Burma, is a most valuable remedy for dysentery; the Arabs and Persians consider the seeds as carminative, astringent, tonic, and aphrodisiac. This tree is now classified under *Holarrhena*, and is a principal source of conessi- or pala-bark.

Wrightsville, York County, Pa., on the Susquehanna River, 31 miles southeast of Harrisburg and 11 miles northeast of York, was the farthest point east reached by the Confederates during the Civil War. In the campaign preceding Gettysburg Gen. Early was ordered to seize the bridge across the Susquehanna at this point, a wooden structure over a mile long, resting on stone piers. Included in the structure was a railroad bridge, a pass-way for wagons, and also a tow-path for the canal which here crossed the Susquehanna. On 28 June 1863 the bridge was defended by the 27th Pennsylvania militia, a few companies of the 20th and some other organizations and convalescents hastily collected, in all numbering about 1,200 men, under command of Col. J. G. Frick, 27th militia. Frick held an intrenched line about a half mile west of Wrightsville. Gen. Gordon's brigade, with Capt. W. A. Tanner's battery and White's battalion of cavalry, marching through York, appeared before Frick's position on the evening of 28 June and began skirmishing, under cover of which Gordon endeavored to cut him off from the bridge by a flank movement, but failed, and then opened fire with Tanner's artillery, to which Frick

could not reply, being without guns. His rear threatened, Frick retreated across the bridge and fired it, leaving 18 or 20 prisoners in Gordon's hands. Gordon attempted to follow, but was checked by the flames. The bridge was totally destroyed and the flames communicated to the town of Wrightsville, consuming several buildings, but the further progress was arrested by Gordon's men. The destruction of the bridge was a keen disappointment to Early, who had hoped to cross it and attack Harrisburg from the east side of the river. On the 20th Gordon marched back to York.

E. A. CARMAN.

Writ. In general understanding a writ is a mandatory precept issued by the authority of and in the name of the executive branch of the State for the purpose of compelling the defendant to do some particular thing mentioned in the instrument. Writs are generally classified as mandamus, habeas corpus, summons, error, quo warranto, certiorari, or review. Writs are further distinguished as original and judicial. Original issued without any order of the court in the particular case, judicial issued in pursuance of a decree or order or judgment of the court. A writ of mandamus is a command issuing from a court of law of competent jurisdiction, in the name of the State, directed to some inferior court, officer, corporation, or person, requiring them to do some particular thing therein specified, and which appertains to their office or duty. In order to secure a writ of mandamus it is necessary to show (1) that the petitioner has a legal right to have the thing done which it is sought to be done; (2) that it is the duty of the respondent to perform it; (3) that the writ is the only plain, speedy, and adequate remedy. A writ has a purely personal effect. An injunction—either mandatory or prohibitory—is a writ framed according to the circumstances of the case commanding an act which the court regards as essential to justice, or restraining an act which it esteems contrary to equity and good conscience. Quo warranto is an order to show by what authority a given act is done or office held. A writ of error is a commission to a superior court by which they are authorized to examine the record in a case on which judgment has been given in an inferior court. Habeas corpus is an order issued by a magistrate to an officer in charge of the person of the defendant and designed to give summary relief against illegal restraint of personal liberty. Summons is a demand made to a person to appear at a given time before a court or officer. Certiorari or review is an order to a superior court to review the evidence presented before an inferior court.

Writers' Cramp, or Scriveners' Cramp or Palsy, an occupation-neurosis to which those who do much writing, especially with the hand too tightly contracted, are very liable. A person with this trouble has no complete control over the muscles of the thumb and middle and fore fingers, brought into use in writing, although other manual operations are performed without difficulty. The affection seldom manifests itself till toward middle age. The various methods of treatment that have been proposed have not been very successful. Small surgical operations have been performed with occasional but far from general good results. The application of electricity to the adductor of the thumb,

and the kneading of the muscles of the ball of the thumb and the lower part of the forearm, so as to promote the circulation in those parts, are said to be beneficial, but the only way to obtain perfect relief is for the patient to abstain from writing altogether. If he is obliged to write he will do so with more ease if he uses a pen with a very thick handle. For extreme cases several contrivances have been devised for assisting the patient to write by altering the movements of the fingers in writing, and giving support to the ball of the hand. The typewriter has proved the best resource of those who suffer from the ailment. See NEUROSES; OCCUPATION, HYGIENE OF.

Writers to the Signet, in Scotland, where lawyers generally are called writers, an incorporated legal society dating from an early period of Scottish history. Originally, the name probably applied to clerks in the office of the secretary of state, where was deposited the seal by which the king's letters and writs for the purposes of justice were authenticated. This duty was monopolized by this close society of practitioners, members being appointed not by public officials, but by the organization. Thus the Writers to the Signet came to control admissions to the bar, like the English Inns of Court (q.v.). They still retain a certain prestige at the bar, but not their former monopoly.

Writing, the art of recording ideas by means of characters or figures of some sort impressed upon some kind of material substance. History, though it does not throw complete light on the origin of writing, suffices to show certain stages in its progress, and upon these a classification has been founded, which is, however, incomplete and unsatisfactory. The simplest classification, and perhaps at an initiatory stage the best, is that which divides all writing into ideographic and phonographic, or signs representing the things symbolized by words, and signs representing sounds, that is, words themselves. Less satisfactory is the classification of writing into three historical stages, the figurative, the transitional or conventional, and the alphabetic. In the first of these, to which hieroglyphic writing belongs, writing is supposed to be pictorial, or immediately representative of objects. After this, in the transitional period comes symbolical writing, in which abbreviated pictures are transformed into arbitrary symbols, first of things, and afterward of sounds and words. Lastly, with the prevalence of phonetic writing sounds are represented first in syllables, and afterward in letters. The course of writing is generally in the direction thus indicated, but it is inaccurate and misleading to represent these stages as epochs in its progress. As the most modern writing contains traces of the first of these methods, so the earliest contains traces of the last. The majority of the letters in modern alphabets can be traced to symbols, or abbreviated pictures representative of things, but as the thing originally represented is usually an object whose name begins with the sound represented by the letter, there is no evidence that the sign was not originally intended in a double sense and used as a phonograph. In Egyptian hieroglyphics we have ideographs and phonographs mixed together. This, however, does not prove the absolute precedence of ideographs, but only the imperfection of the phono-

WRITING

graphic elements in that system. The same thing occurs in the Mexican picture writing, which was long supposed to be purely ideographic. Its phonetic signs are syllabic, not alphabetic. In our own system we use figures and other symbols when phonographic signs are too slow for our purpose, and with a less perfect phonographic system this would naturally occur much more frequently. It does not appear, moreover, that any transition from pictorial to phonetic writing is necessary through arbitrary non-phonetical symbols. Both of these modifications would no doubt proceed simultaneously from independent causes. Pictorial signs not phonetized would be abbreviated as well as phonetized signs, and when the phonetized abbreviations came to prevail the non-phonetized abbreviations would be phonetized also, thus producing the appearance of a transition from arbitrary symbols to phonetic signs.

The reason why writing has had to pass through various stages of pictorial and more or less arbitrary symbolical representation before reaching the more perfect development of the alphabetic form is not very difficult to discover, and it has an important bearing on the order of development. It is not because the representation of words is in itself more difficult to conceive of than the representation of things, or because when the desire for writing as a medium of communication is excited the human intellect is inadequate to the task of forming at once an entire phonetic system. Had phonetic or even alphabetic representation been the only possible means of constructing a written symbol all difficulties would doubtless have been overcome by one sustained effort, as they have actually been by many partial ones; but as an easier process was to be found, and would directly suggest itself as a means of meeting the immediate demand, the more elaborate process was excluded and prevented by this process from being performed. Nothing is easier than to make a rude pictorial representation of certain objects. To draw something resembling a man would be easier than to agree on a sign to represent the word man, hence ideographs would naturally precede phonetic symbols. But for the same reason the earliest systems of writing would not be purely ideographic but mixed. There are many things which form the subject of the least sophisticated human communications which cannot be represented pictorially. When writing was first practised these things were already represented by words, and the idea would naturally occur to form a sign to represent the word, that is, a phonetic sign. These signs could not be directly pictorial, but they might be allegorical or symbolic, and in the absence of analysis of sound they probably would take that form, although the direct intention was to suggest conventionally a specific word by the symbol. This sort of symbol might be called a mnemonic. From such symbols to merely arbitrary syllabic and alphabetic symbols the transition would be easy.

It is generally agreed that writing was introduced to the western nations by the Phœnicians, and it is commonly believed that the Phœnician system was based on the Egyptian, but the comparative antiquity of the Egyptian and Assyrian or Akkadian, the hieroglyphic and cuneiform systems, cannot be definitely determined. The Egyptians attributed their writing

to Thoth, and the first characters are said to have consisted of portraits of the gods. The cuneiform writing, which is cumbersome and exceedingly difficult to read, has been adapted to several languages, the Akkadian, the Assyrian, the Persian, etc., in a variety of ways, ideographic, syllabic, and alphabetic. The Egyptians had three distinct kinds of writing, the hieroglyphic, the hieratic, and the enchorial or demotic. The first is a mixed system, containing large numbers of signs of various characters, ideographic and phonetic. It is used chiefly for inscriptions on monuments and public buildings. The hieratic is a cursive hand abridged from the hieroglyphic for use on papyri. Both these forms were sacred, and the priestly caste only were initiated in them. The demotic was introduced much later than the other forms. It was used for trading and common purposes, and in civil documents. The hieratic writing was more phonetic than the hieroglyphic, and the alphabetic character prevailed in the demotic. The first was written in any direction according to the form of the surface; the hieratic was at first written in columns, but afterward always in horizontal lines. The hieratic and demotic are read from right to left, but the individual letters are formed from left to right. The connection between the Egyptian and the Semitic writings, to which the Phœnician belongs, is by no means unanimously admitted, many scholars holding that the resemblances between them may be explained by the independent adoption of common principles. The leading Semitic forms are the Samaritan or ancient Hebrew, the Chaldee or East Aramaic, the Syriac or West Aramaic, and the Kufic or early Arabic, which continued to be used in MS. for several centuries after the Mohammedan conquest, after which it was replaced by the Nashki or modern Arabic, which, with some slight modifications, is the same with the modern Persian. The Hebrew alphabet now in use, the Babylonian or East Aramaic, is entirely consonantal, the vowel points being of modern origin. The Phœnician which formed the basis of the western languages was of a similar character. Phœnician writing was anciently represented to have been brought by a Cadmean colony to Boœtia about the 16th century B.C. (see CADMUS); and a certain number of the Greek letters are undoubtedly of Phœnician origin. (See the section on language and writing in the article GREECE.) The Greeks at first wrote from right to left, and afterward adopted the method called *boustrophædon*, from the motion of the ox in plowing, that is, alternately from right to left, and from left to right. Writing from left to right was said to have been introduced in the time of Homer by Pronapides of Athens. The various modifications which the Phœnician or Pelasgian forms underwent in Italy are to be found by comparison of the Oscan, Etruscan, Umbrian, and early Latin inscriptions. In the ancient Greek and Roman writing, and even for a time in the mediæval writing of Europe, the words were not separated by spaces, and no punctuation marks were used. The present cursive characters with modifications occur in Greek inscriptions of the age of Augustus. In mediæval manuscripts a variety of styles were adopted in different epochs and countries, and for different uses, to describe which in detail would require a separate treatise. In France the various styles were called after

the dynasties under which they prevailed: Merovingian, Carolingian, Capetian, Valesian, and Bourbon. There were also a variety of styles used for different purposes distinguished by such names as *majuscule* and *minuscule* (great and small letters), diplomatic minuscule, and many others. Capitals were not then used as now to distinguish prominent words, but whole manuscripts were written in large or small capitals. There were also a variety of mixed styles. From the 8th to the 11th centuries writing with *tremblements* was affected in France. The diplomatic minuscule was a mixture of minuscule and cursive characters distinguished by an unusual prolongation of the long letters. Uncial letters, which prevailed from the 7th to the 10th centuries, were rounded capitals with few hair-strokes. The practice of ornamenting pages began in the 8th century, and the earliest manuscripts are also without title-pages. The so-called Gothic characters, in reality of scholastic origin, are merely fanciful deviations from the Roman types, such as the rounding of straight limbs, the substitution of angular facets for rounded forms, with hair-lined projections from the extremities contrasting with massive body-strokes. They became common in inscriptions from the 13th to the 15th centuries, and were employed in church-books from the time of St. Louis. The Gothic cursive was introduced about the middle of the 13th century. The modern German alphabet was also introduced in the 13th century. In England a variety of styles called Saxon prevailed in the early Middle Ages. An elegant mixed style was formed of a combination of Roman Lombardic and Saxon characters. The Norman style of writing came in with William the Conqueror. The old English form of Gothic dates from the middle of the 14th century. The English "court hand," an adaptation of Saxon, prevailed from the 16th century to the reign of George II. In regard to the antiquity of writing in other parts of Europe, it was known to the Gauls before the time of Caesar; but no traces of the ancient writing remain, and whether it was derived from the Greeks or the Phœnicians is doubtful. There are slight traces of writing in Britain previous to the Roman period, but if it were employed by the Druids, as Caesar says, it may have existed without leaving remains. The Germans claim the knowledge of writing previous to their contact with the Romans; but in their case also we are without early remains. The Runic alphabet used for many centuries in Denmark, Norway, etc., may have been employed long before the Christian era.

In the East we find one of the most striking contrasts in the history of language. The Chinese, who have an ancient system of writing which they attribute to Fou-hi, have never reached the alphabetic system. Their characters are syllabic, and as Chinese words are monosyllables, they are strictly ideographic. They have been adopted in this way by peoples speaking not only different dialects, but different languages, who apply the signs to words of different sound but of the same signification as the original. The Chinese system is said to contain 40,000 characters. They were originally hieroglyphic, but from difficulty of interpretation have become conventional. There are, of course, certain general principles of combination and construction, but to master the whole system is said

to be the work of a lifetime. Only a limited portion of it can therefore have any real existence as a medium of communication. Sanskrit, on the other hand, possesses the most perfect known alphabet. The Hindus claim to have derived it from the gods, and call one form of it *devanāgarī* (divine city). It is wholly different from the Semitic, and is founded on a much more complete and subtle analysis of sound. Its consonant signs number 33, its vowel signs 14. They are applied with an analytical method which gives a power of distinction vastly superior to that of European alphabets, and which is greatly admired by scholars. Sanskrit is written from left to right. By means of its derivatives it is widely diffused in the East. The Pali, which forms the sacred language of the Buddhists, has carried it far beyond India. The Burmese Pali character is square, the Siamese round. To complete the vagaries which have prevailed in the direction of writing, the Mexican picture writing was written from bottom to top. See ALPHABET; CUNEIFORM WRITING; ETYMOLOGY; HIEROGLYPHICS; LANGUAGE; PHILOLOGY; SCIENCE OF LANGUAGE; SPEECH.

Wroettes, rō'tta, a sect named from John Wroe, who died in Australia 6 Feb. 1863, and who claimed to have received Divine revelations. They are few in numbers, and sometimes called Christian Israelites. They teach the immediate second coming of Christ.

Wrong, George McKinnon, Canadian educator: b. Ontario 25 June 1860. He was educated at University and Wycliffe colleges in Toronto, took orders in the Church of England and in 1894 succeeded Sir Daniel Wilson as professor of history in the University of Toronto. He is co-editor with H. H. Langton of the annual 'Review of Historical Publications Relating to Canada.'

Wrybill, an extraordinary plover (*Archynchus frontalis*) of New Zealand, which is unique in having a bill bent sideways near the tip,—always toward the right. By this peculiarly adapted instrument it seems to be able to reach and obtain many small crustaceans, etc., which are able to creep under stones out of reach of all the other shore-birds of the region, which have only the ordinary straight kind of beak. The questions and inferences which arise in the mind of the evolutionist in view of this case will be found treated in Newton's 'Dictionary of Birds,' with references to other authorities. See PLOVER.

Wryneck, a European bird (*Jynx or Jynx torquilla*), related to the woodpeckers, which has a habit of twisting its head in a curious manner. This bird visits Great Britain in summer, arriving in April, usually with or just before the cuckoo, and hence is named the "cuckoo's mate." The food consists of insects, and chiefly of ants and their pupæ. It is also said to eat elderberries. The tongue is long and extensile, like that of the woodpeckers. The nest is formed in the holes of trees; and the eggs vary from six to ten.

Wryneck. See TORTICOLLIS.

Wu-chang, woo'chāng', or Woo-chang, China, a city of the province of Hu-peh, on the Yang-tse-kiang, opposite the city of Hankow. The latter is in effect but a suburb of Wu-chang, another portion on the north bank of the

river being Hanyang. It is the great emporium for the tea exported by way of Shanghai. Pop. variously estimated from 500,000 to 1,000,000.

Wu-hu, woo'hoó', China, a treaty-port, opened in 1877, in the province of Ngan-hwei, on the right bank of the Yang-tse-kiang river, about 200 miles west of Shanghai. Some manufactures and a considerable trade are carried on. The number of vessels entered in 1901 was 2,002, with a total tonnage of 2,098,840. The total value of the imports in that year was \$5,776,810, comprising cottons, opium, sugar, kerosene, bags, woollens, metals, etc.; and the exports were valued at \$4,080,145, including rice, rape-seed, raw silk, wheat, feathers, beans, ground-nuts, etc. Wu-hu suffered severely in the Tai-ping rebellion. Pop. 92,000.

Wu Ting-fang, woo'ting'fáng', Chinese diplomatist: b. near Canton. After education at Canton and Hong Kong, he went to England in 1874 for the study of law, having found Chinese merchants greatly at disadvantage through ignorance of the English language and law, and was the first Chinese to be made a barrister (1877). He established himself in successful practice at Hong Kong, where his services proved of great value. For several years he was a secretary on the official staff of Li-Hung-Chang, but first came prominently into notice as secretary of the peace commission to Japan after the war with that country. His skill in these diplomatic negotiations obtained for him the post of envoy extraordinary and minister plenipotentiary to the United States, Spain, Mexico, and Peru (May 1897). During the Boxer troubles in the summer of 1900 he made skilful representations to the state department, for which when no news was obtainable from Peking, he transmitted a message to Minister Conger and secured an answer. He used English fluently; was stated to have been the first Chinese minister to address American audiences, which he did frequently; wrote numerous articles for American magazines; and received the degree of LL.D. from the University of Pennsylvania. In 1902 he was recalled, and in 1903 became vice-president of the newly established Chinese "board of commerce."

Wulfenite, native lead molybdate. It is generally admitted that the best specimens of this mineral are among the most beautiful minerals known. It crystallizes in hemimorphic tetragonal crystals. They are usually in square tabular plates, sometimes very thin and transparent, but occasionally in elongated pyramidal forms and nearly opaque. The mineral also occurs in crystalline masses. It is very brittle, has a hardness of about 3 and is very heavy, its specific gravity ranging from 6.7 to 7.0. Its lustre is resinous to adamantine, and colors are various shades of yellow, orange, red, grayish or greenish. It is associated with other lead ores at many localities, as in Austria-Hungary, and New South Wales, but the United States localities are far more important. Magnificent specimens occur in the Red Cloud and Mammoth mines in Arizona, in the Organ Mountains, New Mexico, at Eureka, Nevada and Tecoma, Utah. It was named in honor of the Austrian mineralogist, Wulfen. It has been used to a limited extent as an ore of molybdenum.

Wulfstan, wulf'stan, Wulstan, or Wolstan, (1) Anglo-Saxon prelate: b. Long Itchington, Warwickshire, about 1007; d. Worcester 18 Jan. 1095. Educated at Evesham and Peterborough, he became a monk in the monastery of Worcester and in 1062 was consecrated bishop of Worcester. He was one of those who submitted to William the Conqueror at Berkhamstead in 1066, and was allowed to retain his see. The crypt of the present Worcester cathedral represents the church which Wulfstan caused to be erected between 1084 and 1089. He was a man of saintly character and loyal devotion to his work, and he is credited with having induced the merchants of Bristol to stop their traffic in slaves. He assisted in the Domesday survey, and led the defense of Worcester against the rebellious nobles commanded by Roger de Montgomery. He was buried in Worcester cathedral, and was canonized in 1203, his day being 19 January. Consult, 'Life,' by William of Malmesbury, 'De Gestibus Pontificum.' (2) Wulfstan: b. about 950; d. 1023. He was archbishop of York, and has been regarded as the author of 'Wulfstan's Homilies,' first printed in 1701. (3) Wulfstan of Winchester, a monk of the 9th century, who wrote metrical lives of St. Swithun and St. Ethelwold.

Wulff, vul'fēr, Richard Paul, German philologist: b. Frankfurt-on-the-Main 29 July 1845. He was educated in Berlin, Leipzig and Marburg and in 1875 was made professor of English at the University of Leipzig. He is the author of 'Das Evangelium Nikodem' (1872); 'Altenglisches Lesebuch' (1874-80); 'Kleinere angelsächsische Dichtung' (1882); 'Grundriss zur Geschichte der angelsächsischen Literatur' (1885); 'Geschichte der englischen Literatur von den ältesten Zeiten bis zur Gegenwart' (1896); 'Bibliothek der angelsächsischen Prosa' (1899).

Wundt, voont, Wilhelm Max, German physiologist and philosopher: b. Neckarau, Baden, 16 Aug. 1832. He was educated at Heidelberg, Tübingen and Berlin, and in 1855 became assistant professor of philosophy at Heidelberg. He was subsequently professor of philosophy at Zürich and in 1875 was appointed to a similar post at Leipzig. Among his numerous works are: 'Science of Muscular Motion' (1858); 'Manual of Human Physiology' (1864, 4th ed. 1878); 'Ethics' (1886, 2d ed. 1892); 'The Human and the Animal Soul' (2d ed. 1892, in English 1894); 'Logic' (1880-3, 2d ed. 1892-5); 'Elements of Physiological Psychology' (1874, 4th ed. 1893); 'System of Philosophy' (1880, 2d ed. 1897); 'Outline of Psychology' (1896, 2d ed. 1897, in English 1894); etc. As a physiologist he advanced psychology by his work, and as a philosopher introduced the inductive method into sciences previously purely speculative (for example, logic and ethics), and sought to advance psychology by exact measurements (as of the time needed by a nerve stimulation to reach consciousness and become a percept).

Wupper, woop'pēr, Germany, a river in the governments of Cologne and Düsseldorf of the Prussian province of the Rhine. It rises on the Westphalian frontier, and flows first northwest and then southwest, joining the Rhine between Cologne and Düsseldorf after a course of about 60 miles. It is not navigable for vessels of any size, but it provides considerable power for man-

ufacturing purposes. Its valley is the most populous in Germany, and contains the important industrial towns of Barmen, Elberfeld, and Solingen. In its upper course it is called the Wipper.

Wurdha, wūr'da, India. See **WARDHA**.

Wurmser, voorm'sēr, Dagobert Sigmund, COUNT VON, Austrian general: b. Alsace 22 Sept. 1724; d. Vienna 22 Aug. 1797. He served three years in the French army, but left it for the Austrian service, where he commanded a hussar regiment during the Seven Years' war, attaining the rank of major-general. During the Bavarian war of succession he commanded a special corps of the army in Bohemia, and after the peace was made commanding general in Galicia, and in 1767 general of cavalry. By the outbreak of the French Revolution his family lost their estates in Alsace. In May 1796, the critical condition of affairs in Italy after the defeat of Beaulieu led to the appointment of Wurmser to the command of the second Austrian army destined to act against Bonaparte. At the head of 60,000 men, he obliged the French to raise the siege of Mantua; but the defeat of his main body at Castiglione, Roveredo, and Bassano, rendered his situation extremely critical. He finally forced his way into Mantua, of which the blockade was resumed. A third Austrian army was sent into Italy, but the defeat of Arcole prevented it from relieving him; and at length, in February 1797, seeing the impossibility of any longer maintaining the defense, Wurmser surrendered Mantua to Napoleon.

Wuro'ra, India. See **WANORA**.

Württemberg, würt'tēm-bērg, or **Württemberg**, Germany, a southwestern state and kingdom of the empire, between Bavaria, Baden, Hohenzollern, and the Lake of Constance, which separates it from Switzerland; area, 7,528 square miles. It was formerly included in the territory of Swabia (q.v.). Except a few tracts in the south, the surface is hilly and even mountainous. In the west the Schwarzwald, or Black Forest, forms part of the boundary, and the Alb or Raube Alp, forming part of the Franco-German Jura, covers an extensive tract. The country belongs in large part to the basin of the Rhine, being drained northward into that river by the Neckar, while the Danube flows across the southern districts. A part of the Lake of Constance is also included in Württemberg. The climate is temperate. In the lower and more favorable districts the fig and melon ripen in the open air, and the vine, cultivated on an extensive scale, produces several first-class wines, maize, wheat, hops, tobacco, and fruit, which is employed in cider making, are largely cultivated. About a third of the country is under forests, which consist chiefly of oaks, beeches, and pine. Of minerals, the most valuable are iron and salt, both of which are worked by the government; the others are limestone, gypsum, alabaster, slate, mill-stones, and potter's-clay. The manufactures consist chiefly of cotton, woolen, and linen goods, paper, wooden clocks, toys, musical instruments, and chemical products. The government is a hereditary constitutional monarchy, the executive power being lodged in the sovereign, and the legislative jointly in the sovereign and a parliament, composed of an upper and a lower chamber. The latter, which is elected

every six years, is composed of 93 members. The yearly revenue from all sources is about \$17,500,000, and the public debt, the bulk of which was incurred in constructing the state railways, is about \$140,000,000. Württemberg is represented in the Bundesrath by 4 members, and in the Reichstag by 17. There is no exclusively established religion, but the king is invested by the constitution with the supreme direction and guardianship of the Evangelical Protestant Church. Education is generally diffused, and the centre of the educational system is the University of Tübingen. Besides Stuttgart (the capital), the chief towns are Ulm, Heilbronn, and Esslingen. The history of the state is of little general interest. Previous to the Napoleonic era the rulers had the title of duke, but in 1806, by the favor of Napoleon, the then duke gained a great accession of territory, as well as the title of king. In the subsequent arrangement of the European states by the Congress of Vienna the territorial accessions were confirmed and the kingly title formally recognized. In the war of 1866 Württemberg sided with Austria against Prussia. It became a member of the German Empire on its foundation in 1871. Pop. about 2,200,000, including nearly 120,000 Jews.

Wurts, John, American legal writer: b. Carbondale, Pa., 10 July 1855. He was educated at Yale and after traveling in Polynesia as a newspaper correspondent (1876-7) was graduated from the Yale Law School in 1884 and practised his profession in Jacksonville, Fla., 1884-96. He is now (1904) professor of the law of real property and equity at Yale, and has published 'The Anti-Slavery Movement with its Relation to the Federal Constitution' (1883); 'Washburn on Real Property' (1902); etc.

Wurts, vürts, Charles Adolphe, French chemist: b. Strasburg, 26 Nov. 1817; d. Paris 12 May 1884. He went to Paris in 1845, in 1851 became professor at the Agronomic Institute, Versailles, in 1853 was made professor of organic chemistry at the Sorbonne and professor of toxicology at the Ecole de Médecine. From 1866 to 1876 he was dean of the Sorbonne faculty of medicine. Among his numerous works on chemistry are: 'La théorie atomique' (1878); 'Leçons élémentaires de chimie moderne' (1868); 'Traité de chimie biologique' (1885). Consult: Friedel, 'Notice sur la vie et les travaux de C. A. Wurts' (1884).

Wurts, Henry, American chemist: b. Easton, Pa., 3 June 1838. He was graduated from Princeton in 1861, studied further at the Lawrence Scientific School of Harvard, was State chemist of New Jersey 1854-6, chemical examiner in the United States Patent Office 1869-61, and from 1871 to 1875 edited the 'American Gas Light Journal.' In 1880 he entered the employ of T. A. Edison (q.v.), as chemist, and has since made several important chemical discoveries, chief of which is that of the geometrical laws of the condensation of chemical modules.

Wurtzite, in mineralogy, a dimorphous form of zinc blende. Crystallization, hexagonal; hardness 3.5 to 4; specific gravity, 3.98; lustre, resinous; color, brownish black; streak, brown; composition, a sulphide of zinc; ZnS; occurrence, in a silver mine near Oruro, Bolivia, in Portugal, Peru, and near Butte City, Montana.

Wurzburger, wérz'bér-ger, Julius, American journalist: b. Baireuth, Germany, 1819; d. New York 14 Sept. 1876. The son of a merchant, he received a thorough education, and studied literature and history at the University of Erlangen. The year of revolution, 1848, found him editor of the Baireuth 'Tageblatt.' He then removed to Munich, where his ardent advocacy of the liberal movement attracted the attention of the ministry and he was banished in 1849 from Bavaria. Soon after Louis Napoleon had declared himself emperor, Wurzburger came to New York, and here established a connection with the *Staatszeitung* which continued from 1856 to 1875. As editor of its 'Sonntagsblatt' he exercised a wide influence.

Wushkum (from the name of their chief village), meaning a species of louse or flea, a tribe of the Chinookan stock of North American Indians. They call themselves *Tlaqluit*, and are the Echeloot of Lewis and Clark and the Wisham, Wishram, etc., of other writers. They occupy the north bank of Columbia River, Washington, from Tenino to the neighborhood of White Salmon River. They subsist largely on salmon, and are not reservation Indians, although they took part in the Yakima treaty of 1855. Their number is not known, but it is small.

Wyandot, English adaptation of the French *Ouendat* (*Wendat*), or *Houandate*, later written *Guyandotte*, the Huron name for themselves, signifying "They are islanders." A tribe composed of the remnants of several politically independent Iroquoian tribes and confederacies whose political integrity was destroyed by the Iroquois during the middle of the 17th century. Among these peoples may be mentioned the ancient *Wendat* (or *Houandate*), or *Huron* confederacy, which was composed of four tribes, namely, the *Attiguenongnahac*, the *Attignawantan*, the *Arendahronons* and the *Tohontacnrat* (for *Tohontakenrat*), and also, later, the affiliated tribes known as the *Ataonchronons* (*Ataonchronons*), the *Wenrôhronons*, and the *Atonthrathronons* (*Muskrat* people), the last being *Algonquian*; and the *Tionontateronons*, the *Attiouendaronk* (*Attiouendarankhronon*) or *Neuter Nation*, and lastly, the *Eries*. To the *Attiouendaronk* may be added the small affiliated tribes known as the *Aondironon* and the *Ongnarahronon* (*Ongmarahronon*). The first known habitat of these several peoples was south and east of Lakes Huron and Erie, in the present States of Ohio and Pennsylvania and western New York, in Ontario, Canada, and the northern shore of the St. Lawrence River as far down as the site of Quebec. To-day the Wyandots so-called live in the Indian Territory, where they number about 290; at Anderdon, Ontario, where the last report says two remain; and at Lorette, Quebec, Canada, where some Hurons who are in fact Wyandots, dwell, numbering about 458; the whole aggregating about 750. All these tribes when first encountered by Europeans were organized into well-governed communities. The social and political organizations were based strictly on blood kinship, real or fictitious. Fictitious kinship was obtained through the rites of adoption. These peoples dwell in lodges constructed of bark, which were long in figure, sometimes having as many as ten or twelve

fires with a family on two sides of each fire. The lodges were usually collocated into villages, many of which were quite strongly palisaded. For their sustenance they depended chiefly on agriculture, raising corn and beans of several varieties, squashes and sunflowers for oil. They tanned and dressed the hides of the animals which they killed. The prepared skins they neatly and skilfully utilized in the preparation of their raiment and their bedding. Reeds and barks of various kinds were useful in making mattresses and other needed articles. The title to their lands was vested solely in the mothers of the people. The choice of a candidate for chief for either of the two grades of this office was solely a prerogative of the mothers of the clan to which the chiefship belonged. The chief held his office during good behavior.

J. N. B. HAZRRT,
Smithsonian Institution, Washington, D. C.

Wyandotte, wí'an-dôt, Mich., city in Wayne County; on the Detroit River, and on the Grand Trunk, the Michigan Central, the Detroit Southern, and the Lake Shore & Michigan Southern R.R.'s; 12 miles south of Detroit. It has alkali works in which there are 1,200 employees; rug and fur coat factory, 300 employees; ship-building works, 500; baking soda and starch factory, 75; salt works, 300; and a number of other manufacturing establishments. The two banks have a combined capital of \$100,000; and the annual business is about \$900,000. There are 10 churches, a high school established in 1873, three public schools, four parish schools, and a public school library. The government is vested in a mayor and a council of six members elected annually in April. Wyandotte was settled before 1850 by Major John Biddle. It was platted in 1854, and in 1867 was incorporated. The government is administered under the commission plan. Pop. (1900) 5,183; (1910) 8,287.

J. D. HAVEN,
Editor Wyandotte Herald.

Wyandotte Cave, in Crawford County, Ind., a natural formation, second in size to Mammoth Cave (q.v.), but having a greater number and variety of stalactites and stalagmites than any other cave in the United States. It has been explored for a distance of 23 miles. The chambers and galleries are numerous, some about 350 feet long and 180 feet high. Some of the remarkable features are Monument Mountain, about 175 feet high, and 75 feet above its crests is the grand dome. The Pillared Place contains several clusters of stalactites, and the Pillar of the Constitution, a large stalagmite 30 feet high and 75 feet in circumference.

Wyant, wí'ant, Alexander Helwig, American artist: b. Port Washington, Tuscarawas County, Ohio, 11 Jan. 1836; d. New York 29 Nov. 1892. After trying the saddlery business, he turned to art, became a painter of landscapes at Cincinnati, exhibited in the National Academy of Design in 1865, was elected associate of the academy in 1868, and academician in 1869. In 1865 he went to Europe, becoming a pupil of Hans Gude at Karlsruhe. He attained high rank in landscape art, painting almost exclusively American scenes, and being particularly successful in views from the Adirondack wilderness. He was a founder of the American Water-Color Society. Among his works are: 'Scene on the

WYATT — WYCHERLEY

Upper Susquehanna (1869); 'Pool on the Available' (1871); 'In the Adirondacks'; 'A North Woods' Brook'; 'An Old Clearing'; 'Pool in the North Woods'; 'New Jersey Meadows' (1872); 'Sunset on the Prairie' (1876); 'Reminiscence of the Connecticut' (1878); 'Evening' (1885); 'Sunset, near Killarney' (1886); 'October Day' (1892). His chief characteristics are subtle tones, the evanescent moods of nature that he was quick and able to catch, and a delicate quality of workmanship.

Wyatt, wiat, James, English architect: b. Burton Constable, Staffordshire, 3 Aug. 1746; d. Marlborough, Wiltshire, 5 Sept. 1813. He was taken to Rome in 1760 by Sir William Bagot, and during the next six years studied architecture in that city and in Venice. Returning to London, he brought himself into notice by his designs for the Pantheon, in Oxford street, a building for many years famous as the rendezvous of the fashionable world. He received innumerable commissions for private residences in all parts of the kingdom; but his designs, for the most part in a sort of Græco-Italian style, have little at the present day to recommend them. About 1782 he turned his attention to Gothic architecture, being one of the first to attempt its revival; and for many years was employed as a restorer of cathedrals and parish churches, in the course of these labors making sad havoc at Salisbury, Hereford, Durham, and elsewhere. It must be said, however, that his imperfect conceptions of Gothic art were shared by his contemporaries and approved by the taste of his time, in large measure. His most famous work in this style was Fonthill abbey, erected for Beckford in 1795. He held the position of surveyor-general subsequent to 1796, and in 1802-3 was president of the Royal Academy.

Wyatt, sm Matthew Digby, English architect and art writer: b. Rowde, near Devizes, Wiltshire, 1820; d. London 21 May 1877. He made a diligent study of the architecture of Italy, France, and Germany, returning to England in 1846 to publish his 'Geometrical Mosaics of the Middle Ages' (1848). In 1856 he was appointed architect to the East India Company, and made many important designs for public works in Great Britain and India; in 1866 was awarded the royal gold medal of the Royal Institute of British Architects; and in 1869 was knighted and made Slade professor of fine arts at Cambridge. His chief books are: 'Metal Work and its Artistic Design' (1852); 'Industrial Arts of the 19th Century' (1853); 'Art Treasures of the United Kingdom' (1857); 'Fine Art' (1870); 'Architect's Handbook in Spain' (1872).

Wyatt, Richard James, English sculptor: b. London 3 May 1795; d. Rome 29 May 1850. He entered the Royal Academy as a student, afterward worked for a time in the studio of Bosso in Paris, and ultimately completed his professional education under Canova at Rome. In the last city he took up his permanent residence from 1821, making only one brief visit to England in 1841. He is one of the best English sculptors in the delineation of poetical and classical subjects. Among his works are 'Penelope'; 'The Huntress'; and 'Flora,' besides several memorials.

Wyatt, sm Thomas, English poet: b. Kent about 1503; d. Sherborne, Dorsetshire, 11 Oct. 1542. He was graduated from Cambridge in 1518, may have studied at Oxford, and subsequently went on his travels to the Continent. After his return to England he appeared at court, where the reputation he had already acquired as a wit and a poet introduced him to the notice of Henry VIII., who retained him about his person and knighted him in 1537. He was employed on several diplomatic missions to different powers, and was a friend of Thomas Cromwell (q.v.), in whose fall he ran some risk of being involved. In 1542 he was returned to Parliament as knight of the shire for Kent. A close student of foreign literature, Wyatt introduced the sonnet into England from Italy. In this he is commonly associated with Henry Howard, Earl of Surrey, but is more correctly to be regarded as the pioneer (see SURREY, EARL OF). None of Wyatt's verse, sacred or secular, appeared in his lifetime. Some of the secular poems were printed (96 are assigned to Wyatt) in the 'Songs and Sonettes' (1557) of Richard Tottel, commonly known as 'Tottel's Miscellany.' There are among the extant works 31 sonnets, and satires in heroic couplets, imitated from Persius and Horace. Wyatt's poems evince more elegance of thought than imagination, while his mode of expression is far more artificial and labored than that of Surrey. Consult Nott's edition of Wyatt and Surrey with the elaborate memoir prefixed thereto (1816); also the article by Churton Collins in T. H. Ward's 'English Poets' (1883), and Simond's 'Sir Thomas Wyatt and his Poems' (1889).

Wyattville, wi'at-vil, sm Jeffrey, English architect, nephew of James Wyatt (q.v.): b. Burton-on-Trent 3 Aug. 1766; d. London 18 Feb. 1840. He designed and superintended the alterations in Windsor Castle, begun in 1824, and his name was changed from Wyatt to Wyattville on the occasion of his being knighted in 1828.

Wycherley, wich'er-li, William, English wit and dramatist: b. Clive, Shropshire, about 1640; d. London 1 Jan. 1716. About 1655 he went to France for his education, but he returned to England a short time before the Restoration, and was entered a gentleman commoner of Queen's College, Oxford, which he left without a degree, and took chambers in the Middle Temple. He paid, however, little attention to the law, but became a man of fashion in the town, and made himself known as author of 'Love in a Wood, or St. James's Park,' a comedy, published about the end of 1671. This piece brought him into much notice, and his popularity was increased by comedies that soon after followed: 'The Gentleman Dancing-master,' published in 1673; 'The Country Wife,' produced in 1672 or 1673, and 'The Plain Dealer,' 1674. He became a favorite of the meretricious Duchess of Cleveland, and was much regarded by Villiers, the witty and profligate Duke of Buckingham. About 1680 he improved his circumstances by marrying the Countess of Drogheda, a young, rich, and beautiful widow. At her death soon after she settled her fortune upon him; but, his title being disputed, the costs of law and other encumbrances produced embarrassment, which ended in arrest. He re-

ained in confinement seven years, until released by James II., who, it is said, was so pleased with his comedy of 'The Plain Dealer' that he ordered his debts to be paid, and added a pension of £200 per annum, which he lost at the revolution. The succession to his father's estate, which was strictly entailed, does not appear to have relieved him from the embarrassments into which he had again fallen, and from which he found a deliverance only a few days before his death in marrying a young woman with a fortune of £1,500. Besides the plays already mentioned he wrote poems of no value or interest. His plays are excessively licentious. He was a friend of Dryden, and in his later years of Pope, but Pope's statements regarding their connection are not much to be depended on. Among latest editions of his plays is that by W. C. Ward (1893).

Wyckoff, wī'kōf, Walter Augustus, American sociologist: b. Mainpuri, India, 12 April 1865. He was graduated from Princeton in 1888, and after further study in Europe began in July 1891, the life of a day laborer, working his way from Connecticut to California and spending 18 months in this manner. His aim was to study from the inside the economic conditions surrounding American wage-earners, and the immediate outcome of his experiment was his three sociological works: 'The Workers—the East' (1897); 'The Workers—the West' (1898); 'A Day with a Tramp and Other Days' (1901). In 1893-4 he went around the world twice as a private tutor, in 1895 was made a lecturer on political science at Princeton, and in 1898 became an assistant professor of political economy there. He died 15 May 1908.

Wyckoff, wī'kōf. See **WICKLIFF, JOHN**.

Wye, wī, a river partly in Wales, partly in England, with its source in Plynlimmon, Montgomeryshire. After a circuitous and winding course of about 130 miles, having passed through Radnorshire, Herefordshire, and separated Monmouth from Gloucestershire, it falls into the Severn below Chepstow. It is distinguished for the beauty and variety of its scenery, especially in the neighborhood of Tintern Abbey. The tide at Chepstow sometimes rises 46 feet. Large vessels cannot ascend beyond Chepstow Bridge, but barges of from 18 to 30 tons reach Hereford. Other towns on the river are Monmouth, Ross, and Builth.

Wyeth, wī'ēth, John Allen, American surgeon: b. Marshall County, Ala., 26 May 1845. During the Civil War he served as a private in the Confederate army, was taken prisoner and held for 15 months. In 1869 he was graduated in medicine at the University of Louisville, and in 1873 from the Bellevue Medical College, where he was assistant demonstrator in anatomy 1873-4. He was surgeon to the Mount Sinai Hospital 1880-97, and in 1882 founded the New York Polyclinic Medical School, the first American post-graduate medical school. He has published 'Essays on Surgical Anatomy and Surgery'; 'Text Book on Surgery' (1888); 'Life of General Nathan Bedford Forrest' (1899); etc.

Wykeham, wī'kēm, William of. See **WILLIAM OF WYKEHAM**.

Wylla, wī'l, Robert, American artist: b. Isle of Man 1839; d. Pont Aven, Brittany,

France, 1877. He was brought to this country when a child, and after some study in the Pennsylvania Academy was sent by his trustees to study in France in 1863. Settling at the village of Pont Aven he was presently surrounded by a colony of artists. In the Paris Salon of 1872 he obtained a second-class medal, but not till after his death did his paintings attract much attention. His 'Death of a Vendean Chief' (1876) hangs in the Metropolitan Museum, New York.

Wyman, wī'mən, Jefferson, American anatomist: b. Chelmsford, Mass., 11 Aug. 1814; d. Bethlehem, N. H., 4 Sept. 1874. He was graduated from the Harvard Medical School in 1833, was professor of anatomy and physiology at Hampden-Sidney Medical College, Richmond, Va., 1843-7, and Hersey professor of anatomy at Harvard from 1847 till his death. He established there the Museum of Comparative Anatomy and for many years was indefatigable in efforts for its increase, was president of the Boston Society of Natural History 1856-70, became curator of the Peabody Museum, Cambridge, in 1866, and published many scientific papers. He was one of the earliest American supporters of the theory of evolution.

Wyman, Robert Harris, American naval officer: b. Portsmouth, N. H., 12 July 1822; d. Washington, D. C., 2 Dec. 1882. He entered the navy in 1837, and while attached to the Gulf Squadron during the Mexican War, took part in the siege and capture of Vera Cruz and the expeditions that captured Tusan and Tampico. He was stationed at the naval observatory in Washington in 1848-50 and 1853-4, and in the Civil War commanded the Yankee and Pawnee and the Potomac flotilla in 1861; and the Santiago de Cuba on blockading duty in 1862-4. He became commodore in 1872, and rear-admiral in 1876; and was commander-in-chief of the North Atlantic Station in 1879-82.

Wyman, Walter, American surgeon: b. St. Louis, Mo., 17 Aug. 1848. He was graduated at Amherst in 1870, and at the St. Louis Medical College in 1873; served in city hospitals 1873-5, and since 1876 has been in the Marine Hospital service, being made assistant surgeon in 1876, chief medical purveyor of the quarantine division in 1888, and supervising surgeon-general in 1891. He was an earnest advocate for the sanitation of ports not only in the United States, but in the West Indies and South America, holding that if this were enforced yellow fever would be entirely eradicated from the Western hemisphere. On his recommendation the government set apart a large tract of land at Fort Stanton, New Mexico, for a hospital whither all consumptive patients in the United States marine hospitals could be transferred.

Wynants, wī'nānts, or Wijants, Jan, Dutch painter: b. Haarlem between 1615 and 1620; d. about 1680. Very little is known of his life except that he was master of Adrian Vanderveelde, Wouwerman, and other eminent painters, and that he was naturally indolent and given to pleasure. His works are consequently few, but are highly valued for their technical merits. They consist of landscapes of small size, the figures and cattle in which were often executed by other hands.

WYNDHAM—WYOMING

Wyndham, win'dam, Sir Charles, English actor: b. 1841. He was at first educated for the medical profession, and coming to this country served for a time as surgeon in the United States army during the Civil War. Later he went upon the stage, appearing with John Wilkes Booth, and then, returning to England, made his debut in London in 1868 in light comedy. In 1876 he obtained control of the Criterion Theatre in London and in 1899 opened Wyndham's Theatre there. He was knighted in 1902. He has made several visits to this country on theatrical tours. Consult Scott, 'The Drama of Yesterday and To-day' (1899).

Wyndham, George, English cabinet officer: b. London 29 Aug. 1863. He was educated at Eton and Sandhurst Royal Military College. He served through the Suakim campaign and at Cyprus in 1885, and was private secretary to A. J. Balfour (q.v.) 1887-92. He also sat in Parliament for Dover from 1889, was parliamentary under-secretary of state for war 1898-1900, became chief secretary for Ireland in 1900 and entered the cabinet in 1902. In March 1903 he introduced the Irish land purchase bill subsequently passed. He has published an edition of 'North's Plutarch' in the 'Tudor Classics' (1894); and 'Shakespeare's Poems' (1898).

Wyndham, Sir William, English statesman: b. Orchard-Wyndham, Somerset, 1687; d. Wells, Somerset, 17 July 1740. He was educated at Oxford, and entering the House of Commons for his native county, identified himself with the Tories, became secretary at war in 1711, and in August 1713 was transferred to the office of chancellor of the exchequer. He was suspected of treasonable relations with the Pretender, and lost his office on the death of Queen Anne. On the outbreak of the rebellion in Scotland under the Earl of Mar in 1715, an order for Wyndham's confinement was issued, and he was arrested at his house in Somerset, but escaped. A reward of \$5,000 was offered for his apprehension. After lurking for some time in disguise he surrendered himself and was committed to the Tower. Released without a trial, he remained till his death a leader of the parliamentary opposition to the ministry of Sir Robert Walpole. He was a very graceful, clear, forcible, and spirited orator.

Wynne, win, Charles Whitworth. See CAYZER, CHARLES WILLIAM.

Wynne, Madeline Yale, American author, artist, and metal worker: b. Newport, N. Y., 25 Sept. 1847. She was a daughter of Linus Yale, inventor of the Yale lock; studied art in the Boston Art Museum, the Art Students' League, New York, and with George Fuller. She has published 'The Little Room and Other Stories.'

Wyntoun, win'ton, Andrew, Scottish rhyming chronicler: b. about 1350; d. after 1400. He was a canon regular of the priory of Saint Andrews, and was in 1395 prior of St. Serf's Inch, in Lochleven, probably holding this office till his death. Wyntoun's 'Orygynale Cronykil of Scotland' is the first historical record in the Scottish vernacular. It received little attention till 1795, when David MacPherson published an annotated edition of a part of it. David Laing edited a complete edition of this

work, 1872-9, and an edition from the Wemyss Manuscript has been prepared for the Scottish Text Society. Wyntoun's 'Chronicle' bears the usual character of the historical writings of the age in the indiscriminate mixture of tradition with history, but he appears to have been faithful to his authorities, whom he sometimes literally transcribes. Wyntoun's scholarship appears to have been considerable, and the candor and generosity with which he speaks of the enemies of his country, are commendable.

Wyoming (Indian, *Moughwewawmo*, meaning 'big plains'), a State of the United States, in the Rocky Mountain region, between the parallels lat. 41° and 45° N., and between lon. 104° 3' and 111° 3' W. It is bounded on the north by Montana, east by South Dakota and Nebraska, south by Colorado and Utah, and west by Utah and Idaho. The boundary lines are all straight. The greatest extent is from east to west, 355 miles; from north to south is 276 miles. Area, 97,800 square miles. Wyoming ranks sixth in size among the States of the Union.

Topography.—The elevation of the State averages from 5,000 to 7,000 feet above sea-level, and it is traversed by the main chains or spurs of the Rocky Mountain Range. From the plateau lands rise a number of lofty ranges and peaks, the summits of which are from 8,000 to nearly 14,000 feet above the sea. The largest mountain masses, or groups of mountains, are in the southeastern and northwestern parts of the State. In the northeast is the isolated group called the Black Hills, a portion of which extends into South Dakota. In the southwest and along the southern border are the Sierra Madre, spurs of the Uintah Mountains, several buttes, and a number of low mountain ranges. The chief ranges of the southeast are Medicine Bow, Laramie, Seminole, Rattlesnake, Sheep, and Snowy. The short ranges, Sheep and Snowy, extend northeast and southwest, but the other ranges of the southeast extend northwest and southeast. In the northwest part of the State the principal ranges are Shoshone, Teton, Snake River, Gros Ventre, Snow, and Owl Creek. In the northern part is a wedge-shaped group, broadest at the northern boundary, and ending abruptly about 100 miles south. The longest and most prominent range of this group is the Big Horn. Extending northwest and southeast across the western central part of the State are the Wind River and the Green Mountains. Some of the most prominent elevations in the State are Fremont, snow-capped all the year, and nearly 14,000 feet, Sheridan (13,691 feet), Atlantic (12,700 feet), Grand Teton (q.v.), Ferris, and Union. The Continental Divide crosses the State from the middle of the southern boundary to the northwestern corner, extending through the Yellowstone National Park (q.v.).

The principal plains are Laramie in the southeast, the Platte and Cheyenne plains in the east, which extend west to near the central part of the State; and Red Desert in the southwest. The great natural curiosity of the State is the region included in and adjacent to the Yellowstone Park. Numerous small parks and several passes have been found amid the mountains; just southeast of the National Park is the Two Ocean Pass, near which are the headwaters of streams whose waters find their

WYOMING

way to the Atlantic and Pacific oceans. (See **ROCKY MOUNTAINS**.)

Hydrography.—The State is noted for being the source of many of the head streams of the three great river systems of the United States: Mississippi, Columbia, and Colorado. The Yellowstone River (q.v.) and its tributaries, Big Horn, Powder, and smaller streams, drain the northern portion of the State and carry the waters to the Missouri. The Little Missouri, Platte, and Cheyenne are the chief rivers which drain the eastern portion, and which belong also to the Mississippi Basin. In the southwest is the Green River, a tributary of the Colorado. The west and northwest sections are drained chiefly by the Snake, or Shoshone, a branch of the Columbia. (In separate articles on the rivers which have their rise in this State descriptions are given of the cañons, cascades, and waterfalls.)

The largest lakes are the Yellowstone (q.v.), Jackson, and Shoshone, all in the northwest. There are many small lakes amid the mountains, bodies of clear water surrounded by wooded mountain regions of great beauty.

Geology.—The surface rock of several ranges, notably Wind River, Cheyenne, and Powder, is chiefly a cretaceous stratum. Eocene deposits are found in the southwest, lava and igneous rocks in the northwest, and crystalline rocks (Archean) on the crests of the mountains that cross the interior. Paleozoic and Lower Mesozoic strata appear in regular bands in the Wind River and adjacent ranges. Deep fissures and rugged sides are features of nearly all the mountains of the State. The lower slopes of the Laramie Range and a portion of the Laramie Plains are covered with the later Tertiary deposits. The geological formation of every age may be found in Wyoming, notably the tertiary, carboniferous, cretaceous, eozone, silurian, triassic, jurassic, Devonian, and volcanic. (See **ROCKY MOUNTAINS**.)

Minerals and Mining.—Wyoming has gold, silver, and most of the valuable minerals found in the Rocky Mountain region. In 1909 there were mined 184 ounces of fine gold, valued at \$3,800; 1,100 ounces of fine silver; 6,303,109 short tons of coal, \$9,896,848; clay products, \$67,755; sandstone, \$13,130; limestone, \$24,346. In 1902 the North American Copper Company began operations at Grand Encampment. The oil fields promise to be most productive. In 1909 the crude petroleum output of Wyoming and Utah was valued at \$36,648. On 1 Sept. 1903 oil was discovered near Evanston. A lubricating oil of superior quality has been found in the central part of the State. Thus far coal has been the chief product of the mines, and so much attention has been given to coal mining in this State that the quantities procured have steadily increased. In 1868 the entire quantity of coal mined was 6,925 short tons; it increased constantly until, in 1887, 1,170,318 tons were produced, in 1900, 3,837,392 short tons, valued at \$4,742,525. The output of the coal mines in 1907 amounted to \$10,883,003. In 1907 the State ranked 11th in the Union in coal production, with the counties of Sweetwater and Uinta taking the lead. The coal reserves are so enormous that they are likely to be among the most important factors in the development of the State in the future.

Climate.—The extremes of temperature

exist for a short period each year. The records show the maximum 116° above zero and the minimum 44° below zero, but those extremes are rare. The highest generally is 100° and the lowest 30° below zero. The mean temperature for January is 18.1° in the northern part of the State, and 25.1° for Cheyenne and vicinity. The mean temperature for July is 67° for the whole State. The extreme cold is not severe on account of the dryness. The greatest amount of rainfall is between March and June; the snowfall is light, and to insure crops in all the productive localities, except along the rivers, irrigation is necessary. The State is remarkably free from all conditions that tend to unhealthfulness, especially malaria and kindred diseases.

Soil.—The soil of nearly all the river valleys is a dark loam, and most fertile. On the higher lands and the lower mountain slopes there is a sandy loam, some of which is productive, as above stated, but irrigation is necessary. In the Red Desert of the southwest the saline deposits have rendered the soil almost unfit to support any but the lowest forms of vegetation. Greasewood and salt-sage are the chief forms of vegetation found here.

Flora and Forest Productions.—The vegetation common to the Rocky Mountain region is found here; the low shrubs, the grasses suitable for pasturage, on the foothills and lower slopes, fir, spruce, hemlock, pine, aspen, walnut, elm, ash, box-elder, red cedar, and along the streams, in places, cottonwood and willow. The wooded districts of the State cover only about 13 per cent of the entire area, or about 12,500 square miles. Of this timbered part of the State, 3,500 square miles are located within the boundaries of the Yellowstone National Park, and 5,207 square miles within the United States reserves. Yellow pine is found on the lower slopes of the Big Horn and Medicine Bow Mountains, and south of the Yellowstone Park. Considerable timber had been taken from the forest districts and has been found very valuable for many purposes. The timber manufactured into lumber, in 1900, was valued at \$831,558.

Fauna.—The animals found wild throughout the State are the black and the grizzly bear, wolf, prairie wolf, badger, wolverine, otter, porcupine, mink, civet, ermine, elk, deer, antelope, prairie dog, rabbit, and wild birds. (See **ROCKY MOUNTAIN FAUNA**; **AMERICA**; **UNITED STATES**.)

Agriculture and Stock Raising.—Crops cannot be raised without irrigation, except in small quantities along the streams, but with irrigation large crops have been produced. The most of the productive land is at a greater altitude than the fertile lands of any other State. This has a controlling effect upon the character of agriculture, the means used and the kind of productions. For a long time agricultural efforts were confined to grains and to sections where irrigation could be easily employed. This is still the case, in a great measure, but the quantity of land tilled has increased. There are about 8,125,000 acres of farm lands, of which 800,000 are cultivated for grains and vegetables. Grass grows in large portions of the State in fairly good quantities, particularly along the streams and where the lands are irrigated. Timothy and alfalfa are cultivated. It

County Seats shown thus: 

1875

WYOMING

is estimated that nearly half the State is suitable for grazing. The native grasses cure naturally, standing on the ground without harvesting, on account of the dry climate. Near the arable lands there are streams that can be used for irrigation. One canal fed by the Big Sandy River irrigates 270,000 acres. The reports of the United States Geological Survey give as the number of acres that may be reclaimed by irrigation 15,000,000. In 1891 the number of acres that had been reclaimed was 2,172,000, but the amount of reclaimed acreage is increasing each year. In 1902 irrigation canals for 210,359 acres were begun. A supply of good water is furnished by the melting snows on the mountain tops. Thus are formed quite large streams, from which water is taken, in irrigating ditches, and distributed over the fields. There are irrigated lands in various parts of the State; but more than half lies in the valley of the North Platte River. Wheat, oats, hay, and potatoes are the principal crops; the climate is too cold for corn. Vegetables and some of the hardy small fruits are raised. The amount and value of the chief crops for 1902 were about as follows:

	Acres	Bushels	Value
Spring and Winter Wheat.....	65,000	2,675,000	\$2,542,000
Oats.....	230,000	4,160,000	2,080,000
Potatoes.....	11,000	1,100,000	902,000
Hay.....	300,000	720,000 tons	9,000,000

Northern Wyoming is a cattle and sheep raising section. The stock raised is of more value than the agricultural products. Great numbers of fine horses are raised, and many are sent each year to the markets in the Eastern States. Sheep are pastured on the mountain slopes in summer and on the plains in winter. In winter they subsist on the cured grasses; but sometimes the cold weather and snowstorms cause many to perish. Sheep raising in this State has increased greatly since 1900. The sheep are of a superior brand and the wool is an excellent quality. The number of stock in the State on 1 Jan. 1903 was as follows:

	Number	Value
Horses.....	113,444	\$3,282,736
Mules.....	1,481	78,292
Milk Cows.....	19,587	753,316
Sheep.....	5,828,158	14,306,693
Pigs.....	15,983	188,780
Other stock.....	796,060	18,533,928

In the amount and value of the wool product, in 1903, Wyoming ranked second, Montana being first.

Manufacturing.—The chief manufactured products are railroad cars and supplies, lumber and lumber products, harness, saddles, boots and shoes, clothing, flour, lime, brooms, cement, tobacco and malt products. In 1909 (government census) there were 266 manufacturing establishments, capitalized for \$5,840,000, and employing 2,811 persons. The total value of the products marketed was \$5,948,000. Manufacturing has increased but slowly from year to year, owing to the great distances from markets and centres of trade, and to the meagre transportation facilities. The manufacturing industries are limited mostly to the production of articles for local consumption.

Transportation.—The Union Pacific Railroad enters from the southeast and crosses the southern part of the State. Several short branches extend from the main line to different towns; three run from Cheyenne, one to the north and two toward the south. At Granger, in the southwest, the road branches, one line going northwest into Idaho, the other southwest into Utah. The Chicago, Burlington, and Quincy Railroad crosses the northeastern part of the State. A branch from the Northern Pacific Railroad extends from Livingston, in Montana, to Cinnabar, at the entrance to the Yellowstone Park. There are no railroads in the central or western part of the State, and the towns of the interior are connected only by stage routes. In 1901 there were 1,279 miles of railroad. The rivers within the State limits are not navigable for commercial purposes. The transportation facilities are entirely inadequate for the needs of so large a State or for the development of its natural resources. Wyoming has less miles of railroad than any other State except Nevada.

Militia.—In 1900 there were in the State, of militia-age, 32,988 men. In 1903 the organized militia numbered 526 men, of whom 43 were commissioned officers.

Banks and Finance.—The State has numerous and thrifty national banks, state, and private banks with a combined capital of over \$2,000,000. In 1890, when Wyoming became a State, a bonded debt was incurred, to the amount of \$320,000, for the capitol at Cheyenne and other public buildings. On 1 Jan. 1902 the debt had been reduced to \$280,000. The main sources of revenue are direct tax, land leases and sales, and fees. The total receipts for the fiscal year ending 30 Sept. 1910 was \$1,058,624; the expenditures, \$908,637. The debt is being reduced each year.

Charitable and Penal Institutions.—There is a State Board of Charities and Reform which has general oversight over and control of the charitable institutions of the State, with ample correctionary powers. Indoor relief has not been provided to any large extent, as it has not been required. There is an asylum at Cheyenne for the deaf, dumb, and blind, but it is used as a home for soldiers and sailors, on account of lack of occupants of the kind for which it was intended. The State Insane Asylum is located at Evanston, and a State hospital at Rock Springs. The penitentiary, first located at Laramie, has been moved to Rawlins. Saint Joseph's (R. C.) Hospital is at Laramie.

Education.—The education of all the children in a country so sparsely settled is very difficult, but the State has attempted to establish schools wherever five pupils can be found to attend. The school term is 89 days (1900). During the year 1900 there were 14,512 children enrolled as having attended school some portion of the year, out of a total enrolment of all persons between the ages of 5 and 18 in the State, which amounted to 19,744. The average attendance was 10,160. There were 524 public school buildings and 570 teachers, and eight Roman Catholic schools. The public school property was valued at \$453,607. In 1902 the schools of the State were University of Wyoming (q.v.) at Laramie, 10 public high schools, one private high school (Academy of

WYOMING

the Holy Child at Cheyenne), one State normal school at Laramie, one business college, at Cheyenne, and three private academies. The university was the only institution in the State which had power to confer degrees. The governing officials of the schools of the State are a State superintendent of schools, city superintendents at Cheyenne, Laramie, and Rock Springs, and a county superintendent in each county.

The requirements for a license to practise medicine in the State are successful examination or a diploma from a college which belongs to the American Association of Colleges or the Homoeopathic Institute, or the National Eclectic Medical Association, or any college of similar standing in a foreign country. To practise dentistry the requirement is a diploma from any dental college recognized by the National Association of Dental Examiners.

Each school district elects its own trustees. Teachers' institutes are provided by law; sessions of from 4 to 10 days are held annually. Discrimination as to pay of teachers on account of sex is forbidden. Children between the ages of 6 and 12 years must attend school 12 weeks in each year. Girls may not work in the mines; boys under 14 years of age may not work in the mines. Indian government schools have been established, and four private schools for the Indian boys and girls.

Government.—Under the State constitution both sexes are granted equal political rights and privileges, including the right to vote. All the State officers are elected for the term of four years and the treasurer is not eligible for reelection. The governor, secretary of state, auditor, treasurer, and superintendent of public instruction constitute the executive department. The salary of the governor is \$2,500; of each of the other officers \$2,000. The legislature holds biennial sessions, beginning on the second Tuesday of January of each odd year, and the term is 40 days. The legislature is composed of 23 senators and 30 members of the lower house. The salary of each member is five dollars a day and mileage. The capitol is at Cheyenne. The State has one representative and the usual two senators in the United States Congress.

Each one of the 23 counties has its own set of county officials.

Population.—The Federal Census of 1900 showed that Wyoming had, with one exception, the smallest population and the smallest density to the square mile of any State in the Union. The males numbered 58,184, the females 34,347. The foreign born numbered 17,415; Indians, 1,686; negroes, 940; Chinese, 401; Japanese, 393. The largest cities were Cheyenne, 11,320; Laramie, 8,237; Sheridan 8,408. State population (1880) 20,789, (1890) 60,705; (1900) 92,531; (1910) 145,965. B. ELLEN BUREA,

Editorial Staff, 'Encyclopedia Americana.'

History.—The stories of Spanish exploration have been much discussed, but the evidence is entirely inconclusive. The first white explorer of whom there is satisfactory record was the Chevalier de la Verendrye, a French-Canadian fur-trader who had settled on Lake Nepigon in 1728, and who, with a view toward developing commerce with the natives, passed 11 years of travel in the western wilderness.

He passed through Wyoming in 1743-4, on his return journey. According to the most authentic accounts, the first American to enter Wyoming was John Colter, who in 1807 discovered the Yellowstone region. The Wyoming section soon thereafter became the scene of the activities of American fur trappers and traders,—among them Capt. B. L. E. Bonneville, 7th U. S. infantry, whose adventures have been narrated in a well-known work by Washington Irving. The territory comprised within the present State belonged (with the exception of the southwestern corner—a portion of the territory ceded in 1848 by Mexico) to the Louisiana Purchase (1803). The first white settlement was at Fort Laramie, on the Laramie fork of the Platte, in 1834. This fort was purchased by the American Fur Company in 1835, rebuilt by the company in 1836, and sold by it to the United States government in 1849. For many years it was an important base of operations against the Indians. Fort Bridger was built on the Black fork of Green River in 1842, but abandoned in 1853. In 1842 Fremont visited Wyoming. Prior to 1866, all armed or migratory expeditions westward, including Gen. Connor's march along the "Bozeman trail" in 1865, had been in support of Mormon emigration, or to reach California and other opening fields of gold discovery. The inception of the Union Pacific Railroad developed new necessities for the occupation of regions farther north, only to be reached by the uncertain navigation of the upper Missouri. Gold discoveries in central Montana evolved the practical fact that neither river navigation, nor the diversion of overland travel from Ogden northward, at a sharp right angle, could furnish the required facility for reaching the new field of promise, but that a new road, following the Bozeman trail, around the Big Horn Mountains and up the Yellowstone Valley, would constitute a diagonal course which would shorten wagon travel by at least 300 miles. During the year 1865, the Harnay-Sanborn treaty guaranteed to Indians occupying that vast hunting region their undisturbed possession, provided they would not interrupt the building of the proposed railroad across the plains. All that upper region once belonged to the friendly Crow Indians, known as "Upsero-kas," or "Absarakas," belonging to "the land the crows fly over," or the "Land of the Crows," and this included the region watered by the Yellowstone, Big Horn, and Big Wind rivers. Northern Sioux, Arapahoes, and Cheyennes had gradually encroached upon these hunting grounds, and were hostile to white intrusion as well as to the Crow Indians themselves. These tribes, however, were summoned to meet a government commission at Laramie in May 1866, to decide upon what terms they would permit the building of a wagon road through that country and around the Big Horn Mountains to Montana. This proposition gained new promise from the fact that during the winter and early spring of 1865-6 hostilities along the lower Platte had almost ceased, and the Pawnees of Nebraska and Spotted Tail's Brulé Sioux were friendly to the whites.

In anticipation of successful negotiations, without conflict, Maj.-Gen. John Pope, commanding the Department of the Missouri, by general order 33, reorganized the department, upon the muster-out of volunteers who served

WYOMING

at the West during the Indian hostilities of the Civil War period, and formed five military districts, the "Minnesota," "Upper Missouri," "Platte," "Upper Arkansas," and the "Mountain District," the last named embracing the entire field desired for the new emigrant route to the Northwest. Army regiments were recruited as rapidly as possible to meet the new conditions. Col. Henry B. Carrington, of the 18th U. S. infantry, a three-battalion regiment, himself a brigadier-general, U. S. volunteers, from November 1862, and afterward brigadier-general, U. S. A., retired, who was then at Fort Kearney, Nebraska, in command of the East Sub-district of Nebraska, covering operations along the Platte River, and the upper forks of the Republican, was detailed to command the new Mountain District. His battalion, about 700 strong, started 19 May, reaching Laramie, 265 miles, on 15 June. Old Fort Connor, changed to Fort Reno, was to be rebuilt, and after another march of 65 miles, and passing Lake De Swedt, the location of Fort Phil Kearney, between the forks of Piney Creek, was surveyed and established 15 July. Later, 91 miles westward, Fort C. F. Smith was built upon the Big Horn River. An additional post on the upper Yellowstone was ordered, but never built, for want of troops. Col. Carrington, a practical engineer, prepared working plans for the building of Fort Phil Kearney, and in person superintended the erection of buildings, magazine, stockade, saw-mills, and all elements of a strong defensive post. Inspector-General Hazen pronounced it the "best on the continent, except one of the British Fur Company." Hostilities were immediate and constant. "During six months 51 hostile demonstrations were made, incurring a loss of 150 citizens and soldiers, and over 700 head of stock." On 8 Dec. 1866 President Johnson advised Congress that treaties had been effective and that peace reigned on the plains. But in a fight on 6 December Lieut. Bingham was killed, and a crisis was reached 21 Dec. 1866 when Capt. (brevet Lieut.-Col.) W. J. Petterson, accompanied by Capt. Frederick Brown and Lieut. George W. Grummond, and 78 men, were decoyed into an ambush and slaughtered. News of the tragedy reached Washington Christmas night. This disaster, so unexpected and complete, and so needless, if "the reinforcements and supplies repeatedly promised, but never furnished, had been received," shocked the whole country, and the first battalion of the 18th, and other troops, long idle at Fort Laramie, were hurried to save the feeble garrison that survived. Such a wholesale and barbarous massacre inspired friends of the new territory to give it a name memorable in the Indian history of Pennsylvania, irrespective of some fancied Indian meaning of the word Wyoming. Official reports at the time urged retention of the name in use by the Crow Indians, and as approved by James Bridger, the guide of the expedition, and an adopted Crow chief. During August 1867 Red Cloud again attacked a working party and was repulsed with great loss. But from lack of troops to sustain the line, Gen. Grant ordered the forts demolished. The original failure to support properly the first occupation delayed the peaceful settlement of the new territory until, after 10 years, another massacre, that of Gen. Custer (q.v.) and his command, compelled the government

efficiently to protect the frontier against the savage tribes of the Northwest.

The Territory of Wyoming was created by Congress 25 July 1868 from Utah, Idaho, and Dakota. The Territorial government was organized in 1869. A constitution adopted in November 1889 was approved by Congress, and the State was admitted to the Union 10 July 1890. In national politics the State has been Republican, save in 1896, when it went Democratic.

Doc. 33, 1st Sess. 50th Cong.; Carrington's 'Ab-saraka, or Wyoming Opened.'

HENRY B. CARRINGTON,
Brig.-Gen., U. S. V.; Col. U. S. A. (retired).

Wyoming, University of, located at Laramie, Wyo. It was chartered by the legislature of the Territory of Wyoming in 1886, and opened to students in 1889; the first State legislature in 1890 passed an act enlarging the scope of the University, and also made the State Agricultural College provided for by the national grants a part of the University organization. The State has since doubled its regular appropriation, and made several appropriations for special purposes. The University is open to women on equal terms; tuition is free except in the Department of Music. The educational policy of the University was liberal from the first; the preparatory and collegiate departments were the first established; the organization now includes (1) the Preparatory School; (2) the College of Liberal Arts; (3) the Graduate School; (4) the Normal School; (5) the College of Agriculture and the Agricultural Experiment Station; (6) the College of Mechanical Engineering; (7) the School of Mines; (8) the School of Commerce; (9) the School of Music. The College of Liberal Arts offers a classical, a literary, and a scientific course, and confers the degree of B.S. for the scientific course without Latin, and the degree of B.A. for all other courses. In each course the work of the Freshman year is required, the work of the Sophomore year partially elective, and the work of the Junior and Senior years almost entirely elective. The Graduate School affords opportunities for advanced study, the different departments offering suitable graduate courses. The master's degrees are conferred. The regular courses in Normal School, the College of Agriculture, the College of Mechanical Engineering, and the School of Mines are five years in length, including one preparatory year; the degree of B. Ed. is conferred for the completion of the normal course; the degree of B.S. for the agricultural, engineering and mining courses. There are also a one year's course in the Normal School, a course in domestic science, a one year's and a two years' agricultural course and a ranchmen's winter course in the College of Agriculture, and a winter course of six weeks in the School of Mines. The School of Commerce offers two two-year courses in bookkeeping and in stenography; the School of Music a seven-years' course in piano. Instruction in military

WYOMING VALLEY—WYTHE

science and tactics is also given. The University has organized a University Extension Association, which conducts extension lectures in all parts of the State; a Correspondence Teaching Department is also conducted, by which some of the work toward a degree may be done. The campus now occupied 40 acres in the eastern part of the city; the buildings are the Hall of Languages, the Mechanical Building, the Hall of Science, and the Gymnasium; the three first mentioned are built of gray sandstone, which is found near Laramie. The library in 1910 contained 28,000 volumes; the students numbered 244, of whom 108 were in the College of Liberal Arts, 50 in the Normal School, 20 in the School of Commerce, 30 in the College of Engineering, 15 in the School of Mines, 11 in the Graduate School, and 107 in the Preparatory Department.

The University of Wyoming, though in numbers one of the smallest of the State universities, is well equipped and maintains a high standard of scholarship, as the real head of the educational system of the State.

Wyoming Valley, a crescent-shaped valley in Luzerne County, Pa., traversed by the northern branch of the Susquehanna River; length 21 miles. It is a fertile alluvial plain, with rich deposits of anthracite coal, and is noted for its beautiful scenery. The valley was claimed by the colony of Connecticut as early as 1753, and was first settled by people from Connecticut; the ensuing dispute between Pennsylvania and Connecticut over this territory is known as the "Pennamite and Yankee war," and was not finally settled till after the Revolutionary War. (See *PENNSYLVANIA; History; Boundary Disputes*.) In 1782 a commission appointed by Congress decided in favor of Pennsylvania; an attempt was made to drive out the Connecticut settlers which led to a renewal of the war; but in 1788 Pennsylvania confirmed the titles of all actual settlers to their land, and all controversy was ended by 1800. During the Revolutionary War, a large proportion of the men of the Wyoming Valley joined the Continental Army; but a number of Tories were living in the valley; and in 1778, when they were joined by British troops and Indian allies, an attack was made upon the settlers who had taken refuge in Forty Fort near Wilkesbarre. The settlers did not number over 400, chiefly boys and old men; the British force, including the 700 Indians, was about 1,100. After a desperate battle fought on the 3d of July 1778, the settlers were completely defeated, about two thirds being killed. They were forced to capitulate, and after the surrender many of the prisoners were tortured and killed by the Indians. The greater part of the inhabitants of the valley were compelled to flee to other settlements, and endured great hardships. Consult Miner, 'History of Wyoming' (1845); Stone, 'Poetry and History of Wyoming' (1844); Peck, 'Wyoming: its History and Incidents' (1858).

Wyon, w'lon, William, English engraver and designer of coins and medals: b. Birmingham 1795; d. Brighton, Sussex, 20 Oct. 1851. Having won several prizes for medals offered by the society of arts, he went in 1816 to London, and was appointed second engraver at the mint, a post which he filled until the close of his life. In 1832 he was elected an associate of the Royal Academy, and in 1838 an academician,

being the first of his department who had ever obtained these honors. His works, comprising coins, pattern pieces of coins not used, medals, and seals, are numerous. His coins cover a period of nearly 30 years, including the latter part of the reign of George IV., the reign of William IV., and the first 13 years of the reign of Victoria. Far more numerous than these are his war, scientific, artistic, and testimonial medals, executed from his own or from Flaxman's designs, and in the highest style of art.

Wyss, vîs, Johann Rudolf, Swiss author: b. Bern 13 March 1781; d. there 31 March 1850. He was educated at various German universities, became professor of philosophy at Bern in 1806, and later also chief librarian. His 'Der Schweizerische Robinson' (1812-13), an imitation of Defoe, was translated into various languages, the first series appearing in English ('The Swiss Family Robinson') in 1820, the second in 1849. Wyss also wrote 'Vorlesungen über das Höchste Gut' (1811), and 'Idyllen und Erzählungen aus der Schweiz' (1815-22); and edited the collection 'Alpenrose' (1811-30).

Wythe, wîth, George, American patriot: b. 1726 in the county of Elizabeth City, Va., a short distance from Yorktown; d. Richmond, Va., 1806. One of his ancestors was George Keith (1639-1716), a Scotch Quaker, distinguished as a mathematician and Oriental scholar, who emigrated to America about 1684. On account of his radical religious views and his opposition to slavery, he was often imprisoned. On 15 Oct. 1693, Keith issued an 'Exhortation and Caution against buying or keeping Negroes,' seemingly the earliest Quaker protest against slavery. These views were inherited by George Wythe. From his mother, Wythe received a life-long bent toward classical scholarship. Even at the age of 80, he began to learn a new language. He was trained in the law by an uncle. Wythe's connection with the House of Burgesses, in Virginia, began on 27 Feb. 1752, on the eve of the French and Indian war. Hence he knew in a practical way the steps leading up to the Revolution, whose course he was destined to influence. He was a member of the Continental Congress, and one of the signers of the Declaration of Independence. He sat in the Philadelphia Convention of 1787 and exerted himself to secure the ratification of the Constitution by Virginia the following year. For ten years he was a member of Virginia's supreme court of appeals, and for above 20 years sole chancellor of the State. However important and varied were such positions that he filled, George Wythe is not to be judged chiefly as statesman or jurist. He was greatest as teacher, and his most lasting work was the subtle influence of his singularly pure and lofty character. Either in his law office or as professor in William and Mary College, he was the teacher of Thomas Jefferson, John Marshall, James Monroe, Henry Clay, and scores of other men only less prominent than these. With Jefferson, in particular, Wythe maintained a friendship and interchange of thought which had a bearing upon national concerns. So highly did Jefferson prize the work of Wythe as a teacher, that he exerted himself to establish, in 1779, in the College of William and Mary a chair of law, expressly for the occupancy of his "master

1. Mechanical Building and Science Hall University of Wyoming.
2. Hall of Languages, University of Wyoming.

WYTHEVILLE

and friend," as he delighted to call Wythe. Wythe was the first professor of law in the United States. William and Mary College was the second in the English-speaking world to have a chair of Municipal Law, George Wythe coming to such a professorship a few years after Sir William Blackstone. Jefferson, in writing from Paris in 1785 to Dr. Richard Price, an English opponent of slavery, gives striking evidence of his estimate of the services which Wythe was rendering to his country: "The College of William and Mary in Williamsburg, since the remodelling of its plan, is the place where are collected together all the young men (of Virginia) under preparation for public life. They are under the direction (most of them) of a Mr. Wythe, one of the most virtuous of characters, and whose sentiments on the subject of slavery are unequivocal." Henry Clay, in a letter of 3 May 1851, to B. B. Minor, says in reference to Wythe: "To no man was I more indebted, by his instructions, his advice, and his example, for the little intellectual improvement which I made, up to the period when, in my twenty-first year, I finally left the city of Richmond." "The most remarkable instance," says Munford, "of his genuine patriotism, to which I confess I am rendered most partial perhaps by my own experience of its effects, was his zeal for the education of youth. Harassed as he was with business; enveloped with perplexing papers, and intricate facts in chancery, he yet found time for many years to keep a private school for the instruction of a few young men at a time, always with very little, and often demanding no compensation." That Wythe conceived the training of publicists to be his true task appears from this sentence in a letter on 5 Dec. 1785, to John Adams: "A letter will meet me in Williamsburg, where I have again settled, assisting, as professor of law and police in the University there, to form such characters as may be fit to succeed those which have been ornamental and useful in the national councils of America." In three signal instances Wythe was a forerunner. As early as 1764, he wrote Virginia's first remonstrance to the House of Commons against the Stamp Act, taking so advanced a position in regard to that ominous Act as to alarm his fellow-burgesses. He was perhaps the first judge to lay down, in 1782, the cardinal principle that a court can annul a statute deemed repugnant to the Constitution, thus anticipating by a score of years the classic decision of his great pupil, John Marshall, in the case of *Marbury v. Madison*. He was an ardent advocate for the emancipation of the slaves, not only infusing his students with his abolition sentiment, but actually freeing his own slaves and making provision for them in his will. His death occurred in Richmond, Va., in 1806, from poison administered by his great-nephew, who hoped to come thus into the inheritance of his estate. "No man," says Jefferson, "ever left behind him a character more venerated than George Wythe. His virtue was of the purest kind; his integrity inflexible, and his justice exact; of warm patriotism, and devoted as he was to liberty and the natural and equal rights of men, he might truly be called the Cato of his country, without the avarice of the Roman; for a more disinterested person never lived. Temperance and regularity in all his

habits gave him general good health, and his unaffected modesty and suavity of manners endeared him to every one. He was of easy elocution, his language chaste, methodical in the arrangement of his matter, learned and logical in the use of it, and of great urbanity in debate. Not quick of apprehension, but with a little time profound in penetration, and sound in conclusion. His stature was of middle size, well formed and proportioned, and the features of his face manly, comely, and engaging. Such was George Wythe, the honor of his own and the model of future times."

S. C. MITCHELL,

President University of South Carolina.

Wytheville, with'vil, Va., town, county-seat of Wythe County; on the Norfolk & Western Railroad; 130 miles west of Lynchburg and 215 miles southwest of Richmond. It is in a stock-raising and mining region and has considerable lumbering interests. It has manufactories of iron works, woolen goods, and lumber products. The town has a county court-house, Trinity Hall Female College (Luth.), Wytheville Seminary (P.E.), Academy of the Visitation (R.C.), public elementary schools, and two libraries. The two state banks have a combined capital of \$100,000. Pop. (1890) 2,570; (1900) 3,003; (1910) 3,054.

Wytheville, Military Operations at.

During the Civil War the lead mines and works near Wytheville assumed much importance. On 13 July 1863 Col. John T. Toland, with the 2d West Virginia cavalry and 34th Ohio mounted infantry, about 800 men, started from Fayetteville, W. Va., to damage the lead works and destroy the railroad near Wytheville. On the evening of the 18th Toland arrived within five miles of the town and detaching two companies to destroy a railroad depot and track, 10 miles west, marched his remaining force into the town, which was defended by less than 200 men, under Maj. Bowyer, most of them distributed in houses and some in the streets supporting two guns. There was an obstinate fight in the streets, lasting an hour, when the town was taken and 8 or 10 of the best houses burned. The two guns and many small arms were captured and some prisoners taken, but all were abandoned when the return march was taken up next morning. The command reached Fayetteville on the 23d after a march of about 300 miles. The expedition had failed of its object, with the loss of 78 killed, wounded, and missing, of whom 17 were killed, including Col. Toland and two other officers. Col. Powell, commanding the 2d West Virginia cavalry, was severely wounded and captured. The Confederates report a loss of 6 killed and 12 wounded. On 2 May 1864 Gen. Crook started from Charleston on the Kanawha to destroy the Virginia and Tennessee Railroad and join Gen. Sigel in the Shenandoah Valley. One of his columns, of 2,600 cavalry, under Gen. Averell, was directed upon Saltville to destroy the salt-works, and then rejoin the main column under Crook at Dublin Station. After a very difficult march through the mountains and some sharp skirmishing Averell reached Taxewell Court House on the afternoon of the 8th, where he learned that Saltville was defended by earth-works and artillery, and was held in strength by Gen. W. B. Jones, upon which he abandoned

WYTTENBACH

the idea of attack and turned toward Wytheville, near which he arrived on the afternoon of the 10th and encountered Col. John H. Morgan, who had followed him from Saltville and by a detour first gained the town with a brigade and two battalions. A detachment of Morgan's command had been pushed out to a small gap in the mountain, through which alone Averell could approach the town from the road on which he was marching. The detachment was immediately attacked and Morgan marched to its assistance with all his command, and Averell fell back to a commanding ridge 800 yards from the gap. The contest continued four hours, or until nightfall, in a succession of attacks on the one side and retreats on the other, when Morgan fell back a short distance and Averell withdrew and next morning marched for Dublin, where he arrived in the evening and, resuming his march, joined Crook at Union on the 15th. Averell had 114 killed and wounded, and lost nearly 100 in prisoners. Morgan had 50 or 60 killed and wounded. When Gen. Stoneman made his raid into southwestern Virginia in December 1864 he captured Wytheville on the 16th, partially burned it, and next day sent a detachment to destroy the lead mines, which was done without loss. On Stoneman's second raid in southwest Virginia and western North Carolina in March 1865, Col. J. K. Miller, with 500 picked men of his cavalry brigade, captured Wytheville 6 April and destroyed the

depot of supplies at that point and the bridges over Reedy Creek and at Max Meadows. At Wytheville Miller was attacked by Confederate infantry and cavalry, but after hard fighting repulsed them, and withdrew with a loss of 35 killed, wounded, and missing, and rejoined the main column on its march for Salisbury, N. C.

E. A. CARMAN.

Wytenbach, vit'ten-bach, Daniel, Dutch scholar: b. Bern, Switzerland, 7 Aug. 1746; d. Osgeest, Holland, 17 Jan. 1820. He studied at Marburg, Göttingen, and Leyden; became professor of Greek at the Remonstrant Gymnasium at Amsterdam in 1771, of philosophy at the Athenæum in 1779, and succeeded in 1799 to Ruhnken's chair of rhetoric at Leyden. His greatest work is the edition of Plutarch's 'Morals,' with copious annotations and an admirable 'Greek Index to Plutarch's Works' (1795-1830). He retired in 1816, and died after some years of blindness. His 'Opuscula' appeared in 1820. Consult Mahne, 'Via D. Wytenbach' (1823).

Wytenbach, Johanna Gallien, Dutch writer: d. Leyden. She was married to D. Wytenbach (q.v.) when he was 72, and after her husband's death lived at Paris and was given the degree of doctor in philosophy by Marburg, in 1827. Among her writings were: 'Theagenes' (1815); 'Leontes' Banquet' (1812); and the romance 'Alexis' (1823).

X

X the twenty-fourth letter and nineteenth consonant of the English alphabet: it is a superfluous letter since it stands for no sound that cannot be signified by other letters.

When it occurs in the beginning of a word it is always pronounced in English as *s*: *Xenophon*, *senophon*, *siphoid*, *siphoid*; in the middle of a word it is usually equal to *ks*: *axis*, *aksis*, *Saxon*, *sakson*; but when in a word it ends a syllable, more especially an initial syllable, if the syllable following it is open or accented, the *x* has often the value of *gs*, as in *luxury*, *lugsurey*, *exhaust*, *egghaut*. Final *s* is always equal to *ks*. As an initial letter *s* does not occur in English save in words mostly technical and derived from Greek, and in a few words, mostly proper names, of Spanish origin.—The power of *x* in English, as in Latin, is that of the Greek letter *xi* (Ξξ), but its form is that appropriated in the Greek alphabet to the guttural aspirate *chi* (Χχ). Before the introduction of *x* (ξ) the Greeks represented the sound of *s* by Ξξ, ξs, and the Latins at first did the like, writing *Massumia*, *prossumus*; but as *s* had in their writing no function but that of representing, with *s* the sound of Greek *si*, the very sight of the *s*, even before the eye came to the *s*, raised in the mind the idea of a sibilant, and thus rendered the sibilant letter itself superfluous, and before long it was omitted and *s*, standing alone, represented the two characters *s* and *s*. In the popular pronunciation of Latin in the later period of the empire, *s* seems to have been sounded like *s* or *ss*: some inscriptions of that period have *visit* for *visit* and *miles* for *miles*. This change in the sound-value of *s* has persisted in the modern language of Italy in which *ss* or *s* is regularly substituted for the Latin *s*: *saxum* becomes *sasso*, *experimentum*, *experimento*, *maximus*, *massimo*, and so on. And in French, in words derived from Latin, the *s* occurring in the middle of a word is often changed to *ss*: *laxare* becomes *laisser*; or Latin *s* is changed to the sound of *sh*: *versare* becomes *facher*; and the word *sorsione* is pronounced *sorsione*. *X* hardly occurs in German words of native origin; its sound is usually represented in that language by *chs*, examples: *ochs* (ox), *works* (wax), *Sachse* (a Saxon).

X-Rays, or **Röntgen Rays**, a form of radiant energy originating in the highly-exhausted vacuum tubes of Crookes (see **VACUUM**), and resembling light in certain respects, though differing from it notably in many ways. The X-rays are propagated in straight lines, and are capable of affecting the sensitive plates that are employed in photography, so that

subsequent development will cause the affected portions to blacken, just as though the plate had been subjected to the action of light. The X-rays are practically invisible to the eye. They are capable, however, of exciting brilliant fluorescence in certain minerals, and their presence may, by this means, be made distinctly evident to the eye. The X-rays were discovered in 1895 by Professor Wilhelm Konrad Röntgen, of the University of Würzburg; the name being given by him to signify that the ultimate nature of the radiation was unknown, "X" being a letter that is commonly used in algebraic operations to represent an unknown quantity.

In the nearly-perfect vacuums employed by Crookes, the high-tension electrical discharge does not take place between the electrodes in the form of a spark, but, when the tension of the gas in the tube is sufficiently low, it assumes the form of a luminous streamer, proceeding across the tube from the negative electrode (or "cathode"), in a direction perpendicular to the surface of this electrode. The luminous shaft that proceeds outward from the cathode in this manner is called the "cathode ray," and it exhibits many interesting phenomena. (See **VACUUM**.) In a general way, it may be said to deport itself as though it were composed of a storm of tiny electrified projectiles, which are negatively charged by contact with the cathode, and are then violently repelled from the cathode in a direction perpendicular to its surface. Many experimenters have devoted their attention to the cathode ray, in the endeavor to discover its true nature; and among these experimenters was Lenard, a young German physicist, who was assistant to Dr. Heinrich Hertz, at Bonn, at the time of the latter's death in 1894. Lenard appears to have been impressed with the idea that it is possible to make the cathode ray emerge from the vacuum tube, into the air. It would seem that the projectile explanation offered above precludes any such possibility; but Lenard found that if the vacuum tube is provided with a very thin pane of aluminum foil at the place where the cathode ray strikes it, this ray can apparently pass through the aluminum so as to emerge into the air outside of the tube. In Lenard's apparatus the vacuum tube is entirely enclosed by opaque material, so that the light from the interior of the tube may not affect the eye; the thin pane of aluminum being placed, as indicated above, at the place where the cathode ray within the tube strikes the wall of the tube. When the proper precautions are taken against the escape of any ordinary light from the interior of the tube, the cathode ray, in a darkened room, can be seen to emerge from the tube through the

X-RAYS

aluminum, taking the form of a divergent and diffuse luminous brush, which, as Lenard showed, can be deflected by a magnet. Lenard also found that the emerging brush affects a photographic plate, and he investigated the relative transparencies (or opacities) of various substances for it. Röntgen repeated certain of the experiments of Crookes, Hittorff, Lenard, and others, and made the further discovery that vacuum tubes also generate another kind of radiant energy, which he called "X-rays," and which resemble the cathode ray in some respects, but differ from it in not being deflected by a magnet, and in not being distinctly visible to the eye. The X-rays and the cathode ray are both capable of exciting strong fluorescence in certain crystalline substances which are subjected to their influence; and in working with the X-rays it is customary to make use of fluorescent screens, which are coated with barium platinocyanide, or with calcium tungstate, or with some other substance in which the fluorescent effects of the X-rays are very pronounced. A screen of this kind, when exposed to the action of the X-rays, becomes luminous, and the intensity of the luminosity is proportional to the intensity of the radiation striking the screen. Thus when a screen of this kind is glowing with uniform brilliance, and an object (such as a piece of lead or glass) which is more or less opaque to the rays is interposed between the screen and the tube from which the X-rays proceed, the object so interposed shields the screen, over a certain area, from the exciting X-rays, so that a comparatively dark region is produced, as though the opaque object were casting a shadow. The relative opacities of various substances can be studied in this manner, by merely interposing the objects whose opacities are to be tested, and noting the depths of the apparent shadows that are produced. Glass is found to be much less transparent to the X-rays than an equal thickness of aluminum or of wood, and, in general, it may be said that the opacity of any substance is approximately proportional to the density of the substance. When a portion of the human body is interposed between the tube and the fluorescent screen, the bones, having a greater density than the flesh that surrounds them, cast shadows upon the screen, so that their images can be seen, dark, against a much lighter background. In comparatively thin parts of the anatomy, such as the hand, very good shadowgraphs can thus be had of the bones; but when the X-rays have to traverse thicker parts of the body, such as the chest, the shadowgraphs are far less distinct. The ribs can be seen through the entire body, though somewhat imperfectly, and the liver and heart can also be indistinctly perceived. Tumors and other morbid growths can likewise be traced to some extent, as well as tubercular areas in the lungs, and certain other pathological conditions. (The haziness of the images that are obtained when the X-rays traverse thick tissues is due, no doubt, to "secondary radiation," as explained below.) Owing to the great density of lead, bullets that are embedded in the flesh can frequently be located with considerable accuracy, and in the surgical treatment of bullet wounds the X-rays are therefore often highly useful.

Permanent images of the shadowgraphs that are produced by the X-rays can easily be had by substituting a sensitive photographic plate for

the fluorescent screen referred to above; the image being allowed to fall upon the photographic plate, which is afterwards developed in the usual manner.

There has been some controversy about the origin of the X-rays;—that is, about the part of the tube from which they emanate. Röntgen believed that they originate in the region where the cathode ray is stopped by the wall of the tube, or by some other obstacle; and although this view has been disputed by other experimenters, it is now believed to be correct. That is, when the cathode ray strikes against the glass wall of the containing tube, the X-rays appear to originate at this point on the wall, and when the tube is so constructed that the cathode ray strikes directly against the anode, then the X-rays proceed from the anode. It has been found, indeed, that the radiation is much more intense when the design of the tube is such as to cause the cathode ray to impinge directly upon the anode, and in most of the modern tubes for the production of X-rays this construction is adopted. It is observed that when an X-ray tube has been operated for a considerable time, the vacuum within it becomes more and more perfect, so that it is eventually difficult to force through the tube a discharge sufficient to generate the rays with the desired intensity. Moreover, the penetrative character of the X-rays given off by a tube appears to depend to a considerable extent upon the degree of perfection of the vacuum, as was observed by Röntgen himself. For these reasons, most of the X-ray tubes are made, at the present time, with regulable vacuums, the main tube being provided with a side bulb, with which it communicates by means of a tube. The glass walls of the auxiliary bulb become covered with a thin layer of condensed air (see *ANODIZATION*); and when, through the operation of the apparatus, the vacuum in the main tube has become so highly perfected that the discharge passes with difficulty, the walls of the auxiliary bulb are warmed by a gas flame or otherwise, so that a portion of the air that is held condensed upon them is driven off into the interior of the bulb, and thence into the main tube, until the vacuum becomes reduced sufficiently to permit of the satisfactory passage of the discharge.

The experimental investigation of the X-rays is beset with serious difficulties, because these rays possess properties so different from those of ordinary light that few of the methods that are employed for the study of light can be applied to them. For example, the X-rays cannot be refracted, and they are apparently not capable of regular reflection. Hence they cannot be focused in any way. Furthermore, they cannot be made to exhibit diffraction, interference, or polarization. Many of the methods employed in the study of light are based upon one or more of these phenomena; and hence, the phenomena themselves being absent in the case of the X-rays, little or no help in the investigation of this form of radiation can be had from our previous experience with light.

When the X-rays traverse a solid which is more or less transparent to them, the distinctness of the shadow-like images that are seen upon the fluorescent screen, or which are recorded upon the photographic plate, diminishes with the thickness of the object through which the rays pass. The images become diffuse with

X-RAYS

increasing thickness in such a way as to suggest that the X-rays do not really travel in straight lines, but that they are capable of bending about an obstacle so as to influence the screen, or the sensitive plate, behind the obstacle. A more careful study of the phenomenon indicates, however, that the diffuseness of the image under these circumstances is due to the fact that each particle in the course of the X-rays acts as a centre of "secondary radiation," from which X-rays again emanate, though with reduced intensity, in all directions. The passage of X-rays through a body may therefore be compared with the passage of ordinary light through a light mist, each particle of the mist acting, in a similar manner, partly as a mere obstacle, and partly as a new centre of radiation, so that the shadows that are observed in such a case are diffuse and indefinite.

The discovery of the X-rays led to much speculation among physicists as to their ultimate physical nature. In the theory of light it was long ago pointed out that the disturbance which takes place in the ether when a light-wave travels through that medium must be such that the displacements that occur, whatever their nature may be, occur only in directions that are perpendicular to the direction in which the ray itself progresses. (See *ETHER; UNDULATORY THEORY*.) There appeared to be no phenomenon whose existence corresponded to the existence of a wave of compression and rarefaction in the ether, such as occurs in air when a sound-wave passes; and in order to explain the absence of this longitudinal wave of rarefaction and compression it was necessary, in the elastic-solid theory of light, to assume that the ether is absolutely incompressible, or to make certain other special assumptions with respect to its nature. Upon the discovery of the X-rays, it was therefore natural to inquire if they do not constitute the missing phenomenon corresponding to a compressive disturbance in the ether. This idea, although it was an attractive one, and agreed well with the absence of polarization in the X-rays, gradually fell out of favor, giving way temporarily to the hypothesis that the X-rays are similar in nature to ordinary light, but that they are of exceedingly short wave-length—much shorter, in fact, than any form of radiation previously known. There was much to be said in favor of this latter hypothesis, for it was known that the phenomena that would be manifested by light of wave-lengths exceedingly short in comparison with the average distances between the molecules of transparent bodies would be very different from those that are observed in connection with light of longer wave-lengths. Even if the wave-length of the X-rays were very short, however, it would be natural to expect that interference phenomena of some sort might still be observable; and yet no such phenomena could be detected. What is probably the true explanation of the nature of the X-rays was given almost simultaneously by Stokes, Lehmann, and J. J. Thomson. The "pulsation theory" advanced by these physicists assumes that the X-rays do not, like light, consist of trains of waves, in which a series of similar waves follow one another in rapid succession and at regular intervals, but that they consist, instead, of a series of electrical pulsations through the ether, following one another without any regularity. A mathematical analysis of the conse-

quences of this theory indicates that it is in entire harmony with the observed absence of refraction, reflection, polarization, interference, and diffraction. The cathode ray within the vacuum tube is believed to consist of a storm of tiny molecular fragments, or electrons (q.v.), the velocities of which may be as great as 40,000 miles per second. When one of these charged particles comes in contact with a solid wall or other obstacle, the abrupt change that is produced in its motion causes a violent alteration in the electrical stress that exists in the ether immediately about the point of collision, and the result is, that this point of collision serves as a centre from which a pulsation of electrical disturbance radiates outward. A fresh pulsation will therefore be produced every time a charged electron collides with the solid obstacle, and hence, since there is no regularity in the collisions, there will also be no regularity in the resulting ethereal pulsations. This view of the nature of the X-rays accords with all the known phenomena, even with the demonstrated absence of the X-rays from ordinary sunlight. This last fact was tested and verified by experiments upon Pike's Peak where a sensitive photographic plate was exposed for several months to the action of the sunlight, protected by wrappings that were impervious to light, but which would transmit, freely, any X-rays that might happen to be present. The elevated position was selected in order that any absorptive action that the earth's atmosphere might exert upon the rays should be reduced to the smallest practicable amount. Subsequent development of the exposed plate showed no evidence of the action of X-rays upon it.

In the course of experiments with the X-rays, it was soon found that they are capable of producing more or less marked physiological effects. The most noticeable of these consists in the "burning" of the skin, the cuticle becoming reddened and inflamed under protracted exposure to these rays, much as it does upon exposure to strong sunlight. It was also found that the human eye can perceive the X-rays faintly, though it is believed that the retina is not directly affected by them; the sensation of a faint, indefinite light to which they give rise being probably due to the fluorescing of some of the inner parts of the eye under their influence. The known fact that the artificial culture of tuberculosis germs must be conducted in the dark, and that strong sunlight will check the development of such germs, or destroy them altogether, led to the hope that the X-rays might have similar properties, and that on account of their marked power of penetrating the human flesh, they might be useful in the treatment of tuberculous disease. These hopes were not very fully rewarded, but the X-rays have nevertheless proved valuable in the treatment of superficial tuberculosis (lupus) and cancer. Some authorities still hold that the cases of apparent cancer which have been successfully treated by the X-rays have not been correctly diagnosed, and that true carcinoma does not yield permanently to the action of this agency. See *ETHER; ELASTICITY; LIGHT; RADIOACTIVITY; VACUUM*. Consult, also, Barker, 'Röntgen Rays,' in the 'Scientific Memoir Series,' where several of the most important of the papers that have appeared are collected. A. D. RISTEN, PH D.

X. Y. Z. CORRESPONDENCE — XANTHOXYLUM

X. Y. Z. Correspondence, in United States history, the name given to the despatches of the three commissioners to France in 1797-8, Marshall, Pinckney, and Gerry. These commissioners reached Paris in October 1797, but were refused recognition by the Directory. They were, however, notified by the secretary of the Marquis de Talleyrand, minister for foreign affairs, that agents would be sent to conclude negotiations. The first of these, Hottinguer, stated that a "loan" of \$1,200,000 would be the necessary means of placating the Directory: the other two, Bellamy and Hauteval, urged that in case the American government would buy at par stock amounting to 32,000,000 livres, but whose market-value was really about one half that amount, the transaction would be viewed as a loan. The intimation was that in default of money war would ensue. These terms were promptly rejected. The despatches sent by the commissioners were submitted in copy to Congress, X., Y., and Z., having been substituted for the respective names of the French agents. A great stir was caused at the time. Preparations for hostilities were made, and war on the sea actually broke out. Consult for the text of the correspondence 'American State Papers, Foreign Relations,' Vol. II. (1832).

Xanthian (zân'thî-an) Marbles, a large collection of marbles of various ages (from 545 a.c. onward) discovered near Xanthus, in 1838.

Xanthine, an organic base, $C_5H_4N_4O_6$, occurring in small amounts in many animal secretions, in the blood, urine, liver, in some urinary calculi, and in tea extract. It may be readily made by the action of nitrous acid on guanine. A white amorphous powder slightly soluble in water, and forming crystalline compounds with both acids and bases. It is closely related to theobromine and caffeine, the alkaloids found in cocoa and coffee respectively. Caffeine may be considered as xanthine in which three hydrogen atoms have been replaced by three methyl (CH_3) groups.

Xanthippe, zân-thîp'ê, the wife of Socrates, the Greek philosopher. Her shrewish temper has become proverbial, but many of the stories about her are probably false, for in ancient Athens gossip was cultivated to the perfection of a fine art, the point and not the truth of the story being the chief consideration. Xanthippe's natural inequalities of temper were heightened by the peculiarities of her spouse, especially his indifference to the commonplace duty laid on the head of the house to make both ends meet. The philosopher received her reproaches with such good-humored indifference that it is not surprising she sometimes resorted to other weapons beside her tongue; as on the occasion when she is said to have finished up a tirade by sousing the philosopher, though his remark, as he moved dripping from the scene, that when Xanthippe thundered she watered, must have shown her that here, too, she was powerless.

Xanthippus, zân-thîp'ûs, Spartan general. He assisted the Carthaginians in the first Punic war and defeated the Romans under Regulus at Tunes (now Tunis) 255 a.c.

Xanthos, zân'thòs, the mythical horse of the mythical hero, Achilles. It is related in the 'Iliad' that being chided by his master for

leaving Patroclus on the field of battle, the horse turned his head reproachfully, and told Achilles that he also would soon be numbered with the dead, not from any fault of his horse, but by the decree of inexorable destiny.

Xanthos of Lydia, Greek historian. He flourished about the 6th century a.c., and was contemporary with Herodotus. He wrote a work called 'Lydiaca,' a history of Lydia onward from heroic times, giving also a geographical description of the country. Only fragments of it have been preserved.

Xanthoxylum, a genus of the *Rutaceae*, composed of erect or climbing shrubs, or trees, often with prickly branches. The leaves are compound, pinnate, sometimes reduced to three, or rarely, to one, leaflet, usually pellucid dotted. The flowers are small, in axillary or terminal panicles, and are from 3- to 5-merous. The fruits split in two, with one or two shining black seeds. *Xanthoxylum* is a large genus, found both in the Eastern and Western hemispheres, especially in their warmer parts. The species are so aromatic and pungent that in the countries where they exist they are popularly called peppers, specially *X. piperitum*, called Japan pepper, which is regarded as an antidote for poison. *X. rhetsu*, an Indian species, has small yellow flowers and small round berries, which, when unripe, taste like the skin of a fresh orange. Its fruit, and the seeds and bark of *X. alatum*, which grows near the base of the Himalayas, and those of *X. budranga*, also Indian, are given as aromatic tonics in fever, diarrhoea, dysentery, and cholera. They are used as a condiment in India and as a fish-poison. The small branches are employed to make walking-sticks, and the twigs as tooth-brushes. The seeds of the latter are as fragrant as lemon peel; *X. clava* and *X. fraxineum* applied externally to the gums or taken internally, are powerful sudorifics and diaphoretics used in toothache, paralysis of the muscles of the mouth, and rheumatism. The root of *X. nitidum* is sudorific, emmenagogue, etc. The powdered bark of *X. himala* is given in Brazil in carache; and the capsules and seeds of *X. hastile* are employed in northern India to intoxicate fish. The West Indian species of *Xanthoxylum* are called yellow-wood, *X. caribæum* being differentiated as the prickly yellow-wood. It is a tree, 20 to 50 feet high, whose prickly young stems are made into walking-sticks. The wood is used for inlaying and for furniture. *X. crissasum* is the satin-wood of Florida and the West Indies, which when first cut has the odor of the veritable satin-wood *X. fagara* (*Pterota*) is a small tree common in the same region, and tropical America, producing a hard, heavy, reddish-brown wood known as savin or iron-wood in the West Indies, or as the wild-lime. Still another species is *X. emarginatum*, a shrub with coriaceous foliage, exported under the name of rose-wood, but is called licca-tree or lignum-vorum at home. The commonest species of the northern United States, and the hardiest, is the *X. Americanum*, a shrub or small tree, with odd-pinnate leaves, and twigs which are generally prickly. The cymose flowers are axillary and sessile, without calyx, and they are greenish-white. The capsules are black and ellipsoidal. It is called prickly-ash or toothache-tree, because both Indians and country people used the

XANTHUS — XENOPHANES

hot, acrid bark of both this species and *X. clava-herculis*, which when chewed produces a stinging sensation, for aching teeth. The bark of both these species, and the capsules of the latter, are a powerful stimulant and tonic drug. The southern prickly ash is *X. clava-herculis*, the sea-ash, or pepper-wood, has its flowers in large terminal compound cymes, and its prickles are supported on corky cushions.

Xanthus, zán'thūs, Asia Minor, (1) an ancient city, the capital of Lycia, on the Xanthus River; about eight miles above its mouth. Its ruins near modern Gunik were discovered in 1838, and have yielded a large collection of marbles, now in the British Museum. (2) The river now known as the Kedja Ak rises in Mount Taurus, and falls into the Mediterranean a little to the west of Patara.

Xave'rian Brothers. See **ORDERS, RELIGIOUS.**

Xavier, zăv'î-ér, Sp. hă-vé-ăr', **Saint Francis.** See **FRANCIS XAVIER, SAINT.**

Xavier, Henry, American horticulturist: b. Lyons, France, 26 March 1826; d. Mount Vernon, N. Y., 19 June 1901. When quite young he came to this country and in 1853 settled at Mount Vernon. He imported into the United States nearly every known species of wine-producing grape vines, making many trips to Europe for this purpose, and bringing the vines from France, Spain, Italy, Germany, and Hungary.

Xavier, Jerome, Spanish Jesuit missionary: b. Navarre; d. Goa, India, 1617. He wrote both in Latin and in Persian, and among his principal works are: 'Treatise on the Mysteries of Christianity' (1600); 'Life of the Apostles'; 'History of Jesus Christ'; 'Directory of Kings for the Government of their Subjects.'

Xebec, zē'bēk, a small three-masted vessel, employed in the Mediterranean, distinguished from other European vessels by the great projection of the prow and stern beyond the cut-water and stern-post. In this respect it resembles the felucca, from which it differs only in having the fore-mast square-rigged. The xebec is constructed with a narrow floor for the sake of speed, and of a great breadth, so as to be able to carry a considerable force of sail without danger of overturning.

Xenia, zē'nî-ā, Ohio, city, county-seat of Greene County; on the Shawnee Creek, and on the Pennsylvania, the St. Louis, the Cincinnati, Hamilton & Dayton, and the Pittsburg, Cincinnati, Hamilton & Dayton R.R.'s; 55 miles southwest of Columbus. It is in the Little Miami Valley, in the midst of a productive farming region. It is well laid out and has good macadamized streets and enough of slope to have surface drainage. The chief manufacturing establishments are two shoe factories, one powder works, one ice factory, flour mill, four twine factories, cigar factory, two machine shops, one automobile factory, brewery, one daily paper house. In 1900 (government census) Xenia had 106 manufacturing establishments, capitalized for \$1,819,614 and employing 1,105 wage-earners to whom were paid annually \$394,386. The total cost, annually, for raw material, rent, fuel, etc., was \$2,171,360; and the value of the finished products was \$3,122,797. The county court-house is in a park in the centre of the

city. Other prominent buildings are the municipal building, the Ohio Soldiers' and Sailors' Orphans Home, and several business blocks. Outside the city limits are the county infirmary and children's home.

The educational institutions are Xenia Theological Seminary (United Presbyterian), opened in 1794, three high schools; Central, established in 1856, East Main Street, for colored pupils, and the Ohio Soldiers' and Sailors' Home High School; public and parish schools, a public library (building presented by Andrew Carnegie), and school libraries. Wilberforce University, in Wilberforce suburb, is for colored pupils. It has departments of law, theology, science, and literature, and a training school for nurses. There are 16 churches: Five Baptist, three Methodist, three Presbyterian, and one each of Roman Catholic, Disciples of Christ, Protestant Episcopal, Lutheran, and Reformed. The two banks have a combined capital of \$200,000, and total resources about \$1,300,000. The government is vested in a mayor, boards of public service and safety, and a council of seven members, elected biennially.

Xenia was settled in April 1803 by John Marshall. In 1808 it was incorporated. Pop. (1890) 7,301; (1900) 8,696; (1910) 8,706.

J. F. CHASE,
Editor 'Xenia Gazette.'

Xenocles, zēn'ō-klēz, Greek tragic poet: b. Athens 4th century B.C., in the time of Philip of Macedon. He obtained a prize for four plays, 'Œdipus,' 'Lycan,' the 'Bacchantes,' and 'Athamas.'

Xenocrates, zē-nōk'rā-tēz, Greek philosopher: b. Chalcedon 366 B.C.; d. 314 B.C. He was a pupil and friend of Plato, whose friendship he gained, and though of a dull and sluggish disposition, supplied the defects of nature by unwearied attention and industry. He succeeded Speusippus in the school of Plato about 339 B.C., presiding over the academy till his own death 25 years later. He was famed for his integrity and it is said that when he appeared in the court as a witness the judges dispensed with his oath. He was the author of numerous works, none of which, however, are extant.

Xenon, a gaseous chemical element discovered by Ramsay and Travers (1898) in the residue left after the evaporation of a large quantity of liquid air. Symbol X; atomic weight 128. It is an inert chemical element having a spectrum somewhat resembling argon.

Xenophanes, zē-nōf'ā-nēz, Greek philosopher and poet; founder of the Eleatic school of philosophy: b. Colophon, Asia Minor, about 570 B.C.; d. about 480 B.C. He was a contemporary of Pythagoras and Anaximander, and having been banished from his native city went to Sicily, and thence to Magna Græcia. He settled, about 536 B.C., at Elea (Velia), whence his system, and the school which he founded, derive their name. Of his poems, in which he treated of philosophical and other subjects, only fragments are preserved in the works of Athenæus, Plutarch, and others. The portions of his didactic poem, 'Peri physeos' (On Nature) have been collected by Brandis in his 'Commentationes Eleaticæ' (1813), and by Karsten in his 'Philosophorum Græcorum veterum reliquie' (Vol. I, 1830). He was an ardent monotheist and declared that Homer and Hesiod attributed

actions to the gods that were disgraceful for men. Consult: Ueberweg, 'History of Philosophy,' English trans. (1872); Zeller, 'Philosophie der Griechen,' 4th ed. (1900). See **ELIATICS**.

Xenophon, zén'ô-fôn, ancient Greek historian and general: b. Athens about 434 B.C.; d. Corinth about 355 B.C. He lived during a period in which the greatest political and intellectual excitement existed at Athens, and in which the most distinguished men, of whom he was one, appeared on the stage. Xenophon was a disciple of Socrates. He was said to have fought with his teacher in the Peloponnesian war, and to have had his life saved by Socrates in the battle of Delium (424 B.C.), but this is not now accepted. When the Persian prince, Cyrus the Younger, contended with his elder brother Artaxerxes Memnon for the throne, the Lacedæmonians sent him auxiliaries, among whom Xenophon served as a volunteer. Cyrus was defeated and lost his life on the field of Cunaxa (401 B.C.). The principal officers of the auxiliary army having been likewise killed in battle, or taken prisoners by artifice, and then put to death, Xenophon was apparently selected to command the Greek forces, 10,000 men strong. They were in a most critical situation, in the midst of a hostile country, without cavalry, surrounded by enemies and innumerable difficulties; but Xenophon was able to inspire them with confidence, to repress insubordination, and to lead them in their return march of 1,500 miles to the Black Sea. Xenophon himself has described this retreat, and at the same time the whole expedition of the younger Cyrus, in his 'Anabasis,' the most famous of military narratives. There is no means of verifying the statements of this work. On their arrival at Chrysopolis (opposite Byzantium) a number of the troops, with Xenophon at their head, entered the service of Seuthes, king of Thrace. Later, Xenophon joined the Spartan general Thimbron or Thibron, who was then conducting the war against the Persian satraps Pharnabazus and Tissaphernes. There is no reason to believe that Xenophon left Asia Minor before 394, when he returned to Greece with Agesilaus, king of Sparta, after his expedition against the Persians. In that year he fought on the side of the Spartans against the Athenians at Coroneia. As a consequence he was found guilty of high treason, and exiled. After that he settled at Scillus, a small town in the neighborhood of Olympia, in Elis. In this solitary retreat he dedicated his time to literary pursuits; and as he had acquired riches in his Asiatic expeditions, he began to adorn the country which surrounded Scillus. He built a magnificent temple to Artemis in imitation of that of Ephesus, and spent part of his time in rural employments, or in hunting in the woods and mountains. He does not appear ever to have returned to Athens, although the sentence of banishment passed on him was afterward repealed. He remained for about 20 years at Scillus, but was ultimately expelled from it (371 B.C.) by the Eleans. Thereupon he retired to Corinth, where he died. Besides the 'Anabasis,' Xenophon wrote the 'Apomnemoneumata,' more commonly known as the 'Memorabilia Socratica,' in which there is no doubt that we have a faithful representation of one side of the Socratic teaching; the 'Cyropædia,' in which, under the guise of a life

of Cyrus the Elder, there is an exhibition of Xenophon's views respecting the best form and methods of government; the 'Symposium' (Banquet), in which Socrates is brought before us under his social aspect; and of several minor works on hunting, agriculture, politics, and the science of war. The style of Xenophon is in general a model of simplicity. The Greeks esteemed his merit as a writer so high that they called him the 'Attic bee' and the 'Attic muse.' Later criticism has found that in both vocabulary and syntax he frequently deviates from the best Attic usage. His works have been often published separately and together. Among the best editions of the complete works of Xenophon are those by Schneider and others (1791-1849), Sauppe (1865), and Dindorf (1875). There is a complete English translation by H. G. Dakyns, with introductions and notes (1890-3). Consult also the studies by Croiset (1873) and Roquette (1884).

Xenophon of Ephesus ('XENOPHON THE YOUNGER'), Greek writer who flourished in the 2d century A.D. One work of his has been preserved, a story in five books, called 'Ephesiaca; or The Loves of Abrocomas and Anthia.'

Xenon, zén'ô, Stefanos Theodoros, Greek author. From 1855 he was a merchant and general broker in London, and in 1858 was naturalized as a British citizen. He published: 'The Devil in Turkey' (1850), a three-volume English translation from the author's unpublished Greek manuscript; in Greek, 'The Heroine of the Greek Revolution' (1861), translated as 'Andronike' (1867); 'East and West: A Diplomatic History of the Annexation of the Ionian Islands to the Kingdom of Greece' (1865); and 'Depredations: or Overland, Gurney and Co. and the Greek and Oriental Steam Navigation Company' (1869).

Xenotime, a mineral occurring in crystals of the same form as zircon. It is essentially an yttrium phosphate, YPO_4 , but much erbium is frequently present, and also sometimes the cerium metals, and small quantities of thorium and silicon. It is usually found in minute crystals of resinous or vitreous lustre, yellow or brown color, and having a hardness of 4 to 5 and specific gravity of about 4.5. It occurs as an accessory constituent in many granites (see Derby in Am. J. Sc. 41, 308, 1891), in large crystals in the granitic rocks of Norway, in the auriferous gravels of North Carolina and Georgia, and in choice crystals in the gneiss of New York city. When obtainable in sufficient quantities it will be an important ore of yttria and erbia.

Xeres, há'rás, Francisco, Spanish historian: b. Seville about 1500; date of death unknown. He accompanied Pizarro, as his secretary, to Peru, about 1530, and of that expedition wrote a detailed history, entitled 'A True Account of the Conquest of Peru' (1547). The work was translated into Italian by Ramusio, and into French by Ternaux-Compan and is still valued as a source of information.

Xeres, or **Jerez**, de la Frontera, Spain, a town in the province of Cadiz, on the Guadalete, 15 miles north-northeast of Cadiz, in a beautiful and fertile plain. Its manufactures are unimportant; but the trade, of which the staples are corn and wine, is very important. The wine is widely known as the popular sherry, and is

XEROPHYTES—XIMENES

largely exported. Near this town a battle was fought between the Moors and Goths in 711, in which Roderick, the last king of the Goths in Spain, lost his life.

Xerophytes, xér'ô-fīts, plants which have guarded themselves by structural means against excessive transpiration. The term was originally applied to plants living in dry and sandy soil, or on rocks, and to those inhabiting deserts; but it is now extended to plants existing in localities where, for one reason or another, they can not readily obtain water, as in the case of beach plants and epiphytes, and have consequently adapted themselves to prevent the waste of the moisture which they have. This result is obtained in various ways. In some, the transpiring surface is greatly reduced, and the foliage is nearly or wholly dispensed with, the stems themselves taking its place, as in switch plants and cacti; and this habit is frequently combined with the storage of water in succulent tissues. Other plants, like the eucalyptus trees predominating in the dry forests of Australia, by a vertical arrangement of their foliage, or a similar disposition of the branches themselves, when foliage is wanting, as it is in the casuarinas, avoid presenting broad surfaces to the sun and hot winds. Some erophytic plants close their leaves just before the dry season; the whole existence of others begins and ends during the continuance of a rainy season; and in the bulbous and tuberous plants we see still another common arrangement for passing the dreaded dry months, the plants growing vigorously and completing their above-ground existence, while the weather is still favorable, and storing up food in their roots or rootstocks, so that they may rest uninjured in the ground during the heated term, and be ready to spring into activity as soon as the rains begin. An extensive development of ligneous tissue is characteristic of xerophytes, and so also are such modifications of tissue as the matted hairs, mineral, waxy and varnish-like encrustations on the epidermis, the closing or concealing of stomata, etc.

Xerxes I., xér'k'séz, king of Persia: b. about 519 a.c.; d. 465 a.c. He was the second son of Darius, the son of Hystaspes, and began to reign in 485. He was preferred to his brother Artabazanes, born before his father was raised to the throne; while Xerxes was born after that event, and was the son of Atossa, daughter of Cyrus, but this preference caused no struggle between the brothers. After having suppressed a revolt in Egypt in a single campaign, he thought himself able to execute the plan of conquering Greece, already conceived by his father, and collected for this purpose an immense army, estimated by the historians as containing 1,000,000 men. In all probability the Greeks greatly exaggerated the number of their enemies; and the train of women and slaves who followed the army made at least half of its numerical amount; still the numbers of the Persians were beyond all comparison superior to those of the Greeks. By means of a bridge of boats Xerxes crossed the Hellespont (480) while the Greeks awaited him on the frontier of their country, in the pass of Thermopylae. After the heroic Leonidas had fallen with his Spartans (see **LEONIDAS**), Xerxes burned Athens, which had been forsaken by

its inhabitants. The first naval battle between the two powers at Artemisium had been indecisive; but it inspired the Greeks with new confidence; and the second naval action at Salamis, in which, if we believe the Greek historians, 2,000 Persian vessels were engaged against 380 Greek, terminated in the defeat of the Persians (Sept. 480). Xerxes now quitted Greece, leaving behind him his best general, Mardonius, who, not long after, was routed at Plataea. Xerxes now gave himself up to debauchery; his conduct offended his subjects and Artabanus, the captain of his guards, conspired against him, and murdered him in his bed. The personal accomplishments of Xerxes have been commended by ancient authors; and Herodotus observes that there was not one man among the millions of his army that was equal to the monarch in comeliness or stature, or as worthy to preside over a great and extensive empire.

Ximena, hê-má'ná, in Spanish legendary history, the wife of the Cid (q.v.).

Ximena, or the Heroic Daughter, an English adaptation of Corneille's 'Cid,' by Colley Cibber, first played in London in 1712, and printed in 1718.

Ximenes, xi-mé'néz, Sp. hê-má'nás, Francisco, Spanish ecclesiastic and prime minister: b. Torrelaguna, Castile, 1436, d. Roa, near Valladolid, 8 Nov. 1517. He was graduated in civil and canon law at Salamanca in 1456, became a priest and going to Rome practised in the courts of the consistory 1459-65. He obtained a papal bull, which secured to him the first vacant benefice in Spain, but the archbishop of Toledo refused to give him any place, and, Ximenes having taken possession of a vacant benefice the archbishop caused him to be imprisoned. Ximenes, nevertheless, recovered his freedom, and the Cardinal Gonzalez Mendoza, bishop of Sigüenza, appointed him his grandvicar. He entered the Franciscan order in 1483, and for several years practised the most rigid asceticism. In 1492 he became confessor to Queen Isabella of Castile, to whose notice he had been recommended by Cardinal Mendoza, and in 1495 was made archbishop of Toledo. He did not accept this dignity till after many refusals, and an express command from the pope. As an archbishop he was very zealous, behaving as a father toward the poor, abolishing a multitude of abuses, and adhering steadfastly to his resolution that public offices should be filled with honorable and well-qualified men. In spite of all opposition he effected a reform in the mendicant orders of Spain, founded in 1499 a university at Alcalá de Henares, and undertook in 1502 the Complutensian Polyglot Bible. His activity was also displayed in other ways. Dissensions prevailed in the royal family. Philip of Austria, son of the Emperor Maximilian I., had married Joanna, the only daughter of Ferdinand and Isabella, and on the death of the latter Philip received Castile, in right of his wife, the sole heiress of her mother. This gave rise to disputes between him and his father-in-law, which were composed by Ximenes. After Philip's death (1506) Ferdinand became regent of Castile for his grandson, afterward the Emperor Charles V., who was a minor. On this occasion he had been much assisted by Ximenes, who in 1507 was made cardinal and grand-inquisitor of Spain. The conversion of the Moors

now particularly occupied his attention. With this view he formed the project of passing over to Africa, in order to take the fortress of Oran, and in May 1508, landed on the coast of Africa. A battle soon followed in the neighborhood of Oran, in which the Moors were defeated. The fortress was immediately taken and the garrison put to the sword. Ximenes caused Oran to be fortified anew, changed the mosques into churches, and returned as a conqueror to Spain. When Ferdinand died in 1516, his grandson Charles being still a minor, Ximenes became regent of Spain, during his regency of two years, brought the finances into order, paid the crown debts, and restored the domains which had been alienated, caused the laws to be observed, and placed the Spanish military force upon a respectable footing. Consult: Fléchier, 'Histoire du Cardinal Ximenes' (1693); Hefele, 'Der Kardinal Ximenes' (1844, English trans. 1860); Barrett, 'Life of Cardinal Ximenes' (1813); Prescott, 'Ferdinand and Isabella' (1838); 'Life,' by Ulrich (1883).

Ximenes de Quesada, dá ká sá fhí, **Gonsalo**, Spanish explorer and conqueror: b. Granada about 1498; d. Mariquita, New Granada, 16 Feb. 1579. He came to America in 1535 as a judicial functionary in the suite of Pedro Fernandez de Lugo, governor of the province of Santa Marta, who chose him to head an expedition against the Chibchas, supposed to number more than 2,000,000 souls, on the great plains of Tunja and Bogota, and the neighboring regions about the head-waters of the river Magdalena. He set out 6 April 1536 from Santa Marta, but at the end of eight months had made no more than 450 miles. After great hardships the expedition reached the mountains and in the following March progress was resumed.

The first Indians he met were so terrified by the sight of his horses that they instantly submitted. Approaching at Tunja the court of one of the great chiefs of the Chibchas, he was allowed to enter the palace, but was treacherously attacked as he was about to embrace the chief. The chief was taken, after much slaughter, and Ximenes became possessed of vast riches. From Tunja he marched upon Iraca, the sacred city of the nation. Here two Spanish soldiers, in pursuit of plunder, accidentally set fire to the great temple of the sun, which had been captured by Ximenes, and it perished with the city after burning several days. Returning toward Tunja, he fought a desperate battle at Borja against 12,000 natives, whom he defeated, after which he made treaties with several caciques, who voluntarily submitted. A usurping chief was then proclaimed king of Spain, but was required to deliver the treasures of his predecessor to the Spaniards. After a short imprisonment he promised within forty days to fill a room with gold and emeralds, but not keeping his promise, was put to death with cruel tortures. On 6 Aug. 1538 Ximenes founded the city of Santa Fé de Bogota.

He was presently joined by Benalcázar, the lieutenant of Pizarro, and Frederman, who presently conspired against Ximenes, but without much success. The three then returned to Europe to lay their claims before Charles V., but while Benalcázar was made governor of Popayan, Frederman and Ximenes gained nothing. Later, however, Ximenes was made marshal of New

Granada, and returning to Bogota in 1551, seems to have protected the people against the rapacity of Spanish officials. About 1561 he was named by the Spanish government *adelantado*, or governor-in-chief of the kingdom of New Granada, and induced to fit out an expedition in search of El Dorado, beyond the territories of Pauto and Papamene. To this enterprise he devoted three years, spending immense sums in fitting it out, but returning with only a handful of followers. In 1572 he founded the city of Santa Agueda, 21 miles from Mariquita. He died of leprosy, and by his will declared himself poor and forbade the erection of any but the simplest monument over his grave. His remains were removed to Bogota in 1597. He left a manuscript work entitled 'Sermones' and a 'Compendio historial,' both of which are lost. Consult J. Acosta, 'Historia del descubrimiento y colonización de la Nueva Granada' (1849); Antonio de Plaza, 'Memorias para la historia de la Nueva Granada' (Bogota 1890).

Xime'nia, a genus of *Oleaceae*, represented by large shrubs or small trees, often spinous. Leaves entire, leathery; calyx very small, petals four, hairy inside; stamens eight, ovary with four one-seeded cells. *X. americana*, the false sandalwood, is a straggling Indian shrub, or low spreading tree; producing dull-white fragrant flowers, smelling like cloves, succeeded by small, oval, red or yellow pulpy fruits, an inch long, aromatic, but somewhat astringent. They contain a white globose nut with a kernel which tastes like a filbert. Its wood is very tough and heavy. This shrub is known in Florida as the hog-plum or wild lime, and in the West Indies as mountain or seaside plum.

Xingú, shén-goo', a river of Brazil, one of the chief tributaries of the Amazon. It is formed by the junction of several head-streams which rise near lat. 15° S., lon. 55° W. Chief of these is the Tamitatosba, which flows from a small lake about 75 miles in circumference. After flowing north for 1,200 miles through a densely forested and little explored region, the Xingu forms a large lake which is connected with the Amazon estuary by a number of deltaic channels 240 miles west of Pará. Steamers ascend the river to the Cataract and Fall of Itamaracá. The river was unexplored until 1884-7, when it was descended from Cuyabá by Von den Steinen.

Xiphodontidae, xíf-ô-dôn'tí-dé, a family of primitive forerunners of the ruminants, whose remains occur in the Upper Eocene rocks of western Europe. Some of them are the largest and most slender artiodactyls of their age, and the only feet hitherto discovered are two-toed, with mere rudiments of the lateral digits. Compare *Oreodon*.

Xiphosura. See HORSE-FOOT CRAB; *Mesostomata*.

Xuarez, hoo-á'ris, Gaspar, Paraguayan botanist, historian, and biographer: b. Santiago del Estero, Paraguay, 17—; d. Rome, Italy, 1804. Entering the order of Jesuits, he devoted himself to teaching philosophy and theology; and after the suppression of his order he removed to Italy, where he occupied himself with botanical researches. He wrote: 'History of Buenos Ayres,' and 'Dissertations,' which remain in MS.; 'Life of St. Francis Xavier'; etc.

XULLA—XYLOPIA

Xulla, shoollā, or **Zorella**, Islands, East Indies, a group in the Molucca Sea, south of the Molucca Passage, and east of Celebes. The largest islands of the group are Taliabo, Mangola, and Xulla Besi. The first is about 40 miles long.

Xurel. See HORSE-MACKEREL; JUREL.

Xylander, ksi-län'dér, **Guilielmus**, German scholar: b. Augsburg 20 Aug. 1532; d. Heidelberg 10 Feb. 1576. His real name was Holzmänn. He was educated at Tübingen and Basel and in 1558 was appointed professor of Greek at Heidelberg. His numerous Latin translations from the Greek have been of much service to later students.

Xylene, in chemistry. Three isomeric hydrocarbons are known by this general name, orthoxylene, metaxylene, and paraxylene. They all have the composition $C_6H_4(CH_3)_2$, and are dimethyl derivatives of benzene. Commercial xylene or zylol, found in coal tar, is a mixture of the above three. It is a colorless, oily liquid, boiling above $140^\circ C.$, not soluble in water, and used as a solvent in various chemical operations.

Xylography. See WOOD ENGRAVING.

Xylodin, in chemistry, an explosive probably of the composition $C_6H_5NO_4O_8$, known also as pyroxylam and nitrostarch. Discovered by Braconnet in 1833 and prepared by dissolving one part of potato starch in eight parts of fuming nitric acid and then pouring this solution, well cooled, into sixteen parts of concentrated sulphuric acid. It is a white hygroscopic powder, insoluble in water and alcohol, but

soluble in ether. It is not used to any considerable extent.

Xylophone, a musical instrument consisting of bars of wood or glass graduated in length and resting on belts. The notes are produced by striking on the bars with small hammers.

Xylo'pia, a genus of anonaceous trees or shrubs, natives of tropical regions, with coriaceous leaves, commonly two-ranked, and flowers in axillary clusters or solitary. The corollas have six petals, the outer three elongated, boat-shaped, curving over and partially enclosing the other three. The receptacle is conical, with the stamens outside and the carpels in its excavated interior. The fruits are elongated berries. *X. sericea*, the pindaíba of Rio Janeiro, bears a highly aromatic fruit, which may be used as pepper, with which it agrees in its flavor. Good cordage is made from the fibres of its bark. The wood, bark, and berries of *X. glabra*, the bitter wood of the West Indies, taste like orange seeds, and impart a similar flavor to the wild pigeons which feed on them. It is said to be useful in colic and for creating an appetite. Martius believes the fruit of *X. grandiflora* to constitute a valuable febrifuge used by the South American Indians. The dry, black, and quill-like fruits of *X. aromatica* form the *Piper athiopicum* of commerce, used as pepper by the West African negroes, as they are aromatic. They are sold in the native markets as a stimulant and condiment. *X. polycarpa* is the yellow dye-tree of tropical Africa, with a bitter bark, that contains berberine, and which yields a yellow dye, of extensive use; it is also employed for the treatment of bad ulcers.

Y

Y the twenty-fifth letter of the English alphabet, derived from the Greek through the Latin, is both vowel and consonant. It came into Latin in Cicero's time in spelling words borrowed from the Greek; for the Latin language has no sound like that of the Greek *Y* (upsilon); the *y* found in some Latin words, as *lacryma*, *satyrus*, *syllus*, is due to an error of modern editors; those words were in ancient Latin always written *lacrima*, *satira*, *silla*. The modern Italian alphabet has no *y*, and the *y* of Greek words adapted into Italian is changed to *i*: *sinfonia*, *symphony*, *sindico*, *syndic*. In Dutch, *y* stands for *ij*, and represents the diphthongal long *i* of English as in *time*. In English, *y* is a superfluous letter, so far as it stands for a vowel sound, as such, it can always be represented by the vowel *i*. The sound of *T*, *θ*, in Greek, was that of French *u* and German *ü*. This sound does not exist in English: it is heard when, with lips and tongue in the positions for pronouncing the vowel sound *oo*, one tries to give the English vowel sound of *e* in *he*. In early English or Anglo-Saxon, *y* represented this peculiar vowel sound; but it has so far dropped out of English speech that a person whose only speech is English cannot pronounce it untaught. At the time of the Norman Conquest *i* had taken the place of this *y*, and soon both the sound and the letter went out of English use. But when Norman words came to be used by the English the French *u* sound was retained in many words, as *muse*, *lute*, *duke*, and they were pronounced with the French *u*; this sound gradually developed into *iu*, but the spelling remained unchanged: this *iu* represents the sound of *u* in *muse*, *duke* as now pronounced. In the beginning of syllables and when followed by a vowel, *y* is a palatal consonant, formed by bringing the middle of the tongue in contact with the palate, nearly in the position for *g* hard; hence Old-English *g* hard has often been softened into *y*, as in *day* from Old-English *dag*. Till comparatively recent times it was customary to write *tho*, *ye* and *that*, *yt*, and those forms were repeated in typography. In those cases the character resembling *y* or identical with it, stood, not for *T* but for the Old-English letter *ȝ*: it is a mere ignorantism to read "y^e year," *ye* year as though *y* here stood for the consonant *T*, and not for the digraph *th*.

Yachts and Yachting. The term yacht is not easily defined, for it is now applied to vessels of widely different size and build, propelled either by means of sails or by steam, electricity, or other similar power, and used for many different purposes, such as racing, cruising, exploration, state ceremonial, etc. Sailing yachts

may be of any rig suited to their size, chiefly cutters, schooners, ketches, yawls, and luggers.

History.—The word *yacht* is of Dutch origin, being from the Dutch *jagt*, a swift vessel, from *jagen*, to chase, to hunt. It seems to have been introduced into England in 1660 when the Dutch presented Charles II. with a yacht. The first recorded yacht race was that between Charles II. and his brother, the Duke of York, which took place on the Thames in 1661, but from that date none is on record till 1796, when ten boats started on a 50-mile race in the Bristol Channel under the auspices of the Bristol Sailing Society. Yacht-racing is a characteristic development of the 19th century, especially of its latter half. For a long period, extending well into the 19th century, yachting was closely connected with naval defense, and private yachts were generally constructed to carry guns and be used in case of need for naval purposes. Private individuals of means were thus able to contribute to national defense not only directly by forming a kind of minor volunteer fleet, but also indirectly by leading the way in the development of naval architecture. In 1832 the *Emerald*, the fastest cutter in the Royal navy, was defeated in a racing and sailing contest with the *Paddy* from Cork, a yacht belonging to a member of the famous Water Club of Cork, and in consequence the head of the government school of naval architecture in Portsmouth was deputed to measure several private yachts with a view to improving the construction of vessels for the navy. In the following year the *Water Witch*, a vessel similar to the 10-gun brigs of the navy, built for Lord Belfast, proved herself faster than any vessel in the Royal navy, and better than any of her kind for purposes of warfare. Of the many yacht clubs now in existence only the Royal Cork Yacht Club and the Royal Thames Yacht Club can trace their history back to a period before the last century. The premier yacht club of Great Britain, the Royal Yacht Squadron, with headquarters at Cowes, dates back to 1815 in its formal capacity. In 1820 it became the Royal Yacht Club, and in 1833 its name was changed by royal order to Royal Yacht Squadron. The Royal Northern Yacht Club, with headquarters at Rothesay, was founded in 1824. The remaining clubs in Great Britain number altogether about 120, of which about one third are Royal.

American Clubs.—In the United States there are more than 200 yacht clubs scattered throughout the country, having about 4,000 yachts. But of these vessels only about 700 are above 40 feet in length, and only a little over half of these are propelled by steam. The New York Yacht Club, the oldest in the United States, having been organized in 1844, has a membership of over 1,000, but there are only about 140

YACHTS AND YACHTING

steam yachts and launches on its list. Thus the sailing yacht is the normal type of American pleasure craft. There are two distinct kinds of yacht, whether propelled by sail or steam—the racing yacht, in which comfort is sacrificed for speed, and the commodious, well-proportioned cruiser yacht; but even in the latter every modern discovery tending to increased speed is incorporated. Popular interest in yachts may be dated from the victory of the yacht *America* in the international contest around the Isle of Wight in 1851. She represented certain American ideas in the shape of her hull and the fit of her sail, which were immediately copied in England. From that day the history of sailing yachts has been a steady improvement in speed through the efforts of such yachtsmen as James Gordon Bennett, General Charles T. Paine, C. O. Iselin, J. Pierpont Morgan, and William K. Vanderbilt, and such designers as the late Edward Burgess, A. Cary Smith, J. Beaver Webb, and Nat G. Herreshoff. The last named was the author of both the latest international cup-racers, *Vigilant* and *Defender*. The same designers have won golden opinions for their work in the field of steam-yachting, as have also Gustav Hillmann, Lewis Nixon, C. D. Mosher, and Charles M. Seabury; and American yards can now turn out steel steam-yachts equal to the best made in England.

Racing Yachts.—The designing and construction of a racing yacht require no small amount of scientific and technical knowledge besides large experience, and consequently the yachts entered for the leading races, at least in the higher classes, are the work of a very few designers and builders. In a yacht intended for racing, speed is the primary essential, and to it accommodation and convenience are in large measure sacrificed. Moreover, a designer has to take into account the circumstances under which his vessel is to be run, or the competitors which she has to meet, because a yacht that does well in fine weather and a smooth sea will usually be of little account in boisterous weather and a rough sea. The rating rules of the Yacht Racing Association (formed in 1873) also condition the designer's work, and it will be necessary, therefore, to give some account of them here. The object of rating regulations is to secure that all competitors shall start on practically even terms in any given race, and this is achieved by the classification of yachts in well-defined groups according to certain measurements, and also, especially among large yachts, by means of time allowances corresponding to differences in these measurements. In the early days of racing, yachts were grouped according to tonnage, the tonnage being determined, as for other vessels at that time, by multiplying the length by the breadth and the depth and dividing by 96 (afterward 94). This was replaced by what is called builder's measurement or old measurement, which is still in use for some purposes connected with yachts. The formula for tonnage

$$(L - \frac{1}{4}B) \times B \times \frac{1}{4}B$$

according to this system is

where L and B denote length and breadth respectively. The Thames measurement rule, introduced in 1854, made tonnage equal to $(L - B) \times B \times \frac{1}{4}B$; but in 1881 the Yacht

Racing Association introduced the 1730 rule, according to which the tonnage was equal to $(L \times B)^2 \times B$.

These rules were found to

1730

have the effect of encouraging the construction of yachts of very narrow beam, especially after about 1871, when designers learned the use of outside ballast on the keel. A great change was effected in 1886, when the length-and-sail-area rule came into force, and yachts were classified according to rating determined by the formula

$$\text{Length} \times \text{Sail Area in sq. ft.}$$

The present

6000

linear rating rule was adopted in 1896, but it cannot be said that finality has yet been reached. Linear rating is expressed in feet, and is determined by the formula

$$\text{Length} \times .73 \text{ Girth} \times .5\sqrt{\text{Sail Area}}$$

2

The relation of the classes under the 1881, 1886, and 1896 rules may be shown as follows: 18 feet linear rating = $\frac{1}{4}$ rating (length and sail area); 24 feet = 1 rating; 30 feet = $2\frac{1}{4}$ rating; 36 feet = 5 rating = 3 tons; 42 feet = 10 rating = 5 tons; 52 feet = 20 rating = 10 tons; 65 feet = 40 rating = 20 tons.

For the smaller vessels wood is the cheapest and lightest material, but larger ones are made of steel, or of steel frames with a wooden skin, the latter class being called composite. Other metals, notably aluminum, have also been used for the construction of yachts. Practically all large composite vessels, and also many small ones, have a copper sheathing to protect the submerged parts of the wood from the action of the water. The sails of racing yachts are generally made of cotton, mostly of the finest Egyptian variety; but ramie fibre is coming into use for this purpose, and a mixed cotton and ramie material is also in use. Up till a comparatively recent date flax was generally used for the sails of racing yachts, though it does not produce a sufficiently smooth and close-textured cloth.

Speed.—The speed of a racing yacht of given size may be regarded as the result of a compromise between stability, which determines sail-carrying power, and resistance. The stability depends upon well-known hydrodynamic principles, and may be roughly said to be determined by breadth of beam, the lowness of the centre of gravity of the vessel, and the quantity and position of the ballast. Resistance at low speeds is due chiefly to surface or skin friction, but at higher speeds it is principally caused by wave-making, a phenomenon too intricate to be discussed here. An increase in beam increases stability, but at the same time increases skin friction. Wave resistance is less in vessels whose displacement is obtained mainly by breadth than in those where displacement is principally determined by depth. Various means of lowering the centre of gravity have been adopted with advantage, such as the use of hollow masts and booms, the use of aluminum for the upper part of the vessel's sides, etc. Stone ballast was used in the early days of yachting, but it was superseded by iron, and that in turn by lead. The lead ballast was afterward carried on a plate of

YACHTS AND YACHTING

lead projecting far below the hull. At present the deep fin-keel is of some other metal than lead, and carries the lead at its base in a cigar-shaped bulb. Surface friction is lessened by making the submerged surface smooth, either by coating it with varnish, or by covering it with polished metal, or in some similar way. The chief names in the evolution of the present shape or lines of yachts from the old "cod's head and mackerel's tail" varieties are those of Scott Russell and John Hyslop, the latter an American. The curve of cross sections for the fore part should be nearly a curve of versed sines, and that for the hinder part a trochoid; but various considerations may modify these theoretical forms. If two vessels differ in nothing but length, the longer will be the faster. The centre-board keel, consisting of a plate of iron which can be raised or lowered according to circumstances, was of British invention, but is now most characteristic of American racing yachts.

Racing Rules.—The ordinary rules of the road at sea apply in the main to yacht-racing. Yachts sailing with the wind free must clear those sailing close-hauled. Yachts on the port tack must give way to those on the starboard tack, and an overtaking yacht must clear the overtaken vessel. The start in a yacht race is now always a flying one, but prior to about 1860 yachts started from anchor. Frequently much depends upon the start, and accordingly maneuvering for initial position is of considerable importance. At the start, as throughout the race, the skipper counts for a good deal. The course to be traversed is marked out by buoys, light-ships, or flag-boats. The time allowances corresponding to differences in rating are determined in accordance with a scale prepared by the Yacht Racing Association. Vessels always start together, the time allowance being made at the end of the race. Handicapping is also practised to some extent in yacht-racing.

British Yachts and Races.—Among pioneer British yachts of the first half of the 19th century the most notable were the *Menai*, in which the hollow bow was first introduced; the *Mosquito* (1848), an iron vessel built on the Thames in accordance with Scott Russell's theories; and the *Tiara*, built at Renfrew in 1850. The visit of the *America* from the United States in 1851 marked an epoch in British yachting. She was a schooner of 208 tons, and entered along with 14 other vessels for a race round the Isle of Wight. Five of the vessels were schooners, nine were cutters, the remaining one being a bark (*Brilliant*), and though they varied in tonnage from 47 (*Aurora*) to 393 (*Brilliant*) no time allowance was given. The *America* won the race and the cup presented by the Royal Yacht Squadron, the *Aurora* coming second, 18 minutes behind. In 1857 the cup was set aside by the owners of the *America* as a perpetual international challenge trophy. This was the origin of the contests for the so-called *America Cup*, for which see the next section. The victory of the new-comer secured the triumph of the views represented in the *Mosquito* and the *Tiara*, and revolutionized the practice of British yachtsmen. For about a quarter of a century the schooner was the popular form of racing yacht, among the most notable being *Cambria* and *Miranda*. Gradually, however, the schooners were displaced by cutters and yawls.

The more famous of the early racing cutters were *Kriemhilda*, *Oimara*, *Cythera*, *Vol-au-Vent* (1875), and *Neva* (1876); and the leading yawls of that period were *Florinda* (1873) and *Julianar* (1877). *Formosa*, a big cutter built in 1878, was supreme in her class till 1880, when G. L. Watson's first large yacht, the *Vanduaara*, came on the scene. Another famous designer, Mr. Fife, scored a great success with the 40-ton yacht *Annasona*, which began to compete in 1881. *Marjorie*, from Watson's lines, a vessel of 68 tons, was the chief new cutter of 1883; and to the following year belong *Irex*, designed by Mr. Richardson, and *Genesta*, an America Cup competitor designed by Beaver Webb. The *Galatea*, another cup challenger, was a complete failure in home waters in 1885, but the challenger of 1887, *Thistle*, from Watson's design, met with great success before crossing the Atlantic. *Thistle* was the first large yacht constructed under the length-and-sail-area rule. *Yarana*, another Watson boat, was the chief novelty of 1888, and in 1889 the same designer produced *Valkyrie I* for Lord Dunraven. The old *Irex* continued racing with considerable success down to 1889, and was succeeded in 1890 by *Iverna*, by the same designer. In the latter year *Thistle* reappeared, and thus the leading yachts of that season were *Yarana*, *Valkyrie I*, *Thistle*, and *Iverna*. These were rated at 69, 77, 121, and 118 respectively. The *Valkyrie I* was ultimately sold to an Austrian archduke, and the *Thistle* to the German emperor, who renamed it *Meteor*. The years 1891 and 1892 were chiefly remarkable for smaller vessels, such as Watson's *Queen Mab* and *Varuna* and Fife's *Thalia* and *Lais*; but 1893 was rendered memorable in the annals of yachting by fine contests between *Valkyrie II*, designed by Mr. Watson for Lord Dunraven; *Britannia*, designed by Watson for the Prince of Wales; *Satanita*, *Calluna*, and *Navahoe*, an American yacht, designed by Mr. Herreshoff. *Valkyrie II* proved to be the best of these cutters, but *Britannia* was a good second. In 1894 these yachts competed with *Vigilant*, a Herreshoff vessel which had defeated *Valkyrie II* in the contest for the America Cup. *Valkyrie II* was sunk by *Satanita* in the Clyde while maneuvering for a start, but *Britannia* repeatedly beat the *Vigilant*. The *Ailsa*, from lines by Mr. Fife, Jr., and the *Valkyrie III*, designed by Mr. Watson for Lord Dunraven, appeared in 1895. The third *Valkyrie* went to America to contest the cup, and the honors at home fell to *Britannia* and *Ailsa*, especially the former. Mr. Fife, however, scored in the 40-raters with *Isolde*, which was distinctly better than Mr. Watson's *Caress*. A new *Meteor*, designed by Mr. Watson for the German emperor, competed in 1896 against *Britannia* and *Ailsa*, the result for the season being: *Ailsa* (60 starts, 21 firsts), *Britannia* (58 starts, 14 firsts), *Meteor* (22 starts, 13 firsts). The principal first-class cutters since that date are: *Bona*, by Watson (1897), for the Duke d'Abruzzi; *Shamrock I*, built for Sir Thomas Lipton to contest the America Cup in 1899; and *Shamrock II*, built for Sir Thomas Lipton to contest the America Cup in 1901.

American and International Yachting.—The *Jefferson*, built in 1801, is regarded as the first yacht built in America; but the first American yachts of importance were those designed by George Steers, notably the *America*. In 1866

YADKIN RIVER—YAKIMA

three American yachts, *Henrietta*, *Fleetwing*, and *Vesta*, raced across the Atlantic, the first-named winning the race with a time of 13 days, 21 hours, 55 minutes. In 1870 the English yacht *Cambria*, which had challenged for the America Cup, beat the American *Dauntless* in a transatlantic race, but she was beaten by the *Magic* and several other boats in the race for the cup. In 1873 Mr. Ashbury, who owned the *Cambria*, again challenged for the cup, but his yacht *Livonia* was defeated by the New York Club's vessels *Columbia* and *Sappho*. Major Charles Gifford, a Canadian, challenged for the America Cup in 1876 with the *Countess of Dufferin*, but his yacht was beaten by the defender, *Madeline*. Another Canadian vessel, the *Atlanta*, contested the cup in 1881, her opponent being the *Mischief*, but the result was the same as before. Sir Richard Sutton sent the next challenge in 1884, and his yacht *Genesta* was pitted against the *Puritan*, but without success. The *Puritan* was designed by Edward Burgess, as was also the *Mayflower*, which successfully defended the cup against the English *Galatea* in 1886. The *Thistle* met another Burgess boat, the *Volunteer*, in the same contest the following year, but, like all preceding challengers, she failed to gain the cup. Mr. Herreshoff scored his first great success as a designer with *Gloriana* in 1891, and soon afterward he produced the *Vigilant*, which defeated *Valkyrie II* in the America Cup contest of 1893. The cup contest of 1895 between Lord Dunraven's *Valkyrie III* and the American Defender had an unsatisfactory result. Two races were awarded to the latter on purely technical grounds, and in consequence Lord Dunraven withdrew from the competition. In the same year a Canadian yacht named *Canada* defeated the United States yacht *Vandedor* in a competition for an international cup. The next challenges for the America Cup came from Sir Thomas Lipton, whose yachts *Shamrock I* and *Shamrock II* were beaten by the American *Columbia* in 1899 and 1901 respectively. Sir Thomas again challenged for the cup in 1902 and 1903, and lost to the Americans.

Steam Yachts.—The use of steam has been a great factor in the increase of interest in private yachts. The cost of steam yachts varies widely even without taking into account the expenditures for furnishings. A yacht 160 feet in length may be built for \$60,000, while one of the 300-foot boats, the largest type, will cost from \$400,000 to \$500,000. One of the most superbly fitted private yachts, though not of the largest class, is the *Niagara*, owned by Howard Gould. It cost \$500,000, and requires \$10,000 a month to keep it in commission. The *Margarita II*, built for Anthony J. Drexel, the Philadelphia banker, was very large and finely equipped. William K. Vanderbilt owns the *Valiant*, 332 feet long, and probably the largest American private yacht afloat. The *Mayflower* and *Nahma*, owned by the Goetts, were built on the Clyde. The most magnificent private yachts owned in Europe are the Hohenzollern, belonging to the Emperor of Germany, which visited New York in February-March 1902, and the *Atmah*, built for Baron Edmond de Rothschild.

Yadkin River, North Carolina. See GREAT PERRA.

Yadrintsef, Nikolai Michailovitch, Russian author: b. Siberia 1842; d. Barnaul, Altai

Mountains, 19 June 1894. Accused in youth of conspiring for the independence of Siberia, he was exiled to Archangel, but later was permitted to return and was appointed on the staff of Gov.-Gen. Kaznakof. Between 1865 and 1875 he traveled extensively in Siberia, publishing the results of his explorations and in 1882 founded the 'Eastern Review,' a strong, popular weekly devoted to the interests of Asiatic Russia. In 1891-2 he made careful explorations in Mongolia, discovering the ruins of the ancient capital of the Tartar Khans, and forming archaeological collections of great value. In 1893 he visited the United States. He was the founder of the Siberian University, and a promoter of universal education. Among his works are: 'The Russian Commune in Prison and in Exile'; 'Siberia as a Colony'; 'The Culture and Industrial State of Siberia', etc.

Yaguarondi, yā-gwā-rūn'dē. See JAGUA-RONDI.

Yahoo, yā-hoo', a name given by Swift in his 'Gulliver's Travels' to a race of brutes, described as having human forms and degraded propensities. They were subject to the Houyhnhnms, or horses endowed with human reason. Hence, the term is applied to a rough, low, boorish, or uneducated person.

Yajur Veda, yā'joor vā'da. See VEDA.

Yak, the native name for the wild ox (*Bos grunniens*) of the mountainous regions of Tibet. There are two races: the wild yak, generally black, which is found near the snow line, descending into the valleys in winter, and a domesticated race of various colors, black and white being most common. The yak is about the size of the common ox, to which it has a general resemblance, but it is covered with a thick coat of long, silky hair, hanging down like the fleece of a sheep, completely investing the tail, and forming a lengthy fringe along the shoulders, flanks, and thighs. This fringe, which exists in both races, was apparently developed as a protection to the animal in its alpine haunts, as the long hair forms a sort of mat which defends the body from the effects of the cold when the animal is reposing in the snow.

The domesticated race is of great importance to the natives of Tibet. The yak is employed as a beast of burden, but never for tillage or draught; the milk is very rich, and yields excellent butter; the flesh is of the finest quality, and that of the calves far superior to ordinary veal. The hair is spun into ropes, and made into coverings for tents, and the soft fur of the hump and withers is woven into a fine strong cloth. The tails, often dyed red, are made into the chowries or fly-flappers, used in India. Yaks are often seen in zoological gardens and menageries, and have repeatedly bred in Europe; and it is probable that they might be advantageously introduced into the northern parts of the continents of America and Europe.

Yakima, yāk'ī-mā. See SHAHAPTIAN INDIANS.

Yakima, a river of the State of Washington, rising in the Cascade Mountains, and after a southeastward course of about 175 miles, flowing into the Columbia about six miles north of Pasco and Kennewick, and 10 miles above the confluence of the Snake River. It flows through an important coal-mining region, and its valley and those of its numerous short tributaries are

among the most fertile in the State. The Northern Pacific Railway traverses the whole length of the valley of the Yakima, almost to its source.

Yakima, or Stampede, Pass, a defile over the Cascade Mountains, in the State of Washington, near the source of the Yakima River (q.v.). Its highest point is 3,600 feet. It is crossed by the Northern Pacific Railway, which at an elevation of 2,800 feet, between Martin and Stampede, passes through the Stampede Tunnel, 9,850 feet long.

Yakoba, yā-kō'bā, or Yakubu, West Africa, a town in northern Nigeria, finely situated on a plateau partly surrounded by mountains, 140 miles southeast of Kano. It is walled, and the interior is finely diversified with gardens and ponds. The climate is healthful. Pop. 30,000.

Yakonan (from *yakwina*, "spirit"). A linguistic stock of North American Indians, consisting of the Alsea, Yakwina, Kuich, and Siu-slaw divisions. The home of the Yakwina was along Yaquina River, Oregon, from the site of Elk City to the sea; they were formerly numerous, occupying 56 villages in early days, but the tribal distinction of the Yakwina, as well as of the other Yakonan divisions, was gradually broken down through extensive intermarriage; there are only a few Yakwina left and these reside on Siletz reservation, but their number is unknown. The Alsea formerly dwelt in villages along both sides of Alsea River, Oregon, and on the adjacent coast; they are now on Siletz reservation, and perhaps a few are on Grande Ronde reservation. The Siu-slaw were also village dwellers, inhabiting Siu-slaw River as late as 1857; they are probably extinct. The Kuich, or Lower Umpqua, villages were on both sides of Umpqua River from its mouth upward for 30 miles; a few survivors still reside on Siletz reservation. The entire population of the Yakonan Indians probably does not exceed 400.

Yakub Beg, yā-koob' bēg, surnamed **ATTALIK GHAZI** ("leader of the champions of the faith"), amir of Kashgar: b. Russian Turkestan early in the 19th century; d. 31 May 1877. He distinguished himself in the defense of Khokan against the Russians. But he first rose to great eminence after the recovery of Kashgar from the Chinese in 1864, when he acted as lieutenant to Buzurg Khan, whom he soon supplanted. For 12 years this remarkable man conferred on a large part of Central Asia the benefits of a settled though rigorous government. He drilled and disciplined a large civil staff, while his army contained the best native soldiers in Central Asia. In his foreign policy he was strongly anti-Russian, and ultimately friendly to Great Britain. China, however, set out to recover its lost Mohammedan provinces, and had gained some victories when Yakub died—by assassination, some said. His realm at once fell in pieces. The Chinese armies overran the country (1878), and Kashgar again came under Chinese rule.

Yakub Khan, khān, amir of Afghanistan: b. 1849. Appointed governor of Herat, he became extremely popular, but in 1870 broke into open revolt, and in 1874 was imprisoned at Kabul. On the death of Shere Ali he was proclaimed amir (1879) and concluded a treaty of peace with the British at Gandamak. By the

terms of this treaty he was to receive a British resident, and on his side to obtain from the British government a subsidy and aid in case of foreign attack. The murder of Sir Louis Cavagnari, the resident, with staff and suite, occurred in the following September. Yakub was suspected of complicity. Lord Roberts (then Sir Frederick) defeated the Afghan force 6 October and seized Kabul on the 12th. Yakub abdicated and fled to the British camp. In December he was sent to India as a deposed ruler.

Yakutsk, yā kootsk', Asiatic Russia (1) A town of Eastern Siberia, capital of the government of the same name, on a plain surrounded by lofty heights, on the left bank of the Lena. The streets present a singular aspect, being composed of about 400 houses of European structure, standing apart, while the intervening spaces are occupied by winter yurts or huts of the northern nomads, with walls of cow-dung, earthen roofs, and doors covered with hairy hides. The principal buildings of the town are a large stone cathedral, other churches, a synagogue, a market-house, and several educational institutions. The trade is important, Yakutsk being the chief commercial emporium for the whole of Eastern Siberia. The principal articles of native produce are furs and fossil ivory, which are exchanged for European produce. Important fairs are held. Pop. about 8,000.

(2) The government of Yakutsk has an area of 1,517,696 square miles, or about two fifths of that of Europe. The surface is generally low in the north, but rises toward the interior, and in the south and east is covered by the Yablonoi or Stanovoi Mountains and their offshoots. A noteworthy feature of the country is the *tundras*, immense boggy plains, which stretch along the north. Farther south there are good pastures, and wheat and rye are successfully cultivated, even where the ground is frozen to a depth of 600 feet, the summer heat being strong enough to thaw it sufficiently deep for cultivation. There are a number of large rivers teeming with fish, the principal being the Lena. There are valuable forests in the south, frequented by numerous fur-bearing and other animals. Caravans with Chinese and European goods collect the produce of the whole line of coast on the Polar Sea between the parallels of 70° and 74°, from the mouth of the river Lena to the farthest point inhabited by the Tchukchia. The towns are chiefly inhabited by Turks and Cossacks, but the great body of the people are nomads, consisting of Yakuts, Tunguses, etc. Pop. about 270,000.

Yale, Elihu, English philanthropist: b. in or near Boston, Mass., 5 April 1648; d. London, England, 8 July 1721. His father was Thomas Yale, one of the original settlers in New Haven, Conn., in 1638, but who removed to Boston soon after and to England in 1651, followed by his family the next year. The son was educated in England, engaged in trade in India in 1672, and in 1687-92 was governor of the East India Company's fort at Madras. He returned to England in 1692 and although he never revisited New England he displayed his interest in the Collegiate School founded at Saybrook in 1700 by sending gifts of money and books to the amount of some £600 in 1715, 1718, and 1721. The largest gift, that in 1718, followed a suggestion from the college authorities that the college

YALE—YALE UNIVERSITY

building then being erected in New Haven might be named for him. In 1745 the whole institution received the name of Yale College in his honor. Yale's latest years were passed at Wrexham, Denbighshire, North Wales, and his body is buried in the magnificent parish church there.

Yale, Linna, American inventor: b. Salisbury, N. Y., 4 April 1821; d. New York 24 Dec. 1866. In 1851 he patented a safety lock, and for the rest of his life was a recognized authority on all matters pertaining to locks and safes. Becoming convinced of the necessity of abandoning the use of a keyhole as affording an easy means of introduction to the lock mechanism, he was led to the adoption of the permanent dial and shaft as used in the combination locks, and subsequently to the perfection of what is known as the "clock" lock. His most notable invention was the double lock, which comprised two locks within a single case, and was operated by the same or different combinations. He received gold, silver, and bronze medals as first awards at various expositions.

Yale University, located at New Haven, Conn. From the time of the first settlement of the New Haven Colony in 1636, the establishment of a college there was contemplated. It was not until 1700-1, however, that definite action was taken by 10 ministers of Connecticut, and a charter was obtained in 1701 for the establishment of the Collegiate School of Connecticut. This school was first located at Saybrook, but until 1707 the classes were taught at Kellingworth, a neighboring town, where the pastor, Abraham Pierson, was the first rector of the school. In 1716 the school was removed to New Haven, and in 1718, the name was changed to Yale College, in honor of Elihu Yale (q.v.), who had given largely to the Collegiate School. The first building was also completed in 1718. In 1745 a new charter was granted by which the full name of the corporation was The President and Fellows of Yale College. Until after the Revolution the college received occasional grants of money from the colonial government; in 1792 the State made a grant of about \$30,000, and the governor lieutenant and governor and six senators were made members *ex-officio* of the corporation. In 1795 Timothy Dwight (q.v.) became president, and during his administration the college attained a higher degree of prosperity than ever before; the college grounds were extended; permanent professorships were established, and the establishment of separate professional schools planned. The Medical School, however, was the only one established (1813) during President Dwight's lifetime. The Divinity School was organized in 1822, and the Law School in 1824, though instruction in theology had been given since the beginning of the college, and instruction in law for some years prior to 1824. The Sheffield Scientific School was established in 1847, and the School of Fine Arts in 1866. The elective system was adopted during the administration of Noah Porter, and from 1886-99 the college still further extended its course and doubled its number of students; the name was changed to Yale University in 1887. In 1872 provision was made by the State legislature for the substitution of graduates in the place of the six State senators in the corporation, so that the corporation now consists of 10 Congressional ministers, the successors of

the founders, six representatives of the alumni, the governor and the lieutenant-governor of Connecticut. In October 1901 the bicentennial anniversary was celebrated with appropriate ceremonies on the university grounds. There were 4,691 Yale graduates present at the anniversary ceremonies, and in addition, 311 former students, not graduates, and 147 holders of higher degrees from Yale. The President of the United States, and representatives from every leading American university and college, and from many foreign universities, were also present. The exercises included addresses by alumni and distinguished guests, a procession in which graduates and undergraduates took part, the "Dramatic" scenes in the history of the university given by the students' Dramatic Society, and the dedication of Woodbridge Hall, the administration building.

The university includes four departments—the Department of Philosophy and Arts, the Department of Theology, the Department of Medicine, and the Department of Law. In the Department of Philosophy and Arts are included the Academical Department of the college, the Sheffield Scientific School, the Graduate School, the School of Fine Arts, the Department of Music, and the Forest School. The University Library, the Peabody Museum of Natural History, the Observatory, and several other adjuncts to the university are organized independently of the separate departments. The undergraduate course in the college covers four years, and leads to the degree of A.B. To receive this degree the student must successfully complete courses aggregating 60 hours per week through a year; three courses which shall be a continuation of subjects offered for admission are required in the Freshman year. Otherwise the work is elective. The courses are arranged in three groups:

1. Language and Literature.
2. Mathematics and the Sciences.
3. Philosophy, History, and the Social Sciences.

Each student is required to complete two majors and three minors so arranged that not more than two of the five units shall be chosen from any one group. A major consists of connected courses of grades A, B and C, aggregating at least seven hours a week; a minor, of connected courses of grades A and B, aggregating at least five hours a week. The rest of the required number of hours are free electives. Sanskrit, Norwegian, Danish, and Swedish, and pedagogy are included in the curriculum. The Sheffield Scientific School was first organized in 1847, and received its present name in 1860; from 1863-92 it was the State College of Agriculture and Mechanic Arts, and received the national grants for such institutions. It offers undergraduate courses of three years; French and German, English, and general science are included in all courses, and the work of the Freshman year is much the same for all.

In the last two years the courses most distinctly marked out are in civil, mechanical, electrical, municipal, and sanitary engineering, in engineering preparatory to mining, in chemistry, in chemistry preparatory to metallurgy, in natural history, in mineralogy and other studies preparatory to geology, in biology preparatory to medicine, in studies preparatory to a forestry course, and in select studies preparatory to other

higher studies. The School of Fine Arts offers both technical courses and courses in art history and criticism; the regular course is three years in length for the completion of which a diploma is conferred. The degree of Bachelor of Fine Arts is conferred on the completion of certain advanced studies and the presentation of a thesis. The Department of Music offers both theoretical and practical courses. The degree of Bachelor of Music is conferred for the completion of advanced courses. The Yale Forest School was established in 1900; it offers a two years' course, the work of the second year being largely field work. The degree of Master of Forestry is conferred on those who have received a bachelor's degree or have had the equivalent of college training. A Summer School of Forestry is also maintained at Milford, Pa. The Graduate School was organized as a separate school in 1847, the professors of the other sections of the Department of Philosophy and the Arts constitute the faculty of the Graduate School. Graduate courses are offered in the Academic Department, the Scientific Department, the School of Fine Arts, and the Department of Music. The degrees conferred are A.M., M.S., Ph.D., C.E., and M.E. In addition to regular class and laboratory work of the school there are numerous voluntary associations of professors and students for the advancement of graduate work in the several departments of study. The Divinity School offers a regular course of three years leading to the degree of B.D. Seniors in the college may elect such courses in the Divinity School as to shorten the course to two years. A fourth year of graduate work is also provided. The work includes both prescribed and elective courses; elective courses in sociology, and in the study of missions, are included in the curriculum. The Medical School offers a four years' course leading to the degree of M.D. Ample provision for clinical work is made in the New Haven Hospital, the State Hospital for the Insane at Middletown, and the Springside Hospital. The Law School course covers three years. Previous to 1896 it was two years in length. The degrees of Bachelor of Laws and Bachelor of Civil Law are conferred, the same amount of work being required in each course. Students in the college may so arrange their course as to receive the degrees of arts and laws in six years. Graduate courses are provided, leading to degree of Master of Laws, and Doctor of Civil Law. The school was the first in America or England to establish a course leading to the latter degree.

Women are admitted to the School of Fine Arts, the Department of Music, and the Ph.D. courses of the Graduate School, and public school teachers are admitted to some of the regular courses. Numerous scholarships and fellowships are provided in the Academic Department, the Scientific School, the Divinity School, and the Graduate School. A "Bureau of Self Help" is maintained, through which students are aided in obtaining employment. The university maintains a public lecture course, and provides several series of lectures in the different departments; prominent among the latter are the Lyman Beecher lectures on preaching, the Silliman Memorial lectures, the Dodge lectures on the responsibility of citizenship, and the Bromley lectures on journalism, literature and public

affairs. The University Library in 1910 contained 600,000 volumes, exclusive of pamphlets. In addition there are several special libraries, including the Linonian and Brothers Library, the Dwight Hall Library, the Law Library, the Scientific School Library, the Trowbridge Reference Library of the Divinity School, the Lowell Mason Library of Church Music, the Library of Foreign Missions and several department and club libraries. The Peabody Museum was established in 1866 by a gift of George Peabody (q.v.) and contains excellent collections in mineralogy, geology and paleontology, and zoology.

Of the buildings of the university, Dwight Hall, Alumni Hall, Durfee Hall, Battell Chapel, Farnam Hall, Lawrence Hall, Phelps Hall, Welch Hall, Osborn Hall, Vanderbilt Hall, Art School, the Library, and South Middle College, are grouped about the college campus, which is rectangular in shape. In another group to the north are the bicentennial buildings, built largely by the alumni at the time of the anniversary; these are Woodbridge Hall, Woolsey Hall, Memorial Hall, and University Hall. The gymnasium is situated to the northwest of the college campus, near the Peabody Museum, Herick Hall, White Hall, and Pierson Hall. The Scientific School occupies seven buildings, lying northeast of the bicentennial buildings. The Divinity School lies to the south of this group. Hendrie Hall (the Law School) lies east of the main campus, facing the Green. The Medical Hall and the Medical School Laboratory lie to the west of the campus, the University Clinic Building is opposite the New Haven Hospital; the Forest School occupies Marsh Hall, the house of the late Professor Marsh, in the Botanical Gardens. The athletic field of 30 acres is situated about a mile from the campus. The students maintain a Christian Association, an Athletic Association, numerous literary, dramatic, and technical societies, and social, and special literary and technical clubs. A chapter of Phi Beta Kappa is also located at Yale. Yale has long taken a prominent part in inter-collegiate athletics, and general physical training is given full attention. The students in 1910 numbered 3,287, including those in attendance at the Scientific School, the Medical School, and the Law School, as well as at the College. The faculty numbered 406.

Yale ranks as one of the leading American universities, in number of students, standards of scholarship and in the influence exercised through her graduates on national life.

CHARLES HENRY SMITH,
Learned Professor of American History.

Yalu, ya'loo, Korea, a river forming the boundary with Manchuria. In its upper reaches it is known as the Am-nok or Ap-nok. Its source is in the Paik-tu-san, the highest peak (8,000 feet) of the Shan-a-lin Mountains of Manchuria. It flows into Korea Bay, near Wi-ju, after a southwesterly course of about 300 miles, and has numerous tributaries, chief of which is the Chang-jin River. It is navigable for sea-going vessels 30 miles from its mouth and by smaller vessels 145 miles to Wi-wen. On 17 Sept 1894 its mouth was the scene of the battle in which a Chinese fleet of 12 warships, some of them powerful ironclads, and 16 other vessels, was defeated, with the loss of four vessels, by a Japanese force of 11 war vessels and two

others. During the Russo-Japanese war of 1904 its banks witnessed much skirmishing and fighting. See MANCHURIA.

Yam, a popular name for various species of the genus *Dioscorea* of the order *Dioscoreales*, and loosely applied to certain varieties of the sweet potato. The true yams belong to a genus consisting of more than 150 species widely distributed throughout the tropics. They have herbaceous, twining or creeping stems; broad, alternate or opposite, usually simple leaves; and small dioecious flowers, followed by three-winged capsular fruits containing winged seeds. The fleshy roots of some species are widely eaten in the tropics. One of the best known species is *D. alata*, a native of India and the South Sea Islands, but distributed throughout the tropics. Its tubers usually attain a length of three feet and a weight of 30 pounds, but specimens three times as large are not uncommon. They are black or brownish externally and pink within, and are rich in starch. When boiled their acidity is dispelled and they become of pleasant flavor. It is claimed that this species is the parent of most of the edible so-called species such as *D. sativa*, *D. aculeata*, *D. rubella*, *D. globosa*, etc. The air-potato (*D. bulbifera*) is an Asiatic species cultivated to a small extent in the southern United States, and in conservatories, for its odd, angled tubers, which are borne in the axils of the leaves. They often exceed two pounds in weight and are sometimes eaten like potatoes. The Chinese yam, Chinese potato, or cinnamon vine (*D. diuricata*), is a native of the Philippine Islands, whence it has been introduced into the gardens of temperate as well as tropical climates for ornament. It bears cinnamon-scented white blossoms, aerial tubers which are used for propagation. As far north as New York the plants have proved hardy.

Yam-a-mai, an Oriental kind of silkworm which feeds on the oak, and produces a silk with peculiar, but useful qualities, extensively utilized in Japan and somewhat elsewhere. See SILKWORM.

Yama, *yā-mā'*, a Hindu god, the judge of the dead, whose good and bad actions are read to him out of a record, and who according to their merits and demerits are sent to the celestial or to the infernal regions. Hindus offer to him daily oblations of water. See also LAMAISM.

Yamagata, *yā-mā-gā'tā*, Aritomo, MARQUIS, Japanese soldier and statesman: b. Chōshū (or Nagato) province 1838. He was active in the overthrow of the shogunate, and was made second vice-minister of war under the new government. In 1869 he visited Russia and France for study of their military institutions. In 1876-7 he ably directed the Satsuma rebellion campaign, in 1878 was made commander of the imperial guard and chief of the general staff. He was prime-minister in 1889-91, in which post he greatly strengthened the army and navy; and minister of justice in 1891-3. He was appointed to command the first army corps in the war with China in 1894, and quickly expelled the Chinese from Korea. His policy was throughout one of study of Western methods. He was a skilful strategist, and was for his services made field-marshal.

VOL. 22—37

Yamagata, Japan, a town in the island of Honshū, capital of a prefecture, 200 miles north of Tokyo.

Yamaguchi, *yā-mā-goo'chē*, Japan, city, capital and chief city of the prefecture of Yamaguchi, in the southwestern part of the island of Honshū; 15 miles back from the coast. It was formerly the residence of the lords of Chōshū, a Mori family, and became the seat of the local government in 1860. In 1550 a church was established here by Francis Xavier, but was finally destroyed.

Yamaji, *yā'mā-jē*, Motobaru, VISCOUNT, Japanese soldier: b. Tosa province, island of Shikoku, about 1840. He won distinction in the campaign against the unsuccessful revolt in Satsuma province (island of Kiu-siu) in 1877; and was promoted lieutenant-general. In the Chinese-Japanese war of 1894-5 he had the immediate direction of the attack on Port Arthur, which was finally taken on 22 Nov. 1894. This won for him a great reputation in Japan, where, in allusion to his loss of an eye, he is known as the "One-Eyed Dragon."

Yamanou'chi Gun. See ORDWANCE.

Yamaska, *yā-mās'ka*, Quebec, Canada; (1) a village and railway junction of Yamaska County, on the Yamaska River, 31 miles north of Saint Hyacinthe. The river affords power for several mills. Pop. about 900. (2) A county bordering on Lake Saint Peter; area, 183,705 acres. Capital, Saint François du Lac. It is drained by the Yamaska, Nicolet, and Saint Francis rivers. Pop. about 18,000. (3) A river flowing from Brome Lake, Brome County, and after a course of about 100 miles through a fertile country, draining into the Saint Lawrence River at Lake Saint Peter.

Yambo, *yām'bō*, **Yambu**, *yām'boo*, or **Yembo-El-Bahr**, *yēm'bō-ēl-bār*, Arabia, a seaport town on the Red Sea, in the province of Hedjaz, 131 miles east of Medina, of which it is the harbor. Marking the end of the third quarter of the caravan journey from Cairo to Mecca, the town bears the title "Gate of the Holy City." The town consists of a long row of white houses built of limestone and coralline, standing on the edge of an arid plain. It has considerable imports and transit trade between Suez, Jidda, and Medina. Pop. est. 7,000.

Yana ("people"), a small tribe, forming the Yana linguistic stock of North American Indians, whose former habitat was bounded on the east by a mountain range a little west of Lassen Butte, and terminating near Pit River, in northern California; on the north by a line running northeast to southwest, passing near the northern side of Round Mountain, three miles from Pit River; on the west by a line extending from Redding southward on an average 10 miles to the eastward from Sacramento River; north of Redding it approximates twice that distance. The tribe and stock were represented in 1884 by 35 individuals divided into two groups—one at Redding, the other in their original country at Round Mountain. They have a tradition to the effect that they came from the East, and it is said that in physical traits they differ markedly from all the northern California Indians.

Yana, *yā'nā*, or **Jana**, Eastern Siberia, a river which rises in the Verkhoyanskii Moun-

YANCEY

tains, and after a northerly course of about 750 miles enters the Arctic Ocean, near Ustjansk, by seven large and many small mouths.

Yancey, yán'sí, William Lowndes, American lawyer, orator, and statesman: b. Falls of Ogeechee, Hancock County, Ga., 10 Aug. 1814; d. near Montgomery, Ala., 27 July 1863. He was the son of Benjamin Cudworth Yancey of Charleston, S. C. His mother was a daughter of Col. William Bird, a descendant of the historic family of "Birdsville," Pennsylvania. The Yanceys were landed proprietors of Virginia in the time of Charles II., and the Cudworths were New England people, devoted patriots in the Revolution. Capt. Joseph Yancey fell at Eutaw Springs, and Maj. James Yancey of the Virginia Continental forces, having come to South Carolina with General Nathaniel Greene, settled there after the war, and became a lawyer and statesman. Benjamin Cudworth, the father of William, was the son of James. As midshipman he had fought the French under Truxton. Yancey's first recourse to attain influence in Federal affairs was in an election to the House of Representatives of Congress. He was successful under a most flattering vote of an Alabama district in 1844 at a special election to fill an unexpired term. The next year he was returned to office without opposition. Yancey resigned at the close of the Twenty-ninth Congress, in the summer of 1846, because he had discovered that any movement which might be necessary to save the South in possession of slavery must come from the people direct without the intervention of their representatives in Congress. He returned to his law office at Montgomery, persistently refused public office and eagerly entered upon the self-appointed tribuneship, the task of educating and animating the Southern masses in the principles of States rights.

The candidature of General Zachary Taylor as the nominee of the Whigs for President of the United States, in 1848, proved a disturbing influence in the Democratic State of Alabama. The long-prostrate Whigs were quick to seize the occasion. In January 1848, they invited all persons favorable to General Taylor's election to assemble at Montgomery in convention. Democrats of high position in party politics answered to the summons. In the next month, the customary State Convention of the Democratic party met at the same place to appoint delegates to the approaching quadrennial National Democratic Convention to meet at Baltimore. In the action of this State Convention Yancey attained to national reputation that never waned. With tact and intellectual prowess he then and there laid the predicate of that agitation which accepted his personal leadership as long as he lived. In anticipation of this meeting, he prepared at his law desk the resolutions that he intended the Democrats of Alabama should present for ratification at the Baltimore Convention. The usual committee on resolutions brought into the State Convention its report. Yancey rose on the floor, drew from his pocket his own substitute, read what he had written, spoke 45 minutes to his own motion, and without a dissenting voice carried it. The substitute was adopted and remained before the country, the pivotal question of Federal politics, until the election of Abraham Lincoln

to the Presidency, in 1860, in token of the final adverse settlement of the proposition set forth by it. The few pages of manuscript that Yancey read of his own construction became the "Alabama Platform." It was not in the nature of suggestion, that the laws of Alabama should go to the common domain to protect the property of Alabama settlers there; but that the laws of Massachusetts should not be permitted to deny to Alabama settlers on the common domain their rights of property as secured by the Federal Constitution. Number 9 of the Yancey resolutions declared: "That the [pending] treaty [with Mexico] should contain a clause securing an entry into those [conquered] territories to all citizens of the United States, together with their property of every description, and that the same should remain protected by the United States while the territories shall continue under its authority."

Yancey was appointed by the Convention the leader of its delegation to Baltimore; the National Democratic Convention refused the principle of the Alabama Platform. Yancey withdrew from participation in its proceedings, returned to Alabama and took the field against General Cass, the Democratic nominee for President. Without advocating Taylor's election he proclaimed from a hundred "stumps" the peril of the cause of the South in support of Cass.

The people of Alabama declined Yancey's advice, in 1850, to secede from the Union. He bided his time, speaking and writing industriously his unflinching sentiments. In 1856 he succeeded in accomplishing the re-organization of the State Democratic party, opening its doors to all who would follow him. Under the spell of his eloquence, the Alabama Democratic Convention of that year re-adopted the Alabama Platform as prepared by him in 1848 and sent it with gratifying results to the quadrennial National Democratic Convention at Cincinnati. As the head of the electoral ticket he canvassed the State, for the first time, for Buchanan and Breckenridge and fixed upon immovable foundations his influence in the generation about him. When Yancey took his seat in the Charleston National Democratic Convention of 1860, he was the acknowledged leader of the South. He was selected by the 15 Southern States in a body to speak for them in argument with the Northern States. He spoke and the Convention was disrupted and the party virtually dissolved, but Yancey desired neither the disruption of the Convention nor the dissolution of the party. He did not expect the election of a Democrat of either faction, Northern or Southern, to the Presidency, even if the factions should unite. The 16 Northern States, that already had Republican State governments and that controlled the election, were not likely to choose Democratic Presidential electors. Yancey looking forward at Charleston to the election of the Republican party candidate to the Presidency, anxiously desired to see the South united in opposition, pending the campaign, to the end that the longed-for Southern Confederacy might be made more sure at the close of the campaign.

Yancey entered the North in the last months of the Presidential campaign of 1860. He spoke at Cooper Institute, at Albany, Syracuse, and Rochester, and at Faneuil Hall. Ostensibly the object of his oratory was to turn opinion to

W. L. YANCEY.

YANG AND YIN—YANKTON

Douglas as the compromise candidate for the Presidency; really he spoke to present to the people of the North finally the Southern argument of self-defense. His audiences, always numbered by the capacity of the hall, were in the main friends of Lincoln. Streets were lighted in his honor, houses were decorated, long processions escorted him. The impression of his oratory was phenomenal. On the night of 20 October he appeared in the last of his Northern appointments at Pike's Opera House, Cincinnati. A grave editorial notice of the event appeared in a local and unfriendly newspaper of the first class the next morning: "Pike's Opera House was crowded to its utmost capacity last evening and contained probably the largest audience ever within its walls, to listen to an address from the Hon. William L. Yancey of Alabama. The notoriety of the man, his great agency in promoting the disruption of the Charleston and Baltimore Conventions, the novelty of hearing one entertaining his extreme views on the slavery question, together with his powers as an orator, would naturally draw him a great audience in this city. . . . His address was about two hours and was listened to with the most profound and marked attention."

Yancey was appointed by President Jefferson Davis immediately upon the organization of the Confederate government, in February 1861, president of a commission of three to the states of western Europe, to seek the recognition of the Southern government. He accepted the post reluctantly. Yielding his will, he desired to be instructed to offer to England and France, unitedly or singly, special privileges of commerce in the Confederate ports for a long period, not less than 20 years, in return for the act of recognition of either or both. In his absence on the foreign mission he heard of his unanimous election to the Senate of the Confederate States and having despaired of effecting good in Europe while denied the instructions from his government that policy suggested, he returned to Alabama. Yancey's service in the Senate of the Confederate States continued as long as he lived. He bitterly resented the inefficiency of the government of President Davis. He urged a war of invasion from the South upon the North, the shipment of all the cotton in the South to Europe, the importation of European arms and supplies without limit at a time when the blockade by the United States was known to be ineffective.

JOHN WITHERSPOON DU BOIS,
Author of 'Life and Times of Yancey.'

Yang and Yin, in Chinese philosophy, terms employed to indicate the two phases under which the supreme principle of the universe, *Tai-ki*, displays itself in the world of phenomena, Yang and Yin being, in various proportions, blended in all forms of existence.

Yang-tse-kiang, yāng'tsǎ-kě-āng, the name generally given to one of the greatest rivers of China throughout its entire course, although this name is only applied in China to the lower course of the river, the entire river being called simply Kiang, or Ta Kiang (river or great river), while in the various provinces it traverses it is generally known by special names. It rises in the Tangle Mountains in mid-Tibet, about lat. 35° N. and lon. 89° E., and is first known by the name of Muru-Ussu. In its upper course

it is sometimes called the Kin-cha-kiang. Its upper course through the mountainous region of Tibet extends to about 1,100 miles, during which its windings and falls present numerous striking scenes of natural beauty. It crosses the Chinese frontier in the province of Yunnan. Between the town of Li-kiang in this province, and Hui-li in Sze-chuen, for a course of about 250 miles, it flows in an easterly direction through a winding channel or mountain gorge of imposing grandeur. Traversing the whole province of Sze-chuen in a northeasterly direction, and passing in southeasterly direction into the province of Hu-pei, it reaches at King-chau the great Chinese plain, and traversing the provinces of Ngan-hui and Kiang-su, and passing the cities of Han-Yang, Han-kau, and Wu-chang, a great seat of the tea exporting trade, Ngan-king, Nanking, and Chin-kiang, it enters the Tung-hai, or Eastern Sea, above Shanghai. Its direct course from its source to its mouth is estimated at 1,800 miles; its course with windings is about or considerably over 3,000. It receives numerous affluents, and is crossed by the Grand Canal, which forms a junction between it and the Hoang-ho. The river and the ports of Chin-kiang and Han-kau were opened to foreign navigation in 1860, I-chang (1,000 miles up), and others since. A British squadron sailed up the river in 1861 for more than 800 miles. The navigation above the confluence of the Tung-ting is interrupted by rapids. The tidal influence reaches in February to Lake Poyang, 436 miles from the sea. Consult Little, 'Through the Yang-tse Gorges' (1898).

Yankee, a cant name for Americans belonging to the New England States. During the Revolution the name was applied by the British to all the insurgents; and during the Civil War it was the common designation of the Federal soldiers by the Confederates. In Great Britain the term is sometimes improperly applied generally to natives of the United States. The most common explanation of the term seems also the most plausible, namely, that it is a corrupt pronunciation of English or of French *Anglais* formerly current among the American Indians.

Yankee Doodle. The air of Yankee Doodle is said to have been a British air known in the time of Cromwell by the name of Nankee-Doodle, and played with derisive reference to the similarity of this name to Yankee by the British troops in evacuating Boston. The Americans took it up and made it their national air. It has since been superseded by 'Hail, Columbia.' See NATIONAL SONGS.

Yankee Gang, a term used in sawmills for an arrangement adapted for logs 21 inches diameter and under. It consists of two sets of gang saws, having parallel ways in the immediate vicinity of each other. One is the slabbing gang, and reduces the log to a balk and slab boards. The balk is then shifted to the stock gang, which rips it into lumber.

Yank'ton, S. Dak., city, county-seat of Yankton County; on the Missouri River, and on the Chicago, M. & St. P., the Great Northern, and the Chicago & N. R.R.'s; 60 miles northwest of Sioux City and 135 miles northwest of Omaha, Neb. It has steamer connection with the Missouri River ports. The city is the commercial and industrial centre of a

YANKTON COLLEGE—YARMOUTH

large agricultural and stock-raising region. The chief industrial establishments are Portland-cement works, breweries, pork-packing establishments, flour mills, woolen mills, brick yards, grain elevators, and stock yards. The city owns and operates the water-works. The educational institutions are Yankton College (Congregational), opened in 1882, Saint Joseph's Academy, a public high school, public and parish elementary schools. It has the South Dakota Hospital for the Insane and a hospital in charge of the Sisters of Saint Benedict. Yankton's water supply is obtained partly from artesian wells. There are two national banks, one State, and the American Mortgage Company; the four have a combined capital of \$175,000. The government is administered under a revised charter of 1885 which provides for a mayor, who holds office one year, and a council. Yankton was settled by Eastern people in 1862, and in 1883 received a city charter. Until 1883 it was the capital of the Territory of Dakota. Pop. (1890) 3,670; (1900) 4,125, (1910) 3,787.

Yankton College, located at Yankton, S. Dak. It was established by the General Association of Congregational Churches of Dakota in 1881, and opened to students in 1882, and is the oldest institution of higher learning in the Dakotas. The majority of the corporate body which elects the trustees must be members of Congregational churches; otherwise the college is non-sectarian. It is open to both men and women. The organization includes the following departments: (1) the College; (2) the Academy; (3) the Conservatory of Music; (4) the Department of Art; (5) the Department of Elocution; (6) the Department of Physical Training; (7) the Department of Stenography. The college offers three four years' courses, the classical, the philosophical, and the scientific, leading to the degrees of B.A., B.Ph., and B.S. respectively. The work of the freshman year is required in all courses; elective work begins in the sophomore year and increases progressively in the junior and senior years. Greek is required for the A.B. degree; one course in Bible study is required of all students, and there are other elective courses; courses in pedagogy are included in the curriculum. The Conservatory of Music offers courses of three to five years in pianoforte, pipe organ, voice, and violin. The course in stenography covers one year. Gymnasium work is required of both men and women, and there is also an athletic park, and ample provision for athletic sports. The students maintain Young Men's and Young Women's Christian associations, literary societies, a branch of the Inter-Collegiate Oratorical Association, and athletic associations. The college has an attractive campus of 25 acres, including the Athletic Park (five acres) to the north of the main campus, and Observatory Hill to the south. The buildings are Middle College, Dakin Hall, the Ward Hall of Science, Clarke Observatory, and the gymnasium: a new library building, the gift of Andrew Carnegie, was constructed during 1904. A Summer School was established in 1903. The students in 1910 numbered 351, of whom about 100 were in the College; others attending the Conservatory of Music in the Summer School.

Yapock, a small, rat-like marsupial (*Achironectes variegatus*) of the opossum fam-

ily (*Didelphidae*), which is found in Central and South America. It is rather larger than a common rat, with large, naked ears, and a long, nearly naked, tail; fur brown above, with three transverse bright gray bands, interrupted in the middle, white below. It differs from the opossums in having webbed hind feet and being an expert swimmer and diver. Its habits closely resemble those of the otter, and it feeds on fish, crabs, and other aquatic animals.

Yapura, *yā-poo-rā'*, or *Japura*, *zhā-poo-rā'*, a river in Colombia and Brazil, South America, a tributary of the Amazon. It is about 1,800 miles long; and fully one half its course is navigable for steamers. At lat. 1° 10' S. and lon. 72° 30' W. navigation is interrupted by a large cataract.

Yard, (1) As a nautical term, a spar slung from a mast and serving to extend a sail. Yards are either square, lateen, or lug sail. Yards for square sails are suspended across the mast at right angles, and are of a cylindrical form, tapering from the middle, which is termed the slings, toward the extremities, which are called the yard arms. (2) A standard measure of length, equal to three feet or 36 inches, the foot in general being made practically the unit. As a cloth measure the yard is divided into four quarters=16 nails. A square yard contains nine square feet, and a cubic yard 27 cubic feet. See WEIGHTS AND MEASURES.

Yarkand, *yār-kānd'*, Central Asia, (1) A city of Eastern or Chinese Turkestan, situated on a fertile plain on the north side of, and at a little distance from the river Yarkand, about 200 miles southeast of Kashgar. It is enclosed by a ditch, and a thick mud wall with towers at intervals. The houses in general are built of sun-dried bricks. Those of the rich are in large open squares surrounded by high walls and well stocked with fruit-trees. The streets are in general too narrow to permit carts to pass. They are intersected by numerous canals, and where three or four streets meet there is always a tank for water. There is a large covered bazaar wide enough to admit carts. The inhabitants, like those of Kashgar, are very mixed in regard to race. The prevailing religion is Mohammedanism. There are 120 mosques and some caravanseries. During the period in which Eastern Turkestan was severed from China a commercial treaty was concluded at Yarkand in 1874 between Sir Douglas Forsyth, representing Great Britain, and Yakub Beg, who was then the independent ruler of Eastern Turkestan. Commercial intercourse with India sprung up in consequence. The chief trade at present is carried on with Russia. Estimated pop. 80,000 to 120,000. (2) A river of Eastern Turkestan, which rises in the Karakoram Mountains, flows generally in a northeast direction and unites with the Kashgar to form the Tarim. The Tarim flows east and enters the Lob Nor Lake, or series of shallow lakes.

Yarmouth, *yār'mūth*, Canada, a town and port of entry of Yarmouth County, Nova Scotia; on the Bay of Fundy, the Atlantic Ocean, and the Dominion Atlantic Railroad; 90 miles south of St. John, N. B. The town has extensive fishing, shipping, and manufacturing interests, electric lighting, and street railways. At the head of its educational institutions is Yarmouth Seminary.

YARMOUTH—YARROW

Yarmouth, Maine, town in Cumberland County; on Casco Bay, the Royals River, and on the Grand Trunk Railroad; 10 miles north-east of Portland. It contains four villages. It has a foundry, paper and cotton mills, and granite quarries. The town has six churches, North Yarmouth Academy, a high school, graded schools, and a public library. Pop. (1910) 2,350.

Yarmouth, Great, England, a seaport town in the county of Norfolk, 22 miles east of Norwich, on a narrow slip of land between the Yare and the sea, and connected by a bridge over the Yare with Little Yarmouth, or South Town, in Suffolk. The older part, near the river, is remarkable for the number of narrow lanes at right angles to the main streets, known as the "rows." Between the older part of the town and the sea is the modern part, with a marine parade and other attractions. The parish church, founded in 1101, is a very large building, and the market-place is also of great size. There are a fine town-hall, a large custom-house, a fine library and museum, borough jail, a lofty Nelson monument, royal hospital, royal naval lunatic asylum, aquarium, two fine piers, and an ancient jetty. The quay stretches along the river upward of a mile. The harbor is in the Yare, and is accessible by vessels drawing 18 or 19 feet. Immediately off Yarmouth, and parallel to the shore, is a great range of sand-banks, between which and the land is the safe anchorage of Yarmouth Roads. Yarmouth is a great seat of the English herring-fishery, in which about 300 vessels and 3,000 hands belonging to the port are employed; many hands are likewise engaged in the mackerel fishery, and in that for cod and other whitefish. Many of the fish are cured, the cured herrings known as "Yarmouth bloaters" being celebrated. There are maling-houses, boat-building yards, rope-works, silk-crape factories, trawl-net works, etc. Yarmouth has risen into considerable importance as a watering-place.

Yarn, any textile before woven into cloth. Cotton yarn is numbered according to the number of hanks contained in a pound of 7,000 grains. Each hank, or skein, measures 840 yards. Worsted yarn has 560 yards to the skein; woolen yarn has 1,600 yards to the skein or run. Linen yarn is wound upon reels, and made up into leas, hanks, and bundles. Flax and jute yarn is numbered according to the number of leas of 300 yards per pound.

Yaroslavl, yā-rō-slāv', or Jaroslav, Russia, (1) a city, capital of the province of Yaroslavl, at the confluence of the Kotorost and Volga rivers, 173 miles northeast of Moscow. It is the see of an archbishop. The Uspenskij Cathedral was begun in 1215, and there are numerous other old churches, several monasteries, schools, gymnasias, a theological seminary, and a lyceum with a law faculty. The left bank of the Volga is the suburban and residential portion of the city and contains many beautiful dwellings. The city is largely engaged in manufacturing and commerce, the right bank of the Volga being lined for two miles with quays. There are numerous cotton and linen mills, silk factories, and bell foundries. The village of Velikoje Selo, included in the city, is the centre of the linen manufacture of Russia, and has an annual output valued at \$3,000,000. Pop. about 80,000.

(2) The province has an area of 13,751 square miles, and is bounded by the provinces of Novgorod, Vologda, Kostroma, Vladimir, and Tver. The surface is level and well watered by the Volga and its tributaries, the Mologa and Sheksma. The western portion has numerous ponds and marshes, the largest being Lake Nero, near Rostov, from which the Weska flows. The Volga is connected with the Neva by two canals, through which considerable commerce is carried on. Market gardening, timber cutting, mining, and manufacturing are the chief occupations. There are extensive linen and cotton mills, and factories for the manufacture of chemicals, machinery, metal ware, flour, tobacco, and spirits, making Yaroslavl one of the principal manufacturing provinces of Russia. Considerable commerce is carried on by the two railway lines, the Rybinsk-Saint Petersburg and the Yaroslavl-Moscow-Vologda.

Yarra-Yarra, yā-rā-yā-rā, Australia, the river of Victoria on which Melbourne (q.v.) stands. It is about 100 miles long, but is not navigable above Melbourne, owing to its falls.

Yarrell, yār'el, William, English naturalist: b. London June 1784; d. Yarmouth, Norfolk, 1 Sept. 1856. Led to note carefully the habits of birds and fishes in 1825 he sent his first contribution to the 'Zoological Journal,' a notice of some rare British birds observed in the years 1823-5. The same year he became a member of the Linnean Society, to whose 'Transactions' he repeatedly contributed interesting papers on the subject of birds, and in 1849 became its vice-president. His chief work is his 'History of British Birds' (1839-43, 4th revised edition 1881-5). He also published 'The History of British Fishes' (1835-6).

Yarrow, yār'ō, Harry Crécy, American physician: b. Philadelphia, Pa., 19 Nov. 1840. He was graduated from the medical department of the University of Pennsylvania in 1861, and during the Civil War served as surgeon of the 5th Pennsylvania cavalry. He was surgeon and naturalist in the expedition to explore the territory west of the 100th meridian, and has been acting assistant surgeon of the United States army for more than 30 years. He is the author of 'Introduction to the Study of Mortuary Customs Among North American Indians,' and various biological and ethnological monographs.

Yarrow, Scotland, a celebrated pastoral stream in Selkirkshire, which rises at Yarrow Cleugh, and, running east a few miles, forms a beautiful lake, called the Loch of the Lowes, which discharges its water into St. Mary's Loch. Issuing from the latter, the river, after a course of 16 miles through the district of Ettrick Forest, flows into the Ettrick near Selkirk. It is famous in Scottish song, and has been celebrated in poems by Scott, Wordsworth, and others.

Yarrow, an erect, hairy composite herb (*Achillea millefolium*), sometimes called milfoil. The terminal corymbs of small white, or occasionally rose-colored flowers, are large, compound, and fastigiate. The leaves are from two to four inches long, and are cut into numerous fine segments, which are very pubescent. Yarrow is a common plant of roadsides, and has been introduced from Europe. It has been used for a long time as a tonic and astringent, and

enters into an ointment for dressing wounds. Several species of *Achilles* are garden plants. Sprigs of yarrow plucked from a young man's grave, by love-sick maidens, who repeat meantime a mystic formula, are expected to invoke the images of their lovers, in dream.

Yarumal, yā-roo-māl', Colombia, a town in the department of Antioquia, on the Cauca, 50 miles northeast of Medellín. Gold mining and stock-raising are the chief industries. Pop. est. 9,000.

Yataghan, yāt'a-gān, the Turkish name for a sort of dagger-like sabre with double-curved blade, about two feet long, the handle without a cross-guard, much worn in Mohammedan countries.

Yates, yāts, **Edmund**, English journalist and author: b. Edinburgh 3 July 1831; d. London 20 May 1894. After a secondary education he obtained a post in the secretary's department of the general post-office (1847), and in 1862 became head of the missing-letter department. Meanwhile he was also active in various literary work,—writing dramatic critiques for the 'Court Journal' and the *Daily News*, contributing to numerous periodicals, editing short-lived humorous journals ('Comic Times,' 'The Train'), and doing some successful farces. In 1858 he became editor of 'Town Talk,' in which he soon made an attack on Thackeray which resulted in his expulsion from the Garrick Club; in 1860 acting editor of 'Temple Bar,' of which he was editor-in-chief in 1863-7; and for a time was also editor of 'Tinsley's Magazine.' Among his subsequent ventures were 'Time: A Monthly Miscellany' (1870-84), and 'The World.' He lectured in the United States in 1872, and in that year withdrew from the post-office department. The best of his works in fiction are probably 'Broken to Harness' (1864), originally published in 'Temple Bar,' and 'Black Sheep' (1867); His 'Edmund Yates: His Recollections and Experiences' (1884; 4th ed. 1885) contains much interesting material.

Yates, **Lorenzo Gordin**, American naturalist: b. England 8 Jan. 1837. He came to the United States in 1853, and after teaching in Wisconsin, he later studied medicine and dentistry. He served in the geological survey of California under Prof. J. D. Whitney (q.v.), and had charge of the scientific department of the Froebel Institute, Los Angeles, Cal. He has published 'California Digest of Masonic Law' (1867); 'Charm Stones' (1866); 'The Ferns of Ceylon' (1887); 'Notes on Hawaiian Ferns' (1887); 'The Channel Islands' (1890); 'The Mollusca of Santa Barbara County and New Shells from the Santa Barbara Channel' (1890); 'All Known Ferns'; 'Aboriginal Weapons of California' (1900); 'Prehistoric California' (1903).

Yates, **Richard**, American politician: b. Warsaw, Ky., 18 Jan. 1818; d. St. Louis, Mo., 27 Nov. 1873. He was graduated at Illinois College, Jacksonville, in 1838; practised law at Springfield, Ill., sat in the State legislature 1842-9, and was sent to Congress as a Whig in 1850. In 1860 and 1862 he was governor of Illinois. He was a strong opponent of slavery, and an ardent supporter of the government during the Civil War, taking an active part in the organization of volunteer regiments. He

was United States Senator in 1865-71, and afterward United States railroad commissioner.

Yates, **Richard**, American politician, son of the preceding: b. Jacksonville, Ill., 12 Dec. 1860. He was graduated from Illinois College in 1880 and from the law department of the University of Michigan in 1884. After being city attorney of his native place, 1885-91, he was county judge of Morgan County, Ill., 1894-7, and collector of internal revenue at Springfield, Ill., 1897-1900. In 1901 he was elected governor on the Republican ticket of Illinois for the term ending 1905.

Yates, **Robert**, American statesman and jurist: b. Schenectady, N. Y., 17 March 1738; d. Albany 9 Sept. 1801. He was educated and studied law in New York, and after his admission to the bar (1760) settled in Albany, where at the commencement of the Revolutionary troubles he was a member of the committee of public safety (1775). In 1775-7 a member of the provincial congress of New York. He was a member of the convention that framed the constitution of the State (1776), in 1777 was appointed judge of the supreme court of New York, and in 1787 was a member of the convention that framed the Constitution of the United States. His notes of the secret proceedings and debates of this convention were printed after his death (1839). In 1790 he was appointed chief justice of the State of New York. On his retirement from the bench in 1798 he was appointed a commissioner to settle disputed titles to lands in the 'Military Tract' with Massachusetts and Connecticut.

Yates, **William**, English Baptist missionary: b. Loughborough, Leicestershire, 15 Dec. 1792; d. at sea 3 July 1845. He studied for the Baptist ministry at Bristol College, was ordained in 1814, and sailed for Calcutta the next year. He settled at Serampore, preaching for a time and subsequently devoted himself entirely to translation. He translated the whole Bible into Bengalee; the New Testament, the Pentateuch, Job, the Psalms, the Proverbs, the Song of Solomon, Ecclesiastes, Isaiah, and Daniel into Sanskrit; and the New Testament into Hindee and Hindustanee. He also prepared in Sanskrit a dictionary, grammar, vocabulary, several school books, and an expurgated edition of the 'Hitopadesa' and 'Nalodaya,' numerous school books in Hindee, Hindustanee, Arabic, and Bengalee; and translations of Bunyan's 'Pilgrim's Progress' and Baxter's 'Call to the Unconverted.'

Yates Centre, Kan., city, county-seat of Woodson County; on the Missouri Pacific and the Atchison, T. & S. F. R.R.'s; about 90 miles east by north of Wichita. It is in a productive farming region. It has industries connected with farm and dairy products, stock-raising, and marketing of wheat, corn, and fruit. There are six churches, a high school, graded elementary schools, and a school library. It has two banks, one national and one state. Pop. (1890) 1,305; (1900) 1,634; (1910) 1,910.

Yawl, a small ship's boat, usually rowed by four or six oars; a jolly-boat; also a sailing boat similar to a cutter, but having a small sail at the stern.

Yawning, or **Gaping**, an involuntary and wide opening of the mouth and inhalation of

YAWS—YAZOO CITY, MILITARY OPERATIONS

breath, generally produced by weariness or an inclination to sleep, sometimes by hunger, sympathy, etc. It often precedes the fit in some intermittent fevers, hysteria, and spasmodic asthma, and in some instances, by the frequency of its recurrence, becomes a real disease. Persons suffering from heart disease may be liable to yawning fits. It is supposed by some to be determined by an interruption of the pulmonary circulation. Yawning is performed by expanding the chest, by extending the lungs, by drawing in, gradually and slowly, a large quantity of air, and gradually and slowly expiring it after it has been retained for some time, the muscles of the chest being restored to their natural state. Its effect upon the muscles brought into play is sometimes very restful. When yawning is troublesome, long, deep respiration, or drawing in the air at long intervals, relieves it. It often seems "contagious."

Yaws, a disease occurring in Africa, America, Samoa, Java, and tropical regions in many parts of the world. It is almost wholly confined to the African races. It is characterized by cutaneous yellowish tumors, numerous and successive, gradually increasing from specks to the size of a raspberry, one at length growing larger than the rest; core a fungous excrescence; fever slight, and probably irritative merely. It is contagious, and cannot be communicated except by the actual contact of yaw matter to some abraded surface, or by inoculation, which is sometimes effected by flies. It is also called *frambesia*, from the French *framboise*, a raspberry. Some regard it as a form of syphilis.

Yazd, yâzd. See **Yazm.**

Yazoo, yâ'zoo (an Indian word meaning "River of Death"), a river in Mississippi, formed by the junction of the Yallobusha, Tallahatchie, and several bayous thrown out by the Mississippi River in the northwestern part of the State. Its general direction is southwest; it is a deep, sluggish stream; the total course of nearly 300 miles, and is very irregular. It enters the Mississippi about 11 miles above Vicksburg. It is navigable all the year. The Tallahatchie River receives part of its waters from the Mississippi; so that small boats from the Mississippi can enter the Yazoo at its source and re-enter the Mississippi not far from Vicksburg.

Yazoo City, Miss., city, county-seat of Yazoo; on the Yazoo River, and on the Yazoo & Mississippi Valley (Illinois Central) Railroad; about 44 miles northwest of Jackson and 60 miles northeast of Vicksburg. It is in a fertile agricultural region in which the chief products are cotton, farm products, and lumber. The chief industrial establishments are cotton factory, lumber mill, cottonseed-oil mills, cotton gins, cotton compresses, machine shops, and brick, lumber, ice, and coal yards. The principal public buildings are the county courthouse, opera house, and library. There are five church buildings valued at \$100,000, and eight churches, for colored persons, valued at \$40,000. The educational institutions are Saint Clara's Academy (R. C.), and public schools for both races. The three banks have a combined capital of \$300,000; and the annual business amounts to \$3,500,000. The government is vested in a mayor and a council of eight members, four of

whom are elected each year. Yazoo City was settled about 1820. In 1830 it was incorporated, and in 1840 chartered as a city. In 1904 the city suffered heavily from fire; practically all the business portion was destroyed; every one of the five churches, the city-hall and Masonic Hall were also burned; the loss was estimated between \$1,000,000 and \$2,000,000. Pop. (1900) 4,944; (1910) 6,796.

J. G. McGURK,
Editor 'Yazoo City Herald.'

Yazoo City, Military Operations at and near. Yazoo City was chosen by the Confederates as a site for a navy yard, at which were constructed some formidable iron-clads. Upon Gen. Grant's approach to Vicksburg from the rear, in May 1863, the Confederates abandoned Haynes' Bluff, near the mouth of Yazoo River, upon which Lieut.-Commander John G. Walker, of the United States navy, went up the river with a small gunboat fleet to destroy all the works at Yazoo City. As the expedition approached the city, Lieut. Isaac N. Brown, of the Confederate navy, set fire to and destroyed three powerful rams which he had nearly completed, and upon which the Confederates were placing great reliance. Walker set fire to everything else of a public character, including the navy yard, containing five saw-mills, planing-mills, machine-shops, etc., and the expedition then returned. Early in June, Kimball's Union division was sent up the Yazoo to destroy the railroad bridge over the Big Black near Canton; but upon arriving at Mechanicsburg Kimball found a large Confederate force in his front at Yazoo City and Liverpool, and as the river, on which he depended for supplies, was rapidly falling, he returned to Haynes' Bluff. After the surrender of Vicksburg a report reached Gen. Grant that Gen. J. E. Johnston was fortifying Yazoo City, and that a number of steamers were at the place, employed in supplying his troops. A naval and military expedition was organized to capture or destroy the steamers and take the place. Four vessels, under Lieut.-Commander Walker, and 5,000 men under Gen. F. J. Herron, in transports, went up the Yazoo from Haynes' Bluff 12 July, and approached Yazoo City at noon next day; the Confederates were reported in force, and the iron-clad gunboat *De Kalb* was pushed ahead and opened her guns to ascertain the number and position of the enemy's guns. The Confederates had a battery of six heavy guns and the town was held by the 20th North Carolina infantry. Finding the defenses formidable, Walker dropped back and notified Herron, who at once landed his troops and a combined attack was made. After a slight skirmish on shore the Confederates fled, previously setting fire to four large steamers. Six heavy guns and one steamer fell into Union hands. Herron captured nearly 300 prisoners. While the *De Kalb* was moving slowly along and firing on the enemy, she ran on a torpedo, and sank in 15 minutes. All on board were saved. Herron destroyed all public property, captured about 2,000 bales of cotton, and returned to Vicksburg on the 21st.

On 3 Feb. 1864, in co-operation with Gen. Sherman's Meridian expedition (q.v.), a combined expedition of gunboats and transports with troops was sent up the Yazoo River from Vicksburg, with instructions for the gunboats to explore Yazoo and Sunflower rivers and all

YAZOO FRAUD—YAZOO PASS EXPEDITIONS

their tributaries. The gunboats were five in number, under command of Lieut.-Commander Owen, United States navy. Five transports conveyed the 11th Illinois and 8th Louisiana (colored) infantry and 35 colored cavalry, in all 982 men, under command of Col. James H. Coates, who was instructed to reconnoitre above Yazoo City and to obtain corn and forage on the Sunflower or on the Yazoo, and also to seize at least 1,000 bales of cotton and to destroy all flats or boats used to cross from the east to the west. From its start the expedition was annoyed by Gen. L. S. Ross, who, with a brigade of about 1,200 men, was guarding the Yazoo River and the Mississippi Central railroad, and who, on the 3d, opened fire with artillery upon one of the gunboats when near Liverpool Heights. Coates landed his men, had an indecisive fight with Ross in which he lost 6 killed, 21 wounded, and 8 missing, and at night withdrew to his transports. Next morning the expedition, under fire of Ross' artillery and musketry, passed up the river, the gunboats clearing the way to within four miles of Yazoo City, where it remained until the 6th, when two gunboats, having been ordered to reconnoitre, reported that the place was occupied in force, with five guns in position and another in course of erection. The guns opened, two shots taking effect on one of the gunboats, and the gunboats and transports fell down the river below Sattartia, where, on the morning of the 7th, Coates disembarked his entire command, drove back some Confederate skirmishers, and at night withdrew to his transports. On the 8th the expedition again pushed up the river, two gunboats passed the city and the transports landed their men within a mile of it. Next day Coates took possession of the city, and on the 11th moved up the river, arriving at Greenwood on the 14th, where he remained until the 19th, gathering cotton, corn, and forage. He then received orders to fall back to Yazoo City. On the 28th when within six miles of the place he ordered his small force of cavalry to move in rear of the city and take possession of all roads leading out of it. That afternoon he landed at Yazoo City and took position in some redoubts commanding the roads. Major Cook, with 50 colored cavalry, was sent toward Benton. When nearly six miles out Cook ran into Ross' brigade, by which he was roughly handled and pursued nearly to the city, losing 8 killed, 35 wounded, and 10 missing. Coates' pickets were much annoyed and on the morning of 5 March were driven in. Ross had been joined by Gen. R. V. Richardson's Tennessee brigade of about 600 men, and at 10 o'clock the two brigades, about 1,600 men, making a determined attack, forced portions of the Union line and gained the streets of the town. At the same time they used artillery upon the redoubt, on the Benton road beyond the town, which, with the adjacent rifle-pits, was held by a part of Coates' command and repulsed all Confederate effort to carry. At 2 P.M. Coates, with those who were not in the redoubt, made a charge through the streets and the Confederates withdrew and gave up the attempt upon the redoubt. The Union loss in the engagement was 19 killed, 80 wounded, and 18 missing. The Confederate loss was 6 killed and 51 wounded. On the evening of

the 6th Coates started on his return to Vicksburg. He took with him over 1,700 bales of cotton, and much corn and forage. The total loss of the expedition was 31 killed, 121 wounded, and 31 missing.

On 19 April 1864 a small detachment of a colored brigade, under command of Col. H. Scofield marched from Vicksburg for Yazoo City and two gunboats went up the river to co-operate in an attack on the city. Scofield skirmished sharply with a part of Gen. Wirt Adams' brigade and on the night of the 20th bivouacked 15 miles below the city. On the 22d the gunboat Petrel in attempting to run past Yazoo City, in order to fire upon the works from above, was fired upon by a section of artillery and a detachment of sharpshooters of Adams' brigade. The men were driven from the guns, the crew from the boat, and most of them captured, including Acting Master McElroy. The Confederates seized the boat, removed her eight guns, and burned her. Next morning the expedition returned to Vicksburg.

E. A. CARMAN.

Yazoo Fraud. The, a name given to the sale of lands in the western part of Georgia by a corrupt legislature, to certain large companies in 1789. This action caused great excitement and bitter controversy until settled by the United States Supreme Court in 1810. See *GEORGIA*.

Yazoo Pass and Steele's Bayou Expeditions. In the Civil War after the battle of Chickasaw Bayou, 29 Dec. 1862, and the capture of Arkansas Post, 11 Jan. 1863, Gen. Grant ordered the army to Young's Point and Millikin's Bend, where he took command in person 30 January. Work on the projected canal across the peninsula opposite Vicksburg was pushed, but on 4 February Grant questioned its success, and began to look for other routes by which the army could reach the high ground either north or south of Vicksburg. Two projects were considered. One involved cutting away from the Mississippi into Lake Providence from a point 70 miles above Vicksburg. This lake, a former bed of the river, was connected by Bayou Baxter with Bayou Macon, a navigable stream, which led to the Tensas, thence into the Washita, and finally into the Red River. Thus it was hoped the army could be transported to the lower Mississippi to co-operate with Banks against Port Hudson. It is 470 miles by the main river from Lake Providence to the mouth of Red River, and much farther by the winding bayous. Upon the cutting of the levee at Lake Providence the water from the river flowed in rapidly and the six miles of the lake beyond were soon available. But Bayou Baxter was found choked for miles with fallen trees and a thick growth of timber overhanging it. Gen. McPherson's entire corps was engaged for some time in attempting to open this channel and those below it. In March this project was abandoned.

On the east side of the river, a few miles below Helena, was Yazoo Pass. This had formed the old route of river steamers through the Coldwater to the Tallahatchie, and the Yal-labusha to Yazoo City, but it had been closed for some years by a strong levee. By reopening this route it was believed to be possible to reach the high ground on the Yazoo bluffs north of Vicksburg. This Yazoo Pass plan promised

greater success than the Lake Providence scheme. Under Lieut.-Col. Wilson of the engineers, later Maj.-Gen. James H. Wilson, the levee was cut 4 February, a way was cleared to the Coldwater, and the Pass opened to navigation on the 24th. Brig.-Gen. Ross, with 4,500 men, was ordered into the pass upon light draft transports, and, preceded by gunboats, penetrated by that stream to the Tallahatchie, and thence to the Yallahusha, where the expedition, after an advance of 225 miles, was stopped 10 March by Fort Pemberton, near the juncture of the last named streams. It was a strong work in a bend which commanded both. The fort was found to be so situated that in this time of high water neither troops nor gunboats could reduce it. As it stood only a few feet above the water, attempts were made to flood it by cutting the levee at Austin above Helena, and widening the cut into Yazoo Pass. These were unsuccessful. The expedition, after several attempts on the fort, withdrew. On the way back a reinforcement under Gen. Quimby was met, and this officer ordered a return to Fort Pemberton for further efforts. He soon became satisfied that the fort could not be reached, and ordered final withdrawal. The gunboats could not turn in the narrow channels and were forced to back out over a large part of the route. Gen. McPherson's corps had been ordered into the pass, but was delayed for lack of light draft transports, and later the intended movement of the army by that route was abandoned. Meantime the Confederates had gathered a strong land force under W. W. Loring, which became first harassing and soon after most threatening. Sherman, preceded by five gunboats of Admiral Porter's fleet, was despatched in haste through Steele's Bayou, by which route it was hoped he could reach the Yazoo, relieve Ross, then supposed to be in danger of capture, and at the same time find a practical way for the army into the Yazoo. Sherman had a winding and difficult route of 150 miles before he could reach that stream. From Steele's Bayou, which he entered at Eagle Bend, he passed to Black Bayou, and thence to Deer Creek. This opened into Rolling Fork by which he could enter the Big Sunflower, and by this stream reach the Yazoo. Even with the tremendous energy of his advance Sherman was barely in time to save the gunboats which had been attacked in Deer Creek by land forces, and were so hard pressed that Admiral Porter was considering the blowing up of his fleet and retreating with his crews through the swamps. These several attempts through the bayous east and west of the river had been carried on over hundreds of miles and against the most formidable obstacles of flooded country, dense forests, and heavily obstructed streams. They were finally abandoned, and the army reassembled at Millikin's Bend and Young's Point. From this position the army subsequently moved in the final campaign against Vicksburg.

H. V. BOYNTON.

Year, the period in which the revolution of the earth round the sun, and the accompanying changes in the order of nature, are completed. The accurate determination of the length of the year, which required great knowledge of astronomy and exact observations, could only be reached by the successive efforts of many generations. On this subject see CAL-

ENDAR. There are years of various lengths, according to the principle adopted in measuring them. The sidereal year is the interval that elapses while the sun moves from a star to the same star again (of course this motion is only apparent), a period the length of which is slightly affected by nutation (which see), but on the average is equal to 365 days, 6 hours, 9 minutes, 9.6 seconds. The tropical or civil year, sometimes called the solar year, is the time in which the sun moves from the vernal equinox to the vernal equinox again; its mean length is 365 days, 5 hours, 48 minutes, 49.7 seconds. This is the year as commonly understood. On account of the precession of the equinoxes it is rather shorter than the true period of the earth's revolution. (See PRECESSION.) A lunar year is the time required for 12 revolutions of the moon, which is 354 days, 8 hours, 48 minutes, 37 seconds. See also DAY; SIDEREAL TIME; SOLAR TIME.

Year and a Day, a period of time fixed upon by ancient statutes and common law, which must elapse between the occurrence of some event before the legal right connected therewith could be either lost or gained. A full year was intended by the expression.

Year Book, law reports of cases and decisions in England, issued annually by the scribes or clerks of the courts, from the time of Edward II. to that of Henry VIII. The name is now given to books sent out at the beginning of each year by cities, States, or countries, or by newspaper and other publishers, and which include, besides an almanac, the agricultural, political, scientific, and educational statistics and chief items of interest of the preceding year. See ALMANAC.

Yerdley, yêrd'li, or Yardley, Sir George, American colonial governor: b. England about 1580; d. 1627. After seeing service in the Netherlands he came to America in command of Sir Thomas Gates' expedition. This was wrecked at the Bermuda Islands, but he reached Virginia in 1610 and was acting governor of the Virginia colony 1616-17. Returning to England the next year he was there knighted and chosen deputy governor of the colony, filling the office 1619-21, and again from 1626 till his death. By his instructions was summoned the first legislative assembly ever gathered in America, the House of Burgesses.

Yeast is a micro-organism of the vegetable kingdom and belongs in the order of the *Gymnoasceæ* to the family of the *Saccharomycetes*, of which there are three classes, namely, *Monospora*, *Saccharomyces* and *Schizosaccharomyces*. The main characteristic of the first class, as its name indicates, is that it only develops one spore in the ascus. Thus far only one type, the *Monospora Cuspidata*, which is parasitic in *daphniada* which it destroys, has been determined. There are many representatives of the second class, while only a few of the third have up to the present time been identified. The second class,—the *Saccharomyces*—is generally what is understood under the term yeast, not only in the brewery but also in the distillery and the compressed yeast fabrication. Its structure is very simple; it consists of a single cell, which has few distinguishing characteristics. Each cell of the *saccharomycetes* is more or less globular or ovoid in form and, just

as every other vegetable cell, consists of a colorless, viscous substance (protoplasm), a cell-wall (membrane), and also a nucleus. In the protoplasm there are observed, according to the species of the plant cell, different numbers of spaces filled with cell-juice, which are termed vacuoles.

In young yeast cells the cell-wall, or membrane, is very thin—0.4 to 0.9 μ —and has almost the same refractive power as the protoplasm which it surrounds. The membrane is thickened through external influences, especially then when the yeast-cells must develop in or upon a highly nutritious medium. An increase in the thickness of the cell-wall is also accompanied by greater impermeability and a corresponding decrease in the fermentative capability of the cell. Through the action of acids or alkalis upon the yeast cell the layers of the cell-wall can be shown, which are two, and sometimes three, or even more in number. Chemically the membrane of the yeast cell consists of cellulose (erythro and achroo-cellulose), pectinic compounds, and plasmatic components, for which reason it is very nitrogenous. The cell contents consists of protoplasm with more or less glycogen. (According to Laurent there is 32.28 per cent glycogen in the dry substance.) In the young yeast cell the whole interior is filled with protoplasm, in a short while, however, apparently hollow spaces appear, which are filled with the reserve nourishment necessary for the vitality of the cells. The nucleus furnishes the substances necessary for building up the cell, and, according to its chemical composition, belongs to the albuminoids in the class of the *proteids*, and especially to the nucleins. The form of the nucleus varies considerably; in a young cell it is spheroid, flattens out with increasing age to a disk whose periphery is no longer entire, but is lobed; elliptical shapes were also found.

The nucleus is in some instances of a considerable size; its diameter in some cases being one third of that of the cell. Concerning the inner structure of the nucleus it was observed that the nucleus of the yeast cell has a pellicle as well as a nucleolus, which is spheroid, and is situated in approximately the centre of the nucleus, the space between the pellicle and the nucleolus being filled with nucleus plasma (Karyoplasma), thus having a netlike structure through which the nucleolus is suspended. One or more vacuoles were observed in several types of yeast in the Karyoplasma under certain conditions, especially then when the cells were transferred into fresh nutrient solutions. With the beginning of the propagation of the cell a corresponding development of the nucleus takes place, in either one of two ways, that is, the direct division (Amitosis), or the indirect division (Karyokinesis, Mitosis). The manner in which the nucleus divides itself differs in the various types of yeast. The yeast cell is propagated in one of two ways, either through exogen spore formation, budding, or through endogen spore formation, the real sporulation.

In the former case a new cell is detached from the parent cell, while in the latter the new cells (spores) are formed inside the parent cell, which it leaves only upon complete maturity. Several recent investigators are inclined to believe in the sexuality of yeast, and close research

with various yeasts, as *Sacch. farinosus*, *Sacch. Bailii*, etc., has been made.

Two types of yeasts have in the course of time become culture plants in the real sense of the word, through intentional continuous cultivation for certain definite purposes. These types are (1) that known as the bottom yeast in the manufacture of beer, and (2) that which is the cause of the fermentation of the top-fermented beers and of the whiskey mash. The former is so called because it settles in a thick, creamy layer upon the bottom of the fermenting vat during the slow fermentation of lager-beers in temperatures of 40° to 50° F. (4.5° to 10° C.), while the latter is termed top yeast because in the more rapid fermentation at 54° to 65° F. (12° to 18° C.) (ale, weissbeer, etc.), it is separated as a yellowish brown foam, which is forced to the surface by the escaping carbonic acid gas. It is the last named species which furnishes almost exclusively the material for the manufacture of that product known as compressed yeast.

As has been said, there are a number of independent species of yeast, which vary not only according to form and size of the cell, but also according to the composition of the nutrient medium in which they live, hence according to chemical and physical properties. Yeast flourishes luxuriantly only then when it finds not only qualitatively but also quantitatively, in the nutrient medium all the substances necessary for its nutrition. The brewer, distiller, etc., therefore endeavors to produce as vigorous a yeast as possible, in order to be enabled to conduct the fermentation in the manner best suiting his purposes. For such normal nourishment, it is essential that diverse substances are at its disposal.

Yeast thrives well when, besides water, carbon in the form of sugar, nitrogen in albuminous compounds or ammoniacal salts and various mineral components, especially sulphate of magnesia and potassium phosphate, are at its disposal. If the necessary nutriment is lacking the vitality of the yeast cell may rest, but the cell does not perish.

Various analytical data are at hand in regard to the composition of the yeast. Dumas found that the yeast contains:

	Per cent
Carbon	50.6
Hydrogen	7.3
Nitrogen	15.0
Oxygen, sulphur, and phosphorus	27.1

Mitscherlich found top yeast of the following composition:

	Per cent
Carbon	47.2
Hydrogen	6.6
Nitrogen	10.0
Sulphur	0.6
Oxygen	35.8

The differences found between bottom and top yeasts have been very slight. Wagner experimented upon top and bottom yeasts and obtained the following averages:

	Top yeast per cent	Bottom yeast per cent
Carbon	49.8	48.4
Hydrogen	6.8	6.0
Nitrogen	9.2	9.3
Sulphur + oxygen	34.2	35.8

A yeast may have all the necessary organic substances in the proper form and amount, yet

YEAST

it will not flourish if the salts are lacking. The yeast in this case is the same as any other plant organism, which must perish if it is deprived of its mineral nourishment. Hence a knowledge of the requirements of mineral substances for a yeast is of utmost importance, and many examinations were made to secure data on this point. Mitscherlich found in the ash of

	Top yeast per cent	Bottom yeast per cent
Phosphoric acid	53.9	59.9
Potash	29.8	24.3
Soda + magnesia	6.0	6.0
Calcium oxide	1.0	1.0
Silica	traces	0.0

The most essential substances which the yeast requires for its sustenance are, accordingly, phosphate of potassium and phosphate of magnesia. The above data are from elementary analyses. Naegeli later instituted investigations which should show the amount of the various combinations, which are observed in a yeast. According to his observations the yeast, when treated with water until its soluble components are absorbed, gives up to the water 37 per cent of the total weight of the dried yeast. The bodies thus brought in solution consist of compounds closely related to vegetable slime. The amount of moisture in a yeast is exceptionally large, for if it is completely dried it loses 83 per cent of its weight, so that in 100 parts of yeast only 17 parts are solid components. The mucous part of the yeast cell, the protoplasm, contains more water than the membrane which surrounds it, and consists chiefly of albuminoids, and about 2 per cent of peptone. Accordingly the composition of the yeast with 8 per cent nitrogen is:

	Per cent
Cellulose and vegetable slime	37
Common albumin	36
Easily converted glutine (casein protein)	9
Peptones (precipitable by lead acetate)	8
Fat	5
Ash	7
Extractive substances	4

According to E. C. Hansen of Copenhagen, yeast is divided into two groups, the real *Saccharomycetes*, which are capable of forming endospores, and the non-saccharomycetes, which never form spores. He subdivides the former into such which separate out sucrose and engender alcoholic fermentation, that is, which vigorously ferment saccharose, dextrose and maltose, as brewer's yeast; and such which ferment saccharose, dextrose, levulose but not maltose, as, for example, *Saccharomyces Ludwigii*; *Sacch. exiguus*, and into such which do not separate out sucrose and do not excite alcoholic fermentation, as *Saccharomyces membranaefaciens*.

The non-saccharomycetes Hansen divides into 3 groups; such which ferment solutions of dextrose and invert sugar, as *S. Rouxi*, *S. apiculatus*; such which separate out no sucrose but ferment saccharose, maltose and dextrose, as *Monilia candida*, and finally such which ferment saccharose, glycoside, galactose and lactose, the lactose yeasts. In practice the division into culture and wild yeasts would be appropriate. The yeasts can also be safely divided according to their power of attenuation, that is, the decrease in the density of the nutrient medium due to fermentation. The attenuation reached by a yeast in a diastase-free beer wort has been

agreed upon as the limit, and in accordance therewith the brewers' yeasts are graded, and we have the Froberg type with high attenuation, and the Saaz with low attenuation. Van Laer has defined a new type, Logos, so that now we have the types Saaz-Froberg, and Froberg-Logos, with all intermediate grades. The numerous wine yeasts vary according to their resistibility against heat and acids; the amounts of sugar produced by them, and the amount of fruitesters, which they impart to the liquid. The distillers' yeasts, mostly top yeasts, are known by their resistance against acids, and foreign ferments, through their fermentative capability and the amount of alcohol developed.

No one can deny that yeast induces alcoholic fermentation, but how this is accomplished is still a matter of controversy. Liebig and other chemists maintain that fermentation is called forth by a ferment contained in the yeast cell, while Pasteur deems it the necessary consequence of life without oxygen. Naegeli claims it to be a transferring of the motion of molecules of protoplasm of the yeast to the fermenting liquid. Eduard Buchner and Rudolf Rapp of Munich discovered in the yeast cell a fermentation-inciting enzyme—zymase—which, however, can only induce fermentation once after the cell is completely destroyed. This discovery, which is of much scientific import, has not yet been made applicable in practical arts.

Besides the culture yeasts, there are a number of wild yeasts, which can produce great disturbances in the liquids infected by them. In order to avoid such infection by wild yeasts and also by bacteria, Hansen experimented and succeeded in preparing a pure yeast culture, that is, a culture originating from a single cell. Such a culture is not only free from all wild yeasts and bacteria, but also can and does remain unchanged as all cells are of the same nature. A reliable fermentation process can only be obtained by the use of one single type.

Such pure cultures are variously prepared; the oldest and best known method is that of Hansen, which has recently been modified by Dr. Lindner of Berlin as the droplet-culture. Both investigators employ for the further development of the young vigorous cultures the propagation apparatus, which when once supplied with an absolute pure culture can be used for a long time if proper care is observed. Upon this pure culture method a new brewing process is based which permits of entirely sterile work from boiling the beer to the putting it on the market. This process, invented by Nathan, has been called by him in honor of Hansen, the senior in the art of pure culture, the Hansen process. Another method to obtain yeast of a high degree of purity is that in which a mixture of yeast is exposed to definite conditions of temperature, aeration, kind of nutrition, action of light, pressure and motion that one yeast of definite properties develops more and better than the other yeasts in the mixture. If, further, the corresponding layer is removed from the yeast and propagated under the aforesaid conditions, a pure yeast of a uniform character is finally obtained. This process, founded by Delbrueck of Berlin upon his scientific observations in American breweries, was further elaborated by him. An idea of the importance and value of pure yeast culture can be had from the

fact that almost all the larger breweries and distilleries employ apparatus for propagation and endeavor through observing the utmost care to protect their yeast against infection. But yeast is not only of great import to the brewer and distiller, but also to the baker, as the quality of his wares depends upon the quality of the yeast used, and in consequence thereof a special industry, that is, the manufacture of compressed yeast, has been introduced. Compressed yeast is chiefly made from distillers' yeasts; but in some instances also, beer yeasts, which must be purified and disemibittered, are utilized. The price of compressed yeast in comparison to beer yeast, is considerably high, but the baker has the advantage that by using the former his wares obtain a larger size than when the latter is used. The process of fermentation with compressed yeast develops more slowly than with beer yeast, hence the dough requires more time to ripen. Much progress has been made in the compressed yeast fabrication and diverse methods are employed in its manufacture. Many operations must be carefully and accurately observed in order to obtain a salable product. In the main these operations are: (1) Preparation of a fluid in which the yeast can properly develop, either under simultaneous formation of alcohol or without the formation of much alcohol; (2) preparation of a mass, in which there is a corresponding amount of vigorous seed-yeast, which is added to the above mentioned fluid (preparation of the mother-yeast); (3) bringing together of the nutrient medium with the stock yeast or "setting"; (4) reproduction of the yeast with or without simultaneous fermentation; (5) separation of the newly formed yeast from the fluid by skimming, etc.; (6) washing the yeast, or removing the last traces of the nutrient medium; (7) pressing of the washed and separated yeast mass; (8) forming the compressed yeast into cakes of suitable size; (9) packing of the cakes for the trade and for shipping.

For some time yeast, especially beer yeast, has been used in medicine, and has been successfully employed partly fresh and partly dried, in tablet form in cases of furunculosis, flemomen, acne, psoriasis, and other skin diseases, dyspepsia and partly in diabetes.

MAX VON KUENSBERG, PH.D.,

Of the Industrial Chemical Institute of Milwaukee.

Yeates, yêts, William Smith, American geologist: b. Murfreesboro, N. C., 15 Dec. 1856. Graduated from Emory and Henry College (Emory, Va.) in 1878, he was connected with the United States Fish Commission in 1879 and 1880-1, and in 1881-93 was successively assistant, acting curator, and assistant curator of the United States National Museum, in charge of the minerals and gems. He was professor of mineralogy in the Corcoran Scientific School of Columbian University (Washington, D. C.) in 1884-93, professor of geology in 1890-3. In 1893 he was appointed State geologist of Georgia.

Yeats, William Butler, Irish author: b. Dublin 13 June 1865. He obtained a secondary schooling in England and Ireland, was for three years a student of art, but turned to literature in 1886. He was a leader in the foundation of the Irish Literary Society and the National Literary Society of Dublin, and a prime mover

in the Irish Independent Theatre, thus becoming one of the chief representatives of the so-called Celtic revival. In 1903-4 he lectured in the United States on subjects connected with this movement. With E. J. Ellis he edited 'The Works of William Blake' (1893) and 'Ideas of Good and Evil' (1903). Among his various further publications in prose and verse are: 'The Wanderings of Oisín' (1889); 'John Sherman' (1891); 'The Celtic Twilight' (1893); 'A Book of Irish Verse' (1895); 'Poems' (1895); 'The Wind among the Reeds' (1899); 'The Shadowy Waters' (1900); and 'Cathleen ni Hoolihan' (1902).

Yellow, one of the prismatic colors; the color of that part of the solar spectrum situated between the orange and the green; a bright golden color, the type of which may be found in the field buttercup, which is a pure yellow. United with blue it yields green; with red it produces orange.

Yellow-bass, Perch, etc. See BASS. **PERCH, etc.**

Yellow Bayou, Engagement at, and Banks' Retreat from Alexandria. Gen. Banks arrived at Alexandria, La., on his retreat from Sabine Cross Roads (q.v.), 25 April 1864. Three days later Gen. Hunter handed him an order from Gen. Grant to close up the campaign against Shreveport without delay and return A. J. Smith's troops to Gen. Sherman, for operations east of the Mississippi. Hunter returned with a letter from Banks to Grant with the information that Porter's fleet was above the Alexandria Rapids in a critical situation should the army abandon it. As to the further prosecution of the Shreveport and Texas campaign, that was not to be thought of, and Banks turned his attention to getting Porter's fleet below the rapids. These falls were a mile in length, filled with rugged rocks, which at the time were nearly bare. As the vessels needed at least seven feet of water to float them, they seemed to be doomed. The plans for their release were suggested and executed by Lieut.-Col. Joseph Bailey of the Fourth Wisconsin Cavalry. The work began on 30 April, nearly the entire army at different times, being detailed for the duty; 2,000 to 3,000 lumbermen from Maine and the Northwest cut down trees; others were set to collecting stones, brick, etc., including whole houses and sugar-mills with all their machinery and kettles, and in a week a dam of timber and stone, with sunken barges in the centre, had been constructed across the river, 758 feet in width, raising the water from 5 to 6 feet deep on the rapids. The work had been prosecuted day and night, the men working up to their waists and exposed to a hot sun. The water having risen, three gunboats and another vessel ran down the rapids on the afternoon of 8 May and lay to just above the dam. Early in the morning of the 9th two of the barges broke loose, making a gap in the dam 66 feet wide, through which the water rushed in a great torrent, and the four vessels went down safely through the opening. Six gunboats and two

YELLOW BOOK OF FRANCE—YELLOW FEVER

tugs were still above the rapids, waiting for a higher rise in the water. The damage to the dam was partially repaired and wing-dams were constructed on the upper falls, which shed the water from either side into the channel between them. They were completed by the 11th, when the water had risen to 6½ feet. Meanwhile the heavier vessels had been lightened by stripping from them their armor-plates and landing some of the heavy guns, ammunition, chain cables, anchors, and provisions, and on the 12th all the vessels had run down the falls and through the dam into deeper water. Meanwhile the Confederates had gotten in Banks' front, south of Alexandria, and taken position on the river 25 miles below the town, where 1 May they captured and sunk a transport, and on the morning of the 3d captured a transport, on her way up the river with 425 men of the One Hundred and Twentieth Ohio on board. Some of the men were killed and wounded, all the officers and 270 men were captured. On the evening of the 4th another transport carrying 400 men of the Fifty-sixth Ohio, while going down the river, convoyed by the gunboats Signal and Covington, was attacked by artillery and musketry, and the gunboats went to her assistance. About 125 men on the transport were killed and wounded; she was soon disabled; the Covington, after losing more than half her men, was abandoned and burned; the Signal, also was disabled and, with the transport, surrendered. No further attempt was made to run the blockade, and for two weeks Banks' communication with the Mississippi was closed. The fleet having passed below the falls and the river rising insuring a safe passage of all the bars below, the gunboats and transports started on the morning of the 13th of May, and in the afternoon Banks marched out of Alexandria for Simsport. From the start his front, flanks and rear were harassed by cavalry and artillery, and on the 16th he had a severe engagement near Mansura, in which the Confederates were driven from position they had taken across the road to Simsport, which place his advance reached on the evening of the 17th. Here it was found that the pontoon-bridge was too short to span the Atchafalaya and Col. Bailey again improvised a crossing. The transports were ranged side by side across the river, with the planking of the pontoons laid across their bows, making a level road of about 700 yards, over which the main body of the army with its trains and artillery began passing on the 19th. While this bridge was under construction A. J. Smith's command was drawn up in line at Yellow Bayou, covering the rear of the army and the crossing of the Atchafalaya. Here Smith's troops were attacked on the afternoon of the 18th by Gen. Wharton's cavalry and Gen. Polignac's infantry. Smith's skirmishers were driven in, and at first the Confederates gained some advantage; but Gen. Mower, who was in immediate command of the Union line, made a counter-charge with two brigades of infantry and one of cavalry and the Confederate attack was repulsed. In endeavoring to follow up his success Mower was checked by a heavy artillery-fire, and withdrew to a thicket, where he formed a new line and brought up artillery. The Confederates renewed the attack and were repulsed with some loss. The thicket now took fire and

made an impassable barrier between the two sides, and Mower withdrew, leaving his dead and wounded on the field. The Union loss was 38 killed, 226 wounded, and 3 missing; the Confederate loss, 452 killed, wounded and missing, of whom 180 were taken prisoners. The army had all crossed the Atchafalaya on the 20th. Banks yielded the command to Gen. Canby, who had been ordered to relieve him; the navy and transports passed into the Mississippi; and the Red River campaign, one of the most humiliating of the war, had ended. On the return march from Alexandria the Union loss was about 165 killed, 650 wounded, and 450 captured or missing. Gen. Taylor says the Confederate loss in the entire campaign, from Sabine Cross Roads to Yellow Bayou, was 3,976. Consult: 'Official Records,' Vol. XXXIV.; Taylor, 'Destruction and Reconstruction'; Mahan, 'The Gulf and Inland Waters'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Yellow Book of France, a government publication issued regularly since 1861, designed to furnish historians and others with official information. It is similar to the British Blue Book and the German White Book.

Yellow Boy, a popular name for a gold coin, formerly much used in the Far West. The term originated in Great Britain, the name being applied to the gold sovereign.

Yellow Copperas, a name sometimes used for the mineral copiapite. Crystallization, monoclinic, usually in translucent pearly yellow plates; hardness, 2.5; composition, a basic sulphate of iron; specific gravity, 2.1. Found near Copiapo as an incrustation on coquimbite; also in other places in South and North America.

Yellow Earth, a clay or kaolin strongly impregnated with hydroxide of iron or limonite. Its chief use is for pigment.

Yellow-eyed Grass, the common name of the genus *Xyris*, composed of rush-like plants, with bright yellow flowers produced from the summit of a naked scape, conspicuous in sandy bogs in July and August. They are mostly of tropical distribution about the world. The yellow-eyed grass (*X. bulbosa*) has a bulbous root; equitant, linear, twisted leaves; an erect, 2-edged, twisted scape; roundish, acute heads, supporting a number of small yellow flowers projecting from between the scales, with perianth and other parts of the flowers in threes. Another species with pretty, large petals (*X. caroliniana*), occurs near the sea from Rhode Island southward. The *X. umbriata*, a plant two feet high, the divisions of its calyx conspicuously fringed on the wing-margined keel, and plumose at the summit, is found in the pine barrens of New Jersey and southward. The foliage and roots of *X. indica*, of *X. americana*, and of *X. vaginata*, are used for a remedy for leprosy and the itch, in India, Guiana and Brazil.

Yellow Fever is an acute infectious disease which is transmitted from the sick to susceptible individuals through the agency of mosquitoes. The yellow fever mosquito (*Stegomyia fasciata*) is found in tropical and semi-tropical regions, and especially in lowlands near the sea or in river valleys. This mosquito serves as "an intermediate host" for

YELLOW FEVER

the yellow-fever parasite, which is present in the blood of those sick with the disease during the first three days of the attack. After filling itself with blood from a yellow-fever patient a period of 12 days is required for the development of the parasite in the body of the mosquito before it can transmit the disease, by its sting, to another individual.

These facts have been established by the experiments of a board appointed upon the recommendation of the present writer, in 1900, for the study of yellow fever in the island of Cuba. The late Maj. Walter Reed, surgeon, U. S. A., was president of this board, and the success attained is largely due to his carefully made plans and their intelligent and conscientious execution by himself and his associates.

In a "preliminary note" read at the meeting of the American Public Health Association, 22 Oct. 1900, the board gave a report of three cases of yellow fever which they believed to be the direct result of "mosquito inoculations." Two of these were members of the board, namely, Dr. Jesse W. Lazear, and Dr. James Carroll, who voluntarily submitted themselves to the experiment. Dr. Carroll suffered a severe attack of the disease and recovered, but Dr. Lazear fell a victim to the disease and to his enthusiasm in the cause of science and humanity. Fortunately no other deaths occurred during the subsequent experiments which Maj. Reed found it necessary to make in order to establish the fact that yellow fever is, beyond question, transmitted by mosquitoes of the genus *Stegomyia*, and in no other way. In a report made in May 1901, Maj. Reed says: "We have thus far succeeded in conveying yellow fever to twelve individuals by means of the bites of contaminated mosquitoes." These experiments were made upon individuals who volunteered to submit themselves to the mosquito inoculations with a full knowledge of the possibility of serious and even fatal results. Some of the volunteers were U. S. soldiers, and some were Spanish immigrants who had recently arrived in Cuba. Further experiments showed that blood drawn from a yellow-fever patient during the first three days of the disease and injected by means of a hypodermic syringe beneath the skin of a susceptible individual gives rise to a characteristic attack of yellow fever in the inoculated individual. But all attempts to demonstrate the specific infectious agent (yellow-fever parasite) in the blood or in the bodies of infected mosquitoes have been unsuccessful. This is probably due to the fact that the yellow-fever parasite is so small as to be practically ultra-microscopic. This inference is supported by experiments made in Cuba by Assistant Surgeon James Carroll, U. S. A., a member of the board heretofore referred to. Dr. Carroll found that when blood taken from the circulation of a yellow-fever patient was passed through a Berkefeldt filter a small quantity of the filtrate injected under the skin of a susceptible person gave rise to a typical attack of the disease.

The experimental results obtained by Maj. Reed and his associates have been fully confirmed by several independent investigators, including a board of experts from the Pasteur Institute of Paris, who were sent to Brazil to make researches with reference to the etiology of this disease.

Having ascertained that yellow fever is transmitted from man to man by an intermediate host—mosquitoes of the genus *Stegomyia*, Maj. Reed and his associates conducted a series of well-planned experiments for the purpose of ascertaining whether the disease may also be propagated, as has been commonly supposed, by clothing, bedding and other articles which have been in use by those sick with the disease. The results of these experiments were entirely negative. That is, all efforts to communicate the disease to susceptible individuals through the medium of such articles were without result.

In view of what has thus far been said it is evident that the preventive measures which were formerly relied upon to arrest the epidemic extension of this infectious disease were either of no avail or of comparatively little value. Isolation of the sick from contact with non-immune individuals is not necessary, but protection of the sick, by mosquito-bars, from the bites of mosquitoes is all-important. Disinfection of clothing and bedding is of no avail, but the destruction of infected mosquitoes, by sulphur fumigation or otherwise, is an essential measure of prophylaxis. Street cleaning and municipal sanitation generally have no material effect in preventing the extension of this disease, except in so far as they result in destroying the larvæ and breeding places of mosquitoes. Applying the knowledge gained by Maj. Reed and his associates in a practical way, as above indicated, the medical officers of the U. S. army stationed in Cuba have been able to completely eradicate yellow fever from the city of Havana, which had been the principal endemic focus of the disease for many years; and sanitarians feel confident that by the application of the same methods the epidemic extension of the disease within the limits of the United States, or elsewhere, may be entirely prevented. Thus has yellow fever, which formerly ranked with cholera and bubonic plague,—although having a more restricted area of prevalence,—as one of the most fatal scourges of the human race, been robbed of its power for mischief by the painstaking researches of scientific investigators. The limits of the present article only permit a brief reference to the history of the disease under consideration. It has a comparatively restricted geographic range, but there is every reason to believe that this might be greatly extended if cases of the disease should be introduced to all of the regions where the intermediate host (*Stegomyia fasciata*) of the "yellow-fever germ" is found. That the disease has not been introduced into regions remote from its principal endemic foci is probably due to the comparatively brief duration of the attack, to the fact that the infectious agent is only present in the blood during a brief period (three days) and to the circumstance that it cannot be transmitted in any other way than by inoculation—either directly, as in the experiments of Reed and his associates, or through the medium of an infected mosquito. Epidemics have occurred in the United States at all of our principal sea-ports on the Gulf of Mexico and on the Atlantic coast as far north as Boston. It has also invaded many of the Southern States, prevailing as a widespread epidemic in the interior, and has extended up the valley of the Mississippi as far as

YELLOW FEVER

St. Louis. It has been epidemic at all the principal sea-port cities of the West Indies, of Mexico, of Central America and of South American countries bordering upon the Gulf of Mexico, also upon the Pacific coast of Mexico and South America and in the Atlantic-coast cities of Brazil and the Argentine Republic. The cities of Havana, Vera Cruz and Rio de Janeiro have long been regarded as its principal endemic foci. The climate of these cities is favorable to the survival of the *Stegomyia* throughout the year. Consequently, when once introduced, the disease continued to be propagated through a series of cases, occurring successively without regard to seasons. Thus it was ascertained by the Yellow Fever Commission, of which the writer was a member (1879), that during the ten years from 1870-79 there was not a single month without some recorded deaths from yellow fever, and this continued to be the case until the disease was eradicated in 1901 by the well-directed efforts of Col Gorgas, of the medical department, U. S. A. In his report as sanitary officer of the city of Havana for the month of November 1901, he says: "Last year (1900) we had, during this month, 214 cases and 54 deaths. This year the last case of yellow fever occurred on 28 September; that is, we have gone over two months without a single case or death belonging to Havana." . . . "This result I consider due to the system, introduced last February, of killing infected mosquitoes in the neighborhood of each point of infection as it developed." The introduction of yellow fever into the previously healthy city of Havana is recorded by the historian Pezuela, as follows: "Although Havana is situated on the northern boundary of the torrid zone, it was very justly considered one of the most healthy localities on the island before its invasion, in a permanent manner, by the *vomito negro*, imported from Vera Cruz in the summer of 1761. In May there came from Vera Cruz, with materials and some prisoners destined for the works on the exterior fortifications of Havana, the men-of-war *Reina* and *América*, which communicated to the neighborhood the epidemic known by the name of *vomito negro*. At the end of the following June there were stationed in this fort nine men-of-war, despatched from Cadiz, and sent to the chief of squadron, Don Estienne de Hevia; they brought a reinforcement of 2,000 men. More than 3,000 persons succumbed to the epidemic on this, the first appearance of the *vomito*."

History also records the first introduction of the disease to the city of Rio de Janeiro. The highest medical authorities in Brazil agree that yellow fever was not endemic in the principal seaports of the empire prior to the year 1849, when it was introduced to the city of Bahia by the North American brig *Brazil*, which sailed from New Orleans, where yellow fever was prevailing, and touched at Havana. Two of the crew of this brig died of yellow fever during her voyage from the latter port to Bahia. Soon after her arrival the disease made its appearance among those who had communicated with the ship. The first case occurred a few days after the arrival of this brig (3 November). From Bahia the disease was carried to Rio Janeiro, where during the epidemic season of 1890 it caused a mortality of 4,160.

In regions where the winter temperature is so low as to kill mosquitoes, or render them inactive, epidemics of yellow fever terminate upon the occurrence of frost, or of continued cool weather. Under such circumstances the disease is not apt to recur during the succeeding warm season, except as a result of a fresh importation of a yellow-fever case, from which mosquitoes of the new brood may become infected. Thus in the United States, even as far south as the city of New Orleans, a recurrence of the disease after its epidemic prevalence is probably rarely, if ever, due to the survival of infected mosquitoes from the year before. It has been shown, however, by Maj. Reed, and by others that infected mosquitoes may survive in a warm room for more than two months. Prior to the civil war yellow fever prevailed almost annually in New Orleans and was generally believed by the residents of that city to be "a disease of the climate" beyond the control of any preventive measures. Later, under a more stringent administration of quarantine restrictions, such success was attained by the health authorities in preventing the introduction of cases of the disease, and consequently of epidemics, that a complete change occurred in public sentiment and it is now generally recognized that the introduction of one or more cases from some foreign seaport—usually Havana or Vera Cruz—is an essential prerequisite for the development of an epidemic in the city of New Orleans. The years of greatest mortality in this city have been: 1847, 2,259; 1853, 7,970; 1854, 2,423; 1855, 2,670; 1858, 3,889; 1867, 3,093; 1878, 4,600.

In 1793 the city of Philadelphia, then a town of about 40,000 inhabitants, suffered a devastating epidemic, the mortality being about 4,000, or 10 per cent of the population. This city was again visited by the scourge in 1797, but the disease was less extended and less fatal—total mortality, 1,300. Philadelphia again suffered in 1798, the mortality being 3,645. The disease also prevailed during this year in more northern seaport cities, although the mortality was comparatively small except in New York, where the deaths numbered 2,080—Boston 200, Portsmouth 100, New London 81. The disease again prevailed in Boston, Philadelphia, Baltimore, Wilmington, and Charleston, in the year 1800. Minor epidemics continued to occur almost annually in one or more of our southern seaport cities until the year 1853, when a fatal and widespread epidemic occurred, involving considerable areas in the States of Florida, Alabama, Louisiana, Mississippi, Arkansas and Texas. The epidemic of 1867 was also notable in the annals of this disease, although the area of prevalence was not so great as in the epidemic of 1853. The disease prevailed extensively in the State of Texas, causing a mortality of 1,150 in the city of Galveston alone. In Louisiana the city of New Orleans suffered the heaviest loss (3,093). The next great epidemic within the limits of the United States occurred in 1873. The States of Florida, Alabama, Mississippi, Louisiana and Texas were invaded. The mortality in the city of New Orleans (225) was comparatively small, but Shreveport lost 759 of its inhabitants, and the disease extended its ravages to Memphis, Tenn., where there was a mortality of about 4,000.

The last great epidemic of yellow fever in

YELLOW FEVER

the United States occurred in 1878, when 132 towns were invaded in the States of Louisiana, Tennessee, Alabama, Mississippi, and Kentucky. The total reported mortality was 15,034, and the number of cases more than 74,000. Yellow fever has never invaded the populous countries of Asia, which have their own endemic pestilential maladies. It has been introduced from the West Indies to Spain and to Portugal, but is unknown as an epidemic in other countries of Europe. In Africa, it appears to be endemic on the west coast and some authors believe that this was the original home of the disease. Others contend that it was originally a disease of the West Indies and that its occurrence on the African coast resulted from the importation of cases from those islands. The early historians, Herrera, Oviédo, Rochefort, and others, make reference to epidemics among the natives which occurred prior to the discovery of the Antilles, and to fatal pestilential diseases among the first settlers of these islands; but their accounts are not sufficiently exact to enable us to affirm that the disease referred to by them was yellow fever. The west coast of Africa was discovered and colonized to some extent before the discovery of America, but the first authentic accounts of the prevalence of yellow fever on this coast date back only to the year 1778, over two centuries after the first settlements had been established. On the other hand, this very epidemic of 1778 at St. Louis (Senegal), was traced to importation from Sierra Leone, a portion of the African coast which, according to Hirsch, "appears to be the headquarters of the disease, and the starting-point of its epidemic inroad into the territories lying to the north and south, as well as into the West African islands."

Rochefort, whose 'Histoire naturelle et morale des isles Antilles de l'Amérique' was published in Holland in 1558, says of the West Indies: "The air of all those islands is very temperate, and healthy when one is accustomed to it. The *peste* was formerly unknown there as well as in China and other places in the Orient; but some years since the islands were afflicted with malignant fevers, which the physicians considered contagious. The bad air was brought there by some ships which came from the coast of Africa, but at present we hear nothing more of these maladies."

It seems very probable that a pestilential malady which prevailed for a time in these usually healthy islands and then disappeared, was in fact yellow fever, and that it was introduced by ships from the west coast of Africa is not at all incredible. Indeed, it almost seems necessary to look for an original endemic focus of the disease outside of the West Indies, for the reason that, in the comparatively few places where it is now endemic, there is historical evidence to show that there was a first importation and a previous period of exemption; while, on the other hand, the conditions upon which endemicity at the present day seem mainly to depend, were formerly unknown—conditions arising from the aggregation of population at seaport cities, as at Havana, Vera Cruz, and Rio Janeiro.

In 1879 the writer went to Havana, as a member of a commission appointed by the National Board of Health, for the investigation of questions relating to the etiology of yellow fever.

One of the main objects in view in the appointment of this commission was the discovery, if possible, of the specific cause of the disease. The commission was fully equipped with the best microscopical apparatus, and with whatever else seemed necessary to promote the accomplishment of the object in view.

As a result of investigations made at that time and subsequently at Rio de Janeiro in 1887 and in Havana in 1888 and 1889, I formulated the following conclusions in my final report:

"The specific cause of yellow fever has not yet been demonstrated.

"It is demonstrated that micro-organisms capable of development in the culture-media usually employed by bacteriologists, are only found in the blood and tissues of yellow fever cadavers in exceptional cases, when cultures are made very soon after death."

Subsequent researches by other investigators have not invalidated these conclusions. For while the researches of Reed and his associates have demonstrated the fact that the specific infectious agent ("germ") of the disease is present in the blood, they have failed, as heretofore stated, to isolate or to recognize this specific infectious agent, and no one else, up to the present time, has been more fortunate. Numerous claims have, however, been made to the discovery of the yellow fever germ.

My visit to Rio de Janeiro in 1887 was made with the special object of investigating the claim of Dr. Domingos Freire, of that city, who had published an elaborate work giving an account of his *Cryptococcus santhogenicus*, and of his extensive inoculation experiments, made with a view to producing an immunity to the disease. In an address delivered in Paris in 1887, Freire gives the following account of his *cryptococcus*, which he claimed to obtain in cultures from the blood of yellow fever patients. He says:

"Each adult cell is ruptured at one or several points, and allows to escape its contents, composed of germs which are to perpetuate the species, and two pigments—one yellow, destined to infiltrate the tissues, and to produce the icteric color which has given name to the malady; the other black, insoluble, and destined to be carried along the circulatory current, producing either capillary obstructions or blood stasis in the parenchyma of the organs."

This account is entirely fanciful, and is evidently based upon erroneous observation and misinterpretation of what had been seen under the microscope, and to imperfect methods of research. No such micro-organism as Dr. Freire has described is known to bacteriologists, and certainly nothing of the kind is to be found in the blood and tissues of yellow fever cases, as Dr. Freire asserts.

With reference to Dr. Freire's protective inoculations, which he had practised, under government patronage, on a large scale, I say in my report to the President of the United States (1888): "There is no satisfactory evidence that the method of inoculation practised by Dr. Domingos Freire has any prophylactic value." Although Dr. Freire stoutly contested the truth of my conclusions, the scientific world has long since ceased to attach any importance to his claims.

A more recent claim to the discovery of the yellow fever germ is that made by Sanarelli, an

YELLOW-HAMMER

Italian bacteriologist, who visited Brazil for the purpose of making investigations with reference to the etiology of this disease. Sanarelli obtained from the blood of a certain proportion of the cases which came under his observation (post mortem) a bacillus which he believed to be the cause of the disease. His standing as a bacteriologist and his published papers relating the details of his experiments led to a general acceptance of his claims by members of the medical profession in Brazil and to some extent in other countries. But the researches of Maj. Reed and his associates have shown that the *Bacillus icteroides* of Sanarelli is a common and widely distributed species which has nothing to do with the etiology of yellow fever, although it may occasionally be obtained in cultures from yellow fever cadavers. It was not present in any instance in the blood obtained from patients in the early stage of the disease, when this blood was proved by experimental inoculations to be capable of reproducing the disease in non-immune individuals, nor could it be obtained from the bodies of infected mosquitoes which has been proved to be capable of communicating the disease.

Yellow fever is a disease in which immunity results from suffering one attack, and this immunity usually lasts for many years, or for life. Second attacks may, however, occur, although this is rare.

The mortality from the disease differs greatly in different epidemics and among different classes and races. It has been asserted that the negro race has a congenital immunity from yellow fever, but this is a mistake. The susceptibility of the negro is, however, much less than that of the white race, and among those attacked the mortality, as a rule, is small. This is shown by the statistics relating to white and black troops in the British service at West India stations. "While in Jamaica the annual loss among the former amounts to 102 per 1,000 of the mean strength, the deaths among the blacks did not exceed 8 per 1,000. In the Bahamas the mortality of the whites was 59 in 1,000, that of the blacks 5.6 in 1,000" (La Roche).

In the report of the Board of Experts appointed by Congress to investigate the epidemic of 1878, we find the following remarks: "Berwick City, 40 cases among colored, no deaths." "Morgan City, 21 deaths among colored persons." "Brownsville (Tenn.), of 162 colored cases, 21 died." "Chattanooga, of 685 cases, 256 whites, 429 colored; of 164 deaths, 118 whites, 46 colored." "Decatur (Ala.), of 64 white cases, 26 died; of 168 colored, 21 died."

Barton gives the following figures, showing the mortality per 1,000 among different races, and those of the same race from different latitudes, in the city of New Orleans in the great epidemic of 1853.

	Per 1,000
Native Creoles.....	3.38
Strangers from West Indies, Mexico, and South America.....	6.14
Strangers from Southern States of the Union...	13.21
Strangers from Spain and Italy.....	22.06
Strangers from Middle States of the Union....	30.69
Strangers from New York and New England States.....	32.83
Strangers from Western States of the Union...	44.23
Strangers from France.....	44.13
Strangers from British America.....	50.24
Strangers from Great Britain.....	54.19
Strangers from Germany.....	125.01
Strangers from Scandinavia.....	163.26

Strangers from Austria and Switzerland.....	200.06
Strangers from Netherlands.....	258.94

There is probably no difference in the susceptibility of the sexes, but males are attacked in greater proportion than females, because they more frequently, and often recklessly, visit infected localities. The mortality is, as a rule, considerably greater among males. Ligon, in giving an account of the pestilence at Barbados in 1647, of which he was an eye-witness, says: "The cause was unknown; one could not say if the ships of commerce had imported the scourge, or if it came from bad food, marshy water, the intemperance of the colonists, and, above all, the great quantity of *sau-de-vie* which they drank. . . . It was the most debauched who perished first, and not one woman died for ten men." No doubt Ligon was right in ascribing the difference in the mortality of the sexes largely to the difference in their habits, with reference to the use of *sau-de-vie*. Those who habitually use spirituous liquors are less likely to recover from an attack than the temperate, and a recent debauch is a recognized predisposing cause.

The mortality among children is considerably less than among adults. This applies especially to children from 5 to 15 years of age. The mortality among children under 5 is somewhat greater.

The idea which formerly prevailed in New Orleans and Havana that native born citizens — "creoles" — have an inherited immunity from the disease is not well founded. Whatever immunity they may enjoy is no doubt, to a great extent at least, due to an attack of the disease frequently occurring during childhood and usually unrecognized.

Hinemann writes with reference to Vera Cruz: "Until lately the physicians and people of Vera Cruz supported with fanaticism the dogma that natives were absolutely exempt from yellow fever. But the fearful epidemics of recent years (1875, 1877, 1878) have worked a change; for so many native children and adults suffered, that the truth could no longer be denied that these do not enjoy an absolute immunity."

In Cuba, the dogma that creoles are exempt from yellow fever, did not withstand the searching investigation made by the Havana Yellow Fever Commission of 1879.

Nevertheless the mortality from this disease among the creole population of cities where it has established itself as an endemic malady is comparatively small, and by far the largest quota of its victims is drawn from among the strangers who visit the infected places, or residents who have recently located in them.

Geo. M. STERNBERG,
Surgeon-General U. S. A.

Yellow-hammer, originally, in Great Britain, the common yellow bunting (*Emberiza citrinella*), which is yellow above, varied by dark-brown patches, the under parts being pure yellow, and the wing-feathers dusky black, with brown or yellow edges. The flanks are of a brownish hue. The nest is placed on the ground, and is composed of grasses, moss, roots, etc., and lined with hair. These birds, when fat, in the autumn, are much in request for their flesh. These inoffensive birds are regarded with superstitious dislike in some dis-

YELLOW JACK — YELLOW PINE INDUSTRY

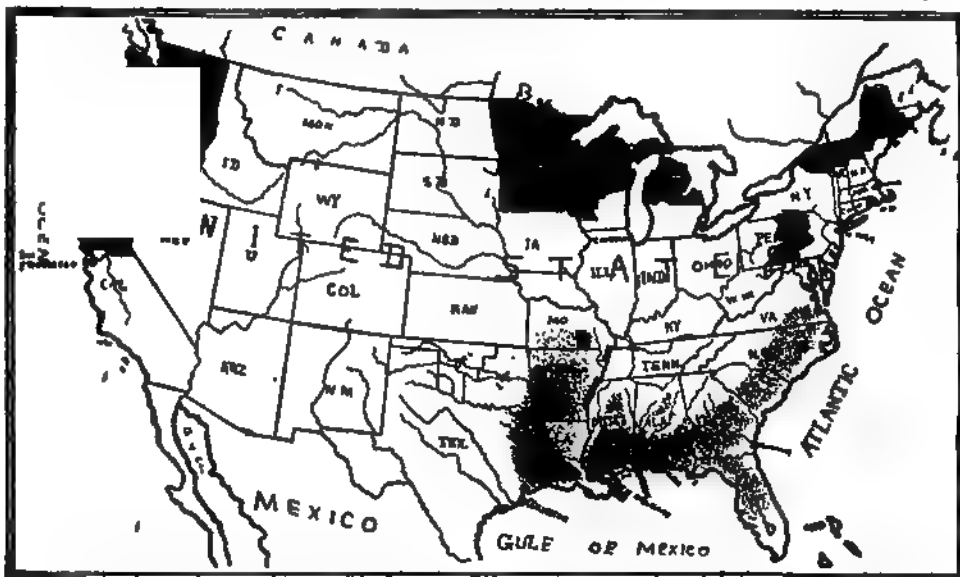

tricts, and their eggs are broken by boys whenever they are discovered, a foolish saying being current that each egg contains a drop of "devil's blood." In the United States the term is misapplied to the goldenwinged woodpecker or highhole. See FLICKER.

Yellow Jack, a quarantine flag displayed at naval hospitals and from vessels in times of epidemics (see QUARANTINE). Also a common name for yellow fever.

Yellow-jacket, any species of small American wasp, marked with black and yellow stripes. See WASP.

Yellow Pine Industry, The. No branch of American lumbering is of such importance as the yellow pine industry of the southern States. The States in the yellow pine district include Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, Arkansas, and Missouri. In

small portable mill, which cuts yearly 100,000 feet, to the colossal modern forest-destroyer, employing hundreds of men, requiring miles of log road, and producing 50,000,000 feet per annum. Of these 10,000 sawmills, only 231 were reported in 1900 to have a capacity of 10,000,000 feet and upward. North Carolina has the greatest number of small mills,—over 1,800,—while Louisiana has the greatest number of large modern plants. The government reports for 1900 show that there were 149,908 laborers in the lumber industry of the States in which lies the yellow-pine belt. These men draw yearly a combined wage of \$35,000,000, and help to put forth a product which finds its way into almost every part of the civilized world. The seaports figuring conspicuously in the exporting of yellow pine are: Brunswick, Ga.; Pensacola, Fla.; Mobile, Ala.; Gulfport, Miss.; Pascagoula, Miss.; Sabine Pass, Texas; and New Orleans, La. Pensacola is the largest exporter,

A Map from the "Review of Reviews" showing the Location of the Four Great Lumber-Producing Districts in the United States, with the General Distribution of Yellow-Pine Timber in the South. (Approximately speaking, the stand of yellow pine per acre is about as follows: Florida, 2,500 feet; Alabama, 5,000 feet; Arkansas, 5,000 feet; Mississippi, 8,000 feet; Louisiana, 8,500 feet; Missouri, 4,000 feet; Texas, 8,000 feet; No. Carolina, 4,000 feet; So. Carolina, 4,000 feet; Georgia, 4,000 feet; and Virginia, 3,500 feet.)

this section are situated 43 per cent of the sawmills of the country. The amount of standing yellow-pine timber in the South was estimated by the government, in 1903, to be 177,000,000,000 superficial feet. The distribution of this timber is approximately as follows:

STATE	Number of acres	Number of superficial feet
Alabama	2,250,000	11,250,000,000
Arkansas	2,000,000	9,000,000,000
Florida	5,000,000	12,500,000,000
North Carolina, South Carolina, Virginia, and Geo. ga.	7,000,000	28,000,000,000
Mississippi	5,000,000	40,000,000,000
Louisiana	4,500,000	38,250,000,000
Texas	4,500,000	36,000,000,000
Missouri	1,500,000	2,000,000,000

There are almost 10,000 saw-mills in the yellow-pine belt of the South, varying from the

with Mobile a close second. The importance of these last two ports may be realized by a glance at the following figures:

	1902	1903
Total export of yellow pine	906,742,088 superficial feet	
Export of yellow-pine lumber and timber from Pensacola	263,304,036 superficial feet	337,415,577 superficial feet
Export of yellow-pine lumber and timber from Mobile	236,985,472 superficial feet	238,660,451 superficial feet
Total export of lumber and timber from the United States	1,458,110,268 superficial feet	

There are three distinct markets for southern yellow pine,—the local, the foreign, and the domestic. The local market consumes about 15 per cent of the output, the foreign 10 per cent, and the domestic 75 per cent. Hence, it is seen that into the interior and eastern States

YELLOW PUCCOON—YELLOWLEGS

goes the bulk of southern yellow pine. The lumber in this last-named trade is generally kiln-dried and dressed, while to foreign countries are sent rough lumber and great quantities of square timber. See also **PINK**.

Yellow Puccoon. See **PUCCOON**; **GOLDEN SEAL**.

Yellow-rattle, a scrophulariaceous plant, *Rhianthus crista galli*, an annual herb with opposite, lanceolate, sessile leaves, and terminal, one-sided, leafy-bracted spikes of yellow flowers. The corollas are two-lipped, with an arched upper lip, and three-lobed lower one. The capsule is orbicular and flat, with several round-winged seeds, which rattle about the pod when shaken, and have given rise to other descriptive names, such as rattle, rattle-box, penny-rattle, etc. In European fields it is very abundant and becomes a pest, since it is parasitic and attaches itself by suckers to the roots of living grasses.

Yellow Ribbon, Order of the. See **ORDERS, ROYAL**.

Yellow River. See **HWANG** or **HOANG-HO**.

Yellow-root, either one of two ranunculaceous plants, one being known as the shrub yellow-root (*Xanthorrhiza apifolia*). Its long roots and rootstock, leaves, bark and pith, are bright yellow, and the root is extremely bitter and astringent, and is used as a tonic. This yellow-root grows in the southern United States and has pinnate leaves clustered at the top of a short stem, giving the plant a fern-like aspect. The foliage turns to gorgeous lines of scarlet and orange in the autumn. The five-merous flowers are wine-colored. The other yellow-root (*Hydrastis canadensis*) is known also as golden-seal, or yellow puccoon; its root is a tonic drug. The plant has abundant reniform, palmately-lobed, basal leaves, and two cauline ones, the uppermost of these subtending the solitary, greenish-white flower. The puccoon (q.v.) is found in woods in the eastern United States and furnished the Indians with a favorite yellow dye.

Yellow Sea, or Hwang-hai, hwang-hi, a gulf of the Pacific Ocean, extending between the northeast coast of China, and the western coast of Korea, northward to Manchuria; length about 600 miles; greatest breadth about 400 miles. North and northwest it terminates in the gulfs of Liao-tung and Pe-chi-li, the latter of which receives the waters of numerous large and important rivers. On the east coast are numerous groups of islets, part of them included in the Korean Archipelago. The Yellow Sea is very shallow, and is so named from the muddy lemon-yellow color of its waters near the land, caused by the large quantity of alluvium continually brought into it by the Hwang-ho or Yellow River, and the Yang-tse-Kiang, which gradually tends to decrease its depth.

Yellow-weed. See **DYER'S ROCKET**.

Yellow-wood, a name applied to several timber trees and shrubs, including *Cladrastia lutea*. This is an uncommon leguminous tree, known in cultivation as the virgilia, American or Kentucky yellow-wood, and is indigenous to the United States from Kentucky southwards. The yellow-wood attains to a height of 60 feet, with a trunk some two feet in diameter. It usu-

ally divides into two or three limbs not far from the ground, which ramify into slender and somewhat drooping branches, forming a broad, graceful head. In winter the smooth, silvery-gray bark of its main trunk, and red-brown of its delicate sprays, are very interesting. The limbs, however, are brittle and break easily. The foliage of the yellow-wood consists of light-colored, odd-pinnate leaves, turning to clear yellow in autumn; and fragrant panicles a foot or more long, of flowers, pea-like and milk-white, droop from the ends of the branches. The fruits are linear legumes. A yellow dye was made from the hard golden-tinted wood, which is used for fuel and occasionally for gun-stocks. The yellow-root (q.v.) (*Xanthorrhiza*); the Osage orange (*Maclura aurantiaca*), a favorite hedge plant; fustic, a dyestuff yielded by the wood of *Maclura tinctoria*, a West Indian tree with oblong, taper-pointed leaves and an edible fruit; and *Schaefferia frutescens*, the valuable boxwood of the West Indies, are all known as yellow-woods. Australian yellow-woods are the *Acronychia laevis*, *Hovea longipes*, and *Xanthostemon pachysperma*; and the white teak, or Queensland yellow-wood (*Phindesia oxleyana*), also called light yellow-wood, is a tall, slender tree with many branches. Another tree called light yellow-wood is the *Rhus rhodanthema*, bearing large red flowers, and growing to 80 feet in height. It is native to Queensland, and yields a fine cabinet-wood, close-grained, capable of taking a fine polish, sound and durable. Natal yellow-wood is a tree of about the same height (*Podocarpus elongata*), with a close-grained wood which will not bear exposure out of doors, but is extensively used for furniture and interior house-building. The bastard yellow-wood of the same region is *P. pruinosa*, with a tough durable wood, also used in house building; still another species (*P. latifolia*), an evergreen about 80 feet high, and having an aromatic wood, is the East Indian yellow-wood. This same name is given to the satin-wood (*Chloroxylon swietenia*). The prickly yellow-wood is *Xanthoxylum caribaeum* (q.v.).

Yellowbird, any of several familiar birds prevailing yellow in plumage. In the United States the name belongs to two small garden-visitors. One is the goldfinch (q.v.), and the other, often distinguished as "summer" yellowbird, is a warbler (*Dendroica aestiva*), common in summer throughout all the eastern United States and Canada. It is greenish yellow, brightest on the breast, where it is diversified by salmon-colored streaks. The song is a melodious trill, often heard among the roses and lilacs of the garden, where the bird is likely to fix its deep nest of hempen shreds in an upright fork. The eggs are pink, with reddish and purplish dots. This nest is one of the receptacles most often chosen by the cow-bird for its surreptitious egg; but the yellowbird frequently defeats the intruder's object, by building a new nest on top of the first one, burying the strange egg.

Yellowhead, a yellow-headed blackbird. See **BLACKBIRD**.

Yellowlegs, a genus (*Totanus*) of birds of the family *Scolopacidae*, large snipe-like species with cross-barred tail-feathers, well-marked gape, long, slender non-sensitive bill and green-

YELLOWPLUSH PAPERS—YELLOWSTONE NATIONAL PARK

fish yellow legs, from which they take their common names of yellowlegs, green-shanks, etc., while, because of their constant noisy calling, they are known to gunners as tattlers or tell-tale snipe. The greater yellowlegs (*T. melanoleucus*) inhabits during some part of the year nearly the entire American continent and breeds chiefly north of the United States, in which it is well known as a coastwise migrant. It is 13 to 14 inches long, with a spread of wings of two feet. Above the color is a mixed dark ashy, varying with the age and season, below white streaked and barred with ashy black. Although chiefly a maritime bird, this species also migrates through the Mississippi Valley and is found about the lakes of the interior; and even along the coast it is fond of frequenting the fresh and brackish pools on the meadows, where it finds an abundance of food in the small fishes, mollusks, shrimps and crabs. It also eats worms, insects and the spawn of fishes, which it catches with great facility. During the migrations, which occur in April and from late August to October through the greater part of the United States, it is commonly seen in small parties of 6 or 8, often consorting with other species of tattlers, willets and godwits. The flight is swift and often elevated, and in alighting in pools in which they wade leg-deep they keep the wings raised until well settled. They are extremely alert and noisy and thus provoke the indignation of gunners. The nest is a grass-lined depression on the ground and the four, pyriform, greenish yellow, brown and gray blotched eggs measure upward of two inches in length. The lesser yellowlegs (*T. navipes*) is in form and colors nearly an exact miniature of the last, but is only 10 or 11 inches long, with a spread of 20 inches. Its range and habits are similar to those of the larger species, but it is much commoner in the East and flies in much larger flocks. It is much better known to shooters of shore-birds. The eggs are more variable, the ground-color being clay or buff, and the markings usually very bold and distinct. The European green-shank (q.v.) occasionally straggles to our shores and may be distinguished from *T. melanoleucus*, which it resembles in size, by the distinctly green color of the lower legs and feet. About a dozen related species are found in other parts of the world and the genus *Heterodromas*, containing our solitary and green sandpipers, is closely allied. For methods of shooting see SANDPIPER.

Yellowplush Papers. The, a series of satirical papers by William M. Thackeray, which appeared in 'Fraser's Magazine' in 1837-8, as 'The Yellowplush Memoirs,' and in book form in 1841.

Yellows, a disease of the peach (q.v.).

Yellowstone, formerly *Subletts*, a lake in the Yellowstone National Park (q.v.), at the northeast base of the Rocky Mountain range. It has an elevation of nearly 7,800 feet above sea-level. It is irregular in form, having extensions called West Arm, South Arm, and South-East Arm. The Yellowstone River flows through the lake, or as sometimes given, the lake is an expansion of the river. It is about 20 miles long and 15 miles wide.

Yellowstone, a river which has its rise in the Shoshone Mountains, in the northwestern

part of Wyoming, near lat. 44° N. It flows north, entering the Yellowstone National Park (q.v.) at the southeast corner, and passes through Yellowstone Lake, which is usually called an expansion of the river. From the lake the course is northeast, east, then north-east to the Missouri River, which it enters at Buford, on the boundary between Montana and North Dakota. The total length of the stream is about 1,000 miles. It is navigable for nearly 800 miles from its junction with the Missouri. The largest tributaries come from the south and are Big Horn, Powder, Rosebud, and Tongue rivers. The Grand Cañon of the Yellowstone (see YELLOWSTONE NATIONAL PARK) is one of the wonderful sights in a region of wonderful scenery.

Yellowstone National Park, a government reservation in the northwestern part of Wyoming and extending into Idaho and Montana about 11 miles along the western boundary of the park and into Montana about three miles along the northern boundary. In 1872 Congress set apart 3,575 square miles as 'a public pleasure ground and a game preserve.' In 1891 a tract of nearly 2,000 square miles was added to the east and south, making the total area 5,575 square miles. The mean altitude of the plateau portion is 7,800 feet. The 'Continental Divide' passes through from the south-east to the northwest, and the 'Rocky Mountain Divide' through the western part. Surrounding the park are numerous snow-clad mountains; on the south are the Shoshone Mountains, the Big Game and Teton ranges, on the east an extension of the Shoshone and on the southwest the Teton Range, the Big Bend Ridge on the west, and the Gallatin Range, part in the park, on the northwest. Some of the high peaks on the east are Index, 11,740 feet; Saddle Mountain, 10,676; Sunlight, 10,678; Fortress Mount, 12,073; and Ishawooc Cone, 11,840. Within the limits of the park is the Absaroka Range on the eastern border, with numerous vast peaks; as Table, Humphrey, Schurz, Langford, Chittenden, Cathedral, and Stevenson. In the northeast, and inside the Absaroka Range, are the Specimen Ridge and the Mirror Plateau. In the northern and southern parts of the park are lofty elevations; Mount Holmes of the Gallatin Range and Bunsen Peak are among the highest. In the southern part of the park is Sheridan Mountain, 10,385 feet high, the highest point of the Red Mountains. This elevation was named in honor of Philip H. Sheridan. A large part of the peak is formed of porphyry of a purple-pink color. Mount Washburne in the north is noted as the peak from which large portions of the park may be seen. It was named in honor of H. D. Washburne, who explored this region in 1870. There are over 20 high peaks within the limits of the park. The central plateau is composed of vast quantities of lava, in some places 2,000 feet deep. The Absarokas Range are made up of volcanic rocks, and nearly every part of this peculiar range shows the marks of having gone through a period of volcanic action. Sheridan in the south and Washburne in the north have been active volcanoes. Between Yellowstone and Shoshone lakes is a volcanic ridge about 255 feet in height. Six miles from the Grand Cañon of the Yellowstone is Sulphur Mountain, an immense mound of pure sulphur

YELLOWSTONE PARK

Terraces built by the overflow of Geysers (Mammoth Hot Springs)

YELLOWSTONE NATIONAL PARK

crystal with a number of steaming springs at its base.

Rivers and Lakes.—The "Continental Divide" marks the land-line of separation of the waters of the Atlantic and the Pacific. The headwaters of several large rivers are in the park; Yellowstone, Snake, Lewis, Madison, and Shoshone are some of the streams which have headwaters here. The Yellowstone River (q.v.), Missouri River's longest tributary, rises or passes through Yellowstone Lake, for a stream which enters the lake on the opposite side is, also, called Yellowstone. The Grand Cañon of the Yellowstone is one of the wonders of this "Wonderland." Its walls on one side are 2,000 feet, and on the other side there is a gradual descent half way down of sliding cinnabar and other delicately tinted chalky formations, broken at intervals by towering pinnacles of mineral rock, which stand out in bold relief against the brilliant background. These pinnacles take on many fantastic forms, inspiring the delusion that one is looking down upon the decaying splendors of antique architecture. From the base of these solemn sentinels, the descent to the water line is as abrupt as from surface to torrent on the opposite side. Far below winds the foaming current of white-crested wavelets spread out like a silvery band. Though the channel is 160 feet wide, it appears no larger than a brook. The whole volume of water breaks over a ledge, in the centre of which stands a huge black boulder which divides the waters for a few feet, and again uniting they fall 370 feet. Showers of spray are sent up, which when touched by the sunlight look like innumerable and varied colored jewels. Another falls above the main waterfall, is of considerable height and great beauty, and above are a series of cascades. The Grand Cañon is about 10 miles long. Tower Falls are so named on account of a mass of stone, about 100 feet from the verge of the precipice. The water below flows over a ledge about 150 feet high, and falls in solid sheets. Belcher River drains the southwestern part of the park. Madison, another tributary of the Missouri, has its source at the confluence of the Gibbon and Fire Hole rivers in the western part. In the northwest is the Gardiner River, a branch of the Yellowstone. Yellowstone Lake (q.v.), the largest body of water in the park, is said to have 300 miles of shore line, but it never has been fully explored. It certainly is the gem of the lakes, set as it is in a series of mountain peaks, with pine-clad slopes and snow-crowned summits. The monotony of its crested waves is broken by a verdure-clad island, Frank Island, giving it the appearance in summer of an emerald in a setting of brilliants. Shoshone Lake, next in size, is west, and Heart Lake is south of Yellowstone. North of Yellowstone is a group of small lakes, the largest of which is White Lake. They are northwest of Plican Cone. Near Mount Chittenden is Turbid Lake.

Geysers and Hot Springs.—The Yellowstone Park is famous for its numerous geysers; it is one of the four regions in the world where there are groups of large geysers. There are three geyser basins located in the valley of the Fire Hole River, at an average altitude of 7,000 feet above the sea-level; Upper Geyser, Middle Geyser, and Lower Geyser. The Upper, or Great Geyser basin, is the most active. Here are located the great spouters, conspicuous among

which are the Giant, Giantess, Castle, Saw Mill, Bee Hive, Lion, Grand Cornet and Cub, and last, but by no means least, Old Faithful. They are all appropriately named. The Giant and Giantess are so called on account of the immense size of their craters and the force of their action; the Bee Hive and Castle because of the peculiar formation of their cones; the Saw Mill and Lion from the roaring noise they make when in a state of activity; and Old Faithful on account of the regular discharges of steam and water at intervals of 64 minutes. One can rely absolutely on Old Faithful giving an exhibition every hour and four minutes. The stated intervals of activity have not varied in the memory of the oldest visitor to the park. Other geysers are variable in the time of their action; all are subject to changes. The Bee Hive is becoming more active every season. It gives an exhibition two or three times every 24 hours. The Giant and Giantess and Castle can not always be relied upon, but they make a magnificent display when in action. The Giant averages an exhibition about every six days and the Giantess about every 11 days. Near the main cone of the Giant Geyser is a small fissure, which seems to do for the Giant what an escape pipe does for a large boiler. When the chambers of the main crater become fully charged, short puffs of steam come hissing through this fissure. The grandeur of the spectacle which follows passes description. The interior forces seem to combine in making a display of power. Accompanying a stunning shock, caused by the volume of steam escaping, a column of water about 10 feet in circumference is thrown up to a considerable height, and emits a dense cloud of steam, so that it is difficult to see what appears in the centre to be a massive marble pillar. But the steam soon floats away and a column of great beauty stands revealed in all its grandeur. In a few seconds comes another change, the column is shattered, the law of gravity asserts itself, and the great body of water which went up in a grand column falls in showers of spray. The greater part of the water returns to the crater, and the overflow is carried off by Fire Hole River, a stream well named, as it flows rapidly through three basins fed by many boiling springs and numerous geysers.

There are no cone geysers in the Middle Geyser basin. The great wonder of the Middle basin is "Hell's Half-Acre." This is located on the bank of Fire Hole, and is a steaming abyss, about 30 feet deep, in a limestone formation. Four or five times each day, at irregular intervals, it gives most astonishing exhibits. A short distance from "Hell's Half-Acre" is a boiling lake, the waters of which are a beautiful blue. The blue liquid-overflow winds over formations which for years have been changing in form and color, making a sight the like of which is nowhere else in the world. The reflection of the trees and hills in the colored water adds to the picturesque beauty of the scene. The "Devil's Paint Pot" is a boiling caldron of many colored clays, which bubble and steam and change their colors in a way most interesting. The Mammoth Hot Springs are in the northern part of the park, not far from Cinnabar, the railroad station in Montana. They are somewhat similar to the springs in the Fire Hole basin. The deposits left by the water have built up scalloped terraces. Some of the results of their activity

YELLOWSTONE NATIONAL PARK

exist in a marked degree on the banks of the Gardiner River. There are places where the water from the geysers is no longer changing the terrace formations, and which seem to be over caverns as indicated by the sound of footsteps. In some parts caverns have been explored, and found to contain many beautiful specimens of stalagmites and stalactites. The springs of this locality are as varied in color and form as in activities. The "Goddess of Liberty" is a mass of limestone, 40 or 50 feet high, and shaped like the cap of the Goddess of Liberty. The Mud Geysers, north of and near Yellowstone Lake, are what their name indicates. At irregular intervals mud and water are shot up quite a distance. This slimy substance falls on the dead cedars which have been killed by the hot substance; but that evergreen cedars grew here shows that vegetation existed long before the present conditions. There are geysers near Heart Lake and in other parts of the park. There are nearly 100 active hot springs and geysers within the park. The geysers change, some becoming extinct, and new ones appearing. In 1878 a large geyser made its appearance in the Norris Basin, near the headwaters of the Madison River. Hot springs are found everywhere in the park; on mountains, in valleys, in the beds of lakes and rivers, near cañons, and near cold water springs. They vary in size, some cover acres, others only inches of surface. There are also a large number of mineral springs and numerous springs of clear cold water. The whole park and much of the adjoining region are volcanic.

Climate.—The climate is not as severely cold as in other parts of the Rocky Mountain region of the same altitude. The winter season practically begins with September or the last of August. The mean temperature in January is about 20°; occasionally the temperature falls to 30° below zero. The summers are short; vegetation begins to grow in May and in July has reached its most luxuriant state. In the last of August the change from summer to winter is usually sudden. In July the mean temperature is 62°; sometimes in summer the temperature rises to 96°. A hot day in summer may be followed by a cold night, even frost appearing. On the plateau the average annual rainfall is 20 inches.

Flora.—Nearly all the park area is covered with forests, chiefly composed of conifers. The treeless regions are the summits of the high mountains, the marshy bottoms, and the steep rocky slopes. The black pine is the most common; in some places there are forests composed almost wholly of black pine (*Pinus Murrayana*), which here do not attain any great size. The balsam is found on the high plateaus, and varieties of fir and spruce are abundant. Forests exist at an elevation of 9,700 feet. Grasses are found on the plateaus, and the herbaceous vegetation found in the Rocky Mountains. Above the timber line the vegetation is about as in other parts of the summits of the Rocky Mountains. The gentian is one of the favorite flowers of this section. Near the hot springs the vegetation is affected by the overflow and other causes; it is stunted and in some places has been killed entirely. Petrified trees are found in the southwest.

Fauna.—The wild animals of the park are protected by government laws, and as a conse-

quence are becoming more numerous than in other parts of the Rocky Mountains. A herd of buffalo is one of the features of the place. The animals found here are deer, antelopes, elk, mountain lions (pumas), beaver, black and brown bears, and moose. Sheep are found on the high lands. Grouse is found in some parts, but there are not many birds in this region. Fish abound, trout is in many streams.

Government and Improvements.—Since 1872 the government has had entire control of a portion of what is now the Yellowstone National Park, and later took control of additional lands, and now has entire jurisdiction over all the park. The administrative officials are under the Secretary of the Interior. An army officer is the superintendent in direct charge, and he has as his aids a detachment of Federal troops. On 1 July 1900, the Secretary of the Interior gave to the public the following instructions:

The following rules and regulations for the government of the Yellowstone National Park are hereby established and made public pursuant to authority conferred by section 2,475, Revised Statutes, United States, and the act of Congress approved 7 May 1894:

(1) It is forbidden to remove or injure the sediments or incrustations around the geysers, hot springs, or steam vents; or to deface the same by written inscription or otherwise; or to throw any substance into the springs or geyser vents; or to injure or disturb, in any manner, or to carry off any of the mineral deposits, specimens, natural curiosities, or wonders within the park.

(2) It is forbidden to ride or drive on any of the geyser or hot spring formations, or to turn loose stock to graze in their vicinity.

(3) It is forbidden to cut or injure any growing timber. Camping parties will be allowed to use dead or fallen timber for fuel.

(4) Fires shall be lighted only when necessary, and completely extinguished when no longer required. The utmost care should be exercised at all times to avoid setting fire to the timber and grass, and any one failing to comply therewith shall be punished as prescribed by law.

(5) Hunting or killing, wounding or capturing of any bird or wild animal, except dangerous animals, when necessary to prevent them from destroying life or inflicting an injury, is prohibited. The outfit, including guns, traps, teams, horses, or means of transportation used by persons engaged in hunting, killing, trapping, ensnaring, or capturing such birds or wild animals, or in possession of game killed in the park under other circumstances than prescribed above, will be forfeited to the United States, except in cases where it is shown by satisfactory evidence that the outfit is not the property of the person or persons violating this regulation, and the actual owner thereof was not a party to such violation. Firearms will only be permitted in the park on written permission from the superintendent thereof. On arrival at the first station of the park guard, parties having firearms will turn them over to the sergeant in charge of the station, taking his receipt for them. They will be returned to the owners on leaving the park.

(6) Fishing with nets, seines, traps, or by the use of drugs or explosives, or in any other way than with hook and line, is prohibited. Fishing for the purposes of merchandise or

BRIDAL-VEIL FALL IN THE YELLOWSTONE PARK

YELLOWTAIL—YENIKALE

profit is forbidden by law. Fishing may be prohibited by order of the superintendent of the park in any of the waters of the park or limited therein to any specified season of the year, till otherwise ordered by the Secretary of the Interior.

(7) No person will be permitted to reside permanently or to engage in any business in the park without permission, in writing, from the Department of the Interior. The superintendent may grant authority to competent persons to act as guides and revoke the same in his discretion, and no pack trains shall be allowed in the park unless in charge of a duly registered guide.

(8) The herding or grazing of loose stock or cattle of any kind within the park, as well as the driving of such stock or cattle over the roads of the park, is strictly forbidden, except in such cases where authority therefor is granted by the Secretary of the Interior.

(9) No drinking saloon or bar room will be permitted within the limits of the park.

(10) Private notices or advertisements shall not be posted or displayed within the park, except such as may be necessary for the convenience and guidance of the public, on buildings on leased ground.

(11) Persons who render themselves obnoxious by disorderly conduct or bad behavior, or who violate any of the foregoing rules, may be summarily removed from the park, and will not be allowed to return without permission, in writing, from the Secretary of the Interior or the superintendent of the park.

Any person who violates any of the foregoing regulations will be deemed guilty of a misdemeanor, and be subjected to a fine, as provided by the act of Congress approved 7 May 1894, "to protect the birds and animals in Yellowstone National Park and to punish crimes in said park, and for other purposes," of not more than one thousand dollars, or imprisonment not exceeding two years, or both, and be adjudged to pay all costs of the proceedings.

Prior to 1870 little was known about the region now included in the park. In 1870 H. D. Washburne, surveyor-general of Montana, and G. C. Doane, an army officer, explored this region and gave the first report of the wonderful springs and geysers. In 1872 the government sent Ferdinand V. Hayden, United States geologist, and a number of assistants, to explore this region. The place is visited annually by thousands of tourists and accounts of this wonderful park have been published in all languages.

Consult: 'Wonderland,' an annual published by the Northern Pacific Railroad; Chittenden, 'Yellowstone National Park'; Richardson, 'Wonders of Yellowstone'; United States Geological Survey.

Yellowtail, or *Bianquillo*, a trachinoid fish (*Caulolatilus princeps*) of the coast of Southern California and southward, allied to the Atlantic tilefish (q.v.), which reaches a length of 40 inches. It abounds about rocky parts of the coasts, is good food and interesting as a gamefish. Several other fishes in various parts of the world are called yellowtails, in reference to the yellow or orange color of the tail fin.

Yellowthroat. See **MARYLAND YELLOWTHROAT**.

Yemassee, yēm-sē', The, a romance of South Carolina in the colonial period, by William Gilmore Simms, published in 1835. The leading events of the tale are in accordance with history. The Yemassee are a powerful tribe of Indians whose hunting grounds are gradually encroached upon by the English colonists, who, by purchases, seizures, and intrigues, presently change the feeling of friendship with which their advent was greeted, into fear, and finally into savage revolt.

Yemassee War. See **COLONIAL WARS IN AMERICA**.

Yem'en, Arabia, a division occupying the southwest angle of the peninsula, and known both to the ancients and moderns as Arabia Felix (Arabia the Happy), from a mistranslation by Ptolemy of *Yemen*, which does not signify happy but the land lying to the right of Mecca. Yemen, in the widest sense, is bounded on the west by the Red Sea, on the south by the Gulf of Aden, on the north by Hejaz and Nejd, and on the east by Hadramaut. It comprises two regions physically distinct: the Tehama or Lowland, lying between a chain of mountains which extends throughout the country and the west coast; and an elevated mountainous tract to the eastward of the former. The Tehama varies in breadth from 10 to 30 miles, and is a barren desert wherever it is not irrigated by the mountain streams. The mountains rise abruptly from the desert plain, enclosing valleys of great luxuriance. The table-land in the interior has an estimated elevation of 4,000 feet, and some of its mountain groups, as Sabar, south of Taas, attain a height of 7,000 to 8,000 feet. The loftiest of these mountains are covered with forest to the summit, and the table-land abundantly produces coffee, dates, aenna, tobacco, and other productions of rather a warm temperate than a torrid region. Yemen, considered in the extent above indicated, has no longer a political existence; the frontier provinces have in some instances become independent, and the Yemen proper of the present day, or the Turkish vilayet known by this name, does not embrace above two thirds of the territory formerly included under the same general title. Its approximate area is 77,200 square miles. Yemen, taken collectively, still bears unmistakable traces of its ancient superiority in wealth and civilization. In its numerous well-built towns are many rich merchants, while in the well-populated rural districts the peasantry are generally in easy circumstances. There are two great schools or universities, one at Zebid for Sunnites, and another at Damar for the Zeidés. The principal towns are Sana, the capital Mocha, and Aden, which last is now in the possession of the British. Pop. 750,000. See **ARABIA**.

Yembo-el-Bahr, yēm'bō-el-bār, Arabia. See **YAMBO**.

Yen, a Japanese coin issued in 1, 2, 5, 10, and 20 yen pieces (gold). A gold yen is equal to 49.8 cents in United States gold.

Yenikalé, yēn-ē-kā'lā, Strait of, called also Strait of Kaffa and Strait of Kertch, Russia, connects the Black Sea with the Sea of Azov; it is about 25 miles long and from 2½ to 8 miles broad, but in some places is so shallow as to leave a channel of little more than two fathoms deep.

Yenisei, yén-t-sá't, Siberia, the longest river of the region, formed by numerous streams from the mountain ranges bordering the Chinese and Russian empires. It has at first a circuitous, and then an almost direct northward course of about 3,400 miles, finally reaching the Arctic Ocean through the long estuary, and gulf of the same name. Its breadth varies from 3,000 feet to 14 miles in its estuary which is 140 miles long, and its depth varies from 11 to 90 feet. The area of its basin is estimated at about 1,000,000 square miles. A canal connects it with the Ob. The principal towns on its banks are Minusinsk, Krasnoiarak, Yeniseisk, and Tarukanak; it is navigable to the last-named town for large vessels. The waters of the Yenisei are clear and rich in fish. They are navigated by paddle steamers, drawing barges, and by a number of five or six cornered flat-bottomed boxes which convey flour down stream, and are broken up at their destinations. The Yenisei receives from the right the Upper Tunguska or Angara (the outlet of Lake Baikal), the Irkut, Middle Tunguska, and Lower Tunguska. Nordenkjöld's voyage in the summer of 1875 from Tromsø to the mouth of the Yenisei opened up a trade by sea with northern Siberia, in which a number of vessels are now engaged, finding six weeks in summer when the passage to and from the Yenisei can be made with little difficulty.

Yeniseisk, yén-t-sá'tsk, Siberia, (1) a town in the government of the same name on the left bank of the Yenisei, 200 miles north of Krasnoiarak. It has several churches, a monastery, museum of natural history and archaeology, and a public library. It is in the northern gold-mining region, has a custom-house, an extensive trade, particularly in furs, and an annual fair. Pop. about 13,000. (2) A province in the government of Irkutsk, bordering on the Arctic Ocean, bounded east by Yakutsk and Irkutsk, south by Mongolia, and west by Tomak; area, 987,186 square miles; capital, Krasnoiarak. The south part of the province is occupied with the Altai Hills and their offsets. In the Yenisei valley considerable tracts are under tillage, but north of the town of Yeniseisk this is succeeded first by pasturage, then by stretches ever more and more desolate, to the frozen tundras. The chief river is the Yenisei. Smaller streams are the Taimyr, Katanga, and Anabar, which, like the Yenisei, form great gulfs at their mouths. The gold washings of Yeniseisk occupy 12,000 to 15,000 men and several thousand horses. Of the native tribes, who live by hunting, fishing, and trade in fur, the chief are Samoyedes and Tungus.

Yeo, yō, Sir James Lucas, English naval officer: b. Southampton, Hampshire, 1782; d. at sea 1818. Entering the navy at 11 he was present at the siege of Genoa in 1800, and while in command of a force of English and Portuguese captured Cayenne, French Guiana. In 1813 he became commander-in-chief of the English naval force of the Great Lakes and soon came into conflict with the American ships of war there. After several indecisive engagements he captured Oswego, 6 May 1814, which the Americans soon retook, and afterward blockaded Commodore Chauncey at Sackett's Harbor. In the following year Yeo was made commander-in-chief of the English fleet on the west coast of Africa.

Yeoman, yō'man, a term of early English origin formerly applied to a feudal attendant or servant, but in the 15th century and subsequently denoting a small freeholder below the rank of gentleman. The term yeoman was given also to the 40 shillings freeholder, and commonly to any small farmer or countryman above the grade of laborer. The term is also familiar in the titles of functionaries in royal households, such as yeoman usher of the black rod, yeoman of the robes, etc.

Yeomanry, a force of volunteer cavalry first enrolled in Great Britain during the wars of the French Revolution, and consisting to a great extent of country gentlemen and farmers possessing their own horses and requisite equipment. They are liable to be called out in aid of the civil power in case of riot at any time; in case of actual invasion, or the appearance of an enemy on the coast or during a rebellion, they may be assembled for actual service; they are then subject to the Mutiny Act and Articles of War, and may be called upon to serve in any part of Great Britain. During permanent service they receive cavalry pay and an allowance for forage. They undergo six days' training, and must attend a certain number of drills yearly, for which they receive 7s. a day as subsistence allowance, and 2s. for forage. Arms and ammunition are provided by the War Office, and there is an annual allowance of £2, or about \$9.74, per man; but each man has to provide his own horse, which is exempt from taxation. For their services during the Boer war, 1899-1900, they received the title of Imperial Yeomanry. Colonial Yeomanry have been enlisted for the defense of the British colonies.

Yeomen of the Guard, in England, a corps of veteran soldiers of stately presence, employed on state occasions in conjunction with the gentlemen-at-arms as the bodyguard of the sovereign. The yeomen were constituted a corps in 1485 by King Henry VII., and they still wear the costumes of that period. The officers of the corps are a captain, ordinarily a peer, a lieutenant, and an ensign—all old army officers. There are also a "Clerk of the Cheque" and four "Exons," besides non-commissioned officers (messengers, sergeant-majors, yeoman bed-goers, yeoman bed-hangers), and 100 privates. The Beef-Eaters or Warders of the Tower, are, contrary to common belief, an entirely different corps, but since the reign of Edward VI have been privileged to wear the yeoman's uniform, without the shoulder belt. See **BEEF-EATERS**.

Yerba Maté. See **PARAGUAY TEA**.

Yerkes, yér'kēs, Charles Tyson, American capitalist: b. Philadelphia, Pa., 25 June 1817; d. New York City, 20 Dec. 1905. He received a secondary education in Philadelphia, was for a time in the flour and grain business, in 1839 became a stock-broker, and in 1861-66 was in banking, first in Philadelphia, and from 1881 in Chicago. In 1871 he was obliged to make an assignment, but by fortunate investments he soon financially re-established himself, and became prominently connected with the Philadelphia street-railway system. After his removal to Chicago he acquired a controlling position in its street-railway system. In 1890-3 he was a prominent member of the board of directors of the World's Columbian Exposition at Chicago, rendering particular service to the

YERKES OBSERVATORY — YEZO

department of fine arts, to whose exhibit he loaned his fine collection of paintings. Among his later enterprises was that connected with the London system of underground railways. He gave to the University of Chicago funds for the buildings and instruments of the Yerkes Observatory (q.v.), with its famous telescope. This was described by Newcomb as "one of the most munificent gifts ever made for the promotion of any single science."

Yerkes Observatory, astronomical observatory of the University of Chicago (q.v.), located on Lake Geneva, near William Bay, Wis. It was founded in 1892 by Charles Tyson Yerkes (q.v.), who presented to the University funds sufficient for its building and equipment. It has a refracting telescope with an aperture of 40 inches, the largest in the world. The observatory is used chiefly for advanced work in astronomy, for which its equipment offers exceptional facilities.

Yew, evergreen coniferous shrub or tree, of the genus *Taxus*. The leaves are flat needles arranged in two ranks to the right and left of the stem, but in a horizontal plane. The flowers are dioecious, and have no perianth; the male inflorescences are composed of a few stamens partly united at the apex of a scaly, axillary stalk, with shield-shaped bracts forming a spherical head. The female flowers are axillary, naked ovules seated on a fleshy annular disk, which becomes cup-shaped and scarlet, and nearly encloses the bony seed. The European yew, a tree famous in the annals of Old World gardens, is the *Taxus baccata*. It is readily recognizable, by its lustrous foliage, so dark a green as to appear velvety, and almost black, in the shadows. When rather young the typical yew has a broadly pyramidal head, but in its old age it becomes ragged and broken, not unlike an aged hemlock. Some of them have attained to a great age, and they reach to a height of 100 feet, and sometimes to a diameter of 10 feet. In cultivation there are several varieties of yew, including the Irish with fastigiate branches, and columnar habit, and the golden yews, with foliage, which, to a certain extent, is yellow. The dark yew was a favorite tree for planting in church yards. It is even now a common plant in European cemeteries, and has been for centuries a symbol of mourning at funerals, and especially at those of unhappy lovers.

Lay a garland on my bier
Of the dismal yew;

This couplet in the 'Maid's Tragedy' is an allusion to this custom. In India the yew is a sacred tree, its wood and gum being burned as an incense, and branches of it carried before ceremonial processions. Although the sweet and juicy scarlet aril of yew fruit does not seem to be poisonous, the enclosed seed is regarded with suspicion, especially when eaten by children, in any quantity. Young branches of yew, too, are dangerous to cattle, which are not seldom killed by feeding upon them. The trunks of yews are twisted, ridged, and gnarled, and the shreddy bark has the rich red-brown tone of an old cedar. The wood is hard, with an orange red or brown heart, which takes a fine polish and is valued for cabinet work and veneers; since it is also fine and close-grained,

flexible, and elastic, easy to split and durable, yew-wood was the chosen material for the bows of the English archers, and no other wood has ever equaled it for that purpose. The Indian tribes of the northwestern American coast arrived at the same conclusion in regard to the beautiful *Taxus brevifolia*, indigenous to that region, and similar in appearance and size to the European tree. It was used by them for bows, spear-handles, paddles, and fish-hooks, and is the most durable timber that the white man can find for his fence-posts. There is another arborescent American yew, found in Florida, a bushy tree (*T. floridana*) with many stout spreading branches and a short trunk. It rarely exceeds 30 feet in height. A Japanese species (*T. cuspidata*), with a bright red bark, is now being introduced to cultivation, and is of bushy habit, and more hardy and successful than the European yew. This is a great favorite with the Japanese, who clip it into fantastic shapes. The most familiar yew in Canada and the eastern United States is the *T. canadensis*, a very low, shrubby species with decumbent branches radiating in every direction and forming thickets hard for a man to travel through, but a first-rate cover for grouse. It grows in moist lands under the shade of trees, and is readily recognized by its dark foliage and the glowing, crimson, oblong, cup-like fruits.

Yezd, yēzd, or Yasd, Persia, (1) A town, capital of a province of the same name, in an oasis in a sandy plain, 190 miles southeast of Isfahan. It is about five miles in circuit; consists of an old town, enclosed by a wall and ditch, defended by a citadel, and entered by four gates; and of a larger new town or suburb, which has risen up in a straggling manner, to meet the wants of the increasing population. Within the citadel are a palace, the principal mosque, several other public buildings, and the residences of the chief men of the district. The bazaars are spacious and well supplied, particularly with the staple manufactures of the town itself, consisting of silk stuffs, velvets, cottons, coarse woollens called *samsad*, loaf-sugar, and sweetmeats. The position of Yezd, on the edge of a desert, at the junction of the principal caravan routes, makes it an important commercial entrepôt for the surrounding countries. Pop. 40,000, of which about a tenth are Zoroastrians or fire-worshippers. (2) The province has an area of about 20,000 square miles, and its population is estimated at 100,000.

Yeseodees, yēr'ē-dēz. See RELIGIOUS SECTS.

Yezo, yā'zō, Ezo, or Hokkaido, hōk-kī'dō, Japan, the northernmost of the four main islands of the empire, separated from Hondo on the south by Tsugaru Strait, from Sakhalin on the north by La Pérouse Strait, while Yezo Strait divides it from Kunashiri, the southernmost of the Kurile Islands; area, including dependent islands, 36,300 square miles. The capital is Sapporo; Hakodate, Mororan, and Otaru are other large towns and open ports. Yezo is curiously like a skate-fish in shape. The centre of the island is but little known, though it has been crossed twice or thrice by Japanese and European explorers. It is traversed by chains of mountains, the principal summits being Tokachi-dake, 8,200 feet; Shiretetsi-yama, 7,874 feet; Ishikari-dake, 7,710 feet; Sapporo-dake, 6,500 feet; and Komaga-take, 3,830 feet. Much

YOGDRASIL—YIDDISH LANGUAGE

of the island is volcanic, especially in the east. The chief rivers are the Ishikari and Tesahio, flowing into the Sea of Japan; and the Tokachi, flowing into the Pacific Ocean. The chief bays are Volcano Bay, in the south; Ishikari Bay, in the west; Shari and Wafish bays, in the northeast. Yezo has a rigorous climate, being for six months of the year under snow and ice, two feet in the south to eight feet in the north. The original inhabitants of Yezo were probably pit dwellers, of whom distinct traces have been found at Sapporo, Nemuro, and elsewhere. After these came Ainos or Ainus, whose principal settlement is at Piratori, 30 miles east of Mororan. The bear festival in September is the great event of their year. The Ainos number 15,000, a population either stationary or decreasing; they are harmless, lazy, and drunken, and live mostly near the mouths of the rivers. The southern corner of the island was wrested from them in the 16th century, and Matsumae, now Fukuyama, in the extreme southwest, became in the next century the headquarters of Japanese rule. From 1600 to 1868 the southwestern portion of the island was in possession of a Daimio named Matsumai, and the Shogun was in possession of Hakodate. At the restoration in 1868 the supporters of the Tokugawa government made a last stand here, and were finally defeated at Hakodate. In 1871 the Japanese began active colonization, fearing aggression on the part of Russia, and a new department—the Colonization Department—was established to further these projects and much development work was done under the supervision of foreigners. This department, however, was abolished in 1881 and the country divided into prefectures, though its inhabitants do not as yet enjoy any electoral privileges. The fauna and flora of Yezo differ materially from those of the main island, the bear being a different species, resembling the grizzly. There are no monkeys; a species of grouse is found. The deer, once very plentiful, are now comparatively scarce. The Yezo pony, originally from Nambu on the main island, is hardy, and foreign blood has been introduced, promising good results. The forests furnish valuable timber. Coal, petroleum, and gold are found and worked to some extent. The official name Hokkaido, "Circuit of the Northern Sea," was bestowed in 1870, when it was brought under a special colonization department. An agricultural mission from the United States assisted in founding model farms, laying out roads, and building bridges. The capital was changed from Matsumae to Sapporo, which was provided with a railroad to Otarunai, its port, and to Poronai, the great coal district inland. An agricultural college, breweries, canning factories, beet-root sugar factories, etc., were established. The coal mines are worked by convict labor. A system of military settlements has of late years been put into force, partly with the view of furnishing a militia against possible invasion from Russia, which is supposed to covet the fine harbors of Yezo. The sheltered harbor of Mororan, on Volcano Bay, is now a naval harbor, to which a railway from Poronai mines has been built. The principal products of Yezo are coal, seaweed, sulphur, fish, the catches of salmon on the river Ishikari being sometimes enormous. Kerosene, beer, glass, and other articles

are manufactured, and internal communication is facilitated by a system of railways, either constructed or projected, joining all the important coast and interior towns. Pop. about 615,000, including 17,573 Ainos; of the administrative division, including the Kurile Islands, 621,000. See JAPAN.

Yggdrasil, *ig-drä-sil*, or *Ygdraal*, in Scandinavian mythology, the giant ash tree overspreading the whole world and reaching above the heavens. It binds together earth, heaven, and hell, and its roots stretch out to the Asa or Æsir gods in heaven, to the frost giants, and to the under world. A marvellous fountain springs up under each of these three great roots and in the tree, whose boughs drip continually with honey, dwell an eagle and the squirrel Ratatöskr. At its roots the serpent Nithögg gnaws, and between the serpent and the eagle runs the squirrel constantly endeavoring to provoke the two to strife. Certain writers detect in this myth a distortion of the story of the Cross, but the translator of Grimm says, "it were a far likelier theory, that floating heathen traditions of the world tree, soon after the conversion in Germany, France, or England, attached themselves to an object of Christian faith just as heathen temples and holy places were converted into Christian ones."

Yiddish Language. Yiddish, the Englishized form of German *Jüdisch* (Jewish), is one of the names applied to the various German dialects spoken by the Jews of German origin in the diaspora, in Russia, Rumania, Slavic and Hungarian Austro-Hungary, and in England, America, and South Africa, whither Russian and Rumanian Jews have been emigrating in the last 30 years. In Russia it is known under the name of *Jargon*, while philologically it is generally spoken of as *Judeo-German*.

No literary documents of any consequence bear upon the condition of this group of dialects previous to the 16th century, and even in the printed works up to a hundred years ago the literary norm seems to have attempted an approach to the literary German, though even then the deviation was considerable and fairly uniform. In the last century the spoken dialects have been asserting themselves in the literary productions, so that the uniformity no longer exists, each author writing in the variation familiar to him from childhood.

It seems that at first, in the Middle Ages, the German Jews employed the language of their Christian neighborhood without any change whatever; in their intercommunication with their coreligionists they transcribed this German with Hebrew characters and introduced, Germanizing them, such Hebrew words as were necessitated by the observances of the Mosaic faith. When the German Jews, in the 14th and 15th centuries, settled in what then was Poland, they were cut off from the rest of the German nation, and so their native dialects perpetuated themselves in the form in which they were brought from their homes. They were subjected, however, to the double influence of their Slavic neighborhood and the language of the Bible and the Talmud, to which the Jews devoted themselves with unwonted zeal. In vocabulary, the Yiddish is predominantly German, less than one-third having been derived

from Slavic, Rumanian, and Hebrew sources. In pronunciation, the influence of Russian and Polish is doubtful or less transparent, while Hebrew, instead of affecting it, was itself affected by the current pronunciation of Yiddish. In syntax and idiom, both the Slavic and the Hebrew have considerably modified the native German, without, however, obliterating the original German basis. At present, three chief varieties may be distinguished in the Yiddish of Russia, the Lithuanian, the Polish, and the Southern; the dialects in Austro-Hungary are more nearly related to the two latter, while the Rumanian is more akin to the Polish variety. In America all three varieties may be heard, but they are strongly influenced in vocabulary by the English, and in the periodic press the Lithuanian variety, affected by literary German, seems to supersede all other dialects. The three varieties correspond to their places of origin in Germany, the Lithuanian issuing from a Middle-German home, the other two from various Upper-German localities. The precise provenience has not yet been ascertained, as the linguistic study of Yiddish has heretofore been greatly neglected.

The chief differences between Yiddish and the modern German are these: Phonetically, Yiddish represents a mediæval stage of German when, for example, *i* and *ei* were still carefully distinguished, while *u* before a nasal had not yet changed into *o*; on the other hand, the consonantism, especially the treatment of *pf*, seems to correspond to a later stage. The vocabulary of Yiddish is rich in words only sporadically found in German dialects and common to the Middle-High-German literary language. The words from the Hebrew are phonetically treated as Yiddish words, while those from Russian and Polish, to some extent, underwent the changes due to the peculiarity of Yiddish, and present some interesting data to the Slavic scholar. In grammar, Yiddish has developed certain peculiarities which are common to various German dialects. Most prominent are the disappearance of final unaccented *e*, of the genitive case in the declension of the noun, of the imperfect tense in the verb. In syntactic structure, Yiddish resembles English, rather than German, and in English-speaking countries naturally adopts some of the English idioms. But, on the whole, Yiddish is an important group of German dialects, well worthy of a thorough study by the Germanic philologist.

Bibliography.—There are no good grammars of Yiddish; for dictionaries one may use the Russo-Yiddish ones by Lifschitz and Dreisin, and the Yiddish-English and English-Yiddish ones by A. Harkavy. To the student of philology the following works and articles will prove of value: A. Landau, 'Bibliographie des Jüdisch-deutschen,' in *Deutsche Mundarten, Zeitschrift für Bearbeitung des mundartlichen Materials* (herausgegeben von Dr. Johann Willibald Nagl, Vienna 1896, Heft II., pp. 126-132); A. Landau, 'Das Deminutivum der galizisch-jüdischen Mundart, Ein Kapitel aus der jüdischen Grammatik' (ibid. Vol. I., pp. 46-58); Jak. Gerzon, 'Die jüdisch-deutsche Sprache, Eine grammatisch-lexikalische Untersuchung ihres deutschen Grundbestandes' (Frankfurt a. M. 1902); Richard Loewe, review of Gerzon's work, in *Anzeiger für indogermanische Sprach-*

und Altertums-Kunde (Vol. XVI., 1904, pp. 43-50); L. Sainéan, 'Essai sur le judéo-allemand et spécialement sur le dialecte parlé en Valachie' ('Extraits des Mémoires de la Société de Linguistique de Paris'), (Vol. XII., première partie, 1902); A. Landau, review of Gerzon's and Sainéan's works, in *Zeitschrift für deutsche Philologie* (Vol. XXXVI., 1904); and a valuable bibliography of scattered articles by L. Fränkel, in *Litteraturblatt für germanische und romanische Philologie* (Vol. XXII., pp. 386-391).

LEO WILNER,
Assistant Professor of Slavic Languages and
Literatures, Harvard University.

Ying-tse, ying'tsé', China. See NRU-CHUANG.

Ylang-ylang, Attar of, a perfume fully as exquisite and as precious as the much-praised attar of roses. The ylang-ylang tree attains a height of 60 feet and has drooping, greenish-yellow flowers three inches long and extraordinarily fragrant. The tree is common in the Philippines. It is found chiefly in the well-populated provinces and islands, and the natives say that it thrives best near the habitations of man. The propagation is plantations, by seed or cuttings, about 20 feet apart, each way (108 trees to the acre), is easy, and the growth rapid in almost any soil. The first flowers appear in the third year, the eighth yielding as high as 100 pounds, the bloom occurring every month. The greatest yield is from July to December. The process of converting the long, greenish yellow, fragrant petals of the flower into essence is by the simplest form of distillation, using merely water and the choicest flowers. No chemicals of any kind are required.

Ymir, é'mír, in Scandinavian mythology, the personification of Chaos, or the first created being, produced by the antagonism of heat and cold in Ginnungagap, the primeval abyss. Slain by Odin and thrown into Ginnungagap, his flesh was transformed into land, his bones becoming the mountains, his blood the rivers and lakes, his hair the forests, while his skull constituted the heavens, and his brains the clouds.

Yoder, yó'der, Robert Anderson, American Lutheran clergyman and educator; b. Lincoln County, N. C., 16 Aug. 1853. Graduated from North Carolina College in 1877, he was ordained to the ministry of the Lutheran Church in 1879, and after study at the seminary of the Church in Philadelphia, held pastorates in North Carolina. From 1888 to 1891 he was president of Concordia College (Fort Wayne, Ind.), and from 1891-1901 was president of Lenoir College (Hickory, N. C.). He was also pastor of St. James' Church at Newton, N. C.; in 1902 was president of the United Synod of the South at Charleston, and in 1904 at New Market, Va., and is now pastor of Saint Andrew's Church, Hickory, N. C.

Yoga, yó'gā, one of the six schools or systems of Brahmanical philosophy, that of Patanjali, the essence of which is meditation. It believes in a primordial soul which has had existence from an earlier period than primeval matter, and holds that from the two arose the spirit of life (Mahanatma). Theoretically at least, its devotees can acquire even in this world entire command over elementary matter by cer-

Yama ascetic practices, such as long continued suppression of the respiration, inhaling and exhaling the breath in a particular manner, sitting in 84 attitudes, fixing the eyes on the tip of the nose, and endeavoring, by the force of mental abstraction, to unite themselves with the vital spirit which pervades all nature and is identical with Siva. When this mystic union is effected, the Yoga can make himself lighter than the lightest, or heavier than the heaviest substance, or as small or as large as he pleases; he can traverse all space, can become invisible, can equally know the past, the present, and the future, and can animate any dead body by transferring to it his own spirit; finally he becomes united with Siva, and is exempt from the necessity of undergoing further transmigrations. See **BRAMHANA**.

Yoke, a piece of timber, hollowed or made curving near each end, and fitted with bows for receiving the necks of oxen, by which means two are connected for drawing. A frame of wood fitted to a person's shoulders for carrying a pail, etc., suspended on each side. The ancients regarded the yoke as a symbol of slavery, and it was customary for vanquished armies to pass under a yoke, formed like a gallows, of two upright spears, and a third fixed transversely at top.

Yokohama, yō-kō-hā'mā, Japan, the chief seaport and treaty-port of the empire, on the Bay of Tokio, about 17 miles southwest of Tokio, of which it is the port. Yokohama is of modern growth, its rise being due to the opening of Japan to foreign commerce and to the establishment here of foreign merchants, consuls, etc., after the adjacent Kanagawa was declared a treaty-port. It is in general poorly built, with houses mostly of wood. The dwelling-houses and warehouses of the foreign residents, however, are of a superior character, and are built on the bluff facing the bay. The commercial buildings occupy the east of the town, the western part being the Japanese town, and the centre being occupied by the prefecture, custom-house, post-office, and other official buildings. The bay is very beautiful, and, though only an open roadstead, affords a good and commodious anchorage, not only to extensive mercantile shipping, but also to the naval squadrons of Great Britain, France, Germany, Russia, and other powers. Work on a large harbor was carried out in 1889-96, the main object of which was to prevent the gradual silting up of the anchorage; it is enclosed by two breakwaters $1\frac{1}{4}$ miles long, and an iron pier, 1,900 feet long, connected with the railway to the capital, 17 miles off. Yokohama is a centre for tourists visiting Japan. The imports into Yokohama in 1901 were valued at \$45,186,375, mainly sugar, metals and metal manufactures, cotton manufactures, kerosene, raw cotton, and woollens; the exports at \$68,305,235, mainly raw and manufactured silk, copper, tea, fish, cotton goods, fish-oil, and paper. The number of vessels entered in 1901 was 893, with a tonnage of 2,032,445, mainly British, Japanese, German, and American.

Yokosuka, yō-kō-soo'kā, Japan, town and naval station on the Bay of Tokio, 12 miles south of Yokohama. It is connected with Yokohama by rail and steamer, and with Kama-

kura and Tokio by rail. It has a spacious land-locked harbor, large dry docks, a naval arsenal, and ship-building yards suitable for the construction of large war vessels. About a mile from the town is the grave of Will Adams (q.v.), the first Englishman to enter Japan. Pop. about 31,000.

Yokuts ("Indians"), a group of about two dozen small tribes, forming the Mariposan linguistic stock of North American Indians, occupying an irregular area in central southern California from Fresno River in the north to near the southern extremity of Tulare Lake in the south, and between the Sierra Nevada in the east and the Coast Range in the west; also a strip, 10 to 20 miles wide, extending southeastward from Tulare Lake along the eastern base of the latter range to Mount Pinos, about lat. 34° 45', together with an isolated area, occupied by the Cholovone division, in San Joaquin Valley from the Tuolumne northward. The tribes in general were segregated by the natural features of their territory, such as river valleys, and each tribe had its hereditary chief. Their villages consisted of a single row of tule-thatched, wedge-shaped houses, with a continuous *ramada* or shelter of brush along the front. In early times, when large game was abundant, hunting formed an important pursuit, but with the coming of the whites and the disappearance of the game they were compelled to resort almost exclusively to the products of the soil and of the streams and lakes, although rabbits and quail were always abundant and were commonly trapped. Seeds of various kinds were gathered for use as food, as also were grasshoppers, caterpillars, worms, and the larvæ of insects; dogs were raised for use also as food, and even skunks were not despised; but the coyote and the rattlesnake were always tabooed. Their basketry was excellent in shape, design, and execution, and formed their chief handicraft. The Yokuts women were chaste before the settlement of their country by the whites; marriage was perhaps by purchase, the husband residing at the house of his wife; infanticide was practised in cases of deformity; the dead were generally cremated. The Yokuts are now but a remnant of a once comparatively populous group of tribes. Early warfare with the Paiutes, who pressed them closely from the east, and later and more disastrous contact with white ruffians who found the Indians in their way, practically exterminated many of the tribes and probably wiped others away completely. Their present population is not known, but there are believed to be about 150 under the Mission Agency, and others are scattered over their old haunts, some of the tribes being represented by only half a dozen individuals or less.

F. W. Hodge,

Of the Smithsonian Institution.

Yon, yōn, Edmund Charles, French artist: b. Paris 2 Feb. 1836, d. there 26 March 1897. He was a pupil of Puget and Lequien. His first work was a series of wood engravings after Millet and others. He later gave his attention mainly to landscape painting. His works include 'A Road in Velizy'; 'The Banks of the Marne'; 'Before the Rain'; 'The Squall'; 'Morning'; and 'San Marco.' His paintings are distinguished for delicacy of coloring and shading.

Yongampo, yŏn-gāmp'a, Korea, a seaport on the left bank of the Yalu estuary, near Wiju, with a large and important harbor. It was used as a landing place by the Japanese during the Chino-Japanese war in 1894, and just prior to the Russo-Japanese war of 1904 was an important outpost of the Russian advance into Korea, and the headquarters of their timber-selling concession. Russia's strong protests against opening the port to foreign trade was one of the many events that hastened the war.

Yonge, yāng, Charles Duke, English historian; b. 1812; d. 1 Dec. 1891. He published: 'An English-Greek Lexicon' (1849); 'A New Gradus ad Parnassum of the Latin Language' (1850); 'History of the British Navy' (1865); 'France Under the Bourbons' (1866-7); 'Three Centuries of English History' (1872); 'Three Centuries of English Literature' (1872); 'A Life of Marie Antoinette, Queen of France' (1876); 'Life of Sir Walter Scott' (1888); etc.

Yonge, Charlotte Mary, English author; b. Otterbourne, Hampshire, 11 Aug. 1823; d. there 24 March 1901. She received a private education. She made her name widely known by the publication in 1853 of a novel entitled 'The Heir of Redclyffe,' which exercised an important influence on some leading minds of that time. She devoted part of the proceeds to fitting out a missionary ship for Bishop Selwyn. None of her later novels came up to the standard of her first work. Among the best of them are 'Katharine Ashton'; 'The Daisy Chain' (1856), the proceeds of which she devoted to founding a missionary college at Auckland, in New Zealand; 'Hopes and Fears'; 'The Little Duke'; 'The Prince and the Page'; and 'The Dove in the Eagle's Nest.' Her staunch attachment to the Church of England more or less colors all these works, and was also manifested, not only in the field of practical effort, but in the choice of the subjects of some other of her works, such as: 'Biographies of Good Women' (1862); 'Life of Bishop J. C. Patteson' (1873); 'John Keble's Parishes' (1898); and 'The Patriots of Palestine' (1898). Her remaining works include: 'Christian Names: their History and Derivation' (1863); 'Cameos from English History' (1869-99); 'History of Germany' (1877); 'History of France' (1879); 'Universal History for Young People.' For 30 years she edited a High Church magazine known as 'The Monthly Packet.' An illustrated edition of her more popular works in fiction appeared in 1888-9. Consult the 'Life' by Coleridge (1903).

Yonkers, yŏn-k'ēz, N. Y., city of Westchester County; on the Hudson River, and on the New York Central Railroad; north of and adjoining New York city. It has regular steamer connection, for passengers and freight, with New York and Albany, and is connected by electric lines with New York, Mount Vernon, New Rochelle, and many of the villages and cities on the Hudson.

Industries.—The good opportunities for shipment of goods by land and water have aided the industrial growth of the city. In 1900 (government census) Yonkers had 387 manufacturing establishments, capitalized for \$13,097,205 and employing 8,615 wage-earners, to whom were paid annually \$3,888,892. The total cost of material used each year, and including rents,

fuels, etc., was \$10,555,218. The value of the yearly products was \$19,580,324. The chief industries were 12 foundries and machine shops, capitalized for \$1,012,892 and producing annually goods to the amount of \$1,381,903; the annual output of patent medicines and compounds was valued at \$744,784. Other manufactures are confectionery, furniture, roofing materials, carpets, rugs, and hats. There are large coal yards, grain elevators, the Otis Elevator Company works, ship and boat building yards, bridge works, lumber mills, flour and grist mills, and carriage and wagon factories.

Municipal Improvements and Buildings.—Yonkers is built on a series of terraces which rise from the Hudson to an elevation of 426 feet above tide-water. The view from the elevated portions includes a long distance up and down the Hudson, the Palisades, and the beautiful valley to the east. In the residential part of the city are the homes of many New York city business men. The city has a frontage of nearly five miles on the Hudson, and extends along the Bronx River for about seven miles. The streets are broad, many of them paved, and well shaded. The city owns and operates the water-works. There are three small public parks maintained by the city, also two public bath houses, and, on the Hudson, a steel pavilion for recreation. There is an excellent sewer system. The principal public buildings are the government building, the library in Washington Park, the churches, schools, and charity institutions. The city-hall is of considerable historic interest; it was formerly the Philipse Manor and was built in 1752. Since 1868 it has been used as a municipal building. Another noted building is "Grey-stone," once the residence of Samuel J. Tilden.

Churches, Charitable, and Educational Institutions.—There are 30 churches, some of which are buildings of considerable architectural merit. The city has the Homoeopathic Hospital, Saint John's Riverside Hospital, Saint Joseph's Hospital, Lenox and Watts Orphan Home, the Hebrew Home for the Aged and Infirm, and private institutions. The educational institutions are Lowden and Halsted schools, Spencerian Business College, a public high school, established in 1882, public and parish elementary schools and kindergartens, a public library (building presented by Andrew Carnegie), the Hollywood Inn for Workingmen, with a library of 6,000 volumes, the Woman's Institute Library, and Saint Joseph's Training School for Nurses. Near the city limits are Saint Joseph's Seminary (q.v.), and Mount Saint Vincent Academy (R.C.). The latter is a school for girls.

Banks and Finances.—Yonkers has both national and state banks, the combined deposits amounting to approximately \$10,000,000. The expenditures for municipal maintenance and operations are annually about \$1,000,000. The chief items of expense are: for schools, about \$248,000; police department, \$91,000; fire department, \$74,500; interest on debt, \$144,500; municipal lighting, \$98,500; water-works, \$80,000; and streets, \$56,000.

History.—In 1650 Adrian Van der Donck and several Dutch families settled in what is now called Yonkers. The region around Yonkers then belonged to the Dutch. It became a part of Philipse Manor in 1672 and the town was called Philipseburg. The town of Yonkers

YONNE—YORK

was founded in 1768, and in 1895 it was incorporated as a village. The town was divided in 1872; the northern part was chartered as the city of Yonkers and the southern part was called Kingsbridge. In 1874 Kingsbridge became a part of New York city. Pop. (1890) 32,033, (1900) 47,931; (1910) 79,803, an increase of 66.5 per cent.

Consult: Scharf, 'History of Westchester County'; Allison, 'The History of Yonkers' (1896).

Yonne, yŏn, France, a northern interior department bounded by Seine-et-Marne, Aube, Côte-d'Or, Nièvre, and Loiret; area, 2,868 square miles; capital, Auxerre. The surface is generally intersected by low hills, sometimes barren, but usually covered with fruitful vineyards, which yield the famous Chablis, Joigny, Auxerre, and Tonnerre wines. Between the hills lie beautiful and productive valleys. The most elevated land is in the southwest, forming the water-shed between the basins of the Loire and Seine. The small part belonging to the former is drained by the Veille. All the rest belongs to the latter, which receives it chiefly by the navigable Yonne. The climate is temperate, and the air pure and healthful, except in some wet, marshy spots. The minerals include iron, red and yellow ochre, building-stone, lithographic stones, pavement, and potter's clay. The manufactures are of coarse woollens, woolen covers, serge, glue, etc. The trade is in corn, wine, vinegar, wood and charcoal, ship-timber, wool, cattle, iron, and ochre. Pop. about 325,000.

Yousafzai, yoo-soof'zi, or **Yusufzai** ('children of Joseph'), an important Afghan tribe, on the northwest frontier of India. Their territory includes about 2,000 square miles within the British district of Peshawar and also the hills beyond the north boundary, and their total number is estimated at 246,000, including 73,000 soldiers. The crops of the region are wheat, barley, millets, maize, cotton, and mustard seed. Iron, cattle, and wool are exported, and the transit trade is considerable.

Yor'ick, (1) The king's fool, whose skull is apostrophized by Hamlet in the fifth act of Shakespeare's tragedy of 'Hamlet.' (2) The pseudonym adopted by Laurence Sterne in 'A Sentimental Journey.' (3) The parson in Sterne's 'Tristram Shandy,' intended as a portrait of himself.

Yoritomo Minamoto, yō-rē-tō'mō mē-nā-mō'tō, Japanese soldier and statesman: b. 1146; d. 1199. He became about 1159 the leader of the military clan of Minamoto in its feud with that of Taira. In 1180 he assembled an army of considerable strength, and began operations against the Taira, whom in 1185 he completely destroyed in the naval battle off Dan-no-ura, not far from Shimonoseki. He became practically ruler of Japan, though nominally subject to the Mikado, was made (1192) Sei-i-tai sho-gun, established his capital at Kamakura, and laid the basis of the feudal system of Japan.

York, Cardinal. See STUART, HENRY BENEDICT MARIA CLEMENT.

York, Duke of, a title formerly conferred on the second sons of the kings of England. It was first borne, however, by **Edmund de Lan-**

cy, fifth son of Edward III., who was created Duke of York in 1365, and died in 1402. He was the founder of the house of York, in English history that of the "white rose," while his elder brother John, fourth son of Edward III., created Duke of Lancaster in 1362, was the founder of the rival house of Lancaster, or the "red rose"; and their claims were contested for nearly half a century in the so called Wars of the Roses. The first Duke of York was succeeded by his son EDWARD, who fell at Agincourt in 1415, and was succeeded by his nephew RICHARD, son of Anne Mortimer, who was grand-daughter of Lionel, Duke of Clarence, third son of Edward III. It was by virtue of this descent from the Duke of Clarence that the house alleged its superior right over that of Lancaster, which was descended from the fourth son of Edward III. The title was subsequently borne by Edward Plantagenet, afterward Edward IV.; by Richard Plantagenet, supposed to have been murdered in 1483 by his uncle Richard III.; by Henry Tudor, afterward Henry VIII.; by Charles Stuart, afterward Charles I.; by James Stuart, afterward James II.; and was conferred by the pretender, James III., on his second son Henry Benedict, known in history as Cardinal York, the last of the royal family of the Stuarts. After the accession of the house of Hanover to the British throne, George I. created his brother ELEANOR AUGUSTUS Duke of York and Albany (1716). He died in 1728, and the title was held by EDWARD AUGUSTUS, the second son of Frederick, prince of Wales, and FREDERIC, second son of George III., who was made commander-in-chief of the British army, but showed little ability. The title was in abeyance until 1892, when it was conferred on Prince George Frederick Ernest Albert.

York (British, *Caer Eborac*; Latin, *Eboracum*), England, an archiepiscopal city and civic county, capital of Yorkshire, 196 miles north-northwest from London by rail, at the confluence of the Foss with the Ouse. It consists of the city proper, and of suburbs, some portions of which are situated across the Foss, and communicate with the rest by several bridges. The city, with a circuit of nearly three miles, is enclosed by ancient double walls, originally Roman, but restored by Edward I., and partly repaired at subsequent periods; the portions which still remain have been converted into promenades, commanding a beautiful prospect of the surrounding country. York is entered by four imposing gates; and is built for the most part in narrow irregular streets, many lined with houses of antique appearance. Improvements have modernized many of the older parts of the city, and many handsome ranges of new buildings have been erected. The minister or cathedral dates from the 7th century, but did not begin to assume its present form till 1171, and was not completed till 1472. A square massive tower rises from the intersection to the height of 235 feet, and two other lofty towers of graceful proportion, 196 feet, flank a richly-decorated western front, divided by paneled buttresses into three compartments, of which that in the centre is chiefly occupied by a beautiful window and a splendid portal. Measured without the walls, the whole length, from east to west, is 524 feet, and the width across the

YORK

transepts, north to south, 222 feet; length, from west door to choir, 264 feet; length of choir, 162 feet; breadth of body and side aisles, 109 feet. The interior consists chiefly of a lofty nave, separated from its aisles by long ranges of finely clustered columns, a still loftier choir, lighted by a magnificent and beautifully blazoned window, and a lady-chapel continuing the choir, and containing some beautiful monuments. The cathedral has twice sustained serious damage and narrowly escaped total destruction from fire, caused in 1829 by an incendiary lunatic, and in 1840 by the negligence of a workman engaged on its repair. The chapter-house, entered from the north transept of the cathedral, is a richly decorated octagon, and near it is a fine old chapel, originally forming part of the old archiepiscopal palace, and now appropriated to the library. York possesses many other places of worship, including a beautiful Roman Catholic pro-cathedral; and collegiate, grammar, blue-coat, gray-coat, and board schools. Other notable buildings and establishments are an ancient Gothic guildhall (1446), and spacious mansion-house adjoining; the fine old ruins of St. Mary's Abbey; Clifford's Tower, part of the city castle founded by the Conqueror; the fine old merchants' hall; county assize courts; city courts of justice in the late Gothic style (1892); the museum of the Yorkshire Philosophical Society, assembly-room, masonic hall, baths, art-gallery, free library, the Yorkshire Club-house, concert rooms, two theatres, cemetery, lunatic and blind asylums, dispensary, county hospital, cattle market, almshouses, and numerous other charities. The railway station is one of the finest in the kingdom. The manufactures include iron castings, bottles, leather, flour, cocoa, and confectionery. York ranks second among English cities, its archbishop having the title of Primate of England (see *ARCHBISHOP*); its chief magistrate takes the title of lord-mayor. It is the headquarters of the North-Eastern Railway Company, and contains their carriage and wagon shops. There is communication by water with Selby, Goole, Hull, etc. York was the early British *Caer Eborac* of the Brigantes and under the Romans as *Eboracum* became their principal seat of power in the north, if not in the whole country. Here died the Roman emperors Severus and Constantius Chlorus, and here it is popularly (but incorrectly) supposed Constantine the Great was born. After their departure it so far retained its importance as to become the capital of Northumbria, whose king, Edwin, in 624 made it an archiepiscopal see. In the 8th century its diocesan school attracted students not only from all parts of the kingdom, but from France and Germany, and sent out scholars who afterward acquired European celebrity. Here the first English Parliament was held by Henry II. in 1160. In after-times it makes a distinguished figure in almost all the great epochs and events of English history, during the Civil War surrendering to the Parliamentarians after a siege of several weeks, subsequent to their victory at Marston Moor in the vicinity. Among its distinguished natives are Alcuin, the tutor to the family of Charlemagne; Flaxman the sculptor; and William Ety the painter.

York, Maine, town, port of entry, York County; on York River, and on the Boston &

Maine Railroad; about 45 miles south by west of Portland and 100 miles southwest of Augusta. It is in an agricultural region, but is known as a favorite summer resort. It has a number of buildings of historic interest, among which is the jail, which is one of the oldest in the country. It contains several villages in which are many summer cottages. The national bank in the village of York has a capital of \$50,000. The town was set off, in 1622, from land granted by the Plymouth Council to John Mason and Ferdinand Gorges. In 1624 the place was called *Agamenticus*. On 1 March 1640, a territory of 21 square miles was incorporated as a borough by Gorges, and chartered as the city of *Georgiana* in 1642. This was the first municipal corporation made by the English in North America. On the death of Charles I., in 1649, *Georgiana* City, Isle of Shoals, Wells, and Kitterytown united and established a confederacy. In 1652 the confederacy, and all of Maine came under the control of Massachusetts. The city charter of *Georgiana* was revoked, and the name changed to York. The limits of the present town are about as in 1652. In the early years the town suffered from Indian depredations; one attack, in 1692, resulted in the massacre or capture of about one half the inhabitants. The population is about 3,000. Consult: Emery, '*Ancient City of Georgiana and Modern Town of York*'; Baxter, '*Sir Ferdinand Gorges and His Province of Maine*' (1890).

York, Neb., city, county-seat of York County; on the Chicago, Burlington & Quincy, the Kansas City & Omaha, and the Fremont, Elkhorn & Missouri Valley R.R.'s; 50 miles west of Lincoln. It was settled in 1871 and in 1880 was incorporated. It is in an agricultural and stock-raising region, and its industries are connected chiefly with farm products. It has a flour mill, machine shop, foundry, large stock yards, and grain elevators. The educational institutions are York College (U. B.), opened in 1890; a high school, established in 1880; Holy Family Academy (R. C.); public and parish elementary schools and public and school libraries. The two national banks have a combined capital of \$150,000. Pop. (1910) 6,235.

York, Pa., city, county-seat of York County; on the Conodorus Creek, and on the Pennsylvania, the York Southern, the Northern Central, and the Western Maryland R.R.'s; about 28 miles southeast of Harrisburg, and 95 miles west of Philadelphia. It is in a productive farming section and has considerable manufacturing interests.

Industries.—In 1900 (government census) the city had 464 manufacturing establishments, capitalized for \$9,640,784. There were 404 officials and clerks whose salaries were \$438,281 per annum, and 7,785 wage-earners who received \$2,679,175 per annum. The total cost for material, rent, power, and heat, each year, was \$6,078,070, and the value of the finished products was \$11,661,706. The foundry and machine finished products amounted, each year, to \$2,654,772; and the tobacco products to \$1,190,155. Other manufactures of which there are large and valuable outputs annually are agricultural implements, cigar boxes, food products, carriages, wagons, carriage and wagon materi-

YORK—YORKE

als, confectionery, flour and grist mill products, furniture, iron and steel products (including nails, spike, wire nails, etc.), lumber products, paper and wood pulp, shirts, and patent medicines. The vast power generated at Yorkhaven, 11 miles north of York, will greatly increase the manufacturing industries of York. The York Haven Water and Power Company have built a crib dam to obtain a sufficient volume of water to run the large plant intended for the generation of electrical power and the distribution of this power to places in York and adjoining counties. There is an extensive trade in the manufactured products and in general merchandise which is distributed to the villages and towns of a large region.

Buildings and Municipal Improvements.—The surface is slightly rolling and has sufficient slope to make excellent drainage. The streets are broad and well shaded. The city is laid out in sections or blocks, 520 feet long and 480 feet wide. There are three small but beautiful parks: Highland, Farquhar, and Penn. The principal public buildings are the government building, the court-house, county jail, the Masonic Temple, four market buildings, an opera house, three public halls, and the municipal buildings. There is an excellent water-supply and a good sewerage system.

Churches, Charitable and Educational Institutions.—There are 60 churches, representing 16 different denominations. The principal charitable institutions and hospitals are the city hospital, charity hospital, county almshouse, Children's Home, and private sanatoriums. The educational institutions are York Collegiate Institute (Presb.), York County Academy, founded in 1787, two business schools, Saint Patrick's Academy (R. C.), a public high school, founded in 1870, public and parish schools, a public library, York County Law Library, and Saint John's Church free library.

Banks and Finances.—There are five national, three state, and two private banks. The combined capital of the banks is \$2,238,000; the annual amount of business is \$11,963,412. The municipal expenditures for annual maintenance and operation are about \$205,000. The chief items of expense are: for educational institutions, \$78,000; police department, \$21,000; municipal lighting, \$24,000; fire department, \$14,500; and street department, \$14,800.

Government.—The government is administered under a charter of 1887 which provides for a mayor, whose term of office is for three years, and a city council of 39 members, elected annually in February. The board of education is chosen by popular vote; the other administrative officials are appointed by the mayor subject to the approval of the council.

History.—A permanent settlement was made in 1735 by a German colony; but in 1741 the town was laid out by John, Thomas, and Richard Penn, and incorporated as a borough in 1787. In 1887 York was chartered as a city. In 1749, the first court of general quarter sessions was held here. In 1777 the Continental Congress left Philadelphia, fearing capture by Howe's army, and convened in York 30 September. Congress continued to hold sessions in York until 27 June 1778. Pop. (1880) 13,940; (1890) 20,793; (1900) 33,654; (1910 census) 44,730. Consult Gibson, 'History of York County.'

York, a river in Virginia, formed by the confluence of the Pamunkey and Mattaponi rivers. It is the tidal estuary of the rivers, which begins at West Point and flows southeast to the Chesapeake Bay. It is 40 miles long and navigable to the head of tide water. At its entrance, on York Spit, is a lighthouse.

York and Lancaster, Wars of. See ROSES, WARS OF THE.

York College, located at York, Neb. It was founded under the auspices of the United Brethren in Christ, and was opened to students in 1890. It is under the control of a board of trustees composed of five members at large and representatives of four conferences of the United Brethren. Its organization includes the College, the Preparatory Department, the Normal Department, the Conservatory of Music, the College of Commerce, the School of Shorthand, the School of Expression, the School of Art, the School of Telegraphy (organized in 1903), and the Summer School. The college offers classical, philosophical, scientific, and literary courses, and confers the degree of A.B. on the completion of the classical, philosophical, and literary courses, the degree of B.S. for the scientific course. The work of each course is very largely prescribed. The normal department offers a normal course of two years, and a three-years' teachers' course, which is preparatory to the normal course. The degree of bachelor of didactics is conferred on all graduates from the normal course. A model school was established in 1903. The conservatory of music offers courses in piano, voice, and violin, and confers the degree of bachelor of music for graduation from the full courses. The College of Commerce offers a course of one year, and an advanced course of two terms additional; the degree of bachelor of accounts is conferred on graduates from the advanced course. The Summer School courses are intended specially for teachers, and a model school is conducted. Instruction in physical training is given, and an organization of college cadets is maintained for military drill; there is also a field for athletic sports on the campus. The students maintain Young Men's and Young Women's Christian Associations, and two literary societies. The library in 1910 contained 2,500 volumes, the students numbered 479, and the faculty 16. York College is considered one of the leading institutions of higher learning in Nebraska.

York von Wartenburg, yörk fön vār'tēn-boorg, Hans David Ludwig, Count, a Prussian field-marshal: b. Potsdam 26 Sept. 1759; d. Klein-Öls, near Breslau, Silesia, 4 Oct. 1830. He entered the army in 1772, but was cashiered for insubordination in 1779, and then served the Dutch in the East Indies 1783-4. He, however, re-entered the Prussian service, becoming a major-general in 1807, and governor of the province of Prussia in 1811. He was especially distinguished during the War of Liberation and the invasion of France (1813-14), was ennobled in 1814, and made a field-marshal in 1821.

Yorke, yörk, Curtis, pseudonym of S. RICHMOND LEE, English novelist: b. Glasgow. She is the daughter of J. J. Long and was married to J. W. Richmond Lee, a mining engineer. Among her numerous works may be cited: 'That Little Girl' (1886); 'A Record of Disasters' (1894); 'Because of the Child' (1896);

VILLAGE STREET IN YORKTOWN.

'A Flirtation with Truth' (1897); 'A Memory Incarnate' (1902).

Yorkshire, England, the largest county of the kingdom, bounded on the north by the Tees, separating it from Durham, east by the North Sea, south by Lincoln, Nottingham, Derby, and Chester, and west by Chester, Lancaster, and Westmoreland; area, 6,067 square miles. Yorkshire is divided into three ridings, or three ridings, respectively the north, east, and west ridings, each riding having a separate lord-lieutenant. The main portion of the county forms a large central valley stretching southeast to the Humber, flanked on one side by the Pennine range and on the other by the Cleveland Hills, and drained chiefly by the Ouse and its tributaries. Considerably more of the North Riding is pasture than under cultivation, but it includes the vale of York, with an area of about 1,000 square miles, in which there is much fertile land growing all kinds of crops. It also includes the Cleveland district, with its great bed of iron ore. In the North Riding is the capital of the whole county, York; Scarborough, a favorite watering-place; and Whitby, famous for its jet. In the East Riding the area under cultivation greatly exceeds that laid down in permanent pasture. Its industrial activity is centred in the great seaport of Hull. In the West Riding the proportion of land laid down in permanent pasture is larger than in any other, being two thirds of that under cultivation. The West Riding has long been famous for its woollen and worsted manufactures, of which it is now the chief seat. Their development has been in modern times aided by the proximity of coal and iron. The great coal field of the West Riding yields not only the Silkstone bituminous coal, most valuable as a house coal, but also the Barnsley thick coal, semi-anthracitic. Leeds produces every variety of woollen goods; Bradford, mixed worsted fabrics and yarns; Dewsbury, Batley, and adjoining districts, shoddy; Huddersfield, plain goods, with fancy trouserings and coatings; and Halifax, worsted and carpets. Barnsley is famous for its linen manufactures, of which Leeds also is a seat, as well as of that of leather. Next to the woollen and other textile industries comes the manufacture of iron and steel machinery, and implements of every description. Leeds is one of the principal seats of all kinds of mechanical engineering, and Sheffield of iron-work and cutlery. Population of Yorkshire about 3,700,000.

Yorktown, Va., town, county-seat of York County; on the York River, seven miles from its mouth, and 68 miles southeast of Richmond. It has regular connection with the Chesapeake and Atlantic ports by means of the Old Dominion and other lines of steamers. York is one of the oldest settlements of the United States; it contains the oldest custom-house in the country. It is famous for having been the place where Lord Cornwallis surrendered, and a monument has been erected in honor of the event. In August 1781 Cornwallis, with a force of 8,000 men, took possession of the place, threw up earthworks and fortified the town. He was supported by several British vessels in the York River. Fortifications were erected also at Gloucester Point, opposite Yorktown. Washington left his headquarters on the Hudson on 19 August, and traveled by land to

Philadelphia, then to Elkton, at the head of Chesapeake Bay, and down the bay, arriving at Williamsburg 14 September. His force consisted of 7,000 French under Rochambeau and 9,000 Americans. On 29 September Washington and his men invested Yorktown. He was assisted by a French fleet under Count De Grasse, who blocked the river in such a way that the British were unable to send assistance to the soldiers at Yorktown. Clinton had sent reinforcements to Cornwallis, but De Grasse prevented the landing. The first parallel was established on 9 October, and the Americans opened fire and destroyed some of the British guns. The next day three large transports and a frigate were destroyed. The attack was renewed on the 11th and again on the 14th. On the 17th Cornwallis offered to capitulate, and on the 19th he surrendered. The American loss, including the French, was about 300 killed, wounded, and missing, and the British loss was about 550. This was the last important battle of the Revolutionary War.

Yorktown was the scene of a second siege during the Civil War (see **YORKTOWN, SIEGE OF**). Pop. (1910) 136.

Yorktown, Siege of, in the Civil War. On 4 April 1862 Gen. McClellan, with 58,000 men and about 100 guns, started from Fort Monroe up the York Peninsula for his campaign against Richmond. His plan of operation was to move in two columns, one on the right direct to Yorktown, and another along the James River westward of and beyond Yorktown to the vicinity of Williamsburg. Should the Confederate works at Yorktown and Williamsburg offer serious resistance he designed to land Gen. McDowell's First corps, reinforced if necessary, on the left bank of the York or on the Severn, and move it on Gloucester and West Point, in order to take in reverse whatever force the enemy might have on the peninsula and compel him to abandon his positions. At the end of the first day's march Gen. Heintzelman's Third corps on the right bivouacked at Howard's Bridge and Cockletown beyond, and Gen. Keyes' Fourth corps on the left, at Young's Mill, near James River. On the 5th Keyes resumed his march for the Halfway House, between Yorktown and Williamsburg, but had hardly got on the road when it was ascertained that a large force of the enemy, with a battery, was at Lee's Mills, six miles beyond, barring the way over the Warwick, which, according to the maps, should not have run in that direction. Keyes advanced, and in the afternoon found the situation as reported; and after some artillery-firing he encamped for the night. On the right Heintzelman advanced to near Yorktown, came under artillery-fire from the works, and encamped fronting them, where he was destined to remain a full month. Yorktown, as well as the line of the Warwick southward to James River, was held by Gen. J. B. Magruder, with about 11,000 men. For ten days McClellan remained in front of Magruder, making some reconnaissances, but no serious demonstrations. He was engaged in bringing up troops and guns preparatory to a regular siege, and was asking for heavy reinforcements and more heavy siege-guns. He was compelled to adopt the slow method of a siege from his exaggerated idea of the Confederate strength in his front and by

YORKTOWN—YOSEMITE VALLEY

the fact that McDowell's corps of 33,400 men, which he had proposed using to flank Yorktown, by Gloucester and West Point, had been withheld from him, to protect Washington (see *PENINSULA CAMPAIGN OF 1862*). On the 16th an attempt was made upon Magruder's lines at Lee's Mill (q.v.), but resulted in failure, and McClellan, giving up the idea of carrying the Confederate position by assault, devoted his attention entirely to siege operations against Yorktown. Under the direction of Gen. Fitz-John Porter, who was made director of the siege, Gen. J. G. Barnard, chief of engineers, and Gen. W. F. Barry, chief of artillery, the operations were conducted elaborately and with great skill. Gen. Barry reports that the siege train consisted of 101 pieces, as follows: "Two 200-pounder Parrott rifled guns, eleven 100-pounder Parrott rifled guns, thirteen 30-pounder Parrott rifled guns, twenty-two 20-pounder Parrott rifled guns, ten 4½-inch rifled siege guns, ten 13-inch sea-coast mortars, ten 10-inch sea-coast mortars, fifteen 10-inch siege mortars, five 8-inch siege mortars, and three 8-inch siege howitzers. Three field batteries of 12-pounders were likewise made use of as guns of position." These guns were mounted on very elaborate works, some 15 in number, established opposite the town and the works to its right, at ranges varying from 1,500 to 2,200 yards. In number and weight of metal they were far superior to those of the Confederates. On the 17th Gen. J. E. Johnston had been assigned to the defense of the peninsula and Richmond, and he had on the Yorktown and Warwick line not to exceed 50,000 men. He made no strenuous effort to interfere with McClellan's operations, but determined to hold his position until McClellan was ready to attack and then to fall back without waiting to have his troops driven from their works. By 30 April McClellan had present for duty 115,102 men, including Franklin's division that had been sent to him to turn Yorktown by Gloucester Point or West Point, but which since its arrival on the 20th had been kept on board transports. On 1 May McClellan proposed to open fire on the morning of the 6th with all his guns, and to press the siege until final assault should be deemed practicable. But on 27 April Johnston had learned that McClellan's batteries were approaching completion and would be ready to open fire in five or six days, and he made his dispositions for retreat. On the night of 3 May, leaving some serviceable heavy guns behind, he evacuated Yorktown and fell back to Williamsburg on the way to Richmond.

E. A. CARMAN.

Yorktown, Siege of. In the war of the American Revolution, Lord Cornwallis and the British army reached Virginia in May 1781, and in the following August invested Yorktown, on the York River. Washington and his army advanced on the enemy by land, and the French fleet of Count de Grasse, numbering 28 ships of the line, with nearly 4,000 infantry on board, reached the Chesapeake and came to safe anchor in the mouth of York River. Cornwallis was

securely blockaded both by sea and land. Just after the arrival of Count de Grasse came also Count de Barras, who commanded the French flotilla at Newport. He brought with him into the Chesapeake 8 additional ships of the line and 10 transports; also cannon for the siege of Yorktown. By the beginning of September York River was effectually closed at the mouth and the Americans and the French began to strengthen their lines by land. On 5 September the English Admiral Graves appeared in the bay with his squadron, and a naval battle ensued, in which the British ships were so roughly handled that they were glad to draw off and return to New York. On 28 September the allied armies, now greatly superior in numbers to the enemy, and confident of success, encamped closely around Yorktown, and the siege was regularly begun. By 6 October the trenches had been contracted to a distance of only 600 yards from the British works. From this position the cannonade became constant and effective. On the 13th, in the night, the Americans made an assault, and the outer works of the British were carried by storm. At day-dawn on the 16th the British made a sortie from their intrenchments, but were wholly unsuccessful. On the 17th Cornwallis proposed to surrender, and on the 19th Major-General O'Hara led out the whole British army from the trenches into the open field, where, in the presence of the allied ranks of France and America, 7,247 English and Hessian soldiers laid down their arms, delivered their standards, and became prisoners of war.

Yorkville, S. C., town, county-seat of York County; on the South Carolina & Georgia extension and the Southern R.R.'s; about 85 miles north of Columbia. It is in an agricultural region, in which are valuable deposits of iron. It has iron works, machine shops, saddle and harness factory, spoke and handle works, and lumber mill. There are seven churches and two graded schools (including high school departments), one for colored and one for white pupils. The savings bank has a capital of \$50,000. Pop. (1910) 2,326.

Yoruba, yó'róo-bá, or Yarriba, yá'rè-bá, northern Nigeria, West Africa, a former independent state situated north and northeast of the colony of Lagos, peopled by a number of confederated tribes, and now attached to the colony and protectorate of Lagos. Much of the country is fertile and well cultivated, and the inhabitants have made great progress in the industrial arts. They are largely pagans, but Mohammedanism and Christianity have made way among them. Protestant and Roman Catholic missions have long been at work. Ibadan, to which there is a railway from Lagos, is the largest town, having about 200,000 inhabitants; Oyo, farther to the north, is the capital.

Yosemite, yó-sém'i-té (Indian, "full-grown grizzly bear") Valley, in Mariposa County, Cal., on the west slope of the Sierra Nevada; about 150 miles, in direct line, east by south of San Francisco. This valley is one of the natural curiosities of America, and is unlike any other known valley in the world. It is about six miles long and from half a mile to a mile wide. It is nearly a mile below the general level of the land near it. Entering the valley from the lower end, the two distinct valley

types may be seen, the V-shaped and the U-shaped (see VALLEYS). It has the characteristics of a gorge and also of a cañon. It is nearly enclosed by walls of granite from 3,000 to nearly 5,000 feet in height. On the north side is a huge block of granite called El Capitan. It projects into the valley so that two of its smooth, almost perpendicular faces are visible; the height is 3,300 feet. Opposite El Capitan are Cathedral Rocks and Bridal Veil Rock. From the summit of El Capitan to the summit of Bridal Veil Rock is one mile; but at the base of the rocks the distance apart is not great. The bottom of the valley widens from El Capitan up to the "meadows." Other conspicuous blocks of the unbroken wall are called the Three Brothers (4,000 feet), the Spires, Cap of Liberty, and Sentinel Rock.

About 15 miles above is the source of the Merced River, which flows through the Yosemite Valley. The Illouette River which enters the valley from the south, and the Tenaya Fork, from the northeast, are branches of the Merced. There are two falls and about half a mile of rapids in the Merced River, beginning just below the point where the stream enters the valley. Nevada Fall, the upper one, is about 600 feet high, and Vernal Fall is about 400 feet. The Bridal Veil Falls is on the side of Cathedral Rock which faces the entrance. Bridal Veil Creek here falls over a precipice 630 feet high, and flows over an irregular bed which forms a series of cascades that combined make a descent of about 300 feet. The total fall is 900 feet. The name comes from the appearance of the highest vertical sheet of water at times when the amount of water in the stream is not too great and when the wind sways the "veil of waters." Just below El Capitan is a fall called Virgin's Tears, which is over 1,000 feet high. The waters flow over this precipice only for a few months after the summer heat has melted the mountain snows. The Yosemite Falls, nearly opposite Sentinel Rock, is made by the Yosemite Creek. The first vertical fall is 1,500 feet; then the water descends, in a series of cascades about 625 feet, and again flows over a precipice 400 feet high. In the "meadows" are a variety of flowers and grasses in the early summer months. The principal trees are the pine, fir, cedar, and oak.

In the vicinity are many features of interest; great masses of dome-shaped rocks, and the famous "big trees" of California are nearby. Among the prominent elevations are North Dome, Sentinel Dome, Half Dome, and Glacier Point. From Sentinel Dome may be obtained a good view of the Yosemite Valley and the surrounding country. Glacier Point (4,740 feet) also affords a magnificent view. Half Dome is an imposing mass, 4,700 feet high.

The Yosemite Valley was discovered in 1851 by settlers who were located near a mining camp in the vicinity. The Indians had been annoying the white settlers and miners, and while in pursuit of the band of red men, the whites found this valley. It was named after an Indian chief. In 1864, Congress gave the Yosemite Valley to the State of California, to be "held for public use, resort, and recreation," and to be "inalienable for all time." It is under the control of commissioners who are appointed by the governor. Private parties have built wagon-roads to the valley, and trails to various

points of interest in the vicinity. In 1886 a railroad, 22 miles long, was built from Berenda, the Central Pacific Railroad, to Raymond, whence a stage line extends to the valley. In the grant to the State, in 1864, besides the valley proper there was included adjacent territory for two miles around it. Since 1890 the whole grant has been called Yosemite National Park.

Consult: Bunnell, 'Discovery of the Yosemite'; 'Guide to the Yosemite' (California Geological Survey).

Yō'abihito, Emperor of Japan: b. 31 Aug. 1879. He acceded to the throne of Japan, as Mikado, on the death of his father Mutsuhito, 30 July 1912, going through the ceremony of "Receiving the Sacred Treasures." He has received a thorough education at the Peers' School in all the learning of modern Japan, as well as in the arts and sciences of the Occident, and is broad, liberal and democratic.

You'atte, William, English veterinary surgeon: b. Exeter, Devonshire, 1777; d. London 9 Jan. 1847. Having been educated for the ministry, he preached for a few years in London, but about 1813 established there a veterinary infirmary, lecturing on veterinary practice 1828-35. He published 'The Complete Grazier' (American ed. 1864); 'Extent and Obligation of Humanity to Brutes'; 'Treatise on Cattle' (1834); 'Treatise on Sheep' (1837); 'Treatise on the Horse' (1831); 'Treatise on the Pig' (1847); and 'Treatise on the Dog' (1842); and was the owner and editor of 'The Veterinarian,' established in London in 1828, the first periodical devoted to that class of subjects.

Youghal, yā'hal or yāl, Ireland, a seaport of County Cork, on the estuary of the Blackwater, 27 miles east of Cork. The parish church is formed of the nave and aisles of the ancient collegiate church, built by the Earl of Desmond in 1464; the "water gate," the "clock gate," and Sir Walter Raleigh's house, Myrtle Grove, are other notable features. The export of agricultural produce and the fisheries are the chief industries. According to local tradition, the potato was first planted at Youghal by Raleigh, who was mayor in 1588. Pop. about 7,000.

Youmans, yoo'manz, Edward Livingston, American scientist: b. Coeymans, N. Y., 3 June 1821, d. New York 18 Jan. 1887. Partially blind at times through many years of his life, he pursued his studies by the aid of his sister, Eliza Ann Youmans, and became widely known as a popularizer of science. He lectured extensively and in 1872 founded 'The Popular Science Monthly,' which he edited till his death and established the 'International Scientific Series.' The volumes of this series were published simultaneously in different languages in London, Paris, New York, Leipzig, Saint Petersburg, and Milan. He also published several other books on popular subjects.

Youmans, William Jay, American chemist, brother of E. L. Youmans (q.v.): b. Milton, Saratoga County, N. Y., 14 Oct. 1838; d. Mount Vernon, N. Y., 10 April 1901. He studied chemistry at Columbia College and at the Sheffield Scientific School, New Haven, and was graduated from the medical department of the New York University in 1865 and practised his profession for a time at Winona, Minn. In 1871 he was called to assist his brother, who had

YOUNG

planned to publish 'The Popular Science Monthly,' and from that time till 1900 was actively connected with the management and editorship of that periodical. He edited 'Pioneers of Science in America' (1895); Huxley's 'Lessons in Elementary Physiology,' adding a second part, 'Elementary Hygiene' (1867).

Young, Alexander, American Unitarian clergyman: b. Boston 1800; d. there 15 March 1854. He was graduated at Harvard in 1820, studied theology at Cambridge, and in 1825 became pastor of the New South Congregational Church in Boston, which office he held till the close of his life. He published 'Chronicles of the Pilgrim Fathers of the Colony of Plymouth' (1841); 'Chronicles of the First Planters of the Colony of Massachusetts Bay' (1846); 'Library of Old English Prose Writers' (9 vols., 1831-4); etc.

Young, Andrew White, American political economist: b. Carlisle, N. Y., 2 March 1802; d. Warsaw, N. Y., 17 Feb. 1877. His publications include: 'Introduction to the Science of Government' (1835); 'First Lessons in Civil Government' (1843); 'Citizen's Manual of Government and Law' (1851); 'The American Statesman: A Political History of the United States' (1855); 'National Economy: A History of the American Protective System' (1860).

Young, Arthur, English agricultural writer: b. London 11 Sept. 1741; d. there 20 April 1820. He was intended for a mercantile career, but early adopted the profession of agriculture, carrying on farms at various places, and especially on his paternal estate, near Bury St. Edmunds. He soon became famous as a writer on farming and allied topics, and especially for his agricultural tours. He also carried on an extensive correspondence with public men both at home and abroad, Washington being one of his correspondents. In 1784 he began the publication of his 'Annals of Agriculture,' of which 46 volumes were issued. This work had the most important influence upon the art of agriculture in England, and a considerable portion of it was translated into French under the auspices of the government. In 1793 he was appointed secretary of the newly erected board of agriculture, with a salary of £400 a year. Young not only visited and examined with great attention many parts of England and Ireland, but also made several tours on the Continent. He became blind some years before his death. Among his numerous works are: 'The Farmer's Letters to the People of England' (1767, enlarged edition 1777); 'Six Weeks' Tour through the Southern Counties' (1768); 'Six Months' Tour through the North of England' (1770); 'Farmer's Guide' (1770); 'Farmer's Tour through the East of England' (1771); 'The Farmer's Calendar' (1771); 'Tour in Ireland' (1780); 'Travels in France during the Years 1787-89' (1792-4); treating of agriculture and national resources, the social and political condition of the people, the most reliable source of information regarding the state of France on the eve of the Revolution; 'Essays on Manures' (1804); 'The Rise of Prices in Europe' (1815). By order of the French Directory his agricultural works were published in French in 20 volumes entitled 'Le Cultivateur Anglais' (1800-1). Consult. Les-

lie Stephen, 'Studies of a Biographer' (1898); his Autobiography edited by Miss Betham Edwards (1898); and bibliography by Anderson in Hutton's edition of 'Tour in Ireland' (1892).

Young, Brigham, American Mormon leader: b. Whitingham, Vt., 1 June 1801; d. Salt Lake City 29 Aug. 1877. He learned the trade of painter and glazier and worked at this occupation in Mendon, N. Y. Early in life he joined the Baptists, but in 1831 was converted to Mormonism, and joined the sect at Kirtland, Ohio, in 1832. In 1835 he was ordained an elder and sent forth as one of the 12 apostles, the New England States being the district assigned him. On the death of Joseph Smith, in 1844, he was unanimously chosen president and prophet, though he had three competitors for the office, one of whom, Sidney Rigdon, he soon afterward excommunicated. On the forcible expulsion of the sect from Nauvoo, Ill., in 1846, Young led them through toils and dangers, which nothing but the most untiring energy could have conquered, over the plains and tablelands to the valley in the heart of the Rocky Mountains, where, between the Wasatches and the Great Salt Lake, he founded in July 1847 the present Salt Lake City. His immediate followers forming a nucleus, others poured into "the Promised Land," and in 1849 an attempt was made to organize a State, to be called the State of Deseret, that being the official name given by the Mormons to the district. The United States government refused to sanction the new State, but Utah was organized as a territory, and Young appointed governor by President Fillmore. The appointment of a "Gentile" governor in 1854 led to serious troubles as Young and the other Mormons refused to recognize his authority, and it was not till a force of 2,500 troops was sent out in 1857 that the United States government could enforce its authority.

Young was the founder of polygamy as an institution, and among the first to practise it. In 1852 he promulgated the "celestial law of marriage," which he declared to have been revealed to Joseph Smith nine years before. A large party, among whom were Smith's wife and sons, in the Church opposed the innovation, and declared the revelation to be a forgery, but Young's influence carried the day. He himself had from 15 to 18 actual wives, besides numerous spiritual wives who were formally "sealed" to him. He was twice indicted for polygamy, but each time the case fell through. His 19th wife, Ann Eliza Young, sued for a divorce in 1875. The Mountain Meadow Massacre of 1857 was brought to the notice of the law in 1875. In it a company of 136 emigrants, which had come into collision with the Mormon settlers, was practically exterminated, only a few children being allowed to escape. The court exonerated Young from complicity in the affair, but Bishop Lee, a leading Mormon, was condemned to death in 1876, and shot in March 1877 on the scene of the massacre. See *Mormons*.

Young, Charles Augustus, American astronomer: b. Hanover, N. H., 15 Dec. 1834. He was graduated at Dartmouth in 1853, was professor of mathematics, physics, and astronomy in Western Reserve College (1857-66); and of astronomy and physics in Dartmouth (1866-77).

YOUNG

He was professor of astronomy at Princeton 1877-1906. He accompanied the eclipse parties to Iowa in 1869, and to Spain in 1870; the transit of Venus party to Peking, China, 1874, and organized the Princeton eclipse expedition to Denver in 1878. He was the discoverer of the green line of the solar corona in 1869, identifying it with the line 1,474 of Kirchhoff's scale. At the 1870 eclipse he detected the so-called "reversing layer" surrounding the solar photosphere, and in 1872 at Sherman, Wyo., noticed the bright reversal of many lines of the solar spectrum in ordinary sunlight. He was recognized as an authority in spectroscopy and lectured in the courses of the Peabody Institute at Baltimore, the Lowell Institute at Boston, and at many colleges. He wrote 'The Sun' (1882); 'General Astronomy' (1889); 'Elements of Astronomy' (1890); 'Lessons in Astronomy' (1891); 'Manual of Astronomy' (1902). He died 4 Jan. 1908.

Young, Charles Mayne, English tragedian: b. London 10 Jan. 1777; d. Southwick, Sussex, 28 June 1856. In 1798 he made his debut at Liverpool as Young Norval, and his first appearance in London, in 1807, was as Hamlet. As Hamlet, Iago and Falstaff he was seen at his best, but his repertoire was very extensive. In 1829 he declined an offer of \$50,000 for a ten months' tour in the United States, and in 1832 retired with a fortune of \$300,000. At his farewell benefit at Covent Garden, 31 May 1852, he appeared as Hamlet, with Mathews as Polonius, and Macready as the Ghost. Consult J. C. Young, 'Memoirs of Charles Mayne Young' (1871).

Young, Clark Montgomery, American educator: b. Hiram, Ohio. He was graduated at Hiram College, and since 1833 has been employed in educational work in South Dakota. He was secretary of the Territorial board of education of Dakota in 1889, and of the State board of education of South Dakota, and since 1892 has been professor of history and sociology in the University of South Dakota. He has published 'The State and Nation' (with G. M. Smith); 'History and Government of South Dakota'; 'Elements of Pedagogy'; etc.

Young, Edward, English poet: b. Upham, Hampshire, 3 July 1683; d. Welwyn, Hertfordshire, 5 April 1765. He was educated at Oxford and in 1708 was nominated to a law fellowship in All Souls College. Befriended by the Duke of Wharton, an annuity of £100 was granted him by the duke. In 1719 and 1821, respectively, appeared his tragedies of 'Busiris' and 'Revenge,' both produced at Drury Lane. In 1725 he began the publication of a series of satires, 'The Universal Passion.' He now took holy orders, and in 1728 was nominated one of the royal chaplains. In 1730 the College of All Souls presented him with the rectory of Welwyn, in Hertfordshire, to which the lordship of the manor was attached. In 1731 he married Lady Elizabeth Lee, daughter of the Earl of Lichfield, and after his marriage the poet lived much in retirement at Welwyn, sadly disappointed that church preferment, which he so eagerly desired and so unscrupulously belauded those in power to obtain, was refused him. The work by which he is best known is 'The Complaint, or Night Thoughts on Life, Death, and Immortality' (1742-5), a series of argumenta-

tive poems in blank verse, intended to prove the immortality of the soul and the truth of the Christian religion—a work displaying great force of pious and somewhat gloomy reflection, and containing many lofty passages, but marred by a straining after antithesis and ornament. The 'Night Thoughts' were translated into French and German, and were as popular on the Continent as at home. Of Young's three tragedies, 'Busiris' (1719); 'The Revenge' (1721); and 'The Brothers' (1753), only the second has kept a place on the stage. His 'Night Thoughts' has never since ceased to be popular, and many of its sententious lines have become proverbial. The poem is not destitute of real excellence, but a note of insincerity runs through it and the poet too often substitutes pomposity for dignity. Consult Mitford edition of Young's 'Poetical Works' with 'Life' (1854); Thomas, 'Le poète Edward Young' (1901); 'Worldliness and Other-Worldliness,' by George Eliot, in 'Westminster Review' for 1857, reprinted in her 'Essays and Leaves from a Notebook' (1884).

Young, Franklin Knowles, American author and inventor: b. Boston, Mass., 21 Oct. 1857. He is the inventor of an automatic breech action for small arms and field artillery and has published 'The Minor Tactics of Chess'; 'The Major Tactics of Chess'; 'Chess Strategics'; 'Napoleon's Campaigns.'

Young, Sir Frederick, English publicist: b. London 21 June 1817. He was formerly a London merchant and has for many years busied himself in endeavors to promote the general welfare, aiding in securing Victoria Park, London, and Epping Forest to the public, and in establishing the People's Palace. He took great interest in emigration and was one of the earliest advocates of imperial federation. He published: 'Long Ago and Now' (1863); 'New Zealand: Past, Present, and Future'; 'A Winter Tour in South Africa' (1890); 'A Scheme for Imperial Federation' (1895); 'Exit Party' (1900); 'A Pioneer of Imperial Federation in Canada' (1902); etc., and edited 'Imperial Federation' (1876).

Young, Frederick George, American educator: b. Burnett, Wis., 3 June 1858. He was graduated at Johns Hopkins University in 1886; was vice-principal of the State Normal School, in Madison, S. Dak., 1887-90; principal of the Portland High School, Ore., 1890-4; president of Albany College, Ore., 1894-5; and was appointed professor of economics and history in the University of Oregon in the year last named. He edited 'Sources of the History of Oregon,' and is editor of the 'Quarterly Journal of the Oregon Historical Society.'

Young, James, Scottish chemist: b. Glasgow 14 July 1811; d. 13 May 1883. He began his career as a cabinetmaker, but in the evenings studied chemistry under Professor Graham in Anderson's College, Glasgow, and became his assistant both there and afterward at University College, London (1832-8). Receiving appointments in chemical works at Manchester and elsewhere, he discovered a method of distilling oil from bituminous shale, and thus became the founder of the mineral-oil industry of Scotland, besides leading to the development of the petroleum industry in America and elsewhere. (See PARAFFIN.) He acquired a large

YOUNG

fortune and endowed a chair of chemistry in Anderson's College, and fitted out at his own expense an expedition in search of Livingstone, in 1872.

Young, James Thomas, American publicist: b. Philadelphia, Pa., 23 Sept. 1873. He was graduated at the University of Pennsylvania in 1893; and became instructor there in 1896. He has published 'Der Staatsdienst in Deutschland, der Schweiz und den Vereinigten Staaten' (1896), and 'Administrative Centralization in France,' and 'Administrative Centralization in England' in the 'Annals' of the American Academy of Political and Social Science.

Young, Jesse Bowman, American Methodist clergyman and author: b. Berwick, Pa., 5 July 1844. He was graduated at Dickinson College in 1868, but had previously served three years in the Union army during the Civil War, becoming captain in the 84th Pennsylvania volunteers. Entering the ministry in 1868, he held pastorates in Pennsylvania and Kansas City, Mo., and was subsequently editor of the 'Central Christian Advocate' (1892-1900); etc. He has published 'What a Boy Saw in the Army'; 'Days and Nights on the Sea'; 'Helps for the Quiet Home' (1900); 'Our Lord and Master' (1903).

Young, Sir John, BARON LISGAR, English statesman: b. Bombay, India, 31 Aug. 1807; d. Ireland 6 Oct. 1876. He was graduated at Oxford in 1829, called to the bar in 1834, and sat in the House of Commons in 1831-45. He was lord of the treasury 1841-4; secretary of the treasury in 1844-6; chief secretary for Ireland in 1852-5; and lord high commissioner of the Ionian Islands 1855-9. He succeeded to the baronetcy on the death of his father in 1848 and from 1860 to 1867 was governor to New South Wales. Appointed governor-general of Canada in 1868 he filled this post till 1872, when he was succeeded by the Earl of Dufferin. During his Canadian governorship he suppressed the Riel rebellion in 1870 and was rewarded with the title of Baron Lisgar.

Young, John Russell, American journalist: b. Downingtown, Pa., 20 Nov. 1841; d. Washington, D. C., 17 Jan. 1899. In 1857 he was copyholder on the Philadelphia Press; and later its news editor. At the outbreak of the Civil War he became war correspondent, and was with the Army of the Potomac from the battle of Bull Run to the end of the Chickahominy campaign, when he returned to Philadelphia and became managing editor of the Press. In 1865 he joined the editorial staff of the New York Tribune, retiring in 1869; established the *Morning Post* in Philadelphia; and the *Standard* in New York (1869); and was European correspondent of the New York Herald (1871-7). As correspondent of that paper he accompanied General Grant in his journey round the world in 1877, and was attached to the editorial staff of the Herald 1879-82. He was minister to China 1882-5; and was appointed librarian of Congress 30 June 1897. He published 'Around the World with General Grant' (1879); 'Memorial History of Philadelphia,' edited 1895.

Young, Julia Evelyn Ditto, American verse writer and novelist: b. Buffalo, N. Y., 4 Dec. 1857. She has published 'Adrift: A Story of Niagara' (1880); 'Glynn's Wife: A Story

in Verse' (1896); 'Thistle-Down,' poems; 'The Story of Savilla' (1897), verse; etc.

Young, Robert, Scottish Biblical scholar: b. Edinburgh 10 Sept. 1822; d. there 14 Oct. 1889. He became a printer and superintended the Mission Press at Surat, India (1856-61). He subsequently devoted himself to preparing, printing, and publishing at Edinburgh a long series of works of somewhat narrow but remarkable Biblical scholarship; among them were an independent translation of the Bible; 'Marginal Readings (10,000) for the English Testament'; 'Concise Critical Comments on the Holy Bible'; 'Grammatical Analysis' of the Hebrew, Chaldee, and Greek Scriptures (1885); 'Hebrew Vocabulary'; and a laborious 'Analytical Concordance to the Bible,' giving 311,000 references (1880).

Young, Robert Anderson, American Methodist clergyman: b. Knox County, Tenn., 23 Jan. 1824; d. 1902. He was graduated at Washington College, Tenn., in 1844; entered the Methodist ministry, and held pastorates in several cities in Tennessee. He was president of the Wesleyan University, Florence, Ala., 1861-4; financial secretary of the board of trustees of Vanderbilt University, 1874-83; secretary of the board of missions of the Methodist Episcopal Church, South; and secretary of the Tennessee Conference for 21 years. He was editor of the 'Advocate of Missions,' and author of 'Personages'; 'Ariel'; 'Twenty Thousand Miles'; 'Celebrities, and Less'; etc.

Young, Samuel Baldwin Marks, American general: b. Pittsburg, Pa., 9 Jan. 1840. He entered the Union army as a private in 1861; served with distinction through the Civil War; and was brevetted brigadier-general in 1865. Joining the regular army as 2d lieutenant in May 1866, he became colonel in 1897; was commissioned brigadier-general of volunteers the next year, and participated in the Cuban campaign. He was promoted major-general of volunteers; served in the Philippines in 1899-1901; was promoted major-general U. S. A. 2 Feb. 1901; and served as military governor of northwestern Luzon and was commander of the 1st District, Department of Luzon. In February 1902 he was elected as the first president of the newly established Army War College, in Washington, D. C.

Young, Samuel Hall, American Presbyterian clergyman: b. Butler, Pa., 12 Sept. 1847. He was graduated at the University of Wooster, Ohio, in 1875, and at the Western Theological Seminary, Allegheny, Pa., in 1878; and ordained to the Presbyterian ministry in 1878. Going to Fort Wrangel, Alaska, as a missionary and explorer in 1878, he organized the first Protestant church in Alaska in 1879; and afterward held pastorates in California, Illinois, Iowa, and Ohio. Sent to the Klondike in 1897, he established the First Presbyterian Church in Dawson in 1898; and organized missions in Eagle, Romfort, Nome, and Teller. In 1901 he was appointed superintendent of all the Presbyterian missions in Alaska.

Young, Thomas, English physicist and archaeologist: b. Milverton, Somerset, 13 June 1773; d. London 10 May 1829. He was of Quaker parentage and was brought up in the strict discipline of that sect, studied medicine and received his degree at Cambridge. As early

YOUNG—YOUNG MEN'S CHRISTIAN ASSOCIATION

as 1799 Young wrote his celebrated memoir on the 'Outlines and Experiments respecting Sound and Light,' which speedily conducted him to the discovery and demonstration of the interference of light. This discovery alone, according to Sir J. Herschel, would have sufficed to have placed its author in the highest rank of scientific immortality. In 1801 he became professor of natural philosophy at the Royal Institution, and in 1802 foreign secretary to the Royal Society—an office which he held for the remainder of his life. The series of lectures delivered in connection with his professorship form the substance of his great work, 'Natural Philosophy and the Mechanical Arts' (1807). In 1811 he was elected physician to St. George's Hospital. In 1818 he was appointed secretary to the board of longitude, with the charge of superintending the 'Nautical Almanac.' In addition to the works already named, and many scientific papers, he published 'An Account of Some Recent Discoveries in Hieroglyphical Literature and Egyptian Antiquities' (1823). Consult Peacock, 'Life of Young,' and 'Miscellaneous Works,' edited by Peacock and Leitch (1855).

Young, William, American poet and dramatist: b. Illinois 1847. He has published 'Wishmakers Town,' poems (1885-98); and the plays: 'Jonquil'; 'The Rogue's March' (1872); 'Pendragon,' verse (1881); 'The Rajah' (1883); 'Ganelon,' verse (1888); 'The Home of Mauprat,' with J. G. Wilson (1882); 'Ben Hur,' dramatization (1899); 'Woman's Wiles' (1898); 'The Sprightly Romance of Mersac' (1900); etc.

Young England, a political party formed in London about 1844 by Mr. Disraeli, after he had begun to oppose the general policy of Sir Robert Peel. Besides its founder it contained some young men of ability and position, prominent among them being Lord John Manners, now Duke of Rutland; George Smythe, afterward Viscount Strangford; and Baillie-Cochrane, afterward Lord Lamington. Its programme was the reconciliation of the aristocracy and the Church on the one hand, and the people on the other. Its principles were attractively expounded in Disraeli's two fictions, 'Coningsby' and 'Sybil.'

Young Germany, a group of literary and political innovators in Germany, headed by Heine (q.v.).

Young Ireland, the name applied to a company of Irish agitators, who were active between 1840 and 1850. They at first adhered to O'Connell, but soon became very radical in their opinions and separated from the conservative Irish politicians in 1844. 'The Nation' was their political organ and in this journal the Irish people were constantly incited to revolt. In 1848 John Mitchell (q.v.), one of the leaders of the party, was arrested and sent to Tasmania, and the attempted insurrection which followed soon collapsed, two of the leaders, T. F. Meagher (q.v.), and W. S. O'Brien (q.v.), being sentenced to death, but their sentences were presently commuted to transportation.

Young Italy, a society of Italian republicans formed by Giuseppe Mazzini (q.v.) in 1831, whose aims were the emancipation of the

Italian peninsula from the control of Austria, and the union of the various portions of the country under a republican rule. Its greatest activity was in 1834, when Mazzini led an unsuccessful invasion of Savoy. The influence of the society soon declined, but it was of service in arousing Italian patriotism and it formed the model for similar organizations elsewhere in Europe, such as Young France, Young Germany, etc.

Young Men's Christian Association. A Young Men's Christian Association is an organization composed of young men who are united together for the purpose of ministering to the spiritual, intellectual, social, and physical needs of young men. Any young man of good moral character, regardless of race or creed, may become a member of this organization and enjoy its privileges; but only active members, who must be in communion with a Protestant evangelical church, can vote or hold office. Local associations are usually under the administration of a board of directors, which employs to carry on its work officers known as general secretaries, physical directors, boys' secretaries, etc. Local societies are independent and autonomous in their administration. Local societies are affiliated together into national, and sometimes into international, unions. These national unions are under the administration of a national committee. The national organizations are further united into a world's organization, having its headquarters at Geneva, Switzerland. The world's organization is administered by what is known as the Central International Committee of Young Men's Christian Associations, 3 Rue Général Dufour.

History.—The establishment of the Young Men's Christian Association was occasioned by the growth of the modern city. The city movement which has spread throughout the more industrial parts of the world created an environment which made necessary special effort in behalf of young men. Without the rise of the city, the parlors, gymnasiums, reading-rooms, educational classes, Bible studies, religious meetings, this vast organization of over 700,000 young men, with its secretaries, directors, committees, costly buildings, and mighty influence would never have been born.

The Association movement was founded by a young man who came from the country to the city. It was founded primarily for commercial young men living away from home in cities. Without the spread of the city it would have remained a London institution, and never have become a world-wide organization. The city has become the dominant factor in modern life. Young men form the largest and most important element of the large army which is annually invading the city from the country. The proportion of young men in the city is much larger than in rural districts. In the city, the home and the Church have a smaller place in the life of the average young man than in the country. The city is full of opportunities to gratify temptation. Contrasted with the country, where life is in the open air and activity is chiefly muscular, life in the city is indoors, and far more full of nervous excitement. It should also be said that the city has brought young men together in large numbers, and so made possible

YOUNG MEN'S CHRISTIAN ASSOCIATION

an organization among themselves in their own behalf.

The history of the Association falls into three periods: 1844 to 1855, the founding of the Association; 1855 to 1878, the development of Association methods; 1878 to the present time, the wide extension of the movement.

Period I, 1844 to 1855. Founding of the Young Men's Christian Association.—The founder of the Young Men's Christian Association, George Williams, now Sir George Williams, who was born at Ashbury Farmhouse, near Dulverton, southern England, in 1821, grew into manhood at the time when the industrial revolution in England was attracting young men from the country to the town. He went to London in October 1841, and became a clerk in the dry goods establishment facing St. Paul's churchyard, of which he is now the proprietor. At that time there were some 80 young men employed in the different departments of the business. Through Mr. Williams' efforts, a Young Men's Christian Association was organized, for the purpose of establishing religious services and Bible classes among the young men employed in various houses of business in London. This organization took effect on 6 June 1844. The name was suggested by Christopher Smith, George Williams' room-mate. The constitution provided that the Association should seek to promote the spiritual and mental improvement of young men engaged in the drapery trade, that its membership should be young men who gave decided evidence of conversion to God, and that its management should be in the hands of a small board chosen from the membership. This movement rapidly assumed important proportions. Prayer meetings and Bible classes were soon established in 14 different business houses, and a missionary to young men was employed in January 1845. In 1848, apartments were rented, in which a library, reading-room, restaurant, social parlors, and educational classes were provided; and young men who made no religious profession were invited, upon the payment of a small fee, to use the privileges of the institution, though they were given no share in its management and were known not as members but associates. A lecture course was established, which soon became the most important lecture platform in London. Branches of the parent society sprang up in different parts of the metropolis, and provincial branches in different parts of the United Kingdom became affiliated with the parent society.

The Association was marked by intense religious zeal. Through personal interviews by its members with young men, through Bible classes and evangelistic meetings for men, a persistent campaign was carried on to win young men to lead a religious life. The secular agencies developed considerably during the first seven years. In 1851, in the Central Association, there were 225 members and 425 associates. There were estimated to be 750 members and associates in the other branches in the metropolis. At this time there were 8 societies in London, and 16 in various parts of the United Kingdom. The 24 Associations enrolled approximately 2,700 young men.

Knowledge of this work came to America in the fall of 1851 at three different centres—Montreal, Boston, and New York. The first movement took place at Montreal, where,

through the efforts of two young men who had become acquainted with the London work through published copies of the lectures delivered before the London Association, an Association was formed on 25 Nov. 1851. In November 1851 George Petrie, who had become well acquainted with the London work during a visit to that city, called together a group of his personal friends in New York. These conferences, however, did not result in organization until encouraged by the success at Boston, where the first Association in the United States was established.

A letter published on 30 Oct. 1851, describing in detail the work of the London Association, came under the eye of Captain Thomas V. Sullivan, who was active in Christian work among seamen, and so impressed him that he determined to establish a society in Boston. His purpose was accomplished at a meeting held on 29 Dec. 1851, in the chapel of the old South Meeting House in Spring Lane. The Boston society laid great emphasis upon the Association as a social resort. It introduced the committee system, and inaugurated the plan of restricting voting and officeholding to members who were in good standing in an evangelical church. It was the Boston society which gave character and direction to the American movement. It immediately became one of the leading religious agencies of the city. Twelve hundred young men joined its membership; 16,000 copies of its constitution and by-laws were printed and scattered broadcast over the United States, representatives of the society assisted in founding Associations at other points, and through its influence, by the year 1854, some 26 Associations had been established in different parts of the Union.

Through the efforts of Chauncey M. Langdon, a government employee in Washington, and later a clergyman in the Episcopal Church, a convention of the American Associations was called at Buffalo in June 1854. This convention established an alliance of the associations of the United States and Canada, under the supervision of an executive committee which was instructed to call annual conventions, and to do everything in their power to foster and extend the work of the associations. The organization was made international at the suggestion of a delegate from the association at Toronto, Ont., who had been invited to the convention. This alliance was known as the American Confederation, and it was largely through its influence that the American movement rapidly took pre-eminence among the associations of the world.

In the meantime, through the efforts of George Williams and others, associations had been established at Paris and other points in France, and at Geneva, in Switzerland. Prior to the founding of the association, a movement known as the "Junglingsverein" had been started among young workmen in Germany in the year 1834. This had already come into friendly correspondence with the associations in England. The German associations, while not on a strictly inter-denominational basis, were invited into alliance with the Young Men's Christian Association, and have always continued in this fellowship. Since uniting with the general movement, they have greatly increased.

The culminating event of the early period was the first convention of the associations of all

YOUNG MEN'S CHRISTIAN ASSOCIATION

lands, held at Paris in 1855, at which the memorable statement of belief known as "the Paris basis" was adopted. This has been called the apostles' creed of the association, and did much to unify the movement. It was proposed by Mr. Frederick Monnier, a layman from Strasburg, and was read before the convention, all the delegates standing, "in which position it was then solemnly passed by the unanimous vote of the whole assembly. The members present then knelt together, gratefully to acknowledge the mercy of God and to entreat His benediction on the decision at which they had arrived." The basis was as follows:

The Young Men's Christian Associations seek to unite those young men, who, regarding Jesus Christ as their God and Saviour according to the Holy Scriptures, desire to be His disciples in their doctrine and in their life, and to associate their efforts for the extension of His kingdom among men.

The reports of this convention showed the estimated strength of the association movement as follows:

	Associations	Members
Continent of Europe:		
Germany	130	6,000
Switzerland	54	700
France	49	700
Holland	10	400
Belgium and Italy.....	3	60
Total	246	7,860
British Isles	47	8,500
United States and Canada...	36	14,000
Total	329	30,360

The period from 1844 to 1855 saw the association founded in the various Protestant countries, an International Alliance established on the American continent, and a uniform basis adopted by the associations of all lands. The fundamental principles of the association began clearly to emerge. Although the movement was at first primarily religious and spiritual in character, the association was led to add secular agencies for ministering to the intellectual and social needs of young men. It recognized the principle that ministering to the needs of a man is one of the surest ways to promote his religious life; and on the other hand, that the Christian religion demands the development of all human powers and their use in the service of God. It is upon these two truths, the power of environment to mold character, and the adoption of the religion of Jesus Christ to redeem manhood, body, soul, and spirit, that the Young Men's Christian Association rests its claim for a place among the agencies of the church.

Period II, 1855 to 1878. Period of Development of Association Methods.—During the years from the Paris convention in 1855 to the Geneva convention in 1878, when a central executive committee for the associations of the world was established, with headquarters at Geneva, the Young Men's Christian Associations were gradually developing a world consciousness as an organization, and slowly evolving a method of work for ministering to the needs of young men. During this period, the American associations rose to the place of pre-eminence, and the type of association developed here has in later years spread throughout the world. For convenience the American development during

this period may be further subdivided into four divisions: The period of the confederation, 1855 to 1861; the War period, 1861 to 1866; the revival of the association work after the War, 1866 to 1870; the period of adaptation of the work to the needs of young men, 1870 to 1878.

The six years preceding the Civil War were remarkable for two results in the association: the creation of the International Committee, with its work of supervision, and the great revival which stirred the entire country during the years 1857 and 1858. During these years, the central committee of the confederation was located respectively at Washington, Cincinnati, Buffalo, and Philadelphia. This migratory plan was soon found to be a source of weakness, but much good was accomplished. Annual conventions were held, and information regarding the new movement was widely disseminated. Many new associations were founded; and at the outbreak of the war there were 240 associations in America, with an estimated enrolment of 30,000 members.

In 1856, several members of the New York association established a union prayer-meeting, chiefly for men at the Dutch Reformed Church, in Fulton Street. This was carried on for nearly a year, and in the following September it was given over to Mr. J. C. Lamphier, the city missionary of the Dutch Reformed Church, with the understanding that it should be continued on a union basis. The committee of the association arranged to co-operate heartily in this meeting.

In the fall of 1857 came the financial panic which prostrated the business interests of the country. Large numbers of men began immediately to attend this noon prayer-meeting, and, under the auspices of the New York association, many more union meetings were established in different parts of the city. Simular meetings were conducted by all the Young Men's Christian Associations throughout the country. It is estimated that over 300,000 persons were added to the evangelical churches of America as a result of this revival.

The years from 1861 to 1866 in America were overshadowed by the cloud of the Civil War. The financial depression and the distractions attending the outbreak of the War brought the association to the lowest point it ever reached. The Boston membership declined from 2,400 to 700. The New York City association, at the beginning of 1862, had but 157 members; it was burdened with a debt of \$2,400, and its work had sadly declined. It is recorded that only 60 organizations survived the War; and yet, in the midst of this depression and apparent weakness, the association performed one of the most heroic tasks ever undertaken by a religious organization.

Through the influence of the association in New York, heartily seconded by those of Boston, Washington, Philadelphia, Chicago, and other places, the United States Christian Commission was organized. This was the first organized attempt, on a large scale, to minister to both the spiritual and physical needs of soldiers in time of war. The plan of work was to send out delegates with supplies and needed comforts, who should spend some five or six weeks without remuneration, nursing the sick and wounded, distributing literature, conducting evangelistic and religious meetings, bearing messages from home, and in various ways encourage

YOUNG MEN'S CHRISTIAN ASSOCIATION

ing and helping the soldiers. Over 5,000 of these delegates were sent to the front during the Civil War. The following table shows the vast efforts of this commission in raising money and supplies for the soldiers:

*RECEIPTS BY THE UNITED STATES CHRISTIAN COMMISSION.

	1862	1863	1864	1865 (4 mos.)	Total
Cash	\$ 40,760	\$358,000	\$1,297,755	\$ 828,257	\$2,524,772
Supplies	191,096	354,637	1,366,594	1,424,498	3,736,825
Totals	\$231,856	\$712,637	\$2,664,349	\$2,252,755	\$8,261,597

*Mass. United States Christian Commission, p. 799.

This was an heroic service, and won for the association the admiration and confidence of the public. In the meantime, the New York City society had secured for its secretary, Robert R. McBurney, and for its president William E. Dodge, Jr. It had on its board of directors Hon. Cephas Brainerd, who had been identified with its work from the beginning, and who had early perceived the true mission of the association. Mr. Dodge with his associates set about developing in New York a work specifically adapted to the needs of young men, and introduced a new era in association history. Mr. Dodge was in sympathy with the idea of a clean, home-like social resort for young men, and with the providing of opportunities for physical training. It was at his suggestion that the constitution of the New York City association was altered so as to provide for the erection of a gymnasium. Mr. Dodge was also influential in enlisting large gifts for the association. He was himself the largest donor to the first building.

The years from 1866 to 1870 mark the revival of the American work after the war. In June 1866 an international convention was called at Albany, which outlined a new policy for the associations. The plan of a migratory international committee was given up, and the headquarters were permanently established in New York city. Hon. Cephas Brainerd was, a year later, chosen chairman of this committee, a position which he held for 25 years. This convention announced the platform that the work of the association should be limited to young men, although it was some years before this became the actual practice. The convention established a day of prayer for young men in November, which has become a world-wide observance. It also arranged for the organizing of State committees, and the beginning of what is usually spoken of as state work. The great contribution of this convention, however, was the emphasis which it placed on the true field of the Young Men's Christian Association as distinctive work for young men. In his opening address, Mr. Brainerd said: "Our future progress rests upon an unswerving devotion to the primary objects and aims of this association—the social, mental, and religious improvement of young men. As organizations with these avowed objects, we challenge attention. As seeking these ends we are prominently before the world. Because of these things we are what we are. When we deviate from them, we trench upon ground assigned to others."

As yet there was no uniformity among the associations in America as to the conditions of membership. At the international convention held in Portland, in 1869, it was decided that only members of evangelical churches should

vote or hold office in the association, and it was stated that:

We hold these churches to be evangelical which, maintaining the Holy Scriptures to be the only infallible rule of faith and practice, do believe in the Lord Jesus

Christ (the only begotten son of the Father, King of Kings, and Lord of Lords, in whom dwelleth the fulness of the Godhead bodily, and who was made sin for us though knowing no sin, bearing our sins in His own body on the tree) as the only name under heaven given among men whereby we must be saved from everlasting punishment.

In the meantime, in New York city a determined effort was being made to erect a suitable building adapted to the needs of young men. In addition to the work already undertaken for the spiritual, intellectual, and social improvement of young men, it was decided to add a gymnasium for physical training. After an earnest canvass for funds, and a most careful study of plans, the historic building on the corner of Twenty-third Street and Fourth Avenue, which provided under one roof for the various phases of association activity, was erected. This building cost \$487,000, and was opened to the public in November 1869. Here was developed the modern type of the diversified work for the cultivation of Christian manhood, which has become characteristic of the American associations, and which is spreading throughout the world.

A unique feature of this building, which has been copied in most association structures, was the central reception-room, or lobby, in which was the public office of the secretary, and through which every one must pass upon entering the building. From this reception-room opened the reading-room, the parlors, the amusement-room, the gymnasium, the library, the educational class-rooms, and the secretary's private office. This enabled the secretary in charge to control the various activities which were housed under one roof, and to keep in touch with the multitude of young men who took advantage of the privileges of the association.

The years from 1870 to 1878 in America may be characterized as a period of adaptation of the work of the association to the needs of young men, and the extension of this work to various classes of young men. It is an interesting fact that, as soon as the organization specialized its work and limited it to young men, it immediately found a large field for service. In 1872, at Cleveland, a branch association was founded for work among railroad men. This met with a hearty response from the men themselves. A secretary was employed, rooms were opened at the railway station of the Lake Shore & Michigan Southern road, and an effort made to extend the work elsewhere. Similar societies were also organized at a number of the terminal points, and in the fall of 1875 the attention of Mr. Cornelius Vanderbilt was called to this work. Through his endorsement, other railroad officials became interested in this movement. It was soon found that it was worth while

YOUNG MEN'S CHRISTIAN ASSOCIATION

for railroad corporations to provide the facilities and attractions of a Young Men's Christian Association for the comfort of their employees.

As early as 1858, at the State Universities of Michigan and Virginia, student Young Men's Christian Associations had been organized. Early in the 70's, Mr. Robert Weidensall organized similar societies in a number of colleges. By 1876 there were 25 college associations, with about 2,500 members. Through the influence of Mr. Luther D. Wishard, a student at Princeton, representatives of all college associations were invited to the international convention held at Louisville, Ky., in 1877. This resulted in the inauguration of the inter-collegiate movement as a department of the work of the international committee. An extended effort was also made during this period among German-speaking young men, and toward its close a work was inaugurated among colored young men.

One of the most important agencies developed during this time was the work of supervision. The international committee located in New York steadily grew in resources and influence. A number of the most prominent Christian business men of New York city and other parts of the country accepted positions of responsibility upon this committee. In 1868, Mr. Robert Weidensall became the first traveling secretary, being located in the West with headquarters at Omaha, afterward Chicago. He is still in the service of the committee. Mr. Weidensall has done much pioneer work, organizing state committees, and introducing many new phases of work for young men. In recent years he has particularly fostered what is known as county work for young men in rural districts. Mr. Richard C. Morse accepted a position with the international committee in December 1869, first as editor of the 'Association Monthly,' and in 1872 as executive secretary of the committee, in which position he has continued until the present time.

At the close of this period, 1878, the American international committee had in their employ eight traveling secretaries, and in addition to the general work, were supervising work for railroad men, college students, German-speaking young men and colored young men. The budget for 1878 showed an expenditure for supervision on the part of the international committee of \$16,875. The American associations at this time reported 141 employed officers. Of these, 100 were general secretaries, 21 assistants, 12 State, and 8 international secretaries.

In other lands, while war, ecclesiastical conditions and general conservatism retarded the growth of the associations, a marked development had taken place. Every three years, conventions of the associations of all lands were held in different European cities. To these, the American associations since 1872 have regularly sent representatives. During the early 70's, Mr. Moody made his evangelistic campaigns in the British Isles, and did a great deal to stimulate the work of the Young Men's Christian Association in securing money for buildings, in arousing spiritual zeal, and in calling the attention of the Church to this important work. In 1878, some 40 representatives of the American associations attended the world's convention, which met at Geneva, Switzerland. Up to that time there had been no established headquarters for the world's work. General affairs had been ad-

ministered from London through Mr. W. E. Shipton, the secretary of the London association. It was chiefly through the influence of the French and American delegates that the Geneva convention voted to organize the work of the associations in all lands under an advisory committee, which should have a quorum located at Geneva, Switzerland. Col. Charles Feraud, an officer in the Swiss army, and a man with bright business prospects in Geneva, consented to give up his calling and accept the position of general secretary of this committee. By the year 1878, with the establishment of the world's committee, the Young Men's Christian Associations of the world may be said to have developed their ideal of work for young men.

Period III, 1878 to 1904. Period of Expansion.—Expansion has been the striking characteristic of the period from 1878 to 1904. The American associations have increased in membership three and one-half times, from 99,000 to 350,455; in value of property, from \$2,295,000 to \$28,827,886; in the number of buildings, eight-fold, from 56 to 460; in employed men, fourteen-fold, from 141 to 1,934; the current expenses for operating the associations have increased ten-fold, from \$376,000 to \$3,583,506. (These figures are taken from reports for 1903.)

The two factors which have most profoundly influenced the Association movement, during this period, have been the securing of property, and of trained secretaries and directors who give their whole time to this service. The carrying on of an all-round work for young men—physical, social, intellectual, and spiritual—demanded not only experienced and able men to conduct the work, but commodious and properly adapted structures in which it could be housed.

The discoverer and demonstrator of the secretaryship was Robert R. McBurney, who was secretary of the New York City association from 1862 until his death in 1868. Under his leadership, this office was developed and the number of employed men increased. Of all the agencies the association movement has brought forth, the most vital is the secretariate. To this may be attributed its permanence and continued power. There are now nearly 2,000 men devoting themselves to this service as a life work. The pre-eminence of the American associations is chiefly due to this policy of employing salaried officers. About five-sixths of the secretaries employed by the associations of all lands are in the United States and Canada.

Not only have men been employed for supervisory work, but since 1870 there has been an increasing demand for Christian young men to devote their lives to service in the association as physical directors. Three hundred and fifty-three of these men are now employed. To the Christian physical director, the Young Men's Christian Association owes the development of the physical department, which aims not only to give young men physical training, but rugged, vigorous bodily development. This department has proved a great attraction to young men. In 1896, the 'Year Book' reports 32,672 men as using the physical department of the association. In 1900, there were 80,433, and for 1908 there are reported 129,193 individuals, of whom 35,210 were boys. Much of the progress in this department has been due to the leadership of Dr. Luther Halsey Gulick, who became instructor of physical training at the Association Train-

YOUNG MEN'S CHRISTIAN ASSOCIATION

ing School at Springfield in 1886, in which position he continued until 1900. In 1888, he was also appointed secretary of the international committee for the physical department, in which office he served until the spring of 1903. The Young Men's Christian Association is doing the most extensive work in physical training of any agency in the country. It is also interesting that more than 40 per cent of the physical directors in academies and colleges have been furnished by the association. The physical department has proved not only a means for physical well-being, which is much needed under modern city conditions, but also a means of leading young men into lives of personal purity.

The following table shows the employed officers in the association exclusive of physical directors:

GROWTH OF THE SECRETARYSHIP

1. Extension Agents—International and State Secretaries.
2. Assistant Secretaries.
3. General Secretaries.

In 1885, at Springfield, Mass., a school was established for the training of general secretaries for the Young Men's Christian Association. The year following, a physical department was added for the training of physical directors. This school at first offered a two-years' course of study, which was later extended to three years. In 1890, a similar school was established at Chicago. This institution also conducts a summer term at Lake Geneva, Wis. In 1902, a summer school was established at Silver Bay, Lake George. These educational agencies seek to thoroughly train officers for the Young Men's Christian Association as a life work. About one sixth of the officers of the association have received training at these institutions. The courses of study cover the Bible, Church history, psychology, sociology, religious pedagogy, physiology, anatomy, anthropometry, physical diagnosis, physiology of exercise, gymnastics, athletics, aquatics, history of the Young Men's Christian Association, methods of work among young men, etc. There are about 150 students enrolled in these two institutions in addition to those attending the summer institutes.

The building movement in America has developed with increasing momentum. In 1890, there were 205 buildings, valued at \$8,350,000, in the United States and Canada; in 1900, there were 359; in 1902, there were 460. During the past year, 40 association buildings have been erected. There is no greater testimony to the confidence of Christian philanthropists and business men in the Young Men's Christian Association and its work than the investment of large sums of money in association property. The type of architecture developed by the Young Men's Christian Association is of the club order, its buildings being home-like and social.

One of the striking developments of this period in the city work has been the growth of the educational classes. Immediately upon the erection of the building on the corner of Twenty-third Street and Fourth Avenue in New York city, evening classes were started in different subjects for young men. Similar classes were carried on in other cities, and by 1892, 20,526 different men were under instruction. In 1892, a secretary for the educational department was appointed by the international committee, and this work has been systematized and greatly developed. International examinations are now held annually, in which large numbers of students take part. International certificates are accepted by more than 100 different colleges and institutions. An illustration of the growth of this department is seen in Boston, where the association in 1903 reported 1,184 different students, studying in its evening classes. This association has a law school which has been given by the legislature a charter, granting the right to confer degrees, and the past year graduated 19 students who were admitted to the Massachusetts bar. Nearly every association contains a reading room, 700 report having libraries, and many others are distributing stations for public libraries. In January 1904, 30,600 different students were reported as taking class work; the total expense for class instruction was \$111,000, and the receipts and tuition fees from the students was \$86,099. In that year, 1,426 students won international certificates.

In its religious work the associations have made the most marked progress in recent years. This has now been organized into a system, having four features: (1) Religious meetings for men, chiefly evangelistic; (2) personal work for individuals, which seeks through individual interviews to win young men into the Christian life; (3) Bible study, which seeks to organize young men into Bible classes and Bible departments for their religious education; (4) missions, which is an effort to interest young men in the study and support of the work of the associations in non-Christian lands.

The religious meetings of the association for men are generally held on Sunday afternoon, and within recent years what is known as the "big meeting" has become common. This effort began at Trenton in 1894, where the average attendance for the first year was 427, the second 608, the third 727, and for the fourth over 1,000. This meeting has continued with equal results to the present time. There are now some 30 associations which conduct these large men's meetings, the ones in Washington, D. C.; Baltimore, Md., and Springfield, Mass., averaging over 1,000 each in attendance. The Cleveland association has inaugurated what is known as the Sunday Club, where a continuous program of music, Bible classes, addresses, an evening tea, and after-dinner talks, occupy the afternoons of Sunday during the winter. The most notable leader in evangelistic work in recent years is Mr. Fred B. Smith, secretary of the international committee for religious work. The religious work prospectus of the city and railroad associations reports 18,716 professed conversions for the year 1903, 22 per cent of whom had already united with local churches.

In its Bible study department, the progress has been even more marked, particularly in the last five years. In 1901, in the city associations,

YOUNG MEN'S CHRISTIAN ASSOCIATION

19,160 students were reported; in 1902, 25,092; for 1903, 31,300; this is in addition to the large number of men studying in shop Bible classes. The student associations have a thoroughly systematized plan of Bible study, covering the four college years. Student conferences are held at Northfield each summer, and at five other points at which leaders for the Bible classes for the coming year are trained. Reports for the summer of 1904 show that nearly 30,000 undergraduates will be enrolled in these classes the coming year.

An important phase of the religious work of the association is the interest in foreign missions which it has aroused among young men. The student volunteer movement, which is an outgrowth of the student department, is the chief missionary agency in the colleges of this country. It annually secures a large number of students to volunteer for foreign missionary service. In 1903, 3,246 men were reported as in mission study classes. The last student volunteer convention, which was held at Toronto in 1902, was attended by 2,200 delegates.

The latest period of association history has also been marked by a great extension in the work for different classes of young men. In August 1895, the world's student Christian federation of under-graduates of all lands was established. This now enrolls 65,000 members, in 1,400 institutions, in 30 different countries, and is the largest organization among undergraduates in the world. In the United States and Canada the movement has been extended to professional schools, theological seminaries, State universities, and other institutions of learning. There are now 716 college associations upon this continent, enrolling 44,500 students. Thirty American student associations own buildings valued at \$1,000,000. There are now 98 student secretaries devoting their whole time to this work.

The work for railroad men has become one of the most remarkable features of Christian endeavor. Railroad corporations which control three fourths of the railroad mileage on this continent contributed last year over \$200,000 toward the current expenses of the railroad associations now in existence. There are 122 buildings, valued at \$1,800,500, occupied by these associations, with a membership of 62,300, a gain of 30,000 in three years. There are 301 secretaries engaged in this department.

Since 1879 the international committee has employed a secretary to develop the work among colored young men. There are to-day 40 Indian associations, with 1,600 members, under the direction of a traveling secretary, who is a native American Indian.

Largely as an outgrowth of the work for students in other lands, the American international committee was invited by missionaries in India to inaugurate a work among young men in non-Christian lands. This work has always been carried on in subordination to the Church, and as a supplementary work where missions have already been developed. There are now 37 secretaries of the American international committee in India, Ceylon, Japan, China, and Brazil.

With the outbreak of the war with Spain, secretaries were sent out with tents and suitable equipments, and a successful effort was under-

taken to preach the gospel to the soldiers and sailors. The army in the Philippines was provided for in a similar way, and some of the Canadian regiments sent to South Africa were equipped in like manner. This work has been established as a permanent department of the international committee. There are now 269 army posts at which work is being done. Seventy-five tons of equipment in 1903 were shipped to Alaska, China, Philippine Islands, Cuba, Porto Rico, and to different parts of the United States. Three army buildings have been erected.

Even before the Spanish war began steps had been taken to inaugurate a work among the seamen of the navy, and after the war a building was equipped for seamen at the Brooklyn navy yard. This department has developed rapidly, and at the present time there is an organized movement among the seamen of the navy, which is full of promise. Through the munificence of Miss Helen Millar Gould, who has contributed largely toward the railroad and army work, a splendid building has been erected for the Naval Association, near the navy yard in Brooklyn, at a cost of \$450,000. Work is now being done at two other home ports, and on a large scale. There are 27 secretaries in the army and navy associations of the United States.

For many years the work of the associations was limited to young men between 16 to 17 years of age, and upward. It is an interesting sociological development that, in the prosecuting of its work for young men, the association has been led to give its attention to work among boys. Careful study led to the conviction that effort ought to begin at the age when the boy is becoming a man—at the dawn of adolescence. There are almost as many boys in cities between the ages of 12 and 17 as there are young men. The first boys' department was organized at Salem, in 1869, but it is only in recent years that a determined effort has been made to organize a work among boys. In 1890 there were four secretaries giving their time to this department. In 1895 this number had increased to 17, and in 1903 to 107. There are now 46,000 members of boys' departments, and 13 buildings devoted exclusively to boys' work. Five hundred and seventy-six associations have either branches or departments for work among boys. The most unique feature of this department is what is known as the boys' camp, which was first developed by the Young Men's Christian Association, and is already a large factor in Christian work. In 1903 214 summer camps were conducted by the American associations.

One of the most important developments of recent years has been the extension of the association among men engaged in industrial pursuits. The associations were originally for commercial young men. Afterwards associations were organized for students, and later for railroad men. The city associations in recent years have been attracting large numbers of skilled mechanics to their membership, and to-day in the eastern associations, 35 per cent of the members belong to this class. Industrial associations existed in 1897 in connection with the Johnson Steel Plant at Lorain, Ohio, and an association building at a cost of \$25,000 was erected for the use of the workmen. Similar

YOUNG PEOPLE'S CHRISTIAN UNION — Y. W. C. A.

associations have been erected at Proctor, Vt.; Wilmerding, Pa.; Stampo, Ark.; Douglas, Alaska; Cananea, Mexico, and at several other places. An extensive work is also done among the miners in Pennsylvania and the lumbermen in several northern States. In 1902 the Brooklyn Young Men's Christian Association employed a secretary for the organizing of association work among the street railway employees of that city. They now have a building erected at a cost of \$30,000. This is a club house with reading room, library, educational class rooms, auditorium, gymnasium, game room with pool and billiards, also bowling alleys, baths, etc. Similar departments have been organized in a number of other cities.

The industrial revolution which attracted the young men to the city, and so created the basis for the Young Men's Christian Association, has to a large extent depleted the rural districts of young men. At the same time it still remains true that a majority of young men are found in the country. There are 8,000,000 young men in the country districts of the United States and Canada. For many years an effort was made to discover some method of carrying on association work among these men. What is known as the county work has proved so successful that in 10 different States there are now county organizations, the most extensive work being carried on in Kentucky, where eight county secretaries are employed. The plan of work is a county committee, which employs a traveling secretary who will supervise and stimulate Christian work among the young men in the county, organizing Bible classes, men's meetings, in many cases establishing reading rooms, social parlors, sometimes educational classes, and in a few instances organizing clubs for athletics of various kinds. County conventions are held, deputation Sundays, and a carefully systematized effort is made through the entire county.

Whether the Young Men's Christian Association has reached its final form, no one would be bold enough to affirm. It is remarkable that it should have grouped together such a variety of agencies upon the simple platform of young men advancing the Kingdom of Christ among young men. Through the three periods of its development, the association has evolved into an institution with an enlarged ideal, closely akin to that of the Christian university. It is still animated by the evangelistic, spiritual purpose of the original band of young men who rallied around George Williams 60 years ago. But, while keeping uppermost this ideal, it has endeavored to do, in a popular way, for the multitudes of young men of our cities, what the Christian university, in a more scholarly way, is doing for the young men who are to enter the professions. There is every evidence that the association has only begun its career of usefulness, and that in the future it will become a manifold more important factor than in the past.

(1896); Mott, 'Strategic

Points in the World's Conquest' (1897); 'Year Book of the British Young Men's Christian Associations' (London 1902-3); 'Year Book of the Young Men's Christian Associations of North America' (1903-4).

L. L. DOGGETT, Ph.D.,

President International Young Men's Christian Association Training School, Springfield.

Young People's Christian Union, an organization in the United Brethren Church, founded 5 June 1890. It is a union of all forms of young people's societies within the church, uniting them for the purpose of denominational direction. There are now in this union 1,971 societies, of which 251 are junior societies. The total membership is 80,243.

Young People's Society of Christian Endeavor. See CHRISTIAN ENDEAVOR, YOUNG PEOPLE'S SOCIETY OF.

Young Pretender, The, a title applied to Charles Edward Stuart, son of the Pretender. He was defeated by the Duke of Cumberland at Culloden 16 April 1746.

Young Women's Christian Association. The World's, has headquarters in London, and embraces organized associations in the following countries: Great Britain, Canada, the United States, Denmark, Norway, Sweden, Finland, France, Germany, Hungary, Italy, and India. Many of these countries hold national conventions and issue national organs.

The affiliated body in the United States is known as the American Committee, organized in 1886. Its headquarters are in Chicago. At the present time there are connected with the American Committee 24 State associations, embracing organized work in nearly every State in the Union and employing 28 State secretaries. There are affiliated with the American Committee 93 city associations and 10 branch associations in six cities. Three of the 93 city associations are gospel settlements for women. The total active membership of the city associations is 50,638. For the past year 306 Bible classes, 434 physical training classes, 676 educational classes, 227 domestic science, and 225 domestic art classes are reported; 52 associations conduct lunch rooms for women, 35 conduct boarding homes. There are also employment bureaus, travelers' aid work, summer homes, and religious meetings maintained. In 227 factories association workers carry on meetings and clubs for young women.

There are 501 student associations affiliated with the American Committee, with a total membership of 35,181; 269 of these have rooms or buildings, all hold regular religious meetings and missionary meetings. They enroll 4,756 young women in mission classes, and 10,567 students in regular study of the Bible.

The American Committee conducts four summer conferences, attended the last season by 2,026 persons. A training institute for secretaries is conducted in Chicago, and a monthly periodical, the 'Evangelist,' is maintained as the national organ.

The International Board of Women's and Young Women's Christian Associations embraces 54 associations in various cities throughout the United States. Of these 40 report boarding homes, 14 report vacation homes, 37

YOUNGHUSBAND—YOUNGSTOWN

report libraries, 20 report women's restaurants, 27 report educational classes, 26 report domestic science and art, 21 report physical classes, 15 have travelers' aid work, 26 have employment departments, 27 maintain work of city relief, hospital, rescue work, homes for the aged and incurables, orphans' home and maternity work, 15 conduct women's exchanges.

ELIZABETH WILSON,

Secretary of the Training Department, Chicago.

Young'usband, George John, English soldier; b. 9 July 1859. Entered the army 1878, and was promoted successively lieutenant 1880, captain 1889, major 1896, and lieutenant-colonel 1900. He served in the Afghan war in 1878-80, in the Sudan in 1885, on the northwestern Indian frontier in 1886, and in the Burmese expedition of 1886-7. In 1895 he was a member of the Chitral relief force, and in 1898 was detailed to accompany the American forces in the Spanish-American war and the subsequent campaign against the Philippine insurgents. He fought in the second Boer war in South Africa (1899-1902), and was severely wounded. Subsequently he was assigned to the Indian staff corps, and in 1904 was the leader of a British diplomatic mission to Tibet which aroused considerable discussion by its unwarranted assumption of the character of a punitive expedition.

Youngstown, Ohio, county-seat of Mahoning County, sixth city in the State, 7 miles north of the southern boundary of the Western Reserve, half-way between Cleveland and Pittsburgh, 67 miles from each; extends nearly 6 miles along the Mahoning River, northwest and southeast, covering 10 square miles. It began where the valley widens and spread mainly north and west to higher land. Since a connecting viaduct was built in 1899 the south side has grown rapidly. The principal business street is Federal, nearly 3 miles long, running through the small Public Square. The best residential streets are Wick, Lincoln and Madison avenues and Bryson street, which are beautifully shaded.

Municipal Service and Improvements.—The city has 125 miles of streets, of which 23 are paved. The street-cleaning service employs 60 men, costs \$34,000 annually and is fairly efficient. There are 48 miles of sewers, discharging by main sewer into the river below the city. The city owns the Holly water-works, installed 1872. This has cost, including efficient filtration plant which was established in 1904 to purify supply from river, \$1,000,000, has 78 miles of mains and supplies about 3,500,000 gallons daily, the expense being \$27,000 annually. The city as a whole is very healthy; average general death rate for last four years being 15.04. The police department has 65 men, 49 patrol boxes, and costs \$66,000. The high pressure immediately obtainable from mains renders many steam fire engines unnecessary, but the fire department has two, one chemical engine, six hose carts, seven stations, employs 44 men, and costs \$58,000. Three street railway companies operate in all 132 miles electric line, 29 in city proper, and 103 connecting with surrounding cities. Another of 60 miles reaching East Liverpool and undeveloped coal territory south is under construction. Gas is still used, but electric lighting is general. Natural gas from Pennsylvania furnishes domestic

fuel. There are two telephone companies with 4,800 instruments.

Parks and Cemeteries.—The only public park within the city is Wick Park, which has an extent of 47 acres, a natural grove near the northern limits, named for the donors. Just outside but readily accessible, extending southwest on both sides of the stream for 3 miles, is Mill Creek Park of 457 acres, of striking natural beauty. From a waterfall 25 feet high at the south the creek flows through a gorge like a cañon, with steep sides, often rocky, rising sometimes over 100 feet, widening in places and well covered with fine trees. The park, which cost \$260,000, has 9 miles of attractive drives and a lake of 28 acres. Idora Park is a popular pleasure resort of 20 acres located near the above falls. Oak Hill cemetery, 27 acres, begun in 1846, is well situated and possesses some fine monuments. Belmont Park just opened, has 100 acres, and Calvary, just west of the city, with an extent of 50 acres, is owned by the Catholic Church.

Chief Buildings.—The most notable is the handsome steel-frame Dollar Savings and Trust Company. The government building is wholly inadequate, a monument to mistaken economy; there is no municipal building and the court-house is now too small. Aside from banks and churches, there are the Y. M. C. A., one of the finest in the State, costing \$90,000; City Hospital; Public Library; Rayen School, in Ionic style with inharmonious addition; Lucretia K. Baldwin Memorial Kindergarten; Elks and Odd Fellows.

Commerce and Manufactures.—The P. & O. canal, built in 1839, stimulated mining of large deposits of Brier Hill block-coal which long furnished a principal part of Youngstown's commerce and warranted building the railroad to Cleveland, opened in 1856. There are now the Erie, Pennsylvania, B. & O., Lake Shore, and Pittsburg & L. E. systems, with 67 passenger trains daily and 155 miles of track within the city, crowded with the immense tonnage of "Mahoning Valley" iron and steel industries, of which Youngstown is the centre.

The second blast furnace in the United States to use raw block-coal and a rolling mill for making bar iron were both built here in 1846. Other iron works, which have formed the main industry of the place, followed, using richer lake ore and Pennsylvania coke and coal since native ore and coal were exhausted. The Ohio plant, making steel and rails, started in 1895. There are now in the city eight blast-furnaces, two steel plants, and five rolling mills, with an annual capacity of 1,140,000 tons pig metal, 1,100,000 tons billets and rails, and 600,000 tons finished material, whose actual tonnage in and out for 1903 exceeded 5,500,000, to which similar concerns, just outside but belonging to the city, and kindred industries making boilers, bridges, cars, cranes, engines, forgings, machinery, metal lath and furniture, pipes, tubes, shafting, steel-castings, stoves and washed-metal added 1,000,000 tons. The investment in these industries in and adjoining the city exceeds \$26,000,000. There are also large oil-cloth and rubber plants and works for making automobiles, brass castings, cement, flour, leather, and powder. The last census gives 249 industrial establishments outside iron and steel, with a capital

YPRES — YPSILANTI

of \$4,818,243; employees, 2,716; wages paid, \$1,458,821; cost materials, \$3,553,156; value products, \$6,597,245.

Finances and Banking.—The assessed valuation of the city is \$22,317,210 with tax rate \$33 but usually under \$30; bonded debt, \$880,304; annual interest charge, \$42,696. The city owns property valued at over \$2,500,000. City income by last annual reports, \$385,000; expenditures, \$378,000. Post-office receipts are over \$100,000. There are five national banks and one trust company with capital and surplus \$3,834,000 and deposits \$10,151,000.

Churches.—There are here 46 Protestant churches, chapels and missions, most numerous being Methodist 11, Presbyterian 10, Lutheran 8; 10 Catholic churches, with 1 Ursuline convent, and 2 Jewish synagogues. Of the churches 41 are English, 4 German, 3 each Welsh and Swedish, 2 Slovak, and 1 each Italian, Polish, and Arabic. The best church buildings are St. Columba's, St. John's, Trinity, and the beautiful Helen chapel.

Benevolent Institutions.—City hospital, with substantial limestone buildings, best modern equipment, cost \$200,000, and Mahoning Valley, conducted by Sisters of Charity; Y. M. C. A., with large membership and well sustained; Children's Home, Florence Crittenton Home, five free kindergartens, an active humane society, and various fraternal societies.

Education.—There are 22 public school buildings, 199 teachers, and 8,000 pupils enrolled; salaries and expenses about \$200,000. The Rayen School, founded in 1854 by Judge William Rayen, with fine building and large grounds, is conducted as the city high school with 450 pupils. There are eight parochial schools with 36 teachers and 2,470 scholars, several private schools, and the Y. M. C. A. sustains good educational classes.

The R. McMillan Free Public Library is well managed, and has 20,530 volumes. The Rayen School has a good library.

Newspapers.—Two daily, *Telegram* and *Vindicator*, each with several other editions; three weekly; one Catholic monthly.

Government.—A biennial mayor, president of council, one councilman from each of seven wards and three at large, board of public service of three, solicitor, auditor, and treasurer. The board of public safety of two, sinking fund trustees, and board of health are appointed by the mayor; city engineer and clerk by council; other officers elected by the city.

Population increased from 8,075 in 1870 to 44,885 in 1900, and rapid growth since makes conservative estimate for end of 1903 over 56,000, besides several thousand belonging to city but outside the boundary. In 1900 the percentage of foreign born was 27.2; native of foreign parentage, 41, leaving but 31.8 of native parentage. In 1910 it was 79,066.

History.—The township was named from John Young, who purchased it from the Connecticut Land Company in 1796. David Tod, afterward "war governor," operated first coal mines and led in establishing the canal and first railroad. Sturdy foreign elements, attracted later by the heavy industries, have combined with descendants of early residents, largely from New England, and others, to form

an enterprising, industrious, upright and patriotic community whose future, with first-class plants established, is bright.

WILLIAM H. BALDWIN.

Ypres, è-pr, (Flemish, *Yperen*), Belgium, a town in the province of West Flanders, in a plain, on both sides of the Yperlee, 28 miles south-southwest of Bruges, 53 miles by rail. Ypres formerly was one of the most important manufacturing towns of Flanders, and in the 14th century had 200,000 inhabitants and employed 4,000 looms. Its manufacturing prosperity has long departed, but a striking monument remains in its cloth-hall (Les Halles), an immense building of the 13th and 14th centuries, in the form of an irregular trapezium, surmounted by a square tower or belfry. One of its wings is used as the town-house, and other parts are occupied by different public establishments and concert-rooms. The Gothic cathedral of Saint Martin dates from the 13th century, and is one of the most remarkable religious edifices in Belgium. The chief manufactures are cottons and lace. Ypres was made by Louis XIV. in 1688 one of the strongest fortresses of the Low Countries, and in the great European wars seldom escaped a siege or bombardment. It is no longer fortified. Jansen (q.v.) was bishop of Ypres, and is buried in the cathedral of Saint Martin. Pop. about 19,000.

Ypsilanti, Ip-si-lan'ti, a distinguished Fanariot family descended from the Comneni and of prominence as defenders of Greek liberties. Its most conspicuous members are: ALEXANDER: b. Constantinople 1725; d. 1805; hospodar of Wallachia 1774-82, and again in 1706-8, and of Moldavia 1784-92. He propounded a scheme for the fusion of the Greek and Turkish people, but having incurred the suspicion of the Porte, was executed. CONSTANTINOS, his son (b. Constantinople 1760; d. Kiev, Russia, 28 July 1816). He early planned the freedom of Greece, but his scheme was prematurely discovered, and he fled to Vienna. Pardon by the Sultan, he was hospodar of Moldavia 1799-1805. He then went to Russia, but returned to Bucharest with 20,000 men, in the hope of freeing Greece. The peace of Tilsit interrupting his plans, he returned to Russia. ALEXANDER, eldest son of the preceding (b. Constantinople 12 Dec. 1792; d. Vienna 31 Jan. 1828). He went with his father to Russia and, joining the Russian army, served with distinction in various campaigns. In 1820 he became head of the secret association known as *hetaeria*, whose aim was the independence of Greece, and in March 1821 entered Moldavia and raised the standard of revolt among the Rumanians. He was defeated by the Turks at Dragaschen, near Galatz, 19 June 1821, fled to Austria, and was imprisoned six years at Munkacs, Hungary. DIMITRIOS, brother of the preceding (b. Constantinople 25 Dec. 1793; d. Nauplia 16 Aug. 1832). After serving in the Russian army, in 1821 he joined the Greek patriots in the Morea, and played a brilliant part in the struggle. But though a brave and successful general, as his victory at Tripolitza and his defense of Argos show, his influence was constantly undermined by the "native" party, who never forgot that he was a Fanariot and therefore a foreigner in part. In 1827,

however, he was made commander-in-chief of the Greek army, but the ungenerous course adopted toward him by the government of Capo d'Istria compelled him to resign 1 Jan. 1830, and he then withdrew from public affairs.

Ypsilanti, Mich., city in Washtenaw County; on the Huron River, and on the Lake Shore & M. S., and the Michigan C. R.R.'s; 30 miles west of Detroit and eight miles southeast of Ann Arbor. It is on both sides of the river. In 1807 there was an Indian trading post on the site of the present city. In 1824 it was laid out as a town, became a village in 1832, and was chartered as a city in 1858. It has considerable manufacturing interests. In 1900 (government census) the total capitalization of the manufacturing establishments in the city was \$898,161; the value of the annual products was \$1,318,793. The chief manufactures are flour, paper, dairy products, underwear, agricultural implements, sash, door, and blinds, tags and labels, pumps, cement and foundry and machine shop products. The city is the commercial centre of a rich surrounding country. It contains 9 churches, and the Michigan State Normal College, a high school established in 1849, a business college, public elementary schools, kindergartens, and public and school libraries. The two banks have a combined capital of \$125,000, and, in 1903, had deposits amounting to \$1,056,570. The city owns and operates the electric-light plant and the waterworks. The government is administered under a charter of 1898, and is vested in a mayor, who holds office one year, and a common council of ten members. Pop. (1910) 6,230.

Yreka, wi-ré'ka, Cal., city, county-seat of Siskiyou County; on the Yreka Creek, and on the Yreka Railroad; about 355 miles north of San Francisco. It is in an agricultural and lumbering region, in which considerable attention is given to fruit cultivation and stock-raising. There are large stock yards, a lumber mill, and fruit-packing houses. The city has one bank with a capital of \$100,000, and a county high school. Pop. (1910) 1,390.

Yriarte, é-ré-á-r'tá, Charles Emile, French journalist and author: b. Paris 5 Dec. 1832; d. there 10 April 1898. He studied architecture as a pupil of Constant Dufeux, became inspector of imperial asylums, and after this post was abolished, went on the Spanish expedition to Morocco in 1859 as correspondent and artist for the 'Monde Illustré,' and in 1860 on Garibaldi's campaign in Sicily in the same capacity. From 1864 to 1870 he was editor-in-chief of the 'Monde Illustré'; in 1881 he was made inspector of fine arts, and in 1889 member of the superior council of fine arts. He wrote for the 'Figaro,' and for 'La Vie Parisienne' over the pseudonym 'Marquis de Villemer.' Among his numerous volumes of various character are: 'Portraits Parisiens' (1865); 'Les Tableaux de la Guerre' (1870), on the war in Morocco; 'Venise' (1877); 'Autour du Concile' (1887); and several works on the Italian Renaissance, such as 'Florence' (1880); 'Matteo Civitali, sa Vie et son Œuvre' (1885); 'Autour des Borgia' (1890), and 'Maso di Bartolommeo dit Masaccio' (1894).

Yriarte, or Iriarte, Juan de, Spanish linguist: b. Orotava, island of Tenerife, 15 Dec.

1702; d. Madrid 23 Aug. 1771. In 1714 he was sent to school at Paris, afterward studying English in London and jurisprudence in Madrid, where he presently obtained a post in the royal library. In 1732 he became chief librarian and in 1742 translator for the ministry of foreign affairs. He published an important 'Codices græci manuscripti' (1759), and wrote many Latin and Spanish epigrams and proverbs, Latin poems, etc., included in his 'Obras Sueltas' (4 vols. 1774).

Yriarte, or Iriarte, Tomas de, Spanish dramatist: b. Orotava, island of Tenerife, 18 Sept. 1750; d. Madrid 17 Sept. 1791. He began to write in boyhood and in 1770 published his comedy, 'Hacer que hacemos,' under the pseudonym, 'Tirso Ymareta.' In 1780 he published a didactic poem, 'La musica,' and in 1782 'Fabulas literarias,' considered the best fables in the Spanish language. He also wrote the first regular comedies in Spanish, the best being 'The Spoiled Child' and 'The Ill-Bred Young Lady' (1788), and published Spanish translations of French plays, Horace's 'Ars Poetica' (1777), and four books of the 'Aeneid.' In 1771 he succeeded his uncle, Juan de Yriarte (q.v.) as royal librarian.

Ysaÿe, é-si-yè, Eugene, Belgian violinist: b. Liège, Belgium, 16 July 1858. He studied at the Liège Conservatory and subsequently with Wieniawski and Vieuxtemps at Brussels. He made many successful European concert tours and in 1880 became a professor in the Royal Conservatory of Brussels. He has originated a new school of violin playing, embracing features of the German, the French, and the Belgian schools, and is considered one of the leading violinists of the world. He visited London in 1889, and in 1894 and 1904 made concert tours in the United States.

Ysleta, é-slá'ta, Texas, city in El Paso County; on the Rio Grande, and on the Texas & P., and the Southern P. R.R.'s; 12 miles east of El Paso. It is in a fertile agricultural region, the productive Rio Grande Valley, in which fruit and grains grow in abundance. In 1540 Coronado discovered here a village of Pueblo Indians. He founded here a colony, erected a church and provided teachers for the Indians. The city claims to be the oldest in the State. Several of the descendants of the Pueblos are residents of the city. Population is more than 2,000; about one third are citizens of the United States, and nearly all the others are Mexicans and Indians.

Yssel, Isel, or IJssel, Netherlands, the name of several rivers, chief of which are: (1) the Nieuw Yssel, one of the principal arms of the Rhine, which leaves that river below Arnheim, flows northeast for 16 miles to Doesburg, where it receives the Oude Yssel from Westphalia, then northeast, north, and northwest, through Gelderland and Overijssel, past Zutphen and Deventer, receiving the Borkel and Schipbeek, emptying at Kampen by many arms into the Zuyder Zee, and forming a constantly widening delta. It is one of the five main arms of the Rhine, is 320 feet broad at Zutphen, 764 at Kampen, and 90 miles in length. (2) The Neder Yssel, an arm of the Leek, which leaves that stream at Vianen, flows west through Utrecht, at Oudewater enters southern Hol-

YTTERBIUM — YUCCA

land and flows southwest past Gouda to join the Maas, forming at its mouth the island of Ysselmonde. Length 30 miles.

Ytterbium, a rare chemical element belonging to the Yttrium group. Discovered by Marignac in 1878 in the mineral gadolinite. Also found in other minerals occurring in Siberia, Scandinavia, and Greenland. Symbol, Yb.; atomic weight, 173. Its oxide Yb_2O_3 forms colorless salts with sulphuric acid, etc.

Yttrialite, a native silicate chiefly of thorium and the yttrium metals. It occurs in Llano County, Texas, in grayish-olive-green masses, associated with gadolinite, and other minerals which have been mined as a source of the rare earths.

Yttrium, a rare chemical element discovered 1794 by Gadolin in the mineral gadolinite from Ytterby. It is always found in combination, some of the minerals containing it being gadolinite, xenotime, euxenite, yttrioantalite and polycrase. Usually separated from the mineral by use of sulphuric acid or aqua regia. The element is obtained by heating the chloride with metallic potassium, by electrolysis of a molten mixture of the chloride and sodium chloride, or by heating the oxide with magnesium. It is a grayish-black, lustrous, metallic powder that burns in the air to the oxide Y_2O_3 . Soluble in dilute acids. Symbol Y. Atomic weight 89. Valence 3. It forms a great many compounds closely resembling aluminium, but unlike that element forms no alums.

Yuba, yoo'bā, a river in California, formed by the junction of three rivers, North, Middle, and South, which have their sources in the Sierra Nevada. The Yuba enters the Feather River just below Yuba City. In its upper course it has many picturesque gorges, and several cascades.

Yuba City, Cal., town, county-seat of Sutter County; on the Feather River, near the mouth of the Yuba River, and on the Southern Pacific Railroad; about 40 miles north of Sacramento. It is in a fertile agricultural region, in which fruits are among the important productions. The industries are chiefly connected with farm products. The town has one bank, Farmers' Co-operative Union of Sutter County, with a capital of \$50,000. Pop. (1890) 1,071; (1900) 1,488; (1910) 1,160.

Yucatan, yoo-kā-tān', Central America, (1) a peninsula forming the southeastern boundary of the Gulf of Mexico and comprising the Mexican states of Yucatan and Campeche, British Honduras, and part of Guatemala. The combined area of the two states is 53,290 square miles; with British Honduras, 60,852 square miles. The capitals of the states of Yucatan and Campeche are Merida and Campeche respectively, and among other towns on the peninsula are Sisal, Izamal, Valladolid, Tixcotob, Progreso, and Bacalar. The peninsula is a limestone plain of coralline formation, and, except for some ridges in the south and in the centre, it has no hills. It has little wood, except near the coast, and surface water is almost wholly absent, though underground water is abundant. The water stored in natural caverns is reached by means of steps cut in the rock, and the Maya Indians formerly excavated large storage basins, many of which have become hot-

beds of fevers. Some of the many rock caverns have been inhabited or used as refuges during periods of war or revolution. The climate is warm, and generally unhealthy. There are no minerals of importance. Some maize and rice are cultivated, but the principal vegetable product is henequen or sisal hemp. Logwood is a product of the forests. Salt is obtained on the coasts, and the fisheries are productive. Yucatan and the neighboring districts were the seat of ancient kingdoms of the Mayas, who were the most highly civilized of all the Central American aborigines, and whose descendants still form the bulk of the population. There are numerous splendid ruins of their ancient cities, notably those of Uxmal, 40 miles south of Merida, Izamal, east of Merida, and Chichen-Itza, southeast of Merida. The Spaniards first entered the country in 1506, and during 1527-43 they effected its conquest. (2) A northeastern state of Mexico with an area of 35,203 square miles.

Yucca, the name of a genus of shrubs with clustered ensiform leaves, belonging to the *Liliaceæ*, but also employed as a common name to designate the plants belonging to the entire botanical family of yuccas. This includes not only the genus *Yucca* but several other genera, as *Samuela*, *Clistoyucca*, *Hesperaloe*, etc. The species are chiefly found in the United States and Mexico, though some of them are distributed to many portions of the world. The best known species in the United States is *Yucca filamentosa*, or Adam's needle, which is found in cultivation as far north as New England, its clusters of large white, bell-shaped flowers making it a favorite in gardens. Until recently none of the species has been regarded as valuable commercially, though the coarse fibre of *Y. filamentosa*, called bear-grass, has long been used in a small way as tie material in the South. In Mexico, however, there are several species with larger leaves that have of late years been exploited for their fibre, which is becoming known as a rather coarse substitute for the better cordage fibres. *Yucca australis*, *Hesperaloe funifera*, and *Samuela carnerosana* especially are used in northern, eastern, and central Mexico for fibre, which is derived from the *cogolla* or central spike of unopened leaves, the *cogollas* first being steamed, and the individual leaves scraped with a dull-edged iron tool, upon a block of wood, and the fibre extracted. This coarse fibre is known as *palma istle*, *pita sylvestris*, *zamandoque*, etc. *Yucca* fibre is stiff, harsh, and brittle, and as prepared is not always of good color, and therefore can never take rank with the better known hard cordage fibres. (See *Fibre*.) *Yucca baccata* yields a fairly good fibre, and the parenchyma or pith, and the root possess detergent qualities, from which the name soap-plant has been derived. The sun-cured, whitish yellow inner leaves of *Yucca glauca* are used by the Arizona Indians for ornamental basketry, either entire or subdivided, and several other species are also employed in the domestic economy of North American Indian tribes for rude cordage, baskets, sandals, mats, etc.

A very remarkable feature in the yucca is its fertilization by the aid of any of several species of small whitish moths of the tinea genus *Pronuba*. The yucca flowers are so

YUCHEE—YUKON

shaped as to be impossible of fertilization, and no other insects attach themselves to this plant. The yucca moth gathers a quantity of pollen in its jaws, then lays an egg in the pistil, and stuffs the hole in which it is laid with pollen, thus fertilizing the ovary. The caterpillar develops in the fruit-pod, but does not seriously harm the plant. This extraordinary case of symbiosis was disclosed by C. V. Riley in 1872, and may be found fully related by him in the 'Fourth Annual Report' of the State entomologist of Missouri.

Yu'chee. See UCHEAN.

Yuga, yoo'gā, or Yooga, one of the periods into which the past history of the globe is divided in the chronology of the Hindus. There are four yugas: The Satya Yuga, containing 1,728,000 years; the Treta Yuga, 1,296,000; the Dwapara Yuga, 864,000 years; and the Kali Yuga, now in progress, which began about 3094 a. c., and which will extend to 432,000 years. Horace Hayman Wilson points out that these numbers originate in the descending arithmetical progressions of 4, 3, 2, 1, according to the notions of diminishing virtue in several ages applied to a cycle of 12,000 divine years, each equal to 360 years of mortals; and $12,000 \times 360 = 4,320,000$, the periods of the four yugas added together. See INDIA.

Yuit. The Eskimos of extreme northeastern Asia, from East Cape to a little beyond Plover Bay. They migrated from America probably in recent times, and in appearance, customs, and manners differ in no great degree from their Alaskan kinsmen. Their population is unknown.

Yukian (adjectival form of the Wintun *yuki*, "stranger," also "bad," "thieving"), a linguistic stock of North American Indians, consisting chiefly of the Ashochimi, Chumaya, Napa, Tatu, and Yuki tribes, which formerly occupied Round Valley and the area extending therefrom to the California coast. The Round Valley reservation was subsequently established to receive these and other tribes, and most of their representatives now reside thereon. The entire group numbers only a few hundred at most. The original home of the Ashochimi was near the present Healdsburg; the Chumaya occupied middle Eel River; the Napa, upper Napa Valley; the Tatu, Potter Valley; and the Yuki, Round Valley.

Yukon, yoo'kōn, North America, a large river, mainly in the United States Territory of Alaska, which rises as the Lewes in British Columbia, about lat. 59°, and after a tortuous north, west by south, and northwest course of 2,044 miles, flows into Bering Sea, on the southern shore of Norton Sound, through a many-channeled delta from 80 to 90 miles wide. The northernmost channel of the delta, the Aphoon Mouth, is the only one navigable. The main stream of the Yukon is formed at Fort Selkirk in 63°, by the junction of the Lewes and the Pelly, the former being constituted by the junction of the Big Salmon and Teslin flowing from Teslin Lake and draining a group of small lakes in the region around Mounts Landsowne and Lorne. From Fort Selkirk the Yukon flows northwest with many windings, passing through the Klondike gold-field, receiving from the right the Stewart River, and at

Dawson the Klondike, and from the left the White River, Sixty-Mile Creek, and Forty-Mile Creek. It enters Alaska in about 65° N., and continues its northwestern course until the Arctic Circle is reached, when at the abandoned Fort Yukon, it is joined on the right by the Porcupine River, bends suddenly, almost at right angles, and thenceforward has a general southwestern trend to its mouth.

The chief Alaskan tributaries of the Yukon are the Kozukuk on the right bank, and the Birch and Tanana on the left bank. Its whole course of 1,260 miles through Alaska is navigable by stern-wheel steamers, and beyond to Dawson in Canada; since the discovery of gold throughout the region in 1897 a regular summer service is maintained; the first impracticable obstruction to navigation is at the Grand Cañon, 1,866 miles from the mouth. In its lower course the Yukon is a broad, muddy stream flowing mostly through a marshy plain and for nearly nine months of the year, from October to June, frozen over; its upper course is through the grand scenery of narrow mountain valleys, and rocky gorges. The Yukon is the largest American river flowing into the Pacific; it is the 17th river of the world as to length, the seventh of the Western hemisphere, the fourth of the North American continent, and the third in the United States. This last assertion is based on its whole length of 2,044 miles, however, but taking only that portion which is in the United States, or Alaska, 1,260; it is the fifth river of our country, the Mississippi, Missouri, Arkansas, and Ohio rivers being longer. Its length in navigable miles is 2,036, there being but four rivers in the world with a greater capacity, the Amazon, the Mississippi, the Missouri, and the Saint Lawrence.

Yukon. The Yukon Territory is the most northwesterly of the political divisions of the Dominion of Canada. It embraces a large, roughly triangular area of country, measuring about 207,000 square miles, bounded on the south by British Columbia, on the west by Alaska, on the north by the Arctic ocean and on the northeast by the series of mountain ranges separating the Yukon and Mackenzie basins. The population in 1910 was about 8,000.

Topography.—The territory includes a mountainous belt on the northeast consisting of the Selwyn, Ogilvie, and Peel river ranges of mountains, all of which are usually classed in the Rocky Mountain System, and the great St. Elias range on the southwest. A number of peaks in the latter range, such as Mount St. Elias and Mount Logan, exceed 18,000 feet in height. The central part of the territory is a broken upland known as the Yukon plateau, a great tract of rolling country deeply trenched in all directions by the wide valleys of the present and preglacial drainage systems. Toward the Arctic ocean the plateau is replaced by a plain sloping easily down to sea-level.

The greater part of the Yukon Territory is drained by the Yukon river, the fourth largest river on the North American continent and one of the great rivers of the world. The Yukon is formed by the junction of the Lewes and Pelly, the former drawing most of its waters from the Coast Range and the latter from the mountains of the Rocky Mountain System. Other large tributaries of the upper Yukon are

YUKON

White river, a swift, turbid stream heading in the glaciers of the St. Elias Range, and the Stewart and Porcupine rivers, both of which enter it from the east. River steamers navigate the Yukon river throughout its whole length and also ascend the Lewes up to Whitehorse rapids, a total distance from tide-water of about 2,000 miles. The Pelly, Stewart and other tributaries are also navigable for some hundreds of miles above their junctions with the main stream.

Fauna and Flora.—The valley flats and the lower slopes of the hills and ridges throughout the Territory are more or less thickly forested while the uplands are bare. In the southern part of the Territory the forest ceases at an elevation of 4,000 feet above the sea. Going northward the tree line descends gradually and at the Arctic circle has an elevation of less than 2,000 feet above the sea. The principal forest trees are the white and black spruces (*Picea alba* and *P. nigra*), the aspen (*Populus tremuloides*), the balsam poplar (*Populus balsamifera*), the balsam fir (*Abies subalpina*), the black pine (*Pinus Murrayana*), and the birch (*Betula papyrifera*).

The larger animals of the district include the black and brown bear, the woodland and barren land caribou, the moose, at least two species of mountain sheep, the mountain goat, the timber wolf, the red fox, and the wolverine, lynx, and martin.

Climate.—The climate is severe. The winter season lasts from about the first of November until April. The rivers are usually frozen by the first of November and remain frozen until May, while the lakes are seldom free from ice before the first of June. During the winter season thaws are infrequent and the temperature usually ranges from zero to 40° F. below. Occasional dips to 60° F. below and one to 68.50° F. below have been recorded. The low temperatures are usually accompanied by a dry atmosphere and do not occasion much hardship. The summer season, lasting from the middle of May to the middle of September, is exceedingly pleasant, as the long clear days are never oppressively hot and the nights are always cool. The rainfall is light, the annual precipitation amounting to about 15 inches.

History.—The history of the Yukon Territory dates back only to the year 1840. In that year Mr. Robert Campbell, a fur trader in the employ of the Hudson Bay Company, crossed from the Liard, a tributary of the Mackenzie, and discovered and named the Pelly, one of the main branches of the Yukon. In 1843 the same explorer descended the Pelly to its junction with the Lewes and was thus the first trader to reach the upper Yukon. In 1846 Mr. J. Bell also in the employ of the Hudson Bay Company descended the Porcupine to the Yukon, and in the following year Fort Yukon was built at the confluence of the two streams. In 1849 Fort Selkirk was established at the junction of the Lewes and the Pelly. It was raided and burnt by the Coast Indians in 1852 and was never rebuilt. Fort Yukon was occupied until 1869, when its site was moved to be in Alaskan territory and it was abandoned, and a new fort was built at the upper Ramnarts of the Porcupine. In 1850 Campbell descended the Yukon from Fort Selkirk to Fort Yukon and proved its identity with the Kwikh-nak, the name by which the lower portion of the river was known to the Russians.

The fur traders were followed, after an interval of some years, by the prospector. The first gold seeker entered the country by the Chilkoot pass, through the Coast Range, in 1873. In 1881, bar-mining commenced on the Big Salmon river, and discoveries of productive bars on the Lewes, Pelly, and Stewart soon followed. The first discovery of coarse gold was made in 1886 on Forty-mile river and was followed by important finds on streams flowing into Sixty-mile river. The Sixty-mile streams were actively worked until the announcement, in 1896, of the discovery of astonishingly rich creeks in the Klondike district drew most of the miners away. In 1897-98 a stream of 30,000 adventurers, including people of all trades and callings, poured into the country, all heading for the Klondike.

The discovery of the Klondike gold fields completely changed conditions in the hitherto unorganized and almost unknown Yukon territory. The town of Dawson was built at the confluence of the Yukon and Klondike rivers, and soon superseded Forty-mile as the chief commercial centre. A local administration, with courts of justice and other organizations necessary to government, was quickly established. The demand for better transportation was met by the construction of a railway from tide-water at the head of Lynn canal to the foot of the Whitehorse rapids on the Lewes river, from which point communication with Dawson is maintained by a large fleet of well-equipped river steamers. Telegraphic communication was also established with the outside world, and roads were constructed up the valleys of most of the producing creeks.

Government.—The Territory is governed, at present, by a commissioner appointed by the Federal Government at Ottawa, assisted by a council of five appointed, and five elected members.

Industries.—**Placer mining.**—The development of the Territory has depended, so far, almost entirely on placer mining. The rich Klondike creeks have been worked continuously since 1897, and have yielded gold to the value of \$121,000,000. The yearly production reached its maximum in 1900, when it amounted to \$22,275,000. During the season of 1905, the yield had declined to about \$7,000,000. The dwindling production marks the gradual exhaustion of the phenomenally rich claims on the various creeks, but does not mean a corresponding decline in the mining industry as the amount of gravel handled has if anything increased in recent years. The decreased returns are due to the lower grade of the gravels mined. In the early days of the camp most of the work was done with pick and shovel. More economic methods such as dredging and hydraulicing, are now being introduced.

Outside the Klondike district, some placer mining is being done on the upper waters of the Stewart, on the south branch of the Big Salmon and on the headwaters of the Alsek and White rivers. A large proportion of the Territory is still unprospected.

Ore mining.—Ore mining follows placer mining in most mining camps, and such promises to be the case in the Yukon. Quartz veins carrying free gold have been found at several points in the Klondike district. An important copper belt occurs west of Whitehorse. Some development work has been done on a few of the claims and some rich ore, principally bornite, has been

YUKON GOLD FIELDS—YUMAN STOCK

shipped to outside smelters. Native copper, sometimes in large masses, occurs loose in many of the creeks at the head of White river, but has not been traced to its source. Numerous discoveries of quartz veins carrying high grade silver minerals have recently been made in the vicinity of Windy Arm, Tagish lake. Work is being actively prosecuted on some of these veins with very satisfactory results. Besides those mentioned, discoveries of ores of various kinds have been reported from nearly every section of the Territory.

Coal mining.—Seams of lignite coal of good quality occur at several points along the Yukon river, and a sufficient quantity is mined to supply the small local demand. Anthracite coal also occurs in the region southwest of Whitehorse but has not, so far, been worked.

Agriculture.—Experiments made during the past few years have shown that nearly all the common vegetables can be grown successfully in the Yukon valley, and there is every reason to believe that in the near future produce of this kind will be raised in sufficient quantity to supply the local market.

R. G. McCONNELL,
Geological Survey of Canada.

Yulan, a Chinese tree. See MAGNOLIA.

Yule, yool, Sra Henry, British geographer and Orientalist: b. Inveresk, Midlothian, Scotland, 1 May 1820; d. London 30 Dec. 1889. He entered the East India Company's military college at Addiscombe in 1837, in 1840 was appointed to the Bengal Engineers, and in 1855 became under-secretary to the public works department. In 1858 he published a 'Narrative of the Mission to the Court of Ava in 1855.' He left India in 1862 and in 1864 took up his residence at Palermo, Sicily, in order to continue and extend the researches which led to the publication of his great work, 'The Book of Sir Marco Polo, the Venetian, Concerning the Kingdoms and Marvels of the East,' newly translated and edited, with notes, etc. (1871, enlarged ed 1875). In 1875 he returned to England, and from that year till 1889 was a member of the Indian Council. His great work gained him the founder's medal of the Royal Geological Society. His other works include: a treatise in 'Fortification,' which was used as a text-book; 'Cathay and the Way Thither' (1866); 'Notes on Hwen Thsang's Account of the Principalities of Tokharistan' (1872); 'Hobson-Jobson: a Glossary of Anglo-Indian Colloquial Words and Phrases, and of Kindred Terms, etc.' (1886), with A. C. Burnell; 'The Diary of William Hedges' (1887-9), edited for the Hakluyt Society, of which he was for many years president.

Yule, the old English name for Christmas, still used provincially. See CHRISTMAS.

Yu'lee, David Levy, American politician: b. West Indies 1811; d. New York 1886. In boyhood he came with his father, whose name was Levy, to Richmond, Va., where he was educated. Sent to Florida in 1824, he there studied law, and being elected to Congress from that territory, served from 1841 to 1845, changing his name at this time from David Levy to David Yulee. He was United States senator from Florida 1845-51, taking a prominent part

in senatorial debates, and again 1855-61, when he resigned on account of the Civil War. He was then made a member of the Confederate Congress. After the war he became president of the Atlantic & Gulf Railroad, and was interested in the commercial development of Fernandina and Cedar Keys, Fla.

Yuma, yoo'ma, Ariz., city, county-seat of Yuma County; on the Colorado River, and on the Southern Pacific Railroad; 150 miles southwest of Phoenix. It is in a mining region in which there are considerable productive farm lands on which are raised grains and fruits. There is one bank, four churches, and graded public schools. Pop. (1890) 1,773; (1900) 1,402; (1910 est.) 1,500.

Yuman Stock, an important family or linguistic stock of North American Indians, the tribes composing it being scattered from the Colorado River region of Northern Arizona to the southern extremity of Lower California and even to the Mexican State of Sonora. The most important tribes of the stock are the Cochimi, Cocopa, Comeya, Cuchan, Diegueño, Havesupai, Maricopa, Mohave, Yavapai, Pericu, Seri, Tonto, Waikuru, and Walapai.

Of these, the Maricopa, or Coco-Maricopa, formerly inhabited the region around the confluence of the Gila and Colorado rivers. Their descendants and the Pimas, with whom they subsequently confederated, are now to be found in the Gila River Reservation to the number of about 400. They were an agricultural people and raised large crops by irrigation. Under missionary influence they have been civilized and are now noted for their industry, their efforts at self-improvement, and their manufactures of cotton cloth, baskets, and pottery.

The Seri Indians (Opata, "Spry") speak a distinct language and live on Tiburn island, in the Gulf of California, and the adjacent mainland of Sonora, Mexico. Their houses are flimsy bowers of cactus and shrubbery, sometimes rudely shingled with turtle shells and sponges. They make graceful balsas of canes lashed together for use in navigating the strait between their island and the mainland. They also manufacture a very light pottery and some basketry. The modern Seris are loosely organized in a number of maternal groups or clans in which polygamy prevails. They manifest implacable hatred toward aliens whether Caucasian or Indian and regard the shedding of alien blood as a great virtue. The population of the tribe was formerly several thousands but by constant warfare this number has been reduced to barely 350.

The name Tonto (Spanish, "foolish") has been inappropriately applied by the Spanish colonists of Arizona in the 19th century to a number of Indian tribes, namely: (1) To the Tulkepaia, a tribe of the Yuman stock settled in 1875 on San Carlos reservation, Arizona. (2) To the Eoyotero Apaches, an Athapascan tribe. (3) To the Pinal Apaches of the same stock. (4) To a mixture of Yavakai (Yuman) men and Pinal women who have intermarried. The name has been especially applied to the last mentioned body, who formerly occupied Tonto Basin and the Pinal Mountains of central Arizona, whence some 500 of them were removed to the Rio Verde reservation and later to the San Carlos reservation. They number about

700, and speak a mixed Yuman-Athapascan language.

The Mohave Indians reside in Arizona and California in the region of the Colorado River. There are upward of 2,000 Mohaves remaining, 600 of whom live on the Colorado River Reservation in Arizona. They are an agricultural people, rank high physically and are expert makers of pottery and baskets. They practise tattooing and cremate their dead.

The Yuma reside in the valley of the lower Colorado River in Arizona and California. Population, 655.

The Cochimi were formerly the most populous of the tribes of Lower California but only a few are now extant. They lived mainly about Loreto Mission.

The Cocopa formerly occupied the valley of the Colorado River up to the Gila junction, but the remaining 500 now live mostly in Mexican territory.

The Havesupai, numbering about 200, occupy the gorge of Cataract Creek, a branch of the Colorado River, in northwestern Arizona.

The Mohave Yavapai left the main tribe in the Colorado valley and migrated to the Rio Santa Maria district, in 1873 were removed to the Camp Verde agency, but since 1875 have been under the San Carlos agency.

The Walapai originally occupied the territory above the Mohaves on the Colorado River.

The total number, 20,000, who originally inhabited the United States has been greatly depleted and at present there are not more than 6,000 living within the limits of the United States.

Yung Wing, *yoong'wing'*, Chinese diplomatist and scholar: b. Nan Ping, province of Kwang Tung, 17 Nov. 1828. After graduation from Yale in 1854, he was in the silk and tea trade until 1864, and then entered the governmental service of China. The China Steam-navigation Company was established on his initiative, as was also the Chinese Educational Mission, for the education of Chinese in America. Yung Wing was made chief commissioner of this enterprise, for which an appropriation of \$1,500,000 was made. He was granted the rank of mandarin of the second grade, and appointed intendant of Kiang-Su province; and was for some time associate-minister to the United States, where he took up his residence in 1902.

Yunnan, *yün-nân'*, China, the most south-westerly province of the empire bordering on Tonkin and Burma; area, about 146,680 square miles. It is very mountainous in the north and west, and has a general slope toward the southeast. The central part is a plateau about 6,500 feet above sea-level, dotted with lakes and diversified by hills of red sandstone; but in the south the elevation of the land is much less. The province is traversed by several large rivers, principally the upper courses of the Yang-tse-kiang (called Kin-cha-kiang), the Si-kiang, the Song-ka or Red River, the Mekong, and the Salwin, but only the Song-ka can be regarded as of use for navigation within the province. The principal crops are rice, opium, and wheat, but tea, indigo, sugar-cane, cotton, earth-nuts, and many vegetables also are cultivated. Cattle, sheep, hogs, and other animals are reared in considerable numbers, and silk-worm-rearing is also extensively carried on.

The chief wealth of the province, however, lies in its immense mineral resources, which include iron, coal, copper, gold, silver, lead, tin, zinc, cinnabar, and precious stones. The manufacturing industries include the making of silk goods and other textiles, leather goods, etc. The climate varies from the rigor of the northern districts, where the mountains are snow-capped for the greater part of the year, to the comparatively tropical condition of the southeast. A large part of the population consists of Miao-tse and other non-Chinese elements, and Mohammedanism has many adherents. Yunnan, the capital, in the southeast, is a busy and prosperous town, with large copper factories, and manufactures of silks and carpets. (Pop. 200,000.) Other towns are Chaotung, Tali-fu, Momein, Lingnan-fu, Puerh, Tung-chwan, Mengtse, and Ssumao, the last two being open to foreign trade since 1889 and 1897 respectively. The British have endeavored to establish a direct trade route between Yunnan and Burma, but from the physical features of the region this is not easy. The history of Yunnan can be traced back to the 3d century A.C. Owing to its distance from the seat of the central authority and its mountainous character this province long remained practically independent. The most noteworthy event of its recent history is the great Panthay revolt of 1855, which was not suppressed by the Chinese authorities till 1873. Pop. estimated at 12,324,574.

Yupanqui Pachacuti, *yoo-pân'kê pâ-châ-koo'tê*, or Pachacutac Yupanqui, Peruvian Inca: b. about 1380; d. about 1440. He was the ninth ruler of the Inca line of sovereigns, and one of the greatest. He was the second son of the Inca Viracocha and after deposing or superseding his imbecile elder brother, Urco, he defeated the Chancas in a great battle, annexed their territory to his own and continued his successful career till the Inca kingdom included nearly all of what is now the republic of Peru. In order to relieve the congested condition of Peru he developed a system of colonies called mitimaes. Yupanqui figures largely in Quechua tradition and various national institutions have been traced to him.

Yu'rok. See WEITSPEKAN INDIANS.

Yuruary, *yoo-roo-â'rê*, a river of Venezuela, rising to the east of the Caroni and flowing eastward to join the Cuyuni in about lon. 61½° W., near the frontier of British Guiana. It gives its name to the Yuruary territory claimed by both Venezuela and Great Britain until 1899, when the award of an arbitration court gave most of it to Venezuela. There are several gold-fields here, including El Callao, etc.

Yuracares, *yoo-roo-kî-râs'*, or Yuracare, Indians of Bolivia occupying the forest plains on the eastern slope of the Andes between the rivers Mamore and Beni. They include several tribes, are tall and shapely, and are almost white. They are hunters and warriors for the most part and their mythology is intricate and confused. Prior to the expulsion of the Jesuits, in 1767, numbers of them were attached to the Chiquito missions.

Yusuf, *yoo's'uf*, or Yussuf, Abu Amru, Arabic historian: b. Cordova 976; d. Xativa 1070. He was profoundly versed in the tradi-

YUSUF—YVON

tions of the Oriental Mussulman countries and wrote: 'Behedjet-Almodjalsyn,' a collection of tales relating to Mohammed, etc.; 'Tamhyd,' a commentary on one of the chief Mussulman works of religious and civil law; 'History of the Opinions and Doctrines of the Principal Mussulman Sects'; 'History of the Wars Against the Christians'; etc.

Yusuf, or **Yussuf-Ben-Taxfy**, yoo's'uf-bën-tāsh-fën', Moorish prince: b. Velad Sahara; d. 1106. He was the second prince of the Almoravide line and in 1086 aided the Emir of Seville, Al-Mo'tamid, to gain the victory over Alfonso VI. at Zalaca near Badajos. In 1090 he again invaded Spain, at the call of the emir of Seville, and taking advantage of Mohammedan dissensions gradually acquired the sovereignty of the kingdoms of Malaga, Grenada, Murcia, Cordova, Seville, Almeria, Badajoz, and Valencia, which he united to the kingdom of Morocco. Notwithstanding his power, Yusuf never assumed a higher title than that of emir, and in 1103 his son Ali was acknowledged heir of both his Spanish and Moorish possessions. Consult Freeman, 'History and Conquests of the Saracens' (1856); Yonge, 'Story of the Christians and Moors in Spain' (1878); Coppée, 'History of the Conquest of Spain by the Arab-Moors' (1881).

Yverdon, è-vër'dôn (German, *Ifferten*), Switzerland, a town in the canton of Vaud, at the southwestern extremity of Lake Neuchâtel. Its castle, built in 1135, was used by Pestalozzi (q.v.) as an educational establishment in 1805-25, and now contains a library and museum. The town has also a fine town-house, a hospital, and a memorial of Pestalozzi; and among the manufactures are railway wagons and materials, beer, etc. The town has also an extensive system of wharves. Yverdon was the *Eborodunum* of the Romans, and there are remains of the ancient walls. Pop. about 8,300, mostly French-speaking Protestants.

Yves D'Evreux, èv dāv-re, **Pierre**, Franco-Brazilian historian: b. Evreux, Normandy, France, about 1577; d. after 1620. He became

a member of the Capuchin order in 1595 and was sent in 1612 with four missionaries as their superior, to Maranhao, Brazil, where a French colony had been established. He returned in 1614 and wrote: 'History of the Most Memorable Things that Happened at Maranhao in the Years 1613 and 1614' (Paris, 1615; 2d ed. 1864), a continuation of the history of Claude d'Abbeville, a work of great historical value.

Yvetot, èv-tô, France, a town in the department of Seine-Inférieure, on an elevated plain, 23 miles northwest of Rouen. It has manufactures of calico, hosiery, linen, leather, and baskets. Antiquaries have been much puzzled by an ancient chronicle, and still earlier edict, which gave the title of king to the lords of Yvetot. This edict was formally abrogated in 1681. 'Le Roi d'Yvetot,' the well-known song by Béranger, translated by Thackeray, was a satire on Napoleon, which has immortalized the ancient dignity.

Yvon, è-vôn, **Adolphe**, French historical painter: b. Eschwiller, Moselle, 1 Feb. 1817; d. Paris 11 Sept. 1893. He studied under Paul Delaroche, traveled in Russia in 1843, and brought back with him a series of designs exhibited in Paris in 1847-8. He obtained the medal of honor at the Salon of 1857, 10 years later became an officer of the Legion of Honor and was professor of drawing at the Ecole des Beaux Arts, Paris. In 1855 he was commissioned by the French government to accompany the army to the Crimea. Among his most important works are: 'The Remorse of Judas' (1846); 'The Battle of Kolikova' (1850); 'The First Consul Descending the Alps' (1853); 'Marshal Ney Supporting the Rear Guard in Russia' (1855); 'The Seven Deadly Sins,' designed after Dante (1855); 'The Capture of the Malakoff' (1859); 'Battle of Solferino' (1861); and an allegorical picture of 'The United States of America' (1870), executed for A. T. Stewart. He was an artist of remarkable power and holds a prominent place among the historical painters of France.

Z

Z the twenty-sixth of the letters of the English alphabet, is a vocal or sonant consonant, as distinguished from *s*, which is the corresponding fricative sibilant. It was adopted into the Latin from the Greek alphabet in the time of Cicero: in the Latin alphabet, as in our own, it holds the last place; but in the Greek its place is sixth, and in the Phœnician, Hebrew, and other Semitic alphabets seventh. In German and Italian it represents the sound of *ts*, in our language and in French it represents one simple sound. In Latin it was used only in words derived from the Greek. The exact value of zeta in Greek is not known with certainty; but beyond any question it stood for a double sound, not a simple sound like our *s*; this is conclusively inferred from Aristotle's remark that *xi* (ξ), *psi* (ψ), and *zeta* (ζ) are like in sound; and the inference is strengthened by the fact that in Greek prosody a vowel short by nature is made long by position when it occurs next before the zeta. The sound of the zeta, however, is in doubt—whether it was *ds* or *sd* or both. The name of Z in Great Britain is *zed*, in the United States *zee*. Though *s* is the alphabetic representative of the sonant sibilant, the special *s*-sound is in English oftener represented by *s* than by *z*.

Z-Bars. See RAILS AND STRUCTURAL SHAPES.

Zabians, a term not identical with Sabæans, but properly meaning certain non-Christian Gnostics, predecessors of the peculiar sect called Mandæans, still surviving in South Babylonia. The Cyrian Zabians were the survivors of the ancient Syrian heathen who, being under Mohammedan rule, took the name of Zabians in order to share the toleration which the followers of Mohammed extended to the real Zabians. This sect became extinct about the 12th century. See MANDÆANS.

Zacatecas, tsā-kā-tā'kās, Mexico, a state bounded by Coahuila, San Luis Potosi, Aguascalientes, and Durango. See MEXICO—THE STATES OF.

Zacatecas, Mexico, capital of the state of Zacatecas; 439 miles from Mexico City and 785 miles from El Paso Texas; elevation 8,044 feet above sea-level. The situation of the city, in a narrow and deep ravine, is most picturesque, surrounded and closely abutted on three sides by mountains or high hills. It is surrounded by a chain of mines many of which are among the oldest in the Republic and have produced enormous quantities of precious metals. Not all these are now worked, a number having seemingly become exhausted in so far as satisfactory returns are concerned. The Banco de Zacatecas, with \$1,000,000 capital, to-

gether with a branch of the National Bank, and an agency of the Bank of London and Mexico, supply the monetary demands of the community. A public library containing some 20,000 volumes is maintained by the local government. The most notable buildings are the historic old Cathedral, with its front wall a mass of artistic carving, and the Theatre, a very imposing structure of modern design. In the heart of the city is the Market House, an iron building admirably adapted to its uses and of pleasing appearance. A few minutes' ride southward toward a broad valley brings the visitor to the little village of Guadalupe, where there is a Chapel of Gold, built by a devout woman and ornamented throughout in solid gold gilt at great cost, estimated by some to have been not less than \$1,000,000. Here, also, is located the State Industrial School for poor boys,—a most interesting and creditable charity, in which shoe-making, tailoring, cabinet-making, and other trades are taught, together with the rudiments of a common school education. There are The School of Arts, The Juarez School and several other educational institutions of merit; the Civil Hospital, and two theatres,—the Gonzalez and the Calderon. Pop. about 40,000.

Zacharia, tsā-ha-rē'ā, Heinrich Albert, German publicist: b. Herbsleben, Saxe-Gotha, 20 Nov. 1806; d. Kannstadt 29 April 1875. He was graduated from the University of Göttingen in 1829, was lecturer there in 1835-42, and in 1842 became professor of law. He took active part in the political movement of 1848 as a member of the National Parliament; in 1866 he opposed annexation to Prussia; and in 1867 took a leading part in the convention which framed the constitution of the North German Confederacy. He wrote: 'German States' Rights and Federal Rights' (1841); 'Manual of German Criminal Procedure' (1860); 'German Constitutional Laws of the Present Time' (1855); 'The Question of the Competence of the Empire in View of the Dogma of Infallibility.'

Zacharia, tsā-ha-rē'ā, Just Friedrich Wilhelm, German poet: b. Frankenhausen 1 May 1726; d. Brunswick 30 Jan. 1777. After studying at Leipzig and Göttingen he became professor of belles-lettres in the Carolinum, Brunswick, and in 1761 at Halle. He wrote: 'Der Rennomist' (The Brawler) (1744), the first burlesque heroic poem that had appeared in German; 'Fables and Tales' (1771), etc.: and translated into German hexameters Milton's 'Paradise Lost' (1760).

Zacharia von Lingenthal, lng'ēn-tāl (Karl Eduard, German writer on jurisprudence. b. Heidelberg 21 Dec. 1812; d. Grosskmehlen,

ZACHARIAH—ZAHN

near Merseburg, 3 June 1894. He is regarded as the founder of the science of Græco-Roman jurisprudence. His works include: 'Outline of a History of Græco-Roman Jurisprudence' (1839); 'History of Græco-Roman Private Right' (1864); 'Græco-Roman Laws' (1856-84); 'Paralipomena ad Basilica' (1893); and an edition of Justinian's 'Novellæ' (1881-91).

Zachariä von Lingenthal, Karl Salomo, German jurist: b. Meissen, Saxony, 14 Sept. 1769; d. 27 March 1843. He studied at Leipsic and Wittenberg, was professor of law at the latter university, 1797-1807, and filled the same position at Heidelberg, 1807-43. He wrote: 'The Unity of State and Church' (1797); 'Forty Books on the State' (2d ed. 7 vols., 1839-43); 'Hand-Book of French Civil Law' (8th ed. 1894-5); etc.

Zacharias, zâk-a-rî'as, father of Saint John the Baptist, and husband of Saint Elizabeth. He was a priest of the temple of Jerusalem, and was stricken dumb on refusing to believe the announcement, made by the angel Gabriel, that a son should be born unto him; but recovered his speech at the birth of Saint John the Baptist. He is supposed to have been put to death by Herod (Luke i. 5-79).

Zacharias, or Zachary, Saint, pope: of Greek birth; d. Rome 14 March 752. He succeeded Saint Gregory III. in the papal chair in 741 and at his death was followed by Stephen II. He exercised a powerful influence over several of the Lombard kings, obtaining the restoration of various cities and territories which had formerly been subject to the papacy, and gave his consent to the setting aside of the Merovingian Childeric III. and the elevation of Pepin the Short to the French throne (752).

Zacharias. See ZACHARIAH.

Zacher, tsân'ér, Ernst Julius August, German philologist: b. Obernigk, Silesia, 15 Feb. 1816; d. Halle 23 March 1887. He was educated at Berlin and Breslau and was professor of German philology in Halle 1856-9, and 1863-87. His works, which are greatly prized by students, include: 'Ulfilas' Gothic Alphabet and the Runic Alphabet' (1855); 'German Proverbs' (1852); 'History of the Palgrave Geneveva' (1860); 'Pseudo - Callisthenes' (1867), dealing with the Alexander myth, etc.

Zack. See KEATS, GWENDOLINE.

Zacynthus, zâ-kîn'thûs. See ZANTZ.

Zadkiel, zâd'kî-él, (1) According to Jewish legend the angel of the planet Jupiter. (2) A pseudonym adopted by William Lilly (b. 1602; d. 1681), the astrologer. (3) The name assumed by Richard James Morrison (b. 1794; d. 5 Feb. 1874), compiler of an astrological almanac, begun by him in 1830, and which reached an annual sale of from 100,000 to 200,000 copies.

Zadok, zâ'dök, (1) A high priest of Israel, contemporary with David. (See SADDUCEES.) (2) A personage in Dryden's 'Absalom and Achitophel,' intended as a portrayal of Archbishop Sancroft.

Zâ'farin Islands, a group of three islands lying off the coast of Morocco, near the Algerian frontier. They are at the mouth of the Mulya River and shelter its harbor. They have belonged to Spain since 1848. The central island is fortified.

Zaffre, in chemistry, an impure oxide of cobalt containing some arsenic and made by roasting speiss cobalt. Used in place of smalt in painting on cheap glass and porcelain ware.

Zagazig, zâ-ga-zêg', or **Zakazik**, Egypt, the chief town of the province of Sharkieh, in the delta of the Nile, on the Muizz and Fresh-water canals, connected by rail with Cairo, Alexandria, and Suez, 40 miles north-northeast of Cairo. The great number of factories, with their tall chimneys, and the structure of the houses, give the place a European appearance, and testify to the industrial activity which prevails. Nearly all the cotton grown in the eastern Delta is sent here to be cleaned, sorted, and partly spun before being put on the market. The town is also a centre of the grain trade, and has rapidly increased in prosperity and population since its connection with Suez by the Fresh-water Canal. The excavated ruins of ancient Bubastis are in the vicinity. Pop. about 38,000.

Zagoskin, zâ-gôs'kîn, Mikhail Nikolaievitch, Russian author: b. government of Penza 1789; d. Moscow 1852. For some time he held a post in the department of mines at St. Petersburg. His comedy, 'The Scapegrace,' was praised by Prince Tschakovski, a dramatist of influence, and he wrote a number of others which had some success but were deficient in originality. His efforts in the domain of historical fiction, with Scott as a guide, were more worthy, the chief being 'Yuri Miloslavski' (1829). There were half a score of others, their subjects derived from Russian history or legend. Their patriotic quality assured them an audience on their first appearance, and that they do not yet lack for readers is shown by the commencement of a complete edition of his works in 1898. There is a Russian biography by Aksakov in an edition of selected works published in 1858.

Zahn, zâm, John Augustus, American educator: b. New Lexington, Perry County, Ohio, 14 June 1851. He was graduated at Notre Dame University in 1871 and entered the Order of the Holy Cross the same year. Appointed to the charge of the scientific department of Notre Dame in 1874, he became director in 1875, and vice-principal and director of studies in 1876. He has been provincial of the Order of the Holy Cross since 1897, has lectured extensively, and is known as an advanced evolutionist. His publications include: 'Evolution and Dogma'; 'Sound and Music'; 'Catholic Science and Catholic Scientists'; 'Scientific Theory and Catholic Doctrine'; 'Science and the Church'; etc.

Zahn, tsân, Johann Karl Wilhelm, German architect, painter, and art critic: b. Rodenberg Schaumburg, 21 Aug. 1800; d. Berlin 22 Aug. 1871. He became professor in the Academy of Arts, Berlin, 1829, and among his writings were: 'The Most Beautiful Ornaments and the Most Notable Pictures from Pompeii, Herculaneum, and Stabie' (1828-30); 'Ornaments of All Classical Periods of Art' (1832-9).

Zahn, Theodor, German theologian: b. Mörs, Prussia, 10 Oct. 1838. After studying at Basel, Erlangen, and Berlin he became professor of theology in the University of Göttingen in 1871. He filled a similar chair at Kiel

ZÄHRINGEN — ZAMBALES

in 1877, at Erlangen in 1878, at Leipsic in 1888 and in 1892 returned to Erlangen. Among his works may be named: 'Marcellus of Ancyra' (1867); 'The Shepherd of Hermas' (1868); 'Ignatius of Antioch' (1873); 'The Acts of St. John' (1880); 'Cyprian of Antioch and the German Story of Faust' (1882); 'Researches into the History of the New Testament Canon' (1881-93); 'The Gospel of Peter' (1893); 'Introduction to the New Testament' (1897).

Zähringen, tsä'ring-ën, the house from which the reigning grand-ducal family of Baden (q.v.), Germany, takes its origin. The name is derived from the castle of Zähringen, now in ruins, in the village of that name, about two miles north of Freiburg in Baden. The founders of the family were from the 8th to the 10th century Counts of Breisgau, but the history of the house really begins with Duke Bertold I., "the Bearded," who began to rule in the first third of the 11th century.

Zaira, zä-ä-rä, Africa, a name given to the Kongo River in part of its lower course.

Zakariä, zä-kä-zäk', Egypt. See ZAGARIA.

Zaleski, zä-lës'ki, Bohdan, Polish poet: b. Bohaterka in the Ukraine 14 Feb. 1802; d. Villepreux, near Paris, 31 March 1886. He studied at Warsaw and being obliged to leave his country after the revolution of 1830, he went to France. Many of his poems depict in the most vivid manner the scenery of Poland. His chief works are: 'The Spirit of the Steppes' (1842); 'The Most Holy Family'; and collections of shorter poems.

Zaleucus, zä-lä'küa, the legendary law-giver to the Epizephyrian Locrians, the Greeks who colonized Magna Græcia, the southwest extremity of Italy. He is supposed to have flourished in the middle of the 7th century B.C. and his code is said to have comprised the first written laws of the Greeks. According to tradition his laws were exceedingly severe.

Zalinski, zä-lin'ski, Edmund, "LOUIS GRAY," American soldier and inventor: b. Kurnich, Prussian Poland, 13 Dec. 1849. Coming to the United States in 1853 with his parents, who settled at Seneca Falls, N. Y., he was educated at the Syracuse High School, and entered the army in 1864 as volunteer aid on the staff of Gen. N. A. Miles. He was appointed second lieutenant 5th United States Artillery in 1866, and captain in 1887. He was professor of military science at the Massachusetts Institute of Technology 1872-6, and was graduated in 1880 from the United States Artillery School at Fort Monroe and the School of Submarine Mining at Willett's Point, N. Y. From 1883 to 1889 he devoted himself to the development and perfecting of a pneumatic dynamite torpedo gun. Among his inventions are an intrenching tool, a ramrod bayonet, a telescopic sight for artillery and a system of range and position finding for sea-coast and artillery firing. He retired from active service in 1894. See ORDNANCE.

Zalinski Gun. See ORDNANCE.

Zalokos'tas, Georgios, Greek poet: b. Syrrhako, Epirus, 17 April 1805; d. Athens 3 Sept. 1858. An ardent patriot, at 16 he fought in the insurrection at Missolonghi. Greek children are taught his songs, and among his best-known poems are: 'Missolonghi'; 'Armatoles

and Klepts'; 'The Entrance of Prevesa'; 'Hours of Leisure'; 'Marco Botzaris'; etc. Several of his verses have been translated into Italian, Spanish, English, German, French, and Russian. His 'Poetical Works' were published at Athens in 1860.

Zabaki, zä loos'kë, Josef Andrezej, Polish prelate and scholar: b. Poland 1702; d. 9 Jan. 1774. After serving for three years at Rome as ambassador to Pope Clement XII. he was made bishop of Kiev, but was banished to Kaluga for his opposition to the Dissidents. He is chiefly remembered for the service he did in awakening Polish literature. He spent his fortune in collecting a great library, which he bequeathed to Poland, but which was taken by Russia after the partition, and formed the nucleus of the Imperial Public Library.

Zama, zä'mä, North Africa, the name of two ancient cities about 30 miles apart, 100 miles southwest of Carthage, now represented by Djama and Sidi Amor-Djedidi. Both claim to be the scene of the victory of Scipio Africanus over Hannibal, which decided the fate of Carthage 202 B.C. It led to an ignominious peace which closed the Second Punic War 201 B.C. The Romans lost about 2,000 killed and wounded, while the Carthaginians lost in killed and prisoners over 40,000.

Zamacola, thä-mä-kö'ës, Ednardo, Spanish artist: b. Bilbao, Vizcaya, 1842; d. Madrid 14 Jan. 1871. He was a pupil in Madrid of Balaca, Federico de Madrazo, and the Academy; in Paris of Meissonnier and the Beaux-Arts; and has been ranked as second to only Fortuny among Spanish genre-painters of the 19th century. His subjects were drawn largely from the 16th and 17th centuries, and frequently treated in a satirical vein. His technical finish has been described as "almost as perfect as Meissonnier's." Among his paintings are: 'The Hunchback'; 'Spanish Recruits'; 'The Bull Fighters'; 'Indirect Taxes'; 'A Court Jester of the 16th Century'; 'The King's Favorite' (1867); 'Cervantes as a Recruit'; 'The Rival Confessors' (1868); 'Return to the Convent' (1869); 'The Education of a Prince' (1870); 'The Puzzled Musician.' Very many of his works are in private collections in the United States.

Zambales, thäm-bä'läs, Philippines, a province of Luzon, in the southwestern part of northern Luzon; bounded on the west by the China Sea; on the north by Lingayén Gulf; on the east by Lingayén Gulf, and the provinces of Pangasinan, Tarlac, and Pampanga; and on the south by Bataan; length 120 miles; width, 28 miles in the southern part, 25 miles in the northern part, and 12 miles in the central part; area, 2,160 square miles; with dependent islands, 2,210 square miles. A chain of mountains near the eastern boundary parallels the coast; and there are also two groups of peaks but a few miles inland from the coast. There are numerous short rivers, and several thermal springs in the province. The chief industry of the province is agriculture; rice and wheat of superior quality are the special products; sugar, cotton, tobacco, and coffee are also extensively cultivated. Next to agriculture in importance is the raising of cattle, horses, carabaos, and hogs. The mechanical industries are very limited and primitive; copper and coal are mined; and there are

ZAMBEZI — ZAMBOANGA

indications of iron. The forest products are valuable, and amber is collected in considerable quantities on the coast. There are but few roads, and these are mostly impassable in the rainy season; a road and telegraph line parallel the coast for the greater part of the distance. Civil government was established in August 1901, and the provincial governor reported the province in a peaceful and prosperous condition in January 1902.

Zambesi, zām-bě-zě, or **Zambesi**, South Africa, a river rising in Portuguese West Africa, in lat. $11^{\circ} 21' 3''$ S., and lon. $24^{\circ} 22'$ E., and reaching the Indian Ocean at Chinde and Conceição in Portuguese East Africa, opposite Madagascar, after a total course of 1,650 miles, of which the middle part belongs wholly to Rhodesia. The Victoria Falls and the Kebrabasa Rapids, the former in the west of Rhodesia and the latter in Portuguese East Africa, above Tete, are regarded as dividing the river into three sections, the Upper, Middle, and Lower Zambesi. The neighborhood of the source has an altitude of about 5,000 feet, and the river has its origin in a deep depression at the base of steep undulations, where the water oozes from a black marshy bog and quickly collects into a well-defined stream. Another head-stream of the Zambesi is the Kabompo, which rises in the northwest of Rhodesia, about lat. $11^{\circ} 34'$ S., and lon. $25^{\circ} 17'$ E., also at an altitude of 5,000 feet, and in a region of open grassy downs. The former stream, at first known as Yambeshe and then as Liambai (Liambeshe), flows at first west with a southward trend, and then turns south-southeast. Ten miles of rapids precede the Sapuma cataracts ($13^{\circ} 7'$ S.), where the river flows "through a narrow rocky fissure into a pool of considerable extent." At about 14° S. it is joined by the Kabompo from the northeast and the remaining course of the Upper Zambesi has a south and southeasterly direction through the low-lying, grassy Marotse country, and is marked by various cataracts and rapids. Sesheki is a place of some importance on the left bank, near where the river begins to be wholly in British territory; and a short distance farther down, opposite Kazungula, it receives from the west the waters of the large tributary Kuanda. In about 18° S. there are the celebrated Victoria Falls (q.v.), discovered by Livingstone in 1855. Here the broad river suddenly plunges into a transverse chasm 400 feet deep amidst a scene of tremendous grandeur. The gorge just below and in full view of the falls is spanned since 1904 by a lofty bridge on the Cape to Cairo Railway. The Middle Zambesi, whose direction is east, northeast, and again east, receives the Guay-Shangani and San-yati from the south; the Kafukwe and Loangwa from the north, the latter at Zumbo, where the river leaves British territory; and is interrupted by various rapids and rocks, especially at low-water, the Kebrabasa Rapids being the first impassable obstacle to navigation from the mouth. The remaining course of the river (Lower Zambesi) has been described as, except for the Lupata Gorge, "merely a broad expanse of sand, three to five miles wide, with low, reed-fringed banks, and intersected by numerous shallow streams." It passes the town of Tete, below which it is joined on the right

by the Mazoe, and after passing Sena it receives from the left the Shiré from Lake Nyassa, the waterway to British Central Africa. It enters the Indian Ocean by several mouths, of which the Chinde one is the most practicable. The delta covers an area of about 25,000 square miles, and commences about 90 miles from the coast, a little below the confluence of the main stream with the Shiré. The river drains an area estimated at 600,000 square miles. Its basin is separated from that of the Orange River on the southwest by a slight watershed, and from that of the Limpopo on the south by a mountain range. The valley of the Zambesi is capable of immense development in the way of trade. The Portuguese government has long exercised sway for 300 miles from the mouths of the river, and by the international arrangement of June 1891 the river from the coast to the confluence of the Loangwa is recognized as being in Portuguese territory. The Zambesi and its affluents are now free to the flags of all nations. The Upper Zambesi was first explored by Livingstone, who reached the Liambai in 1851.

Zambesia, zām-bě-zhī-ā, one of the three districts of Portuguese East Africa, and a name popularly applied to the regions in Rhodesia divided by the Zambesi, and known respectively as North and South Zambesia. See EAST AFRICA, PORTUGUESE; RHODESIA.

Zamboanga, zhām-bō-ān'gā, Philippines, (1) town, capital of the comandancia of Zamboanga; on the southern coast, 17 miles across the strait from Isabela. It was founded in 1635 as a base of operations against Moro pirates; shortly before the American occupancy of the islands it was almost entirely destroyed by fire, partly by the Spaniards and partly by the Filipinos; since then it has been rebuilt. Many of the houses are of stone, and the town contains a fort, the Castle of San Felipe, a cathedral, and a public hospital. It is connected with Manila by steamer, and is the chief market in the southern part of the archipelago for hemp, copra, and gutta percha. (2) Comandancia of Mindanao, forming the western peninsula of that island; bounded on the north by Dapitan, on the south by the Celebes Sea and Basilan Strait, on the east by Cotabato, and on the west by the Sulu Sea; length from northeast to southwest 103 miles, and from east to west along the northern boundary 94 miles; area, 3,358 square miles; with dependent islands, 3,486 square miles. The main mountain range extends west and then southwest from the northeastern boundary; another range traverses the Bañganinan or Flecha peninsula. The climate is the best in the Philippines, the temperature varying but a few degrees. Agriculture and stock raising are the more important industries; rice, hemp, cotton, coffee, sugar, cocoanuts are cultivated; and cloves and nutmegs and vegetables are also among the valuable products of this province. Cattle, horses, and hogs are raised. There is an abundance of valuable woods, particularly teak and juniper; several saw mills, coconut mills, and small sugar mills are in operation, but the mechanical industries are almost entirely for supplying home demand. There are indications of coal and gold, but no mining. There are no roads except near the towns.

ZAMBONI'S PILE—ZAMORA

Zambo'ni's Pile, in electricity, a dry voltaic pile or battery invented by Zamboni. Paper silvered on one side is damped and coated on the other with manganese dioxide; half a dozen of these sheets being superposed to save time, disks are punched out, and 1,000 to 2,000 single sheets are compressed in a glass tube with metal caps and knobs at the ends. Such a pile will charge a Leyden jar, though it will not give shocks or sparks.

Zamia, a genus of *Cycadaceae*. (See CYCADAE.) In aspect the species partly resemble palms, and partly tree ferns; in affinity they are nearer the latter than the former, but rise considerably above them in organization. They are natives of tropical America, tropical Asia, the Cape of Good Hope, and Australia. *Z. caffra* is the bread-tree *Zamia*. It is six or seven feet high, and is a native of southeastern Africa, where the Kaffirs and the Hottentots make cakes of the pith after it has putrefied. *Z. spiralis* has many smooth leaflets, with a few spines at the tip. It grows in Australia, where the natives eat the fruit. The stems of *Z. tenuis* and *Z. furfuracea*, and the seeds of *Z. integrifolia* or *pumila*, in the West Indies, yield arrow-root. The Florida Indians call the last "coontie," and manufacture flour from the rhizomes. It grows in the everglades of Florida, and has large tubers of the shape and size of parsnips, which are rough and gray on the outside, but are white internally. The tubers are pounded to a pulp, in a log mortar, and washed in a straining cloth, the abundant starch of the coontie passing through and settling in a deerhide. This process rids the plant of an acrid poisonous principle which is carried away by the water. The Federal armies lost a number of men during the Civil War, who ate the root in its crude poisonous state. The sediment, or starch left in the deerskin after straining, is fermented and dried, and becomes a yellowish-white flour ready for use, which has long been a staple food of the Seminoles. The coontie starch, when extracted in proper mills, is finer and whiter than the Indian product, and is called Florida arrow-root. It is nutritious, and makes excellent puddings, and the like.

Zamojski, ză-moi'skê, an ancient family of Poland, whose most distinguished members have been JAN ZAMOJSKI, statesman and general (b. Skokow, palatinate of Chelm, 1 April 1541; d. near Skokow 3 July 1605). He was educated at Paris, Strasburg, and Padua, and in 1564 was elected rector of the university at Padua. In 1565 he returned to Poland, and upon the death of King Sigismund Augustus in 1572, succeeded in so organizing the equestrian order, that in the diet of 1573, held at Warsaw, Henry of Anjou (afterward Henry III. of France) was chosen king of Poland. Upon the abandonment of Poland by Henry, a party of nobles elected Maximilian II. of Austria, and he was proclaimed king by the primate; but the party hostile to the house of Austria chose Stephen Báthori (q.v.), who marched rapidly to Cracow, and was there crowned Zamojski, the leader of this movement, was made grand chancellor of the kingdom. In 1580, during the war with Russia, Báthori appointed him commander of the principal army, with the title of hetman; and in 1582 he negotiated the peace by which Livonia, Esthonia, and Novgorod were

ceded to Poland. After the death of Báthori in 1586, he might have secured the crown for himself; but he used his influence in favor of Sigismund III., son of the king of Sweden, defeated the army of the opposing claimant, the Archduke Maximilian, at Cracow, pursued him into Silesia, and took him and his forces prisoners. From 1590 to 1597 he was engaged in a constant series of wars; and while Sigismund, with whom he was no favorite, did not concern himself about the condition of the kingdom, he almost alone maintained the integrity of the state, fighting successfully against the Turks, Tartars, and Cossacks, and oftentimes supporting the army from his private fortune. Zamojski was not only a great statesman and general, but a munificent patron of literature and the sciences. He founded New Zamosc, which came to be regarded as one of the strongest fortresses of Poland, and established there an academy and a famous printing press. He wrote 'Testamentum Joannis Zamor' (1606), and many letters of his are to be found in Lunig's 'Literæ Procerum Europæ.' JAN ZAMOJSKI, general, grandson of the preceding (b. 1626; d. Warsaw 2 April 1664). He participated in the campaign of 1651 against the Cossacks, was made palatine of Sandomir, and was very conspicuous in the following wars. In 1659 he was at the head of the army which acted in the Ukraine against the czar of Russia. ANDRZEJ ZAMOJSKI, statesman (b. Biegun 1716; d. Zamosc 10 Feb. 1792). He entered the military service of Saxony, went back to Poland in 1754 and was made marshal of the palatinate of Smolensk. In 1760 he emancipated his serfs, and on the accession of Stanislas Augustus was appointed grand chancellor. In 1776, at the request of the diet, he drew up a code of laws, which was printed under the title of 'Zbiór praw sądowych' (1778). The liberal character of the code, especially its provision for a general measure of emancipation, aroused against it so great a hostility, that in the diet of 1780 it was not permitted to be read, but it was adopted in 1791. ANDRZEJ ZAMOJSKI, statesman, grandson of the preceding (b. 2 April 1800; d. Cracow 29 Oct. 1874). He studied at Geneva and Edinburgh, entered the Polish civil service in 1823 and was minister of the interior of the revolutionary government in 1831. He later introduced steam navigation on the Vistula, but as the head of an important agricultural association incurred the suspicion of the Russian government. The association was suppressed in 1862 and Zamojski banished.

Zamora, thā-mō'rā, Antonio de, Spanish dramatist: b. Madrid about 1660; d. there before 1744. He was a court officer during the reign of Philip V. and also held a secretaryship in the department of Indian affairs. He wrote a number of dramas which were highly esteemed by his contemporaries. He imitated the style of Calderon, but rarely attained the poetic beauty of that author; the best of his dramas, however, show skillful development of character. Among the most noteworthy are 'Mazariegos y Monsalves'; 'Cada uno es Linaje Aparte'; 'El hechizado por fuerza,' a comedy produced in Spain in modern times; and 'El Convidado de Piedra,' on which is based the libretto of the opera of 'Don Juan.'

ZAMORA — ZANESVILLE

Zamora y Coronado, z kô-rô-ná'thō, **Jose Maria**, Central American jurist: b. Cartago, Costa Rica, 1785; d. Cuba after 1846. He was educated in Spain and on his return from there held important judicial and civil posts in both Porto Rico and Cuba. He published 'Registro de la legislación ultramarina' (6 vols. 1844-8), a work of much historical value on account of its being a collection of laws and regulations pertaining to the Spanish-American colonies.

Zamora, Spain, a city in Leon, capital of a province of the same name, 140 miles northwest of Madrid, on a rocky hill on the right bank of the Douro, here crossed by a fine bridge. It has interesting mediæval buildings, and is the see of a bishop; the cathedral is a Gothic structure, completed about 1174, but partially modernized in the Corinthian and Doric styles. Zamora as a fortified town played an important part in early Spanish history, and is renowned for the successful defense which it made against the Moors in 939 A.D. Pop. about 18,000.

Zamora, Venezuela, an interior north-western state bounded by Lara, Miranda, Bolivar, and Los Andes. The capital is Guanare (q.v.). Area, 25,212 square miles. Pop. 246,676.

Zamosc, ză'mōsch, Russian Poland, a fortified town in the province of Lublin, on the Wieprz, 50 miles southeast of the town of Lublin. It was laid out in 1588 in the Italian style by Jan Zamojski, and all its houses have arcades. Its fine castle, the four churches, the arsenal, and the town-house are the chief buildings. The manufacture of furniture is the principal industry.

Zamouze, ză-moos', the West African buffalo (q.v.).

Zampa, zăn-pă, **Ou la Fiancée de Marbre**, an opera comique by the French composer, Louis Joseph Ferdinand Hérold (q.v.), first produced in 1831.

Zampieri, dzăm-pē-ă'rē, **Domenico**. See DOMENICHINO.

Zanardelli, Giuseppe, joo-sēp'pē dzā-nār-dē'lē, Italian statesman: b. Brescia 29 Oct. 1826. After study at Pavia, he was a volunteer in the war of 1848, then was for a time in journalism and gave lectures on law, but was forced by the Austrian officials to discontinue them. Elected deputy in 1859, he held various administrative posts, in 1876 became minister of public works, and in 1878 of the interior. From 1881 to 1883 he was minister of justice, and from 1887 to 1891 again held that portfolio. During the latter period of service he issued the penal code and commenced a reform in the magistracy. He was president of the Chamber of Deputies in 1892-4, in 1897 was again chosen, in December 1897 accepted the portfolio of justice for a third time, but withdrew in May 1898, once more to become president of the Chamber. This post, too, he relinquished, to identify himself with the opposition, and at the fall of the Saracco cabinet in February 1901 was able to form an administration with the aid of the extreme left. He was an orator of high rank, a steadfast Liberal, and the recognized leader of the constitutional left.

Zandeh, zăn'dă. See NYAM-NYAM.

Zane, zân, **Ebenezer**, American pioneer: b. Berkeley County, Va., 7 Oct. 1747; d. Wheeling, W. Va., 1811. Of Danish descent he made the first permanent settlement on the Ohio River in 1770, on the site of the present city of Wheeling, building there a block house called Fort Henry, whence he repelled several Indian assaults during the Revolutionary War. He was a disbursing officer under Lord Dunmore; held several military and civil offices, and attained the rank of colonel. The land where the city of Zanesville, Ohio, now stands, formed a portion of his property, and he assisted John McIntire in laying out that town in 1799. The locality was called by them Westbourn, and the present name was not adopted till 1802.

Zanella, Giacomo, jă'kō-mō dzā-nē'lā, Italian poet: b. Chiampo (Vicenza) 1820; d. Vicenza 17 May 1888. After studying for the priesthood at the Vicenza seminary, he became professor there of philosophy and Italian literature. Having held posts in lyceums at Venice, Vicenza, and Padua, he was made professor of Italian literature in the University of Padua in 1866, and in 1871-2 was rector of the university. His work is noted for beauty of style and mastery of form; his most popular poem being 'La Conchiglia Fossile' (The Fossil Shell). His first volume of poems, 'Verses,' appeared in 1868, and was followed by several others. Among his poetic tales are: 'The Little Calabrese' (1870), and 'Robin Redbreast' (1881). He published also some volumes of prose, including 'On Italian Literature in the Last Century' (1885).

Zanesville, Ohio, city, county-seat of Muskingum County, on the Muskingum River at the confluence of the Licking, and on the Baltimore & O., the Cincinnati & M. V., the Ohio & L. K. branch of the Baltimore & O., the Ohio River & W., the Wheeling & L. E., the Zanesville & W., and the Zanesville, M. & P. R.R.'s, and on the Columbus, Newark & Zanesville Interurban Electric Railroad. The town was originally founded by Jonathan Zane and John McIntire in 1799. The city is situated in the midst of a fertile agricultural region, and near the city are extensive deposits of coal, clay, and limestone.

Principal Buildings, etc.—The chief buildings include the New Masonic Temple, the People's Saving Bank building, Soldiers and Sailors' Monumental building, Schultz Opera House, Weller Opera House, County Court-house, Schultz office building, Zanesville High School, Clarendon Hotel building, and City Market House.

Manufactures.—Manufacturing began early in Zanesville, and was rapidly increased owing to the excellent water-power furnished by the Muskingum River, and the low price of fuel. The manufactures are varied and consist of the largest tile works in the world, potteries, agricultural implements, bent wood works, breweries, brick-yards, coffin factories, foundries, flouring mills, glass houses, leather tanneries, machine-shops, mining tool factory, tube works, and woolen mills, etc. The employment list numbers nearly 6,000 persons.

Banks, Churches, Schools, etc.—The city has four national banks, with a capital of \$650,000; there are also two state banks and seven savings banks; there are 31 churches, in-

cluding nearly all the leading denominations. There are 44 secret societies. The city has a very complete school system, there being 17 public schools, the Zanesville Business College, two Roman Catholic parochial schools, besides a high school, a Roman Catholic academy, and a Lutheran parochial school. The McIntire Children's Home was endowed by the estate of John McIntire.

Government, etc.—The organization of the city under the Ohio Code consists of a mayor, three members of the board of public service, who also constitute the board of health; two members of the board of public safety, appointed by the mayor; joint city and county board of workhouse directors, appointed by the mayor; and a police judge. The city has a municipal water plant and a municipal hospital. Pop. (1910) 28,026.

FLORENCE C. HYSEN,
Secretary Post-Office Executive Department,
Zanesville.

Zangwill, Israel, British author: b. London 1864. He was educated at the Jews' Free School (Spitalfields) and the University of London, published in 1888 'The Premier and the Painter,' a fantastic romance, in 1890 established 'Ariel, or the London Puck,' a brilliant but short-lived periodical, and soon made his reputation by his essays, works in fiction, and plays. His department of literary causerie, 'Without Prejudice,' in the 'Pall Mall Magazine,' became well known in Great Britain for its able critiques. Some of these essays were gathered into a volume of that title in 1896. Some of Zangwill's best fiction deals with Jewish types and subjects, as in 'Dreamers of the Ghetto' (1898), with its semi-historical pictures of Heine, Spinoza, Uriel (Gabriel) Acosta, and others. He lectured in Great Britain, Ireland, Palestine, Holland, and the United States, and, as a prominent Zionist, gave addresses in connection with that movement and the application to it of the Baron de Hirsch millions. His literary work is in a style of much distinction, with frequent touches of irony. Among his farther volumes are: 'Children of the Ghetto' (1892); 'Ghetto Tragedies' (1893); 'They That Walk in Darkness' (1899); 'The Mantle of Elijah' (1900); 'The Grey Wig' (1903); 'The Celibates' Club' (1904); and 'Blind Children' (1903), a collection of his verses. The play which he constructed (under the same title) from his 'Merely Mary Ann' (1893), was more successful (1904) than the dramatization (1899) of 'Children of the Ghetto' or the one-act 'The Moment of Death' (1900). 'Six Persons' (1892) was well received in England.

Zangwill, Louis, English author, brother of I. Zangwill (q.v.): b. Bristol 25 July 1869. At first a journalist he later took up literature as a profession, using for a while the pseudonym 'Z.Z.' He has published 'A Drama in Dutch' (1894); 'The World and a Man' (1896); 'The Beautiful Miss Brooke' (1897); 'A 19th Century Miracle' (1897); 'One's Woman' (1902); etc.

Zankoff, zân'kôf, Dragan, Bulgarian politician: b. Sistova 1827. He studied at the universities of Odessa, Kiev, and Vienna, and entering the service of Turkey, became secretary to the Pasha of Rustchuk, Bulgaria. In 1880 he was made premier of Bulgaria and minister

of foreign affairs by Prince Alexander, and again held the post of premier 1883-4. Later he became the enemy of Alexander and the head of the pro-Russian party. On the night of 20 Aug. 1886 Zankoff with a party of fellow-revolutionists broke into Prince Alexander's palace and forced him to resign. Zankoff then became a member of the provisional government.

Zanotti, dzâ-nô'ttê, or Cavazzoni Zanotti, Giovanni Pietro, jô-vân'nê pê-â'trô, Italian artist: b. Paris 1674; d. Cortona 1765. He was a pupil of Lorenzo Pasinelli at Bologna, and became a good designer and colorist, and an adept in chiaroscuro. For churches at Bologna he executed several altar-pieces, among the chief that of 'The Incredulity of St. Thomas' in the church of that saint. There is also in the Palazzo Pubblico a large picture by him of 'The Ambassadors of Rome Swearing Fidelity to the Bolognese.' At Cortona, where he long resided, he distinguished himself by such pictures for churches as 'Christ Appearing to Mary Magdalene' and 'Christ Carrying His Cross.' He was a careful writer on art, the most important of his works being the 'Storia dell' Accademia Clementina di Bologna' (1739).

Zante, zân'tê, or Zacynthus, Greece, one of the Ionian Islands, in the Mediterranean, between eight and ten miles south of Cephalonia, and 15 miles from the nearest point of Greece. It is about 24 miles long, 12 miles broad, and 60 miles in circuit; area, 277 square miles. It has the form of an irregular oblong, indented with a deep bay at its southeast extremity. The western half is hilly, rising to 2,500 feet, and the west coast exhibits limestone cliffs. The east coast has a harbor, within which is situated the town of Zante [pop. (1896) 14,906] a thriving and well-built place, the see of a Greek protopapas, and of a Roman Catholic bishop. Part of the island consists of an extensive fertile plain, having the appearance of one continued vineyard, with a few patches under cereals or pasture. The prevailing rocks are calcareous; gypsum appears in various parts, and its pitch-wells are famous. Earthquakes frequently occur. The staple export of Zante is currants. The other chief exports are oil, soap, and a little wine; pomegranates, melons, peaches, oranges, citrons, and other fruits are grown, but the corn raised scarcely supplies three months' consumption. Goats are the only live stock. The island forms a nomarchy of the kingdom of Greece, since 1864; it is mentioned by Homer, and was formerly an independent state which successively came under Macedonian, Roman, and finally Greek rule. Pop. about 50,000.

Zanza'liana. See JACOBITES.

Zanzibar, zân-zî-bâr', East Africa, (1) A former sultanate comprising the whole coast between Magdishu (Magadoxo), about lat. 2° N., and Cape Delgado, lat. 10° 42' S., with the four islands of Zanzibar, Pemba, Lamu, and Mafia. The continental part of the sultanate in 1890 was divided between British East Africa and German East Africa; while the island and town of Zanzibar, and the island of Pemba became a British protectorate; joint area 1,020 square miles; pop. est. 250,000. (2) The island of Zanzibar with an area of 600 square miles, is very fertile and well cultivated, being espe-

ZAPOLYA—ZAVALA

ially suited for the cultivation of cloves, sugar, coffee, cocoa, and various spices, of which there is a considerable export. The heterogeneous population estimated at 200,000 includes Europeans, Arabs, half-caste Portuguese from the Malabar coast of India, and the Suahilis from the mainland. (3) Zanzibar, the chief town (pop. 100,000) on the west side of the island, is the centre of trade for the eastern seaboard of Africa, and of missionary and exploring work for the interior.

Zapolya, zā'pōl'yō, John, king of Hungary: b. about 1487; d. 1540. After the death of Louis II. at Mohács (1526) he was elected king of Hungary by the National party, having previously been voivode, or prince, of Transylvania. The crown was contested by Ferdinand of Austria, who was at first so successful as to compel Zapolya to flee to Poland. But the latter, with Turkish assistance, by 1529 had subdued a great part of Hungary, together with the capital city of Buda, as well as Transylvania. The kingdom was divided between Zapolya and Ferdinand in 1538 by the treaty of Grosswardein.

Zappi, Giovanni Batista Felice, jō-vān'nē bā-tēstā fā-lē'chā zāp'pē, Italian poet: b. Imola 18 March 1667; d. Rome 30 Aug. 1719. After a legal training at Bologna, he went to Rome, where he gained a brilliant reputation as juriconsult and poet. He assisted in establishing the Academy of Arcadians, in which he held the name Tirsi Leucasio. His verse abounds in fantastic adornments. A collection of it appeared in 1776, and it has been otherwise published, both separately and in association with that of his Arcadian colleagues. He received the patronage of Pope Clement XI.

Zara, zā'rā, Ital. dzā'rā, Austria, a seaport town, capital of Dalmatia, on a promontory, which was converted into an island by cutting through the narrow isthmus which formerly connected it with the mainland, 70 miles northwest of Spalatro. It was a fortress till 1873, and still has four gates and mediæval ramparts, the latter now converted into a public promenade. It has steep and narrow streets; several squares; an ancient and interesting cathedral, in the Lombard style; several other churches; a town-house; a lyceum, gymnasium, archiepiscopal seminary, normal and other schools; a civil and a military hospital; and a capacious but somewhat shallow harbor, admitting warships of medium size. It has manufactures of rosoglio, maraschino, and glass, and some trade. Zara has stood many sieges, particularly one in 1202, when it was taken by the Venetian doge Dandolo, with the assistance of the French crusaders; and another in 1346, when it was taken by Marino Faliero in the face of a large Hungarian army. Pop. about 35,000.

Zarate, thār-ā'tā, Antonio Gil y, Spanish dramatic poet: b. San Lorenzo de l'Escorial, Spain, 1795; d. 1860. He was educated in Paris; and on his return to Spain became professor of physics in Granada. He afterward wrote dramas notable for striking situations, lively dialogue, and elegant versification; among them are: 'Blanche of Bourbon' (1835); 'Guzman the Brave'; 'The Czar Demetrius.' He also published a history of Spanish literature.

Zarate, Augustin de, Spanish historian: b. about 1492; d. Madrid about 1560. After holding for 15 years the office of comptroller of Castile he accompanied Nunez Vela, viceroy of Peru, to South America in 1543, and while there was not only an eye witness of many historical events of importance, but made a close study of Peru and its annals. On the fall of Gonzalo Pizarro he returned to Spain and in 1555 published 'Historia del descubrimiento y conquista de la provincia del Peru' (History of the Discovery and Conquest of the Province of Peru). There have been many later editions of this most valuable work, and it has been translated into French and Italian.

Zarathushtra, zā-rā-thoosh'trā. See Zoroaster.

Zar'atite, an emerald-green incrustation usually on chromite. It is a hydrous basic carbonate of nickel. Its best known locality is at Texas, Pennsylvania. It is often called "emerald nickel."

Zarso'ba. See ZERIBA.

Zarits'in, Russia. See TSARITSYN.

Zarlino, Giuseppe, joo-sēp'pē dzār-lē'nō, Italian composer: b. Chioggia, near Venice, 1520; d. Venice 14 Feb. 1590. He became a Franciscan in 1537 and in 1541 went to Venice to study music with Willaert. In 1565 he was appointed choir master of Saint Mark's, Venice, and continued in that position till his death. He was especially famous for the music he composed to be performed on the occasion of the victory of Lepanto. He determined the relations of the tones and semi-tones more precisely than had previously been done, and on this subject wrote 'Istituzioni armoniche' (1562-73). Other works of his are: 'Dimostrazioni armoniche' (1571); 'Sopplementi musicali' (1588). Among his musical compositions may be named 'Modulationes' (1566); 'Lectiones pro Mortuis' (1563).

Zarncke, tsārn'kē, Friedrich, German scholar: b. Zahnestorf, near Brüel, Mecklenburg-Schwerin, 7 July 1825; d. Leipsic 15 Oct. 1891. After study at Rostock, Leipsic, and Berlin, he founded the 'Litterarisches Zentralblatt für Deutschland' at Leipsic in 1850, and in 1858 became professor at the university there. His work in connection with mediæval literature was of particular importance, and his chief publications were his edition of Brant's 'Narrenschiff' (1854), and joint-edition of Benecke's 'Middle High German Lexicon' (1863). His valuable library was acquired by Cornell University. Among his further writings were a study of Christian Reuter (1884) and 'Kurzerfasstes Verzeichniss der Originalaufnahmen vom Goethes Bildniss' (1888).

Zarskoje-Selo, zār-skō't-sā'lō, Russia. See TSARSKO-SELO.

Zauberflöte, tsow'bēr-flē'tē, Die ('The Magic Flute'), an opera by Mozart, first produced at Vienna in September 1791, under the direction of the composer. A French version of the opera bears the title 'Les Mystères d'Isis.'

Zavala, thā-vā'lā, Joaquin, Nicaraguan politician: b. Nicaragua about 1839. He entered the army, became prominent in political affairs and was president of Nicaragua 1879-83.

He was afterward minister to the United States and in 1893 headed the insurrection which secured the deposition of President Sacaza in May 1893. On 17 July of that year he was declared provisional president, but only to lose his position through another revolt a fortnight later.

Zbylitowski, zbi-li-tow'ské, Andre, Polish writer, philosopher and poet: b. Galicia 1732; d. 1813. He was doctor of philosophy for a time at Cracow and later made extensive travels through South America and Europe. He has published 'Rhythms in Polish Verse' (1763); 'The Marshal'; 'A Beard'; etc.

Zbylitowski, Pierre, Polish writer and poet: b. in the palatine of Lublin 1684; d. Warsaw 1757. He was educated at the University of Warsaw and after leaving there traveled extensively through Europe and North America. He has published 'Porydia' (1734); 'Epigrams' (1735); 'Lucie,' a poem (1739); etc.

Zea, thá'a, Francisco Antonio, Colombian naturalist and statesman: b. Medellin, New Granada (Colombia), 21 Oct. 1772; d. Bath, England, 28 Nov. 1822. After study at the College of Popayan, he was connected with the botanical expeditions of Mutis, in 1795 was sent to Spain under arrest on the charge of circulating republican literature, and though acquitted in 1799 was forbidden to return to New Granada. He carried on botanical researches in Europe, but in 1815 joined Bolivar at Jamaica. In 1819 he was chosen vice-president of Colombia by the congress of Angostura, and in 1820 went to Europe as envoy of the Colombian republic to France and England. He has sometimes been styled the "Franklin of Colombia." Among his published works are: 'Memoria sobre la Quina según los Principios de Mutis' (1800), and a 'Historia de Colombia' (1821).

Zea, zé'a. See **Cnos**.

Zealand, zé'land, or **Stjælland**, Denmark, the largest island of the kingdom, between the Cattegat and the Baltic, separated from Sweden by the Sound and from Funen by the Great Belt; area, with the two southern islands of Møen and Samsøe, 2,793 square miles; pop. 833,702. It has no mountains; but the surface is finely variegated, having small hills and fields of a fertile soil, intersected by canals. It produces large crops of corn, and has excellent pasture. Besides several other towns of considerable importance, it contains the fortress of Elsinore or Helsingör, and the capital and royal residence, Copenhagen.

Zealand, or **Zeeland**, Netherlands, a province bounded south by Belgium, and west by the North Sea; area, 690 square miles. Capital, Middelburg, in the island of Walcheren; principal seaport town, Flushing. The province consists of a low-lying tract of land on the frontiers of Belgium and on the southern shore of the estuary of the Schelde, and of the islands of Walcheren, North and South Beveland, Schouwen, Tholen, etc., separated from each other and from the mainland by arms of the Schelde, from which and from the North Sea it is protected by dikes. As a whole the province is flat and fertile, producing excellent crops of the ordinary cereals, a considerable quantity of clover, rape, and madder, and a superabundance of excellent fruit. The grass

lands also are rich and extensive. The climate is rather moist, but comparatively healthful. Large tracts partially covered by the sea have in recent times been successfully reclaimed. Pop. about 225,000.

Zeal'ots, a sect of the Jews, composed of the more fanatical elements opposed to Roman rule. They led a revolt against the Romans in 6 A.D., and after that frequently robbed and murdered those whom they knew to be supporters of or sympathizers with the Romans. Felix tried to suppress them by crucifying all of the sect whom he could capture, but this only caused an increase in the number of their acts of violence. They continually stirred up the Jews against the Romans, and were largely influential in bringing on the Jewish war of 66-70, which resulted in the overthrow of Jerusalem.

Zeballos, thá-bál'yós, or **Ceballos**, Pedro (ZEBALLOS CORTES Y CALDERON), Spanish general: b. Cadiz 25 June 1715; d. Cordova 26 Dec. 1778. Entering the army as a cavalry captain in 1738, he became a lieutenant-general in 1755 and was despatched to Buenos Ayres as governor the next year. On the outbreak of the war with Portugal and England in 1762, Zeballos besieged the Portuguese port of Colonia de Sacramento, near the entrance of the Uruguay River, forcing its surrender 2 Nov. 1762, and capturing 26 English ships in its harbor. He returned to Spain in 1767 and in 1777 was made viceroy of the newly established viceroyalty of La Plata. On his way thither he wrested Santa Catharina from the Portuguese and retaking Colonia de Sacramento, which had reverted to Portugal since its former capture, destroyed it. He was relieved of his duties in 1778 and returned to Spain.

Zebid, zé-béd', Arabia, a town in Yemen, on the inland route from Hodeida to Mokha, 60 miles north of the latter. It was formerly the seat of a long line of princes, and was famous for its commerce and learning. The population has dwindled to 7,000 inhabitants.

Zebra, the name of several animals, natives of Africa, belonging to the family of the horses. The zebra belongs to the same general type as the ass, distinguished from *Equus* (the horse) proper by smaller size and by having the body more or less banded black upon yellowish. The forelegs only possess the "warts," seen in both fore- and hind-limbs in the horses; and the tail is "tufted." The typical or mountain zebra (*Equus zebra*) inhabits South Africa, but it is now almost extinct. A few specimens, however, are strictly preserved in the mountainous districts of eastern Cape Colony, where, until about 1875, they abounded in herds on the plains. The body is cream-colored, its characteristic bands being deep black. The stripes are drawn at right angles to the axis of the body. The legs are striped right down to the hoof, but the under part of the body has no stripes. The neck bears a faint development of skin or dew-lap, and the mane is very short. The animal was long considered untamable, but experiments made since 1872 have shown that with proper treatment it can be made to work well in harness. Any general utilization and improvement of it, however, seems impracticable. The dauw, or Burchell's zebra (*Equus burchelli*), is higher and more graceful than the true zebra.

ZEBRA PARRAKEET — ZECHARIAH

and is the one commonly seen in menageries. Its stripes are narrower and somewhat differently disposed from those of the true zebra, and extend under the belly, but are absent from the lower part of the legs. It has been driven northward, and is now rare even in the Transvaal. Chapman's zebra (*E. chapmani*) is another variety, found from Bechuanaland north to the Sudan. Grévy's zebra (*E. grevyi*) is restricted to Abyssinia and Somaliland. The quagga (q.v.) is a near ally of the zebras. Consult Lydekker, 'Royal Natural History,' Vol. II. (London 1895); Tegetmeier and Sutherland, 'Horses, Zebras, Mules and Mule-breeding' (London 1895).

Zebra Parrakeet, an Australian or East Indian parrot. See BUDGERIGAR.

Zebra-shark. See TIGER-SHARK.

Zebra Wolf, an early colonial name for the wolf-like, striped, predatory marsupial of Tasmania. See DASYURE.

Zebra Wood, in botany and commerce: (1) A kind of wood, imported from South America, and used by cabinet makers, produced by *Connarus guianensis* (*Omphalobium lam-berti*), a large tree belonging to the natural order *Connaraceae*, and growing in Guiana. Its colors consist of brown on a white ground, clouded with black, and each strongly contrasted, thus somewhat resembling the skin of a zebra. It is also called pigeon wood, and is used for furniture. (2) The wood of *Eugenia fragrans*, variety *cuneata*. It is a shrub about eight feet high, growing in Jamaica. (3) The wood of *Guetardia speciosa*, an evergreen tree 25 feet high, with scarlet-colored flowers, growing in the East Indies.

Zebu, zē-boo' or thā-boo', Philippine. See Cebu.

Zebu. See INDIAN HUMPED CATTLE.

Zebulun, zēb'ū-lūn, or Zebulon, the tenth of Jacob's 12 sons, and the sixth and last by his wife Leah (Gen. xxx. 19-20). Of his individual history nothing is related in the Scriptures, but his name was given to one of the 12 tribes of Israel, and to a region of Palestine. At the time of the exodus from Egypt the tribe of Zebulon moved in the van, following the tribes of Judah and Issachar. The territory of the tribe lay in the fertile hilly country to the north of the plain of Jezreel, and included Nazareth. The tribe of Zebulon was inferior in importance to several of the other tribes and its tribal existence closed when Tiglath-Pileser carried its principal members, with the northern tribes, into captivity (II. Kings xv. 29).

Zech, Frederick, American pianist and composer: b. Philadelphia, Pa., 10 May 1853. Taken to San Francisco when very young, he began to study music there and afterward studied in Berlin, 1877-82. Since the year last named he has resided in San Francisco, where he has been conductor of the symphony orchestra and has given many piano recitals. Among his many compositions are four symphonies, four concertos for piano and orchestra, two symphonic poems, 'The Eve of Saint Agnes,' and 'The Raven'; an opera, 'The Cruise of the Excelsior'; sonatas and songs.

Zechariah, zēk-ā-rī'ā, the eleventh in order of the Hebrew writers known as minor proph-

ets. Little is known of his personal history, but he first publicly discharged his office as priest in the second year of Darius 519 a.c. He is called in his prophecy the son of Berechiah and the grandson of Iddo, but in the Book of Ezra he is termed 'the son of Iddo.' He was priest as well as prophet and is associated with the prophet Haggai. Tradition states that Zechariah had much to do in furnishing the liturgical services of the temple, and in the Septuagint and Vulgate versions several psalms are attributed to him. He deals in his prophecy with the same objects as occupied the mind of the prophet Haggai. His style is characterized by symbolic vision and dramatic action. It is distinctly Apocalyptic. This form of prophecy never predominated until after the Exile and seems to have constituted an element in the last and most powerful appeal made by the mouthpieces of Jehovah to the heart and conscience of His people.

Contents of the Prophecy.—The greater portion of the Book consists of a series of visions intended to represent grounds for national confidence and to encourage national effort. The prophecy opens with an exhortation to repentance and a warning against neglect of the prophet's word. The remainder of the book consists of two sections. The first section runs from Chapters i. to vi.

Ch. i. 15 contains nine symbols, mostly visions, accompanied by their interpretations:

Ch. i. 8-17, a vision of the horses of Jehovah, which, as His messengers, report to Him; along with His reply.

Ch. i. 18-21, four horns, representing the opponents of Israel, are broken.

Ch. ii., a man with a measuring-line lays out the restored Jerusalem.

Ch. iii., Joshua, the high priest, is accused by Satan, and acquitted, and is honored with commissions and revelations from Jehovah.

Ch. iv., the beautiful symbol of the golden candlestick and two olive trees, with the practical application of encouragement to Zerubabel.

Ch. v. 1-4, a flying roll recording a curse upon immoral actions.

Ch. v. 5-11, an ephah measure containing a woman is seen carried away to Babylon.

Ch. vi. 1-8, four chariots, each having horses of a particular color, are the four heavenly spirits charged to carry out God's purposes in the earth.

Ch. vi. 9-15, the symbolical action of crowns of silver and gold being made and placed upon the head of Joshua the high-priest, who thus represents the Messiah-priest upon His throne.

The second section runs from chapters vii. to xiv. In ch. vii. the prophet, in answer to a question as to observance of a certain fast, replies that the true fast is justice, mercy and piety, which had been so much neglected in earlier generations. This suggests, in ch. viii., the coming Messianic time, when the city shall be populous and happy under the renewed protection of Jehovah, and the fasts shall be joyful feasts, attended by multitude of strangers seeking His favor.

There is so much that is matter of dispute in ch. ix.-xiv., as regards their date and immediate application, that we shall have to content ourselves with a summary and a few general re-

ZEDEKIAH — ZEEMAN EFFECT

marks. The contents are largely symbolical and figurative. Ch. ix.-xi. form a division by themselves, perhaps written by the Zechariah of Isa. viii. 2. It has an entirely different historical setting from that of ch. i., 8. Here we are transported back to the 8th century a.c. Ch. ix. 1-8 refers to conquests made by Tiglath-pileser III. (745-727 a.c.). Northern Israel is still in existence, and Assyria is still in its "pride" (x. 10ff.). These allusions form part of the very texture of the prophecy, and are assumed by some to be old fragments embedded in a post-Exilic work.

Ch. ix. 1-8, Syria, Phœnicia, and Philistia are to be brought low. Yet a remnant of the Philistines shall be united with Judah, and both shall be under the protection of Jehovah. Ch. ix. 9-17, the Messiah shall come as the Prince of Peace to restore the dispersed of Israel, and save them from their enemies. Ch. x., the people are entreated to turn to Jehovah in their troubles, and not to diviners and images. Jehovah will be the defender alike of Judah and Israel, restoring and strengthening them, and bringing low their oppressors. Ch. xi. announces the shock of war which appals the rulers of Judah (ver. 1-3). The rest of the chapter is allegorical. It represents Jehovah as rejected by His people, they being in turn rejected by Him, their true Shepherd. By an expressive figure, the brotherhood of Judah and Israel is declared to be broken. Ch. xii. 1 to xiii. 6, the nations come against Jerusalem; but Jehovah defends and saves it. The conflict is shown to be spiritual, for a spirit of grace and supplication is to be poured upon Judah and Jerusalem. Also a fountain is to be opened for the cleansing of guilt, and the idols and false prophets are to be banished. Ch. xiv.—Again Jerusalem is besieged, and this time it is taken, half the people going into exile; but the residue are saved. After various figurative illustrations of the processes and results of the Messianic reign, it is declared that the survivors among the nations shall go up to worship in Jerusalem, which shall be wholly consecrated to Jehovah.

Zedekiah, zēd-ē-k'fā, the last king of Judah of the line of David. He was the third son of Josiah and Hamutal and his name was originally Mattaniah. At 21 he was appointed by Nebuchadnezzar to succeed his nephew Jehoiachin (whom he had carried to Babylon) as king of Judah (about 599 a.c.), and changed his name to Zedekiah. He took an oath of allegiance to Nebuchadnezzar, which he afterward broke, and entered into a league with Egypt against him. His action in so doing was denounced by the prophet, Jeremiah, who, as well as Ezekiel, then in Chaldea, predicted the approaching fall of Jerusalem. Jerusalem was besieged by Nebuchadnezzar and taken in 588 a.c., after a siege of a year and a half, the temple and city destroyed, and the leaders of the Jews carried captive. Zedekiah, whose sons were killed in his presence, had his eyes put out, and was carried in fetters of brass to Babylon, where he died, but the time of his death is unknown. His history is recorded in the books of Kings and Chronicles, and more fully in Jeremiah.

Zedlitz, tsēd'ltz, Josef Christian von, Austrian poet: b. Johannisberg, Austrian Silesia, 26

Feb. 1790; d. Vienna 16 March 1862. He served in the Austrian army at the battles of Regensburg, Aspern, and Wagram, and afterward entered the service of the Austrian foreign-office. His dramas 'Kerker und Krone' (1834); 'Der Stern von Sevilla' (1830), etc., were long popular, but he is best known by his pleasing lyrics and ballads, 'Totenkränze,' a collection of elegies (1827); 'Soldatenbüchlein' (1848).

Zedlitz, von, Karl Abraham, BARON, Prussian statesman: b. Landshut, Silesia, 1731; d. 1793. He was appointed minister of justice in 1770, and was placed at the head of the department of ecclesiastic affairs and public instruction in the next year. He did much to uphold the liberty of the press and was a leader in the matter of prison reform. He resigned office in 1789.

Zedoary, certain species of *Curcuma*, natives of India, China, etc, whose rootstocks are aromatic, bitter, pungent, and tonic, and are used for similar purposes with ginger, although less effective. The round zedoary is the produce of *C. aromatica Zedoaria*, having palmate rootstocks, straw-colored within, which are used like turmeric for dyeing. Long zedoary is produced by *C. aerumbet*, having long palmate rootstocks, yellow within. Zedoary is a powerful sudorific, and is employed in the Orient in alterative medicines and for incense.

Zeehan, zē'hān, Tasmania, a mining township on the west coast near the base of Mount Zeehan, from which it takes its name, and 29 miles from the port of Strahan on Macquarie harbor. The township owes its existence to the discovery in 1884 of rich silver-lead ore in great abundance, extending over an area of more than 160 square miles. Pop. 10,000.

Zeeland, zē'lānt, Netherlands. See ZEE-LAND.

Zeeman, Remigius, Dutch marine painter: b. Amsterdam about 1609; d. there about 1672. His real name was Nooms, but he received the name of Zeeman from painting marine subjects. There are a number of his works in the royal palaces at Berlin, where he resided for a number of years. He also produced several etchings of more than ordinary merit.

Zeeman Effect, a phenomenon highly important in connection with theoretical physics, discovered in 1897 by Dr. Pieter Zeeman, of the University of Amsterdam. It consists in the doubling (or further multiplication) of the lines of the spectrum of a substance, when the source of the light under examination is placed in a powerful magnetic field. (See SPECTROSCOPY.) The results that are obtained under varying conditions are too complicated to admit of full discussion in the present place. In general, however, it may be said that when the ray of light under examination travels in a direction parallel to the lines of force in the magnetic field, each line of its spectrum is separated into two lines, which are collectively known as a "magnetic doublet." The two components of such a magnetic doublet have (in general) the same intensity, and they are circularly polarized in opposite directions. Previous to Dr. Zeeman's discovery, no source of light was known, the rays from which were completely polarized, either circularly or otherwise. In order to ob-

serve the Zeeman effect properly, it is essential for the magnetic field to be both intense and uniform, and for the spectroscopy to have a high resolving power. An idea of the order of magnitude of the phenomenon may be had from the following fact: In a magnetic field whose intensity is 10,000 C. G. S. units, each of the two well-known D lines of sodium is resolved into a doublet, and the separation of the constituents of either of these doublets is approximately equal to one twelfth of the distance between the original D lines.

When the ray of light under examination leaves the magnetic field in which it originates in a direction perpendicular to the lines of magnetic force, the phenomena that are observed are much more complicated. The lines of the spectrum are often observed to be triple, and not infrequently they are quadrupled, or even more complex. In all cases, however, each constituent of the modified line is completely polarized; but the polarization, instead of being circular as before, is now plane. The several constituents into which each primitive line is resolved may, in fact, be divided into two groups, one of which is polarized in a plane parallel to the lines of magnetic force, while the other is polarized in a plane perpendicular to those lines.

It will be observed that the Zeeman effect is due, apparently, to the influence of the magnetic field upon the ultimate molecular mechanism which is concerned in the very genesis of the light-ray; and herein lies its great theoretical importance. The ordinary theories of light treat of the propagation of luminous waves through the ether and through matter, after those waves have left their source; and little is known of the way in which a light-wave originates, at the atom which presumably gives it birth. The phenomenon discovered by Dr. Zeeman enables us to trace the consequences of modifying, by direct experimental means, the ultimate conditions that prevail at the very source of the light; and for this reason it is likely to lead to results of the highest importance with respect to the structure of matter and the nature of the ether and its motions. At the present day, physicists are of the opinion that the atoms which constitute matter are themselves composed of far smaller particles called "electrons" (q.v.), the electron, or ultimate unit in the structure of matter, being of the nature of a tiny disembodied charge of electricity. Light is believed to be due to the motions of these electrons within the atoms; and the Zeeman effect is believed to be due to the influence of the magnetic field upon the motions of the electrons. See LIGHT; ETHER; ELECTRON; SPECTROSCOPY. Consult, also, Cotton, 'Le Phénomène de Zeeman'; Lewis, 'Effects of a Magnetic Field on Radiation,' in the 'Scientific Memoir Series.' As the subject is now undergoing extensive investigation, reference should also be made to current scientific periodicals.

A. D. RUTHER, Ph.D.,

Editorial Staff, 'Encyclopedia Americana.'

Zegedin, Stephen de, Hungarian Protestant theologian: b. Zegedin 1505; d. Revim, Hungary, 2 May 1572. He studied under Luther and Melancthon at Wittenberg, and taught and preached abroad throughout the cities of Hungary; was taken prisoner by the Turks, who treated him with great cruelty. Among his

works were: 'Speculum Roman Pontificum Historicum' (1600); 'Assertio de Trinitate' (1573); 'Tabulae Analyticae in Prophetas, Psalmos, et Novum Testamentum' (1592).

Zegedin, Hungary, city in Csongrad, near confluence of the rivers Maros and Theisse. It is one of the largest towns in Hungary and has manufactures of woollens, leather, and toys. Being located adjacent to two navigable rivers, it controls the commerce of a large surrounding district. Pop. 35,000.

Zegers, ză'gers, Hercules, Dutch landscape painter: b. about 1625. He was an artist and engraver of great merit, but notwithstanding the general excellence of his works he found great difficulty in disposing of them, and, becoming discouraged, fell into habits of intemperance. After his death his works sold for very high prices.

Zegers, Tacite Nicolas, Flemish theologian: b. Brussels in the latter part of the 15th century; d. there 1559. According to all authorities he was one of the greatest critics of his time. Among other works he published an edition of the New Testament in Latin (1559).

Zella, ză'la, Zaylah, or Sela, Northeast Africa, a seaport of the British Somali Coast Protectorate, on the Gulf of Aden, a few miles southeast of Jibuti, the port of French Somaliland. Its former commercial importance as the terminus of caravan routes from Harar and Shoa in Abyssinia, has diminished since the construction of a railroad from Jibuti to Harar. Pop. 12,000.

Zeller, ză'ler, Martin, German geographer: b. Styria 1589; d. 6 Oct. 1661. He was one of the foremost authorities of his time, and a voluminous writer on various subjects. He published some useful works on the geography and topography of Germany.

Zeisberger, tsă'berg-er, David, American Moravian missionary among the Indians: b. Zanchenthal, Moravia, 11 April 1721; d. Goshen, Tuscarawas County, Ohio, 17 Nov. 1808. Educated in Saxony, he emigrated to Georgia in 1740, then went to Pennsylvania, and was one of the founders of the town of Bethlehem. In 1743 he became a missionary to the Indians, and labored until the breaking out of the Indian war in 1755 among the Delawares at Shamokin (Sunbury, Pa.), and the Iroquois at Onondaga. In the time of the Pontiac conspiracy, he assisted in ministering to the Christian Indians for whom the governor of Pennsylvania had provided a refuge at the barracks at Philadelphia. Peace having been concluded, he led the remnant of these Indians to Wyalusing, on the Susquehanna, in Bradford County, Pa. In 1767 he penetrated through the wilderness to Goshunk, on the Allegheny, in Venango County, and established a church among the Monseys. He removed with his flock in 1770 to the Beaver Creek, and began another station, called Friedentadt, in what is now Lawrence County; two years later explored the Muskingum region, in the present State of Ohio, and laid out an Indian town, Schoenbrunn, on the Tuscarawas. After a time he was joined by all the Moravian Indians of Pennsylvania, whom the march of civilization drove westward. Two more towns were built, a number of other missionaries entered the field, and many new converts were

added. In 1761 the Wyandots fell upon the settlement of the Christian Indians at Gnadenbutten and massacred many of them. This was a death blow to the Moravian mission among the Indians. With a small remnant Zeisberger built an Indian town, in what is now the State of Michigan, but in 1786, at the head of a small band of followers, he returned to Ohio, and in the following year commenced a new settlement, which he called New Salem, in Huron County. In 1791 the hostility of other Indians obliged them to emigrate to Canada, where they founded Fairfield, on the river Thames. In 1798 the United States Congress having granted to the Moravian Indians the tract of land in Ohio upon which they had formerly been settled, Zeisberger returned to that country with some of his converts, and near the ruins of their once flourishing towns established a new station, to which he gave the name of Goshen. There he preached until the close of his life. His published works are: a 'Delaware and English Spelling Book' (1776); 'A Collection of Hymns in Delaware' (1803); 'Sermons to Children,' in Delaware (1803). In recent years have appeared his 'Dictionary in German and Delaware' (1887); 'Diary of David Zeisberger 1781-98' (1888); and 'Essay toward an Onondaga Grammar' (1888). Consult Schweinitz, 'Life and Times of David Zeisberger' (1870).

Zeise, tsí'sé, Heinrich, German poet: b. Altona (province of Schleswig-Holstein, Prussia) 19 April 1822. He was an apothecary successively in Altona and Copenhagen, and from 1863 to his retirement in 1875 was proprietor of a chemical manufactory at Altona. He finally settled in Grossflotbek, near Altona. During an extended journey through Norway, Sweden, and Denmark, he familiarized himself with Scandinavian literature, and subsequently he translated the writings of Oehlenschläger, Andersen, Holst, Jørgen, Moe and others, and works of natural history by Schouw and Oersted. Zeise's original verse is often careless in diction, but has generally a pleasing quality, and reaches a stirring note in his patriotic songs, many of which are among the more valuable in his collection of 'Deutsche Kriegs- und Siegeslieder' (1864). Among his volumes are: 'Reiseblätter aus dem Norden' (1848); 'Gedichte' (2d ed. 1852); 'Neuere Gedichte' (1850); 'Kampf- und Schwertlieder' (1849); 'Kleine Lieder' (1871); 'Aus dem Leben und den Erinnerungen eines Nord-Deutschen Poeten' (1888); and 'Natur- und Lebensbilder' (1892).

Zeising, tsí'sing, Adolf, German writer on aesthetics: b. Ballenstedt (Anhalt) 24 Sept. 1810; d. Munich 27 April 1876. He wrote 'Neue Lehre von den Proportionen des menschlichen Körpers' (1854); 'Ästhetische Forschungen' (1855); 'Religion und Wissenschaft' (1873); and several works of fiction. For a time he held a professorship in the Bernburg (Anhalt) gymnasium, but after 1853 devoted himself to letters, residing generally in Munich.

Zeitun, zî-toon', or **Zeitun**, Asiatic Turkey, a town in the province of Aleppo, 25 miles northwest of Marash, in an iron-mining district, inhabited chiefly by Armenian Christians. The district is fertile but mountainous. The people,

distinguished by their martial spirit and their immunity from crimes of violence, are descendants of the Armenian kingdom which existed in Cilicia from the 11th to the 14th century. A sanguinary conflict with Turkish troops soon after the Crimean war drew European attention to the community, and it was stopped by the intervention of the British and French consuls. In 1878, 1890, and 1895 they defended themselves successfully from Turkish oppression, securing favorable conditions of peace. Pop. 20,000.

Zeitz, tsits, Germany, a town in the province of Saxony, Prussia, on the Weisse Elster, 23 miles by rail southwest of Leipsic. A gymnasium, and a library in a former Franciscan monastery are among its educational institutions. It is a busy industrial centre with manufactures of woollens, cottons, calicoes, leather, hosiery, mineral oil, sugar, pianofortes, cycles, etc.

Zela, zé'la, an ancient town of Asia Minor, in the Pontus, where Julius Cæsar defeated Pharnaces, king of Pontus and son of Mithridates, and announced his victory to the Roman Senate, in the famous brief despatch, *Veni, vidi, vici*—'I came, I saw, I conquered.' This battle ended the war; Pharnaces escaped into Bosphorus, where he was slain by his lieutenant, Asander; Pontus was made a Roman province, and Bosphorus was given to Mithridates of Pergamus, 47 B.C.

Zelaya, thá-lá'yá, José Santos, Nicaraguan statesman: b. Managua, Nicaragua, about 1845. Educated in England, he entered the Nicaraguan army and was made a general in 1885. He became the leader of the Liberal party and united with Joaquín Zavala in the revolt of April-June 1893, which resulted in the overthrow of President Sacasa. When Zavala was made provisional president Zelaya rebelled and Zavala was obliged to resign. A new constitution was then proclaimed, under which Zelaya was elected president 17 Sept. 1893. In the next year he invaded the Mosquito territory and in May 1895 an English force held the port of Corinto for a short time until Nicaragua agreed to pay indemnity for the murder of an English subject.

Zelaya, Mexico, a town of Guanajuato, on the Rio Grande de Santiago, 120 miles northwest of Mexico City. It is a cotton manufacturing centre. The chief buildings are a large and elegant cathedral and several convents. Pop. 10,000.

Zelko'na Tree, a large elm-like tree (*Planera richardi*), native to the Orient. The timber is much prized, the heartwood when dry being exceedingly hard, capable of a fine polish, and an excellent furniture wood.

Zell, tsél, Karl, German philologist and archaeologist: b. Mannheim, Baden, 8 April 1793; d. Freiburg-un-Breisgau, Baden, 21 Jan. 1873. He studied in Heidelberg, Göttingen, and Breslau, was made professor of philology at Freiburg in 1821, and, as representative of the university in the first Baden chamber in 1831-5, secured a reorganization of the system of higher education in the grand duchy. He was made a member of the council for higher studies, with the title of ministerial councillor. From 1846

until his retirement in 1855, he was professor of archæology at Heidelberg, where his lectures were very inclusive in their scope. His scholarship is amply shown by his studies of Aristotle and the Aristotelian philosophy. He was prominent in the Catholic Church, and president of the assemblies of the Catholic Union in 1852 and 1853. Among his writings are: 'Observationes Criticæ de Aristotele' (1817); 'Ethica Nicomachea' (1820); a translation (1834) of the 'Organon'; 'Bilder aus der Gegenwart' (1855); and some *opuscula academica*.

Zeller, tsél'lér, Edward, German theologian and historian of Greek philosophy; b. Kleinbottwar, Württemberg, 22 Jan. 1814. He studied at Tübingen and Berlin, and was made *privat-docent* at Tübingen in 1840. Though bitterly opposed by the more orthodox, he became professor of theology at Bern in 1847, and at Marburg in 1849. Appointed to the chair of philosophy at Heidelberg in 1862, he went to Berlin in 1872 and retired in 1895. He early forsook theology and his Hegelianism for historical work which reveals the most impartial and eclectic spirit. Among his writings the following are the most important: 'Platonische Studien' (1839); 'Die Philosophie der Griechen,' his greatest work (1844-52; 4th ed. 1876-81); 'Das Theologische System Zwingli's' (1853); 'Die Apostelgeschichte kritisch untersucht' (1854; English trans. 1875-76); 'Vorträge und Abhandlungen' (1865; 2d ed. 1875-77-84); 'Staat und Kirche' (1873); 'David Friedrich Strauss' (1874); 'Geschichte der deutschen Philosophie seit Leibnitz' (1872); 'Friedrich der Grosse als Philosoph' (1886). His work on Greek philosophy has been translated into English under the titles 'Socrates and the Socratic Schools' (1868); 'Stoics, Epicureans, and Sceptics' (1870); 'Plato and the Older Academy' (1876); 'The Pre-Socratic Philosophy' (1881); 'The Eclectics' (1883); 'Aristotle' (1897).

Zeller, zél-lâr, Jules Sylvain, French historian; b. Paris 23 April 1820; d. there 25 July 1900. After study in Paris and afterward in Germany, he held the chair of history successively in the lycées of Rennes, Bordeaux, and Strasburg, in the faculty of Aix, and in the Paris normal school. In 1863 he was made professor of history in the Ecole Polytechnique, in 1874 member of the Academy of Moral and Political Sciences, and in 1876 inspector-general of higher education. His works include: 'Les Empereurs Romains' (1863); 'Entretiens sur l'Histoire' (1865); 'Pie IX. et Victor Emmanuel' (1879); 'Histoire de l'Allemagne' (1872-91); and 'Histoire Resumée de l'Allemagne' (1888).

Zemstvo, or *zemskiy uchrezhdeniya* (district institutions), a Russian political body, originally designating the country people, but now used for the province and its representative body, comparing favorably with our State legislatures. The Zemstvo was first mentioned by Alexander II. in the imperial edict of 1859, and after years of labor in perfecting it, in January 1864, was officially recognized by him as an institution. Its original intent was the greatest possible development of local home rule, the members of the district assemblies or zemstvos being elected by three different electoral classes—the land owners, the city people and the country inhabi-

tants—thereby introducing for trial a sort of constitutional representation. Before long, however, dissensions arose, the central government accusing the zemstvos of assuming too much authority, of becoming too liberal, and by several edicts the orderly development of these districts was checked. Finally by the edict of June 1890 the zemstvo representation was limited to two classes of citizens—the hereditary and personal nobility and the burghers of the cities—thus depriving the peasants entirely of their elective franchise, their representatives now being selected by the governors and by members of the volost assemblies.

Zenana Mission, a mission founded in 1852 under the auspices of the Protestant missionary societies in India, with the object (1) of sending the Gospel to the women of India by means of female missionaries; (2) of alleviating their sufferings in sickness, and ministering to their spiritual need; and (3) of promoting education, based on Holy Scripture, especially among women of the higher classes. See INDIA.

Zend, more correctly **Avestan**, an ancient Iranian language, in which the Zend-Avesta is composed. This language was first introduced to notice by Anquetil Duperron, and the accurate knowledge of it has been developed among others by Rask, Burnouf, Bopp, and Haug. It is now recognized to be a cœveal and cognate dialect with the Vedic Sanskrit. It embraces two dialects called Bactrian, in contradistinction to the ancient languages of Media and Persia, which are called the Western Iranian, while the Zend or Bactrian dialects are called the Eastern Iranian dialects. The two Zend dialects consist of an earlier and a later, analogous to the Vedic and classic Sanskrit or to the Homeric and classic Greek. The period of transition between them is perhaps from 100 to 200 years. The earlier dialect is called the Gâthâ, from the Gâthas or sacred songs which form the only remains of it; the later is that in which the greater part of the Zend-Avesta or Zoroastrian sacred writings are found. They differ both in grammar and pronunciation, they are both highly cultivated languages, and rich in inflections, but the earlier is richer in inflections and the later in compounds. The earlier is distinguished by long vowel terminations, probably produced by transcribing the singing pronunciation of the gâthas. The present alphabet is comparatively modern, and is probably derived from the Syriac. There are 12 simple vowels, 14 diphthongs, and 29 consonants, represented by separate characters. The roots are mostly monosyllabic, some consisting only of a single vowel, others of a vowel and consonant or a vowel between two consonants. These primitive roots are modified by articulate additions, which extend or limit their meaning after the manner of prefixes and suffixes, thus *dâ*, to make, with the addition of *th*, becomes *dath*, to place. Verbal roots undergo modifications producing three distinct forms, the causal, the desiderative, and the intensive. Verbs have three voices, active, middle (reflective), and passive; and four moods, indicative, subjunctive, potential, and imperative. Some of these moods are double. The tenses include one for the present, four for the past, and two for the future. Nouns are

formed from roots by means of suffixes. There are three genders, masculine, feminine, and neuter. There are also three numbers, singular, dual, and plural, with eight inflections in the first and last and five in the middle number. The forms of the declensions closely resemble those of Sanskrit; and there are many other analogies between the Gāthā dialect and the Vedic Sanskrit. See SANSKRIT LANGUAGE AND LITERATURE.

Zēnith, the vertical point of the heavens at any place, that is, the point right above a spectator's head, and from which a line drawn perpendicular to the plane of the horizon would, if produced, pass through the earth's centre, supposing the earth a perfect sphere. Each point on the surface of the earth has therefore its corresponding zenith. The zenith distance of a heavenly body is the arc intercepted between the body and the zenith, being the same as the co-altitude of the body.

Zenith Sector, an astronomical instrument, consisting of a telescope swinging upon pivots, and having attached to it an arc graduated into degrees and minutes. It is used for the same purpose as the mural circle, namely, to ascertain the zenith distance of the several stars.

Zenith Telescope, an instrument used in field astronomy for the determination of latitudes, by the measurement of the difference of meridian-zenith distance of two stars, one culminating north of the zenith, and the other at so nearly the same distance south that that difference can be measured by a filar micrometer in the field of the telescope when the latter is revolved 180° round a vertical axis between the two culminations.

Zenjan, zēn-jūn', or Zinjan, Persia, a town in the province of Khamseh, 170 miles northwest of Teheran, on the highway to Tabriz. It has manufactures of carpets, woolen cloths, and arms. Pop. 20,000.

Zenkoji, zēn-kō'jē, Japan. See NAGANO.

Zeno, zē'nō, Emperor of the East (Byzantine empire) from 474 to 491 A.D. An Isaurian by birth, he married the daughter of Leo I, commanded the imperial guards and armies, and was elevated to the consulship in 469; procured the assassination of Aspar, the minister of Leo, in 471, and usurped the crown on the death of Leo in 474. He was driven out of his capital by Basiliscus, who was proclaimed emperor in 475, but regained Constantinople in 477 by buying over Harmatius, the nephew and general of Basiliscus, who was deposed and died shortly afterward. In 478 a Gothic invasion was bought off; in 479 a revolt in Constantinople was put down by corrupting the troops engaged; a second Gothic invasion was bought off, and a third was repelled by purchasing the aid of an opposing party among the Goths, one of whose chieftains, afterward Theodoric the Great, was made consul in 484. Having quarreled with Theodoric, Zeno, anxious to save himself and his capital, proposed to him to invade Italy, and expel Odoacer and the Heruli. Among the more important events of his reign was the publication of the so-called 'Henoticon' (482), or 'Decree of Union,' intended to adjust the controversy between the Monophysites (q.v.) and the Orthodox Church.

Zeno, dzā'nō, Apostolo, Italian dramatist and literary historian: b. Venice 11 Dec. 1668; d. there 11 Nov. 1750. He was a founder (1710) of the critical periodical 'Giornale de' Letterati d'Italia,' in 1718-29 was at Vienna as court-poet, and made his reputation in Italian literature by libretti for the musical drama, which in his work attained real literary rank. For many years he was the chief dramatic poet of Italy. He was also a scholar, antiquary, and well-known numismatist. His collected dramas appeared in 1744. Among his further writings is the 'Dissertazioni Storico-Critiche e Letterarie' (1752-3). Consult the 'Life' by Negri (1816).

Zeno, Nicolò and Antonio, Venetian navigators of the late 14th and early 15th centuries. Antonio about 1390 fitted a ship with which he sailed northward on the Atlantic. He was wrecked on one of the Faroe islands. Here he would have been killed by the Scandinavian natives had he not been opportunely rescued by Earl Sinclair, whom Hacon VI. of Norway had invested with the Orkneys and Caithness. He was made commander of the earl's small fleet, and in 1393 or 1394 sailed with three ships to Greenland, where he spent some time. He died in the Faroes about 1395. Antonio went out to the Faroes in 1391, and was in Sinclair's service for 14 years, dying at Venice in 1406. After Nicolò's death he was commander of the fleet; and on one occasion, to verify fishermen's reports of land some 1,000 miles westward, he undertook a voyage of discovery in the Atlantic. He described his adventures in a letter, and on this letter and some others and a sailing-chart, probably made by Antonio, is based a work containing matter of some interest in connection with pre-Columbian discovery in the New World. The letters were worked into a narrative, and, with a copy of the map, appeared in book-form in 1558. The narrative says that a fisherman, returning to the Faroes after a 26 years' absence, told of a land called Estotiland, where there was much gold and forest. The people built small boats and traded with Greenland. The description of Estotiland is vague, and contains little to suggest North America. But a voyage was undertaken from Estotiland to a region southward, called Drogio. There, said the fishermen, the people were cannibals. "They have no kind of metal. They live by hunting, and carry lances of wood, sharpened at the point." Farther south, "they have cities and temples," as well as "some knowledge and use of gold and silver." The honesty of the Zeno narrative has been sufficiently well established; but whether or no the fisherman had the experiences he narrated in Drogio, and whether that may be identified with North America, are questions that have been much debated. Consult: Major, 'The Voyages of Nicolò and Antonio Zeno' (Hakluyt Society, 1873), with a translation of the narrative and a copy of the map; and Fiske, 'The Discovery of America,' Vol. I. (1892).

Zeno (zē'nō) (Gk. Ζήνων), of Citiium, ancient Greek philosopher: b. Citiium, island of Cyprus. He flourished in the late 4th and early 3d century a.c., and was the founder of the Stoic school of philosophy (see STOA). The circumstances of his life are not well known. Tradition says that after suffering shipwreck near

ZENO OF ELEA—ZENONIA

the Peisima, and according to one account losing his all, while by another his wealth amounted to 1,000 talents, he settled at Athens. There he early made himself remarked for the virtues of moderation and contentment, and during his long life he so acquired the esteem of the citizens that they voted him a crown of gold and a public burial in the Ceramicus. He is said to have declined the citizenship of Athens from fidelity to his native country. He first resorted to the teaching of the Cynic Crater, and by this school his own views, especially in the earlier period of his career, were much influenced. It may seem surprising that Zeno, who rejected both the contempt for established usages and for general knowledge which distinguished the Cynics, should have attached himself to that school, but the central point of every true system of philosophy is its ethics, and he was attracted to the Cynics by their doctrines of moral obligation, which he made the foundation of his own system. Contrary to the advice of Crater he afterward studied under Stilpo the Megarian. Among his subsequent advisers or teachers are enumerated the Megarians Cronus and Philon, and the Academics Xenocrates and Polemon. Of the last two he is said to have been a pupil. He maintained a friendship with Antigonos Gonatas, king of Macedon, of whom his disciples Perseus and Philomides were companions. About 310 a.c. he opened his school in the *Stoa Poikile* (Stoa), or 'Painted Porch.' This place, which was adorned with paintings by Polygnotus, had formerly been the resort of a school of poets, who were from this circumstance called Stoics, and the name was now transferred from them to the disciples of Zeno, who at first had been called Zenonians. All the works of Zeno are lost. They were numerous, and include treatises 'On the State' (early and of cynical tendencies); 'On the Ethics of Crater'; 'On Life According to Nature'; 'On Impulse'; 'On the Nature of Man'; 'On the Affections'; 'On the Becoming' (or Fitting); 'On Law', and 'On Grecian Education'; various treatises on physics, logic, and poetry, and a work on the Pythagorean doctrine. Concerning the doctrines of Zeno, which employed very largely the ethics of the Cynic school, as well as the physics of Heraclitus and Pythagoras, consult the article STOICS referred to above; also Zeller, 'Stoics, Epicureans, and Skeptics' (1870); Ueberweg, 'History of Philosophy' (Eng. trans. 1887); and Ritter and Preller, 'Historia Philosophiæ Græcæ' (8th ed. 1898).

Zeno (Ζῆνων) of Elea, ancient Greek philosopher: b. Elea (Velia), Lucania, southern Italy, about 488 a.c. He was the favorite disciple of Parmenides, whose opinions he defended, and whose ethico-political schemes he shared. He appears to have lived for a considerable time in Athens, where he taught for remuneration, and had distinguished pupils, as Pericles and Callias. He is said, on unsatisfactory evidence, to have engaged in an enterprise on behalf of his native land against the tyrant Nearchus. Whether he perished in this attempt or survived is not known. None of his writings are extant, but his opinions are referred to by Aristotle, who attempted to confute some of them, and who has distinguished

him as the inventor of dialectic. As a defender of the Eleatic doctrine of the unity of the existent, he was the first to lay down the problems of skepticism in regard to the real existence of the phenomenal world, and has thus exercised an important influence on philosophy. He is said to have directed four arguments against the reality of motion, first from the impossibility of a moving body arriving at a place without passing through an infinite number of intermediate places; second, from the contradictoriness of relative notions of speed, based on the same reason; third, from the fact that each body at each particular moment must occupy one particular portion of space, and is therefore at rest; fourth, from the contradictoriness of relative notions of time in respect to motion, the same portion of time being regarded as long or short, according as it is measured by different standards. He is also credited with an argument against the veracity of sensuous impressions, which rests merely on an imperfect knowledge of physics. It is in this form. If a measure of millet-grains in falling produces a sound, each single grain, and each fraction of a grain, however minute, must also produce a sound; for as the results of the motion of the whole mass is but the sum of the results of the motion of its parts, if no sound is produced by the smallest of the parts, no sound can be produced by the whole. Aristotle, in his 'Physics' (VI.), pointed out the fallacies in the arguments against the reality of motion. Consult: Zeller, 'Pre-Socratic Philosophy,' Vol. I. (1881); Ueberweg, 'History of Philosophy,' Eng. trans. Vol. I. (1887); Ritter and Preller, 'Historia Philosophiæ Græcæ' (8th ed. 1898); and Zeller, 'Philosophie der Griechen,' Vol. I. (4th ed. 1900).

Zenobia, sê-nô-bî-â, queen of Palmyra (q.v.). She was instructed in the sciences by the celebrated Longinus, and made such progress that besides her native tongue she spoke the Latin, Greek, Coptic, and Syrian languages. She also patronized learned men, and herself formed an epitome of Egyptian history. She was married to Odenathus, king of Palmyra, accompanied him both in the war and the chase, and the success of his military expedition against the Persians is, in a great degree, attributed to her prudence and courage. Gallienus, in return for services which tended to preserve the East to the Romans after the capture of Valerian by Sapor, king of Persia, acknowledged Odenathus as emperor, and on his death, 267 a.d., she assumed the sovereignty, under the title of Queen of the East. She preserved the provinces which had been ruled by Odenathus, and was preparing to make other conquests, when the succession of Aurelian to the purple led to a remarkable change of fortune. That martial prince, disgusted at the usurpation of the richest provinces of the East by a female, determined to make war upon her, and having gained two battles, Antioch and Emesa, besieged her in Palmyra, where she defended herself with great bravery. At length, finding that the city would be obliged to surrender, she quitted it privately; but the emperor, having notice of her escape, caused her to be pursued with such diligence that she was overtaken just as she got into a boat to cross the Euphrates, in 272. Aurelian spared her life, but made her serve to grace his

ZENOBIA—ZEPHYRUS

triumph. The Roman soldiers demanded her life; and according to Zosimus she purchased her safety by sacrificing her ministers, among whom was the distinguished Longinus. She was allowed to pass the remainder of her life as a Roman matron; and her daughters were married by Aurelian into families of distinction. Her only surviving son retired into Armenia, where the emperor bestowed on him a small principality. Consult: Gibbon, 'Decline and Fall' (ed. Bury, 1896-1900); 'Life of Aurelian' by Vopiscus in 'Augustæ Historiæ Scriptores' (Eng. trans. Bernard, 1740); Ware, 'Zenobia, or The Fall of Palmyra' (1836).

Zenobia, or *The Fall of Palmyra*, a noted historical novel, first issued in 1836 in the 'Knickerbocker Magazine,' and then entitled 'Letters from Palmyra.'

Zenos, zē'nōs, **Andrew Constantinides**, American educator: b. of Greek parentage, Constantinople, Turkey, 13 Aug. 1855. He was graduated at Robert College, Constantinople, in 1872, studied theology at Princeton Seminary and was pastor of a Presbyterian church in Brandt, Pa., 1881-3. From 1883 to 1888 he was professor of Greek in Lake Forest University and of New Testament exegesis at Hartford Theological Seminary 1888-91. In 1891 he was made professor of church history in McCormick Theological Seminary in Chicago, and in 1894 was transferred to the chair of Biblical theology in that institution, a position he still (1904) holds. He wrote: 'Elements of Higher Criticism'; 'Compendium of Church History' (1896), etc.; and edited Xenophon's 'Anabasis' (with F. W. Kelsey) (1888).

Zenta, zēn'tō, Hungary, a town in the county of Bács-Bodrog, on the Theiss, 120 miles southeast of Budapest. Here, 11 Sept. 1697, the Germans under Prince Eugene, defeated the Turks, a victory which led to the peace of Carlowitz, ratified January 1699. Pop. about 30,000.

Zéolite, a name given to a group of hydrated silicate minerals commonly found in cavities in igneous rocks, from which they are derived through secondary alteration. They include thompsonite, natrolite, scolecite, analcite, chabazite, gmelinite, phillipsite, harmotome, stilbite, and heulandite. The name is derived from the boiling reaction before the blowpipe.

Zephaniah, zēf-ā-nī'ā, the ninth in order of the Scriptural writers known as the minor prophets. His pedigree is traced back for four generations. He is the son of Cushi, the son of Gedaliah, the son of Amariah, the son of Hizkiah, and he is supposed to have been of noble, if not of royal, ancestry. His brief but pregnant prophecy was delivered just after the time of the first appearance of Jeremiah (626 B.C.)—that is, in the first half of the reign of Josiah. The next preceding prophet was Micah, who died in the early part of the reign of Manasseh. But the condition of the whole of western Asia, including Palestine, portended a speedy upheaval. Above all, Nineveh was beginning its memorable decline after the death of its king, Assur-banipal (668-626 B.C.). Morally and religiously the Jewish nation had improved but little since the degeneracy that had followed the death of Hezekiah, and Josiah's reform (621 B.C.) had not yet begun, if we may

judge the invectives of the prophet against idolatrous practices. Zephaniah was apparently a descendant of King Hezekiah.

The Prophet's Message.—Zephaniah spoke and wrote primarily for the correction and warning of Judah and Jerusalem, though he draws illustrations from the sins and fates of other peoples. The culmination of these is found in the iniquities, the pride, and the speedy fall of Nineveh. A division into four parts is as follows:

The threatening: ch. i. 1, the whole world—that is, the Semitic world—is to undergo exemplary punishment, particularly Jerusalem and its apostates from Jehovah (ver. 1-6). (2) The classes of people who are to be thus visited—the royal house, the nobles, the wealthy traders, the careless and defiant generally—are characterized, and their chastisement set forth in language largely figurative (ver. 7-18).

The lessons from the nations: ch. ii. God's own people are warned to repent in time (ver. 1-3), and so avoid the doom that is about to fall upon the Philistines (ver. 4-7), Moab (ver. 8-11), Egypt, under the name of Ethiopia (ver. 12), and finally Assyria and Nineveh (ver. 13-15).

The remonstrance: ch. iii. 1-7. Rebellious and obstinate Jerusalem is urged to repent by the righteous and reasonable God, in view of coming woes; for the lesson of the fate of other nations has so far been unheeded.

The promised redemption: ch. iii. 8-20-1. The faithful remnant is bidden to wait and trust. It shall survive the ruin of the nations, be joined by exiled brethren from far and near, and rest in quiet content (ver. 8-13). (2) Joyous thanksgiving is now in place, for Jehovah is in the midst of Jerusalem, to comfort and bless his people. Their reproach is taken away; dispersion and captivity are at an end.

Zeph'yr, a soft, cool, agreeable wind; in Greece the west, or rather west-southwest wind. The Greek name, according to the etymology, signifies life-bringing, because at the time when this wind begins to blow, the plants are restored to life by the balmy spring air.

Zephyran'thea, a genus of *Liliaceæ*, indigenous to the warmer regions of America, and most commonly represented by the atamasco lily (q.v.). The species are bulbous, and are not hardy in the Northern States, but make charming summer-blooming window and greenhouse plants, resting in the winter. The foliage is linear, springing from the bulb, and a scape, appearing at the same time, is crowned by a regular, 3-merous corolla which is nearly, or quite, erect, from 1 to 3 inches across, and red, yellow, or white in color. *Z. candida* is one of the white-flowered species, and is also one of the hardiest and thriftiest. It is a lovely, crocus-like plant, with pure-white blossoms opening out flat in the sunshine, and evergreen foliage.

Zephyrus, zēf'i-rūs, in Greek mythology, a son of Æolus, or of Astræus and of Aurora, a lover of Chloris or Flora. By the harpy Podarge he was the sire of the swift horses of Achilles, Xanthos, and Balios. His love being rejected by Hyacinthus, he was the cause of his death by blowing Apollo's quail against his head. Some make him the husband of one of the Hours. Flowers and fruits are under his

protection. He is represented as a gentle beautiful youth, naked, with a wreath on his head, or flowers in the fold of his mantle.

Zeppelin, tsép'pè-lín, Ferdinand, Count von, German inventor: b. Constance, Baden, 8 July 1838. He took part in the Franco-German war as an officer of cavalry; arose to the rank of lieutenant-general in the German army; and was attached to the suite of the king of Württemberg. He became known for his experiments in connection with dirigible balloons. His first ascent was on 6 July 1892 at Bern, the balloon safely arriving at Lucerne. On 2 July 1900 he made an ascent at Manzell, near Friedrichshafen, on Lake Constance, in "one of the most ingenious, expensive, and carefully constructed balloons of modern times." This balloon rose 1,300 feet, traveled 3¼ miles in 17 minutes in a prescribed direction, and was finally forced only by an accident to the sliding-weight and one of the rudders to descend, which it accomplished with perfect ease. On 17 October, Zeppelin undertook a second ascent, the balloon on this occasion remaining in the air for an hour at an average height of about 2,000 feet, making noticeable headway and remaining in perfect control against a seven-mile wind. See **Balloons**.

Zeravshan, zér-áf-shān', Asiatic Russia, a river rising in a valley at the junction of the Hissar and Turkestan Mountain chains, and after a westerly by north course of about 400 miles, passing the towns of Penjakent, Samarkand, Katakurgan, Kerminch, and Bokhara, dispersing itself in the desert sands between Karakul and the Oxus River. A railway line traverses the valley from Karakul to near Penjakent.

Ze'rah, a king of Ethiopia, known to the Egyptians as Azekh Amen, who flourished in southern Egypt about 900 B.C. He conquered Egypt and invaded Palestine, where Asa, king of Judah, completely defeated him, as a consequence of which Zerah abandoned not only Palestine, but also Egypt.

Zerbi, Gabriel, Italian physician and anatomist: b. Verona in the 15th century; d. there 1505. After many years of study he lectured for some time at Rome, and became professor of medicine at Padua in 1495. His chief work is 'Anatomy of the Human Body' ('Liber Anatomiz Corporis humani'), published about 1490, which contains the germ of several discoveries in anatomy.

Zerbond di Sponetti, Joseph, German philosopher: b. Breslau 1766; d. 1831. Having written, in 1796, a letter to the governor of Silesia, showing the unreasonableness of attaching an unlimited importance to the right of birth in the nobility, he was imprisoned for three years on a charge of high treason, by order of Frederick William III. Being at last brought to trial he was liberated, and was subsequently employed in several public offices.

Zerbst, tsérpst, Germany, a town in the duchy of Anhalt, on the Nuthe, 21 miles southeast of Magdeburg. The chief buildings are the great Schloss in a fine park; the 15th century Nikolai kirche; and the stately 15th century Rathhaus on the market place where are the

Roland column (1445), and the Butterjungfer, a slender column bearing a female figure. The chief educational institution is the Francisceum, a gymnasium of high repute. The town has manufactures of noted bitter beer, of silks, plush, cloth, leather, machinery, musical instruments, etc. Zerbst was founded in 1007. From 1603 to 1793 it was the capital of a principality of the same name, which in 1797 was absorbed in Anhalt-Dessau.

Zerffi, George Gustavus, English author: b. Hungary 1821; d. Chiswick, England, 28 Jan. 1892. He edited a newspaper at Budapest, and in 1848 served as a captain in the revolutionary army. He also acted for a time as Kossuth's private secretary. On the failure of the revolution in 1849 he came to England and was naturalized, and some years later was engaged as a lecturer in the department of art at South Kensington. Throughout his career Zerffi gave much attention to the subjects of decoration and history, and wrote many works treating these themes in a comprehensive manner. He maintained that history should be studied as a whole on philosophical principles. He planned a general work on these lines entitled 'Studies in the Science of General History' in two volumes, dealing with ancient and medieval history respectively. Among his other publications are: 'A Manual of the Historical Development of Art, with Special Reference to Architecture, Sculpture, Painting and Ornament' (1876); and an English version of Goethe's 'Faust' with critical and explanatory notes (1859).

Zeri'ba, or Zaree'ba, a temporary military enclosure, the sides of which are formed of prickly brush wood, sheltered by which a force may camp comparatively safe from sudden surprise. The term came into prominent use during the Anglo-Egyptian campaign of 1884.

Zermatt, tsér-mät', or zér-mät', Switzerland, a mountain village and tourist-resort in the canton of Valais, at the foot of the Matterhorn and near the head of the Visp Valley, 22½ miles by rail southwest of Visp. It stands 5,315 feet above sea-level, having to the south the great Théodule glacier, above which tower the Breithorn on the east, and beyond the Monte Rosa group, and on the west the rocky cone of the Matterhorn. An electric mountain railway connects with the Riffelberg and the summit of the Gornergrat (10,290 feet). The Théodule Pass or Matterjoch (10,899 feet) leads to Aosta in Italy. In the village churchyard are the graves of many victims of mountaineering. Pop. about 1,000.

Zero, in mathematics, the absence of magnitude; the remainder that is obtained when any quantity is subtracted from itself; nothing, considered as a quantity; that which separates real positive quantities from real negative quantities. Zero is denoted by the symbol 0 ("cipher"), and this symbol itself is often called "zero." In the theory of functions, any value of a variable which reduces a given function of that variable to zero is called a "zero" of the given function. In infinitesimal analysis, infinitesimal quantities are sometimes called zeros. This usage is incorrect, and it leads to confusion of thought. An "infinitesimal" has an actual magnitude, and although that magni-

tude is smaller than any quantity that can be definitely stated or assigned, the fact that it exists distinguishes the infinitesimal from zero, properly so-called.

In physical measurement, the "zero" of any scale is the starting point from which measurements on that scale are reckoned. In thermometry (q.v.) it is customary to distinguish three different kinds of zeros. These are, respectively, (1) the arbitrary zero, (2) the "natural" zero, and (3) the "absolute" zero. The arbitrary zero on such a scale is a zero that is selected arbitrarily, as a convenient point of reference; the selection being governed by practical considerations of convenience, or by the facility with which the point can be experimentally determined. (See **THERMOMETRY**.) The "natural" zero is employed chiefly in connection with the gas thermometer. In a gas thermometer in which the temperature is indicated by the expansion of a given volume of gas at constant pressure, the "natural" zero is the temperature at which the volume of the gas would just vanish, if the contraction of the gas were to follow, at very low temperatures, the law of variation with temperature that prevails between the freezing and boiling points of water. Similarly, in a gas thermometer in which temperature is measured by the change in pressure of a mass of gas that is confined at constant volume, the "natural" zero is the temperature at which the pressure of the gas would just vanish, if the law of variation of pressure were the same, at very low temperatures, as it is between the freezing and boiling points of water. The "natural" zeros of the various gas thermometers that are in actual use are not identical, but their positions differ only by a few degrees, at the most.

The "absolute" zero of temperature is the temperature that a body would have, if it were absolutely deprived of heat; and this "absolute" zero is identically the same for all substances. It happens that the "absolute" zero has nearly the same position on the thermometric scale as the "natural" zeros of the various gas thermometers that are in use, and this fact has led to a great deal of confusion in popular and semi-scientific writings upon the subject of temperature, the "natural" and "absolute" zeros being very commonly confounded with one another. The "absolute" zero is slightly lower than the "natural" zero of any gas thermometer that we know of, with the possible exception of the "natural" zero of the hydrogen thermometer. There is some reason for believing that the "natural" zero of the normal hydrogen thermometer (whether at constant volume or at constant pressure) is a few hundredths of a centigrade degree lower than the true "absolute" zero. If further research bears out this opinion, then it is plain that the "natural" zero of the hydrogen thermometer can never be attained; for the "absolute" zero, being the temperature corresponding to absolute cold, is the lowest temperature that can possibly have a real existence. On the absolute centigrade scale, the temperature of the "absolute" zero is approximately 273.10° below the freezing point of water. This estimate is probably in error by a few hundredths of a degree. There is no theoretical reason why the position of the "absolute" zero cannot be determined to the thousandth of a degree; but the experimental data

required for such a determination are not yet available. See **THERMODYNAMICS**.

A. D. RISTEN, Ph.D.,
Editorial Staff, 'Encyclopedia Americana.'

Zer'rahn, Carl, American musical conductor: b. Maichow, Mecklenburg, 28 July 1826. In 1848 he came to America and six years later became director of the Handel and Haydn Society of Boston. He was conductor of the Harvard Symphony concerts 1861-82, and for several years was a successful director of famous musical festivals throughout New England.

Zerubbabel, zē-rūb'ā-bēl, leader of the first band of Israelitish exiles returning from Babylon. His name in the Captivity was Sheshbazzar. He was the recognized prince of Judah, and on arrival at Jerusalem, with Jeshua, the high-priest, directed the renewal of public daily worship and of festival days, and in the second month of the second year of the return, the reconstruction of the Temple. This last work was stopped by their foes and revived only after 16 years, when it was again undertaken and finally completed by Zerubbabel and Jeshua.

Zeta, zē'tā, a small closet or chamber; applied by some writers to the room over the porch of a Christian church, where the sexton resided.

Zet'land Islands. See **SHETLAND**.

Zeuglodon, zē'glō-dōn, a gigantic fossil cetacean mammal, found in the Eocene and Miocene strata of the southern United States and Europe, so named by Owen from the yoke-like character displayed by a section of the molar teeth. Its remains were first discovered in 1834 in the Tertiary of Louisiana, and were supposed to belong to some reptile, to which Dr. Harlan gave the name of *Baniosaurus*; but Owen showed that it was a mammal, and belonged among cetaceans. A few years later a German collector named Koch collected great quantities of the bones and stringing them together in some semblance of a natural skeleton, constructed a "sea-serpent," mostly neck and tail, no less than 114 feet long, which was exhibited widely in America and Europe, and required the exertions of eminent men (for example, Wyman, 'Proc. Boston Soc. Nat. Hist.,' November 1845) to expose as a humbug. The form was probably cetacean, though slender, elongated, and more snake-like, with small anterior limbs in the shape of paddles, and no hind limbs; the skin was supplied with an armor consisting of small irregular bony plates more or less fused together. The skull in some specimens was nearly a yard in length. It is well constructed, the blow-hole in the middle of the face, and the brain-cavity. The teeth are limited in number and disposed in three series as incisors, canines, and molars; the molars are double-rooted, and have serrated crowns. Much discussion has occurred as to the affinities of this great sea-beast, whose characters are so generalized, and period of existence so early that it is now agreed to be a representative of the most primitive *Cetacea*, and is set apart as a family, *Zeuglodontidae* constituting a primitive order *Archaeoceti*. Consult Woodward, 'Vertebrate Paleontology' (New York 1898); Zittel-Eastman, 'Text-Book of Paleontology,' Part III.

Zeugma, *zēgma*, the connection of one word with two words or with two clauses, to both of which it does not equally apply; so that, for one of them, another word (to be gathered from the sense of the passage) must be mentally supplied. Zeugma is therefore a species of ellipsis; both abbreviate discourse. Where the word to be supplied is a form of another in the sentence, as "I love you, and you [love] me," the construction is elliptical; where the sense requires a different word, as "The sun shall not burn thee by day, neither the moon [injure thee] by night" (Ps. cxi. 6, Prayer Book), it is zeugma.

Zeus, *zēs* (Greek *Zeus*), in Greek mythology, the chief of the gods. He was the son of Cronus and Rhea. According to the myth Cronus was in the habit of swallowing his children immediately after their birth. When Zeus was about to be born Rhea consulted Uranus and Gaia as to how he might be saved, and they sent her to Crete (the Trojan Ida and other places are mentioned in other accounts) to be delivered. She concealed Zeus in a cave in Mount Ida, and gave Cronus a stone wrapped up in a cloth to swallow. The infant Zeus was tended by the nymphs Ida and Adrastea; he was supplied with milk by the goat Amalthea, and the bees gathered honey for him. When he had reached manhood, by the aid of Gaia or Metis he persuaded his father to restore to the light the children he had swallowed. Zeus now united with his brothers to dethrone his father, a change of government which led to a war with the Titans. This struggle was not terminated until Zeus delivered the Cyclopes, sons of Uranus and Gaia, who had been bound by Cronus, and who in return provided him with thunder and lightning, and also liberated the hundred-handed beings Briareus, Cothus, and Gyes, who likewise lent him their aid. Having vanquished the Titans, the other children of Uranus and Gaia, he shut them up in Tartarus. Tartarus and Gaia now begot another monster, Typhoeus, who engaged in a fearful struggle with Zeus, but was finally vanquished by a thunderbolt. Zeus now obtained the dominion of the world, which he divided by lot with his brothers Poseidon (Neptune), who obtained the sea, and Hades (Pluto), who received the lower world. Zeus himself possessed the heavens and the upper regions, while the earth was held as common property. Another dreadful war was now waged against the Olympian gods by the giants who were sprung from the blood of Uranus. In this struggle the gods were assisted by Athene, Apollo, Heracles, and other children of Zeus, and the giants were completely vanquished. Zeus had three sisters as well as three brothers, namely, Hestia (Vesta), Demeter (Ceres), and Hera (Juno). He first married Metis, a daughter of Oceanus and Tethys; but as Fate had prophesied that she should bear a son who should rule the world, Zeus swallowed her when she was with child, and Athene subsequently sprung from his head. As his second wife he took for a time Themis, daughter of Uranus and Gaia, but his final and best beloved wife was his sister Hera, by whom he had Hebe, Ares, and Hephaestus. Zeus was regarded as the founder of law, order, and authority, the avenger of wrongs, the punisher of crime, the rewarder of good actions, the source of prophetic

power, the author of all good things, and, in short, as the omnipotent, all-wise, and benevolent ruler of the universe. He was especially looked upon as the controller of all the phenomena of the heavens, and was constantly spoken of as the "Cloud-gatherer" or the "Thunderer." Notwithstanding his general character of wisdom and benevolence, his conduct was anything but immaculate. The incongruity struck some of the ancients themselves, and led to protest against such stories being believed. There appear to have been various local gods of the same name, with various attributes and legendary histories, who were finally merged in the national Hellenic Zeus; traces of the original traditions, however, remained in the local rites of particular localities. An Arcadian and a Cretan Zeus are particularly distinguished. The former had a temple at Mount Lycaeus, so sacred that if any one entered it he died within 12 months, while intentional trespassers were stoned to death. In Crete there were many places sacred to Zeus, who had passed his early life there, particularly Mount Ida and the district around it. Zeus also landed on the island at Gortyn in the shape of a bull, when he carried off Europa, and was worshipped there by the surname of Hecatombeus. The national god was worshipped by sacrifices of bulls, cows, and goats. Two of the principal localities where his worship was carried on in Greece were Athens and Olympia. At the latter place the Olympic games, the most splendid festival in Greece, were held in his honor. (See OLYMPIC GAMES.) Here there was a magnificent temple and a gold and ivory statue of the god, the work of Phidias, and reckoned one of the seven wonders of the world. In representations of Zeus the attributes in connection with him are the eagle, the sceptre, and the thunderbolt. Consult Preller-Robert, 'Griechische Mythologie' (1887).

Zeuss, *tsois*, Johann Kasper, German philologist and historical scholar: b. Vogtlandt, near Kronach, in Upper Franconia, 22 July 1806; d. there 10 Nov. 1856. He was educated in Munich, and became professor of history in the lycée at Bamberg (Upper Franconia). He wrote several valuable books—'Die Deutschen und die Nachbarstämme' (1837); 'Die Herkunft der Bayern von den Markomannen' (1839); 'Traditiones Possessionesque Witzzenburgenses' (1842); 'Die Freie Reichstadt Speier vor ihrer Zerstörung' (1843). But his greatest work was 'Grammatica Celtica' (1853; 2d ed., by Ebel, 1868-71), a pattern of scholarship and thorough method, in which he really founded the science of Celtic philology.

Zeuxippus, *zēk-sip'ūs*, one of the eight successors of Anaximander (q.v.) in the last school of Greek skeptics. Of him, as of all the others with the exception of Sextus Empiricus (q.v.), nothing further is known. Consult Zeller, 'Outlines of the History of Greek Philosophy' (trans. Alleyne and Abbott, 1886).

Zeuxis, *zēk'sis* (Greek *Zeuxis*), ancient Greek painter. He was a native of Heracleia, but which town of that name was his birthplace is not certain. He was born about the middle of the 5th century before Christ, and flourished about the end of the 4th century B.C. He is said by some authorities to have studied under Demophilus of Himera, by others under

Nessus of Thasos. He also studied at Ephesus. Aristotle says that an elevated conception of character was wanting in his work, while Cicero praises him along with Polygnotus and Timanthes for *forma et linamenta*. He learned from Apollodorus the treatment of light and shade, which he greatly developed, and from Phidias to take Homer's descriptions of his heroes as ideal models and to paint them with limbs larger than the ordinary human proportion. One of his most famous works was a picture of Helen for the temple of Hera at Croton. The rivalry of Zeuxis and Parrhasius is represented in a well-known story about a contest in which Zeuxis painted grapes at which the birds pecked, and Parrhasius a curtain which Zeuxis wished to have raised in order to see the picture. Some of his later works he gave away as being valuable beyond any fixed price. As far as may be judged from extant accounts, he painted small works on panels in contrast to the large mural paintings of Polygnotus. It is of course now impossible to form a correct idea of his art, though more anecdotes are told of him than of any other painter of antiquity. These are to be found in Lucian, Cicero, and especially the 'Historia Naturalis' of Pliny.

Zevcot, zäv-kö, Jacques (ZEVCOIUS), Dutch poet: b. Ghent 1604; d. 1646. For a time he was a barrister, but subsequently he became a friar of the rule of St Augustine, and wrote Latin verse which made him widely and favorably known. He visited Rome in 1624 and declined flattering offers of preferment from Pope Urban VIII. In 1605 he made open profession of Protestantism, and later was appointed professor of history and eloquence in the University of Harderwijk (Gelderland). Certainly in the Netherlands, if not beyond, he was esteemed the best Latin poet of his time. The best edition of his verse is 'Jacobi Zevcotii Poematum Editio Ultima' (1740).

Zeyer, ts'ér, Jules, Czech author: b. Prague 1842. After travel in France, Germany, Italy, Greece, and Russia, he became an instructor in the last, and published a number of volumes highly rated in literature. In prose these include 'Count Xavier,' and 'Andrew Cernysev,' the period of which is that of Catharine II.; in verse, 'Vysehrad,' a series of epic poems, the subjects of which are derived from the early history of Bohemia.

Zezschwitz, ts'etsh'viah, Gerhard von, German Lutheran theologian: b. Bautzen (Saxony) 2 July 1825; d. Erlangen 20 July 1886. Educated in the University of Leipzig, he became pastor at Grosszschocher (near Leipzig), but subsequently passed from a lectureship in the university to an extraordinary professorship there. Still later he held chairs in Giessen (from 1865) and Erlangen (from 1866). He was in his time an authority in the department of practical theology. A full list of his volumes cannot be given here; but they number such solid compendiums as 'System der Christlich-Kirchlichen Katechetik' (1863-72; 2d ed. of Vol. II. 1872-4); 'System der Praktischen Theologie' (1876-8); and 'Die Christenlehre im Zusammenhang' (2d ed. 1883-6). Consult 'Zur Erinnerung an Gerhard von Zezschwitz' (1886).

Zhob, zhób, Northwest India, a river of Lewistan, British Beluchistan, which joins the Gomul northwest of the Suliman Mountains, and with it flows into the Indus near Dera Ismael Khan. The Gomul and the Zhob valleys—the latter of which was annexed by Great Britain in 1889—are passes into Afghanistan of strategical value.

Zhukovskii, zhoo-köf'ski-i, Vasilii Andreievich, Russian poet: b. government of Tula, Russia, 29 Jan. 1783; d. 12 April 1852. He served in the campaign of 1812 against Napoleon, later settled in Dorpat, in 1816 obtained an imperial pension, and in 1826 became tutor to the Tsarevitch, later Alexander II. His most important service to Russian literature is to be found in his translations of the poems of Byron, Gray, Moore, Scott, Goethe, Schiller, Rückert, and others; 'Don Quixote'; the 'Odyssey'; and various further foreign classics. Among his original verses, 'Liudmilla,' an imitation of Bürger's 'Lenore,' and 'The Minstrel in the Russian Camp' were the most successful. Examples of them were turned into English verse in Bowring's 'Specimens of the Russian Poets' (1821-3).

Ziegenbalg, ts'g'én-bälg, Bartholomäus, German missionary: b. Pulsnitz (Saxony) 24 June 1683; d. Tranquebar (Coromandel coast) 6 March 1719. He obtained a university training at Halle, and in 1705 sailed from Copenhagen for Tranquebar in response to the call of Frederick IV. of Denmark for missionaries to the Danish possessions in India. He compiled a grammar of Tamil and two lexicons, and translated the New Testament and the Pentateuch. His labors were effective despite much opposition. He was the first Protestant missionary to India. Consult: Germann, 'Ziegenbalg und Plutzschau' (1868); and Plitt, 'Kurze Geschichte der Lutherischen Mission' (1871).

Ziegler, ts'g'lér, Friedrich Wilhelm, German actor and dramatist: b. Brunswick 1750; d. Pressburg 21 or 24 Sept. 1827. He first appeared in 1784 at Vienna, and from that time until his retirement in 1822 he was connected with the Court Theatre there, holding excellent place. Of his many dramatic works, the comedy 'Die Temperamente' and the drama 'Parteiwuth' were among those of less ephemeral value.

Ziegler, Karl, Austrian poet: b. Saint Martin, Upper Austria, 12 April 1812; d. Vienna 20 May 1877. He studied at the University of Vienna, was in the government service from 1835 until his retirement in 1857, and subsequently devoted himself to literature. He contributed largely to the literary periodicals and 'annuals' of the time, and under his pseudonym of 'Carlopagio' published a collection of 'Gedichte' in 1843. His other volumes were 'Himmel und Erde' (1856); 'Oden' (1866); and 'Vom Kothurn der Lyrik' (1869). His verse is simple and original in quality, and was once extremely popular, especially in literary circles.

Ziegler, Theobald, German philosopher: b. Göppingen, Württemberg, 9 Feb. 1846. He studied in Tübingen, from 1871 was an instructor in various gymnasia, in 1884 was appointed lecturer on philosophy and pedagogy in the University of Strasburg, and in 1886 professor there. His 'Sittliches Sein und Sittliches Wer-

den' (2d ed. 1890; English 1892) was a substantial enrichment of the literature of moral philosophy, and the 'Geschichte der Ethik' (2d ed. 1892) is also a work of importance. His further volumes include: 'Religion und Religionen' (1893); and 'Fr. Th. Vischer' (1893).

Ziegler, William, American capitalist: b. Beaver County, Pa., 1 Sept. 1843; d. Stamford, Conn., 24 May, 1905. He at first entered the printers' trade, and in 1868 the bakers' and confectioners' supplies business. In 1870 he organized the Royal Chemical Company, which he developed into the Royal Baking Powder Company, retiring from active business in 1886. He also operated largely in real estate. He fitted out the Ziegler expedition to explore the Arctic by way of Franz Josef Land, and, if possible, reach the North Pole. The expedition, Commander Fiala, left Vardö, Norway, 10 July 1903, and was not heard from thereafter.

Ziegler und Klipphausen, oont klîp'howzên, Heinrich Anselm, German poet: b. Radmeritz, Upper Lusatia, 6 Jan. 1663; d. Liebertwolkwitz, near Leipsic, 8 Sept. 1696. He was educated at Frankfurt-on-the-Oder, and lived as a landed proprietor. His chief work is 'Asiatische Banise, oder Blutiges doch Mutiges Pegu' (1688), which continued to appear in successive editions as late as 1764. It was reprinted, under Felix Bobertag's supervision, from the third edition (1707), in Vol. 37 of Kürschner's 'Deutsche Nationalbibliothek'. The work is done in a turgid style, but met in its day a great success, and had in Germany considerable literary influence. Its author's further writings are of less significance.

Ziem, zêm, Félix, French artist: b. Beaune (Côte d'Or) 25 Feb. 1821. He studied in the art-school of Dijon, traveled in southern France, Italy, and the Orient, obtained a third-class medal at the Salon of 1851, a first-class in 1852, and became well known for his landscapes, particularly for scenes of Venice. Among his many canvases are: 'View of Venice' (1852; Luxembourg); 'The Bank of the Amstel' (Bordeaux Museum); 'Quai Saint-Jean at Marseilles' (Marseilles Museum); 'The Doge's Palace' (Ravené Gallery, Berlin); and several in private collections in the United States.

Zieriksee, zê'rik-zâ, Netherlands, a town in the province of Zeeland, and the chief town of the island of Schouwen, three miles from the Ooster Schelde, with which it is connected by two canal harbors, and 21 miles east-northeast of Flushing. It has six churches, a fine town-house, and a gymnasium, manufactures madder, carries on brewing and oyster fishing, and has considerable trade and shipping. It is the oldest town of Zeeland, and was formerly an important Hanse town. Its demolished walls are now replaced by promenades. Pop. 7,000.

Ziethen, tsé'tên, or Zieten, Hans Joachim von, German soldier: b. Wustrau, near Neu-Ruppin, Brandenburg, 14 May 1699; d. Berlin 27 Jan. 1786. He entered the Prussian army in 1714, distinguished himself as a colonel in the Silesian campaign of 1742 and as a major-general in that of 1745, and in May 1745 made his celebrated march through the enemy's country in Upper Silesia, in order to communicate with the Margrave Karl at Jägerndorf. In 1756 he was made lieutenant-general. He obtained

his chief renown in the Seven Years' war, winning the victories of Reichenberg, Prague, and Leuthen, and deciding the day at Torgau by storming the heights of Suptitz. He was promoted general of cavalry, and was the most famous of the commanders of Frederick the Great. In the development of the light cavalry service he made important contributions. Consult the biographies by Count zur Lippe-Weissenfeld (2d ed. 1885) and by Winter (1886).

Zif, Ziv, or Ziph, in the Hebrew calendar, the second month of the year, extending from the new moon in May to that in June; or, according to some rabbis, from the new moon in April to that of June.

Zileh, zêl-lê', or Zile, ancient Zela, Asiatic Turkey, a town in the vilayet of Sivas, 25 miles southeast of Amassa. It is built on a hill, the mound of Semiramis mentioned by Strabo; a modern castle occupies the site of an old Byzantine fortress. Ancient Zela was a theocracy ruled by the priests of the temple of Anaitis. Pop. 20,000.

Ziller, tsîl'lêr, Tuiaken, German educator: b. Wasungen, Saxe-Meiningen, 22 Dec. 1817; d. Leipsic 20 April 1882. He was educated at Leipsic, where he was at first a lecturer in jurisprudence, but in 1864 became professor of philosophy and pedagogy. At his initiative the Verein für Wissenschaftliche Pädagogik was founded. Among his books are 'Einleitung in die Allgemeine Pädagogik' (1856; 2d ed. 1901) and 'Allgemeine Philosophische Ethik' (1886; 2d ed. 1886).

Zillerthal, tsîl'lêr-tâl, Austria, a valley of the Tyrol in the eastern Alps, about two miles below Innsbruck, famous for its scenic beauties. It is traversed by the Ziller, which joins the Inn River at the mouth of the valley. It is much frequented by tourists, a railway line connecting with Mairhofen in the valley.

Zimbabwe, zêm-bâb'wâ, or Zimbabwe (Bantu for 'here is a great kraal'), a name applied to numerous interesting South African ruins in Rhodesia and the Transvaal. The best known and most important is the Great Zimbabwe, near the Sabi River, about 17 miles from Victoria in southern Rhodesia. There are two principal structures at Great Zimbabwe, one on the crest of a granite hill breaking down precipitously to the south, and the other on the level ground about a third of a mile to the south. The lower one is roughly circular or elliptical, enclosed by a wall of 30 or 40 feet high, 14 feet thick at the base, and from 6 to 9 feet thick at the summit. The wall is composed of well-trimmed blocks of granite fitted together without mortar in regular courses, and occasionally set angularly for ornamental purposes. An inner wall runs close to the outer for a considerable distance, forming a passage which leads to a sacred enclosure containing two conical solid towers, the larger of which is some 40 feet high. The rest of the enclosure is divided into irregular chambers, none of which are roofed. The building on the hill is very strongly built for defense, and also contains a sacred enclosure. Phallic emblems, many curious objects in soapstone, and undoubted remains of gold-working utensils have been found in the Zimbabwe. The nearest gold deposits and ancient gold workings are, however, some

miles distant. Some theorists would locate here the Ophir of Solomon. It is generally believed that the lower building was a kind of town occupied by pre-Mohammedan Arabs who came here in search of gold, and that the ruin on the hill was a stronghold for defense. The buildings show distinct signs of orientation. Consult: Bent, 'The Ruined Cities of Mashonaland' (1892); and Hall and Neal, 'The Ancient Ruins of Rhodesia' (1902).

Zimmerman, Eugene, American caricaturist and illustrator: b. Basel, Switzerland, 25 May 1862. After a public school education in Paterson, N. J., and some time in various employments, he turned his attention to comic art, was on the staff of 'Puck' illustrators in 1882-5, and in 1885 became connected with 'Judge.' He also executed illustrations for some of the works of 'Bill' Nye and others.

Zimmerman, Jeremiah, American clergyman and numismatist: b. Snodysburg, Md., 26 April 1848. Graduated from Pennsylvania College, Gettysburg, in 1873, and the theological seminary there in 1876, he was pastor of the Lutheran Church at Valatie, N. Y., in 1877-8, and in 1879 organized at Syracuse, N. Y., the First English Lutheran Church, of which he is still the pastor. He also became a lecturer in Syracuse University. He is regarded as an authority on the historical branch of numismatics. Among his writings is the volume 'Spain and her People' (1902).

Zimmermann, tsim'mër-män, Albert, German painter: b. Zittau, Saxony, 20 Sept. 1808; d. Munich 18 Oct. 1888. He studied in Dresden and Munich, and was made professor in the Milan Academy in 1857 and at the Vienna Academy in 1860. His works display admirable characterizations of mountainous scenery and excellent light-effects. Among them are: 'Rocky Landscape with Centaurs and Leopards'; 'Chiem Lake in Storm'; 'The High Göl'; 'Sunset on Hintersee'; and 'Lake Como'.

Zimmermann, Johann Georg, CHEVALIER von, Swiss philosopher and writer: b. at Brugg, canton of Aargau (then in Bern), 8 Dec. 1728; d. Hanover 7 Oct. 1795. He studied medicine under Haller at Göttingen, and in 1754 was appointed public physician to his native town. He employed his leisure in the publication of pieces in prose and verse, including the first sketch of his popular work 'Ueber die Einsamkeit' (On Solitude, 1756; completely re-written 1784-5). This was followed by his essay 'Vom Nationalstolz' (On National Pride 1758). In 1763 he composed his work 'Von der Erfahrung in der Arzneikunst' (1764), which he followed up by several other professional treatises; in consequence of which he received an offer of the post of physician to the king of England for Hanover, which he accepted, and removed in 1768 to that capital. In 1786 he attended Frederick the Great in his last illness, which afforded little room for medical skill, but enabled him to publish on account of his conversations with that celebrated sovereign, 'Ueber Friedrich den Grossen und meine Unterredung mit ihm' (1788), and 'Fragmente über Friedrich den Grossen' (1789), works of no value. His 'Solitude' was at one time very popular, and was translated into almost every language of Europe.

Consult the studies by Bodemann (1878) and Ischer (1893).

Zimmermann, Wilhelm, German poet and historian: b. Stuttgart 2 Jan. 1807; d. Mergentheim, Württemberg, 22 Sept. 1878. After study at Tübingen, he was connected with various journals at Stuttgart, from 1847 to 1850 was professor of history and of German language and literature in the Polytechnic Institute there, but lost the post through his liberal attitude as a member of the German National Assembly (1848) and the Württemberg parliament. Subsequently he was pastor of Evangelical churches at Leonbronn, Schnaitheim, and Owen. He is best known for his 'Gedichte' (1831; 2d ed. 1839; 3d 1854), which reveal the influence of Schiller and Uhland, but are never merely imitative. Others of his publications are: 'Befreiungskämpfe der Deutschen gegen Napoleon' (1836; 3d ed. 1859); 'Geschichte des Grossen Bauernkriegs' (1841; 2d ed. 1856), and 'Geschichte der Deutschen Nationalliteratur' (1846).

Zimmermann, Helen, English authoress: b. Hamburg, Germany, 25 March 1846. After a secondary education at Bayswater, she became a contributor to 'Once a Week,' 'Old Merry's Monthly,' the *Press*, the *Examiner*, and other periodicals and journals, and in 1876 achieved a success with 'Schopenhauer, his Life and Philosophy.' From 1887 she has resided at Florence, Italy, where she corresponds for Italian, English, and American periodicals. She has also lectured in Italy, England, and Germany, on Italian art. Among her further publications are: 'Gothold Ephraim Lessing, his Life and his Works' (1878); 'The Epic of Kings' (1882), a paraphrase from Firdusi; a 'Life of Maria Edgeworth' (1883); and 'The Hansa Towns' (1889). She also translated from Nietzsche, and Lessing's prose, and edited the comedies of Goldoni (1892).

Zimri, zim'ri, in the satire 'Absalom and Achitophel' (pt. i. 1681; pt. ii. 1682) by John Dryden (q.v.), a character representing Villiers, Duke of Buckingham:

Some of the chiefs were princes in the land:
In the front rank of these did Zimri stand, etc.
(Pt. i. 345 et seq.)

Buckingham was depicted as a factional leader, like Zimri who conspired against Asa, king of Judah (1 Kings xvi. 9).

Zinc, or **Spelter**, a white metal with a bluish gray tint like lead. Its texture is lamellated and crystalline, and its specific gravity about 7. It is hard, being acted on by the file with difficulty, and its toughness is such as to require considerable force to break it when the mass is large. At low or high degrees of heat it is brittle, but between 250° and 300° F. it is both malleable and ductile, and may be rolled or hammered into sheets of considerable thinness and drawn into wire. Its malleability is considerably diminished by the impurities which the zinc of commerce contains. It fuses at 773° F., and when slowly cooled crystallizes in four- or six-sided prisms. Zinc undergoes little change by the action of air and moisture. When fused in open vessels it absorbs oxygen, and forms the white oxide called flowers of

ZINC WHITE

zinc. Heated strongly in air it takes fire and burns with a beautiful white light, forming oxide of zinc. Zinc is found in considerable abundance in Great Britain, Austria, Germany, Belgium, Italy, and in some parts of the United States. It does not occur in the native state, but is obtained from its ores, which are chiefly the sulphide, or zinc-blende, and the carbonate, or calamine. The oxide of zinc (ZnO) is a fine white powder, insoluble in water, but very soluble in acids, which it neutralises, being a powerful base of the same class as magnesia. It combines also with some of the alkalies. Several of the salts of zinc are employed in medicine and the arts; as the sulphate, which is used in calico printing, and in medicine as an astringent, a caustic, an emetic, and a tonic; the oxide and the carbonate, used as pigments, etc. Sheet-zinc is largely employed for lining water cisterns, baths, etc., for making spouts, pipes, for covering roofs, and several other architectural purposes. Plates of this metal are used as generators of electricity in voltaic batteries, etc. Zinc is much employed in the manufacture of brass and other alloys, and in preparing galvanised iron.

Joplin District.—The centre of the zinc industry in the United States is at Joplin, Mo. (q.v.), and the purity of the sulphide ores of the Joplin District has made it famous the world over. Most particularly is this true in relation to the sulphide zinc ores. There is no other known territory of like area in the whole world where sulphide zinc ores are mined with so high a per cent of metallic contents. The ideal state of sulphide zinc ore is 66½ per cent metallic zinc and 33½ per cent sulphur. Ores have been assayed here carrying 66½ per cent metallic zinc, and the average of the district output seldom falls below 58 per cent, returning to the smelter over 50 per cent metal in actual process of recovery, with a very nominal loss in residue. Those smelters provided with a means of recovering sulphuric acid from the sulphur in these ores produce one ton of this acid from every ton of the ore, combining a valuable by-product with the metal recovery. While the average falls as low as 58 per cent, hundreds of tons are marketed each week that assay 60 to 64 per cent metallic zinc contents.

Method of Marketing.—The ore producer places an open bin outside his mill from which the purchasing agents of the various smelters take samples, have them assayed, and, on the result of the assay, base a price in the bin. For the best grades of ore this price is about eight times as much per ton as the price of spelter per hundred pounds in Saint Louis. Weekly cash settlements are made for all ore purchased averaging in 1904 \$11,000 per week.

Ore Deposits.—Zinc ore is found in three distinct deposits—cavernous, disseminated and in blanket or horizontal vein.

Ore Occurrence.—Cavernous deposits were the original form of discovery, occurring near the surface. Deeper mining discovered disseminated deposits in some sections of the district, and blanket or horizontal vein deposits in other sections. The depth of ore occurrence in the discovery period of the district was at or near the surface. Mining is now in operation on the 175 to 250 foot level with a few mines being opened on the 300-foot level. Compared with other mining districts this is considered

still the surface level. The existence of ore deposits on still lower levels has been demonstrated by the churn drill, the lowest level tested being 1,100 feet.

Future of the Industry.—With known ore deposits on the 1,100-foot level, and the history of the old world mines, operating at these deep levels, gives an unlimited future to the mining of zinc ore in the Joplin district. The infancy of the industry in this district could be demonstrated by no stronger illustration than the difference in the working levels here and in the Old World zinc mines. Each decade marks a gradual deepening of the workings here about 100 feet deeper each decade.

Ore Formations.—In addition to the large amount of sulphide of zinc produced here, there is a lesser production of silicate of zinc, and a minor production of carbonate of zinc. In some mines of the district these ore formations occur alone, and in a number of mines they are associated with lead. The lead of this district occurs in the same three formations, and is proportioned in quantity with the sulphide leading, the silicate next and a small amount of carbonate. The output of lead in tonnage is practically one-tenth that of zinc.

Methods of Mining.—The district has progressed from the crudest to the most modern methods since the war of the rebellion. In the earliest stages of mining the ore was thrown out at first with a shovel, then a hand windlass, similar to the old well windlass, then came the horse hoist in varying stages of improvement as the depth was increased; steam followed; electricity is being introduced from a central energy plant, located on Spring River, 13 miles southwest of Joplin; natural gas is being piped in from the Kansas gas field.

System of Leasing.—There are five classes interested in the welfare of mining: land-owners, first lessees, sublessees, miners and the commercial interests. The land-owner is seldom a mine operator. That part falls to the first and second lessees. Formerly a first lessee was not an operator until mining operations passed below the 200-foot level. In earlier days the first lessee was a drainage company. With deeper mining the methods are required to be amplified on account of the greater cost. With still deeper mining the mine-operating company will of necessity become the fee holder, to avoid the payment of tribute as royalty from the earnings of the mine.

Commerce.—Four railroad systems at present supply the shipping interests—the Frisco-Rock Island, the Kansas City Southern, the Missouri Pacific and the Missouri, Kansas, & Texas. Aside from the heavy outward shipments of ores, the crushed chert, a refuse from ore concentration, is shipped in large quantities for city streets and for leveling the roadbeds of the railroads. Several factories manufacture hollow building blocks from this chert in combination with cement, a new industry that is rapidly becoming an important factor, in addition to the superior building stone of the Carthage quarries. The inward shipments are coal and timber for the mines, lumber, mining machinery and merchandise, for wholesaling and retail. Vast quantities of fuel are consumed, an important per cent of which will be superseded by the introduction of natural gas and electricity.

ZINC WHITE — ZINZENDORF

Developed Areas.—There exist five chains of development extending from the northwest to the southeast, on what is termed an eleven o'clock range, and one chain extending from the northeast to the southwest on a one o'clock range. The first five begin on the northwest with Badger, Zincite, Central, Jackson, Spring City, Spurgeon and Racine, the next chain to the east comprises Lawton, Lehigh, Mitchell (old Sherwood), Chitwood, Joplin and Saginaw; in the third are Oronogo, Webb City, Carterville, Prosperity, Duenweg, Diamond and Granby; in the fourth are Neck City, Albia, Carthage, Reeds, Wentworth and McDowell; in the fifth Stott City and Aurora comprise all the developments. From Zincite to Cave Springs, Empire Galena and Baxter Springs occurs the one o'clock chain of development. In the third chain is found the blanket or horizontal vein underlying the cavernous deposits. In the fifth chain occur occasional ore channels, or extended cavernous deposits. Occasional irregular connections occur between these slightly separated eleven o'clock ranges. Chitwood and Joplin have the largest development of disseminated ores. The entire area embraces about 25 to 35 miles in extent.

Historical.—Lead mining alone was prosecuted here prior to the war of the rebellion. The mining of this mineral was confined to Granby, Minersville (now Oronogo), Leadville hollow (now Joplin), and east and west hollow of the Stevens Diggin's (now Zincite). Silicate of zinc was found in great abundance with the Lead of Granby, but was put aside with no demand. The first demand for silicate of zinc was in 1871, when less than 1,000 tons were marketed. By 1883, the first year that sulphide of zinc ore was marketed, the output had grown to 53,900 tons, mostly silicate. The next decade, 1893, marked almost a complete change, with an output of 134,090 tons, mostly sulphide. An increase of nearly 100 per cent was recorded in 1907, with an output of 223,745 tons, principally sulphide of zinc ore. Two years later, 1909, the output reached 239,225 tons of zinc, with a market value of \$24,864,300 as compared with \$26,401,910 in 1907. JESSE A. ZOOK.

Statistician for the Joplin District.

Zinc White. See WHITE COLORS.

Zincite, a deep blood-red to orange-red mineral found quite abundantly in Sussex County, New Jersey. It is usually in granular or foliated masses, associated with franklinite, willemite, tephroite, and calcite. It rarely occurs in hexagonal, hemimorphic crystals, with perfect basal cleavage. Its hardness is 4 to 4.5 and specific gravity about 5.7. It is an oxide of zinc, ZnO, and is valuable as an ore of that metal. It is often called red 'oxide of zinc.'

Zincography. See LITHOGRAPHY.

Zingarelli, dzén-gá-ré'lé, *Nicolo Antonio*, Italian composer: b. Naples 4 April 1752; d. there 5 May 1837. He studied at the Conservatorio di Loreto and also under the Abbate Speranza, and on leaving the conservatory received the place of master of the chapel at Torre dell'Annunziata. In 1781 he composed for the Theatre San Carlos, in Naples, his opera 'Montesuma,' and in 1785 brought forward his 'Alzinda' in La Scala, Milan, with great success. In this work he adopted a more simple and easy style. His best operas are 'Pirro,' 'Artaserse,'

and 'Romeo e Giulietta.' In 1789 he brought out his 'Antigone,' from Marmontel in Paris; but the public events then occurring absorbed the attention of the public, and he soon returned to Italy, where he became director of the Vatican chapel. About 1812 he was appointed director of the musical academy of San Sebastiano, and in 1816 chapel-master in St. Peter's. Zingarelli composed much church music, and his works are highly esteemed for their expression. From 1781 he wrote about 40 operas, many melodies from which have continued to be interpolated in modern Italian productions.

Zingerle (von Sommersberg) tsing'ér-lé, *Ignaz Vincenz*, Austrian Teutonic scholar: b. Meran 6 June 1825; d. Innsbruck 17 Sept. 1892. He was a nephew of Pius (q.v.). He studied at Innsbruck and (theology) Brixen, and from 1859 until his retirement in 1890 was professor of German language and literature at Innsbruck. Among his works are: 'Sagen aus Tirol' (2d ed. 1891); 'Sitten, Bräuche, und Meinungen des Tiroler Volkes' (2d ed. 1871); 'Schildereien aus Tirol' (1875-88), and 'Der Bauer von Longvill' (1874).

Zingerle, *Pius*, Austrian Orientalist and Catholic theologian: b. Meran 17 March 1801; d. Marienberg cloister 10 Jan. 1881. He studied at Innsbruck, became in 1862 professor of Oriental languages in the Sapienza at Rome, and in 1867-71 was director of the gymnasium at Meran. Among his works are: 'Ausgewählte Schriften des Heiligen Kirchenvaters Ephraim' (2d ed. 1845-6); 'Akten der Heiligen Märtyrer des Morgenlandes' (1836); 'Chrestomathia Syriaca' (1871); and 'Lexicon Syriacum.'

Zinjan, sín-ján', Persia. See ZANJUN.

Zinnia, a genus of annual and perennial herbs and sub-shrubby plants of the order *Compositae*. The species, of which 16 have been described, are indigenous from southern Colorado to Chile, but are chiefly distributed in Mexico and Central America. They have opposite, generally entire leaves and terminal heads of very variously tinted flowers, for which some of the species have become popular in gardens. The best known species is the garden zinnia or youth-and-old-age (*Z. elegans*), an erect annual usually about 18 inches tall and originally bearing yellow or orange flowers, but now exhibiting nearly every tint except blue and green in both single and double forms, which often exceed three inches in diameter. *Z. haageana* was introduced into cultivation in 1861, but being less showy and smaller than the former is of secondary importance. A hybrid race developed from these two species, and known as *Z. darwini*, has been developed, but has not become widely popular in America. The plants are rather stiff, formal, and coarse in habit, and their colors, although brilliant and metallic, lack the delicacy of the dahlia and the china aster, to which they are not distantly related. They are, however, among the most useful garden annuals, because they will thrive upon almost any kind of soil and yield a profusion of bloom from midsummer until frost.

Zinzendorf, tsín'tsén-dórf, *Nicholas Ludwig*, COUNT VON, German religious leader, founder of the Society of United Brethren: b. Dresden, Saxony, 26 May 1700; d. Herrnhut,

Upper Lusatia, 9 May 1760. From 1716 to 1719 he studied at the orthodox University of Wittenberg, and subsequently traveled in Holland and France, describing his journey in 'The Pilgrimage of Atticus through the World.' In 1721 he received an appointment to the council of state from the Saxon government, which he held till 1727. He then completely withdrew from public affairs. He received at his estate in Upper Lusatia (1722) the persecuted Moravian Brethren. This settlement received in 1724 the name of Herrnhut. With a view to founding the body called the United Brethren (q.v.), he published various projects, not in harmony with each other, which excited opposition, but he persevered in his plan and finally succeeded. In 1734, after passing a theological examination under an assumed name, he was ordained a clergyman of the Lutheran Church. After two years spent in traveling on behalf of his society, he was banished in 1736 from Saxony. The order of his banishment was repealed in 1747. In the meantime he had been consecrated bishop of the Moravian Church in Berlin, founded Moravian colonies in Holland, Esthonia, and Livonia, and visited England. In 1739 he wrote a catechism which he styled the 'Good Word of the Lord,' and the same year visited the missions of the Brethren in the West Indies. In 1741 he founded the well-known Moravian colony at Bethlehem, Pa., and before returning to Germany in 1743 assisted in establishing missions among the Indian tribes. After returning to Europe he made a journey to Livonia, whence the Russian government sent him back under a military escort to the frontier. He afterward visited Holland, spent several years in England, and obtained an act of Parliament for the protection of his followers in the British dominions. He wrote more than 100 works of prose and verse. A collection of his hymns, edited by Knapp, appeared in 1845. Consult the 'Lives' by Spangenberg (1773-5; Eng. trans., abridged, 1838) and Römer (1900); also, Plitt, 'Zinzendorf's Theologie' (1869-74), and Becker, 'Zinzendorf und sein Christentum im Verhältnis zum Kirchlichen und Religiösen Leben seiner Zeit' (2d ed (1900).

Zi'on, or Zion, the loftiest mount of Jerusalem, and often used to designate the whole city, and metaphorically the kingdom of God on earth and in heaven. Zion rises about 2,500 feet above the Mediterranean, and from 200 to 300 feet above the valleys at its base. It was separated from Akra on the north and Moriah on the northwest by the Valley Tyropoeon; and had the valley of Gibbon on the west, that of Hinnom on the south, and that of the Kidron on the southeast. It was a fortified town of the Jebusites till subdued by David, and thenceforward was called the 'City of David.' A mosque near its southern brow now covers the 'tomb of David' so called. This mount, together with Moriah and Ophel, was enclosed by the first wall, and fortified by citadels. On it were erected the palaces of Solomon, and long afterward those of Herod. At the present day a considerable portion of it lies outside of the modern wall on the south.

Zi'onism, a name given to a scheme for the acquisition of Palestine by purchase from Turkey, with a view to establishing Russian and other Jews in the Holy Land. A Zionist

Congress with this end in view opened at Basel 29 Aug. 1897; and again 28 Aug. 1898. About 200 European delegates were present. The financial instrument of the Zionists is the Jewish Colonial Trust, Ltd., of London, capitalized at \$10,000,000, of which \$1,400,000 has been paid in. In the United States the Zionist organization is called the Federation of American Zionists, and has 165 affiliated societies, and about 10,000 members. See JUDAISM — ZIONISM.

Zipaquira, sè-pà-kè-rà', Colombia, town, department of Cundimarca, 25 miles north of Bogotá. It is built on the site of an old Chibcha Indian town, which was the residence of the chiefs or *Zipas*. It is especially noted for its valuable salt bed which is owned and operated by the government, and supplies the greater part of the salt used in the republic. Coal and iron are also found in the vicinity; and the town carries on an active trade with the surrounding district.

Ziph. See ZIP.

Zir'con, the native zirconium silicate, $ZrSiO_4$. Its crystals are tetragonal and isomorphous with thorite, xenotime, cassiterite, and rutile. Though its crystal forms are very varied, they are usually prisms terminated by pyramids, the base being rare. Small crystals frequently show a wealth of faces, among which the "zirconoids" or ditetragonal pyramids are prominent. It is a heavy mineral, its specific gravity averaging about 4.7, and it has a characteristic greasy-adamantine lustre. Though often nearly or quite opaque, transparent crystals are not uncommon, and owing to its hardness, 7.5, strong double refraction and the variety of rich colors in which it is found, zircon has long been prized as a gem. Its dispersive power is excelled only by the diamond. "Hyacinth" or "jacinth" includes reddish, orange, or brownish gem stones, while "jargon" embraces the colorless, yellowish, grayish, or smoky varieties. It is often an important accessory constituent of gneiss, syenite and many crystalline rocks. Because of its resistance to weathering and abrasion it frequently occurs in fine little crystals in alluvial sands as in Ceylon, Brazil, and the monazite region of North Carolina. The finest zircon gems come from Ceylon and New South Wales, while France yields very small stones of remarkably fine red color. Excellent translucent to opaque crystals occur in Norway, the Ural Mountains, Canada (up to 15 pounds), in New York, New Jersey, Colorado, and North Carolina. By far the most important locality is in Henderson County, North Carolina, where many tons of crystals occur loose in the soil. Zirconia, derived from this source, was used in the 'Welsbach' or 'Auer' mantles, but its incandescence had not sufficient permanency and its use has been superseded by thorium. Zirconia is still useful as a refractory material in furnace and crucible linings, and because of its incandescence in the "zircon light," which is an improvement on the ordinary lime light.

Zirconium, a chemical element named after the mineral zircon in which Klaproth discovered the oxide zirconia (1789). Afterward found in many other minerals, some of the most important being endialyte, hyacinth, polymignite, etc. It has many physical and chem-

ical properties resembling the element silicon. Like silicon and carbon it exists free in three allotropic forms; the amorphous, obtained as a black powder by heating sodium zirconium chloride with metallic sodium or potassium; the crystalline, as foliated leaves from heating sodium zirconium fluoride with metallic aluminum; and the graphitoid, obtained in scales of a steel gray color by action of iron on sodium zirconium. Symbol Zr; atomic weight 90.7; specific gravity 4.15. The element is only slightly soluble in hydrochloric or sulphuric acids, but is really so in aqua regia or hydrofluoric acid. When heated highly in the air it burns to the oxide ZrO_2 . This oxide, commonly known as zirconia, is prepared by fusing the mineral zircon ($ZrSiO_4$) with a mixture of sodium hydrate and sodium carbonate, treating with hydrochloric acid and heat to separate the silica, precipitating the solution so obtained with ammonia, and heating this white precipitate. Another method is now used by which the chloride is made by treating crushed zircon with chlorine, separating the silicon chloride by heat, precipitating the solution of zirconium chloride with ammonia, and heating the precipitate. Zirconia forms a white powder or amorphous lumps. It has both basic and acid properties. It dissolves slowly in hydrofluoric or sulphuric acids, the fluoride (ZrF_4) uniting with fluorides of other metals forming complex salts called zirconofluorides, example K_2ZrF_6 , potassium zirconofluoride. With strong alkalis zirconia forms zirconates, example, K_2ZrO_4 , potassium zirconate. Zirconium forms a long series of salts, in most of which it acts as a basic element.

Uses.—Zirconia possesses the power of being extremely refractory toward heat, not being changed even by that of the oxy-hydrogen blowpipe flame. It also has great radiating power. Because of this it is used in the "zirconia light," a light used considerably in lighthouses. A cone of zirconia is played upon by the very hot flame of the oxy-hydrogen blowpipe so that it glows with a very intense white light. While this is the principal use of compounds of zirconium, certain minerals containing it are found as clear beautiful stones and are used as gems.

Zirknitz, tsirk'nitz, Austria, a phenomenal lake in Carniola, 30 miles east-northeast of Trieste, in a deep valley surrounded by mountains, the principal of which are Javornik, Succhi, Slivinja, and Sternitz. The lake takes its name from Zirknitz, situated at an elevation of 3,500 feet, and one of many villages in the neighborhood. Receiving the waters of six streams, and surrounded by mountains with no outlet, the characteristic feature of the lake is its internal drainage. The bottom of the lake partakes of the limestone formation of the district, which fissures readily, and has numerous subterranean caves and channels. Some of these caverns are of great depth, and in the dry season absorb the waters of the lake, leaving it sometimes completely dry, with only a few pools, in which the fish take refuge. A luxuriant natural vegetation covers the surface of the deserted lake, and when the drought is protracted grass, millet, or buckwheat is sown on it and the harvest reaped before the return of the water. In June the lake is frequented by wild ducks, which afford abundant sport, and when

the water is decreasing fish are caught in great numbers. The lake is from six to seven miles long, nearly three broad, and of an average depth of 11 feet, but there is no stated limit to its basin. It receives the drainage of a considerable country, and even when no rain falls in the immediate neighborhood its reservoirs are filled from the rainfall of more distant hills. In dry seasons the lake takes about 30 days to empty. When rain has been abundant, and all its subterranean sources are in simultaneous activity, it reaches the average height in 72 hours, and when the rain has extended to all the tributary region it reaches its extreme level, which is about two feet above the average, in 196 hours. The natural outlets then no longer suffice to carry away the water, and it overflows the country, damaging or destroying the surrounding villages. The emptying and flooding of the lake depends upon the drought or moisture of the season, and is not strictly periodic. It has been known to empty and fill three times in one year. From 1707-14 it was only once dry, and from January 1834 to February 1835, it remained entirely without water, the longest drought on record. This lake was known to the ancients for the same phenomena, and it has been picturesquely described by Tasso in his 'Sette Giornate del Mondo.'

Ziska, zis'ka (properly **Ziška, zhižh'ka**), John, Bohemian Hussite leader: b. Trocznov, near Budweis, about 1360; d. Píseňslav 11 Oct. 1424. He was educated at the court of King Wenceslas at Prague, entered the profession of arms, joined the contingent that went from Bohemia and Hungary in 1410 to the assistance of the Teutonic Knights against the Poles and Lithuanians, and fought with great prowess in the fiercely contested battle of Tannenberg (15 July 1410). Then he served in Hungary against the Turks, and on the English side at Agincourt (25 Oct. 1415). Soon after the execution of Huss (q.v.), he returned to Bohemia and became a leader of the Hussites. In 1419, when the Hussites broke into rebellion against the Emperor Sigismund, Ziska organized their military forces into a well-disciplined army of infantry, supplying the want of cavalry by means of the *Waggenburgen*, or "cart-forts," constructed of the baggage-wagons. He took up his headquarters at a stronghold on the heights of Austie, in southern Bohemia, the fortress being known as Tabor (with reference, perhaps, both to *tabor*, Bohemian for "encampment," and to Mt. Tabor in Palestine), and the extreme Hussites as "Taborites." Sigismund sent an army of 30,000 into the country, but Ziska, with a hasty levy of about 4,000 took up his position on Mt. Vitkov, near Prague, and on 14 July 1420 defeated the enemy with great slaughter. The eminence has since been known as the Hill of Ziska. On 1 Nov. 1420, at Pankratz, he was again victorious over Sigismund, and on 2 November captured the fortress of Vyšehrad, near Prague. He won a second great battle against Sigismund 8 Jan. 1422 at Deutschbrod, and penetrated into Moravia and Austria. He had long had but one eye, and had lost the other by an arrow-wound at the siege of Raby castle, but he continued to direct his troops with great efficiency and almost unvarying success. Prague

refused to recognize his authority, and he thoroughly subdued it in 1424. In that year, it is said, Sigismund, realizing the impossibility of conquering Bohemia, began negotiations toward a treaty, by the terms of which the Hussites were to have full religious liberty and Ziska was to be governor of Bohemia. Such negotiations, if undertaken, were interrupted by Ziska's death at the siege of Pflav. Ziska became the hero of the Bohemian revolutionary party, and for this character he was well fitted by his zeal and military ability. He was frequently cruel in his method of warfare and conquest. Much fiction has been mingled with the facts of his career. Alfred Meissner's epic 'Ziska,' based on the leader's history, reached a 12th edition in 1884. Consult the German translation (1882) of Tomek's 'Life.'

Zith'er, a modern development of the musical instrument known to the Greeks as cithara. In the early part of the 19th century it became a favorite with the peasantry of the Styrian and Bavarian Alps, and was introduced into England about 1850. The zither consists of a resonance box, with a large circular sound hole near the middle; the strings, 32 in number, in some cases increased to 40 and even 46, being made of steel, brass, catgut, and silk covered with fine silver or copper wire, and tuned by pegs at one end. Five of the strings are stretched over a fretted keyboard, and are used to play the melody, the fingers of the left hand stopping the strings on the frets, the right-hand thumb, armed with a metal ring, striking the strings, which are tuned in fifths, and have a chromatic range from C in the second space of the bass staff to D in the sixth ledger line above the treble. The remainder, called the accompaniment strings, are struck by the first three fingers of the right hand. The viola zither, in which the resonance box is heart-shaped, is tuned like the violin, and is played with a bow.

Zittau, tsit'tow, Germany, a town of Saxony, on the Mandau, near the Austrian frontier, 49 miles by rail east-southeast of Dresden. The chief public buildings are a splendid town-house, the churches of Saint Peter and Saint Paul, Saint John, and Mary, hospitals, custom-house, gymnasium, a municipal museum, and a valuable library. Its principal manufactures are cotton-spinning, dress goods, iron-founding, machinery, stained glass, cycles, ropes, paper, brewing, and brick-making; and there is a trade in cotton and linen goods, chemicals, etc. There are a number of lignite mines in the neighborhood.

Zittel, tsit'til, Karl Alfred von, German paleontologist and geologist: b. Bahlingen, Baden, 25 Sept. 1839; d. Munich, Bavaria, 6 Jan. 1904. After study at Heidelberg and Paris, he entered the geological survey at Vienna, in 1863 a lecturer in the university there, and in the same year professor of mineralogy at Karlsruhe. In 1866 he was made professor of paleontology and geology at Munich; and in 1899 president of the Bavarian Academy of Sciences and curator-general of the scientific collections of Bavaria. The Rohlf's expedition to Egypt and the Libyan desert in 1873-4 derived much of its value from his important labors. Among

his publications are the 'Paläontologische Studien über die Grenzschichten der Jura- und Kreideformation' (1868-83); 'Aus der Urzeit' (1872; 2d ed. 1875); 'Handbuch der Paläontologie' (with Schimper and Schenk 1876-93), the most complete and authoritative work in that field; and 'Geschichte der Geologie und Paläontologie bis Ende des neunzehnten Jahrhunderts' (1899). He edited the periodical 'Paläontographica.'

Ziwet, Alexander, American mathematician: b. Breslau, Germany, 8 Feb. 1853. Graduated from the Polytechnical School of Karlsruhe in 1880, he came in that year to the United States, and for some time was connected with the United States lake survey (Detroit) and the coast and geodetic survey (Washington). Subsequently he became successively instructor in, and junior professor of, mathematics in the University of Michigan. In 1892 he was made co-editor of the 'Bulletin' of the American Mathematical Society. He published an 'Elementary Treatise on Theoretical Mechanics' in three parts, as follows: Pt. I., 'Kinematics' (1893); Pt. II., 'Introduction to Dynamics, Statics' (1893); Pt. III., 'Kinetics' (1894).

Zizania, a genus of grasses (q.v.) including the wild rice.

Zizyphus, a genus of *Rhamnaceae*, shrubs or small trees, with spiny stipules, alternate three-nerved leaves, a spreading five-cleft calyx, five hood-like petals, five stamens, a five-angled disk, adhering to the tube of the calyx, and having enclosed within it the two-or three-celled ovary. Fruit a drupe, which is sometimes edible and has a large stone or kernel containing from one to several flattened seeds. *Zizyphus* is widely distributed, but is chiefly indigenous to tropical Asia and America. The fruits of the cultivated *Z. jujuba*, and of *Z. sativa*, are of the size and shape of a small, oval plum. They ripen in September when they are gathered and stored in a dry place, the pulp becoming sweeter by the process. They have a dark-red skin, but are yellow within. If carefully dried, these fruits, called jujubes, will keep for a long time, and retain their acid flavor, which has made them a refreshing dessert fruit, in the Mediterranean countries and in China. They are nutritive and demulcent, a cough medicine having been prepared from them, and formerly, the sweet-meat known as jujube paste, was made from the evaporated juice of jujube, and of gum-arabic; but now the jujube is displaced by the gum and by gelatine. *Z. sativa* is a handsome arborescent shrub, with small, varnished, oval leaves and greenish inconspicuous flowers, succeeded by the bright drupes. It is sometimes cultivated in the United States, being hardy as far north as Washington. The bark, in its native countries, was used medicinally, for fever and for sores; and it is also employed for tanning and for a dye-stuff like that of *Z. xylopyra* which yields a black dye. Various parts of other species yield medicines, and the edible fruits of *Z. baeli* of Africa are used for a pleasant drink and are also made into bread. *Z. lotus* is by some believed to be the lotus-trees the fruit of which produced such indolence in those who ate them. It grows in Barbary, where it is called sadr. *Z. spina-*

ZLATOUST—ZOAR

christi is a small, prickly tree, which is reputed to have composed Christ's crown of thorns. Like other spiny species of *Zurphus*, this is a good hedge plant. *Z. nummularia* of Persia and India is one of the camel's thorns, whose foliage forms a fodder, and which has edible fruits. The cog-wood of Jamaica, an important timber tree, is *Z. chloroxylon*.

Zlatoust, zlá-tó-oost', Russia, a town in the province of Ufa, on the Ai, an affluent of the Ufa, near the Ural Mountains, 150 miles northeast of Ufa. In the vicinity are rich iron and gold mines, and in the town are government works, manufacturing sword-blades, steel instruments, and ammunition. Pop. about 22,000.

Znoim, tsnim, Austria, a town of Moravia, on the Thaya, 50 miles northwest of Vienna. The chief buildings are a Rathaus (1446), a circular church, said to have been a heathen temple, and the Gothic church of Saint Nicholas. The old ducal castle crowns a neighboring height. The trade is largely agricultural. Mustard, wine, and cucumbers are exported. Fine majolica, leather, and chocolate are manufactured. New waterworks were opened in 1877. As Znoimo, it was the capital of Moravia, destroyed in 1145 by the Bohemian Prince Vladislav, and rebuilt in 1226. On 11 July 1809, the French under Massena and Marmont defeated the Austrians here, and in 1866 it was captured by the Prussians.

Zoar, zó'ar, Separatist Society of. The Separatist Society of Zoar was a communistic religious organization located at Zoar, on the Tuscarawas River, Tuscarawas County, Ohio. They were German Protestant peasants, 225 in number, who emigrated from Würtemberg in April 1817. Their chosen leader was Joseph Baumler, whose name was later changed, for the sake of euphony, to Bimeler. Bimeler was of humble origin, but a man of unusual ability and independence, well educated, a natural leader, and a fluent speaker; he purchased in his own name, in the locality named above, 5,000 acres of farm land, at an average value of \$3 per acre, giving a mortgage at long time for the entire amount. This Separatist emigration had been primarily, for the purpose of securing religious liberty; and, for better opportunities in obtaining a livelihood. It was expected that each family would, by its industrious labor, secure separate ownership in a portion of the land held by Bimeler, but the colonists being diverse in age, strength, experience, education, and enterprise, they soon realized that their personal inequality stood in the way of the collective success of the colony, and early in 1819 they decided to organize into a community of property and effort. Articles of agreement were signed by 159 adults—53 males and 104 females. The articles created a community of interest, present and prospective, whereby all the property, movable and immovable, of the individual members, and their future earnings should become the common stock of the association, to be held and managed by chosen directors. Death of a member passed no property interest to his heirs, and withdrawal from the society, voluntary or compulsory, carried with it no claim upon a divided or undivided right in the association. Bimeler was to retain the realty in trust

until the society by its earnings could pay the mortgage and assume title.

In 1832 the society was incorporated under the then existing laws of Ohio by the name of "The Society of Separatists of Zoar." This conferred upon the society the ordinary powers of a corporation, with perpetual succession, power to hold property, purchase and sell, pass by-laws, etc. Under this reorganization the members were divided into two classes, known as the novitiates and the full associates; the novitiates were obliged to serve at least one year before admission to the second class, and this applied to the children of the members if, on becoming of age, they wished to join the society; the full associates must be of legal age—the males 21 and the females 18; all officers were elected by the whole society, the women voting as well as the men, all elections being by ballot and a majority vote; the government of the community vested solely in a board of three trustees (or directors) to serve three years each, one to be elected annually; these trustees had unlimited power over the custody and management of the property and all the temporalities of the society, but were bound to provide clothing, board and dwelling for each member "without respect to person," and use all means confided to their charge for the best interests of the society; they directed the industries and detail of affairs of the society; assigned each member his especial work, and the portion of necessities each should receive. Beside the board of trustees there was a standing committee, or council, of five, one member being elected each year. This council was the supreme judiciary, or board of arbitration, of the society, in cases of disagreement, dissension, or complaint; it had power to excommunicate members or deprive them of participation in the affairs of the society. They also elected once in four years a cashier or treasurer who had custody of all moneys, kept the books, and had immediate oversight over the finances of the society. In addition there was an official known as the "agent general," who acted as the trader to buy and sell for the society in its dealings with the outside world, make and enforce contracts, etc. The office of agent general was regarded as the position of honor and influence, and to it Joseph Bimeler was elected for life; after his death the office remained vacant, its duties being performed by the cashier or the trustees.

The society, from its organization as a commune, steadily prospered, and in time built up a large number of enterprising and successful industries, having in the period of its height two large flour mills, saw mill, planing mill, machine shop, tannery, dye house, stove foundry, cooper shop, woolen mill, brewery, slaughter house, blacksmith shop, tile works, pottery, etc. In all these concerns a high grade of goods was produced, which found a ready market with foreign customers. The value of the Zoar property increased until about 1875, when their land, industrial plants, and money accumulation were estimated at \$1,500,000. From that time the enterprise began to decline. Bimeler died in 1853, and there was no leader or director his equal in sagacity or personality. The environment of the society slowly changed from that of a western pioneer frontier to a prosperous, cultivated section of country, and rival neighboring in-

dustries made inroads into the export business of Zoar; the Zoarites were not progressive and did not keep pace in their manufactures with modern methods and improvements, and in time found that they could purchase products for use and wear cheaper than they could make them; there were few accessions to the society; the original members became too old and feeble to conduct its affairs; outside laborers had to be employed; the younger members were inclined to leave and seek their fortunes where they could acquire independent property and freedom of action. This decline continued until in 1897, when, by a common consent, the organization decided to disband and place the property in the hands of a commission for equal division. The appraisal and distribution was completed in the fall of 1898. There were at this time 222 people, adults and children, in the society, of whom 136 were entitled to one equal share. They each received a few hundred dollars in cash and a portion of the farm land or village property.

The religious tenets of the Zoarites were few and simple. They confessed the doctrine of the Trinity; the fall of man; the return through Christ; the Holy Scriptures as the guide of their lives; all ceremonies were declared useless and injurious; marriages were contracted by mutual consent and before witnesses; they recognized no ordained minister, and engaged in no public prayer. Bimeler was their only preacher and teacher; he spoke each Sunday to the society, and after his death his published discourses were read in the public meetings by various members. The society did not seek additions and made no attempt to propagate its principles, either economic or religious. The life of the Zoarites was one of utmost simplicity, serenity and morality. There never was a divorce in the community and no member was ever charged with a crime or felony. Consult: Randall, 'History Zoar Society,' and Nordhoff, 'Communitistic Societies in U. S.'

E. O. RANDALL, Ph.D.,
Secretary of the Ohio State Archaeological and
Historical Society.

Zöckler, tsék'ler, Otto, German Lutheran theologian; b. Grünberg, Hesse, 27 May 1833. He was educated in the universities of Giessen, Erlangen, and Berlin, became a lecturer at the first-named in 1857, and in 1863 professor of theology. In 1866 he was appointed professor at Greifswald, and in 1885 consistorial councillor. He is one of the leaders of the movement toward the establishment of a state church in Prussia. In 1882 he became editor of the 'Evangelische Kirchenzeitung.' Among his works are: 'Hieronymus, sein Leben und Wirken' (1865); commentaries to Chronicles, Job, Proverbs, Ecclesiastes, Canticles, and Daniel, in Lange's 'Bibelwerk' (1866-72; Eng. trans. 1870 et seq.); 'Das Kreuz Christi' (1875; Eng. trans. 1877); 'Gottes Zeugen im Reich der Natur' (1881; Eng. trans. 1886); and 'Biblische und Kirchenhistorische Studien' (1893). For the 'Kurzgefasstes Kommentar zum Alten und Neuen Testament und zu den Apokryphen' (1886 et seq.), which he edited with Strack, he prepared the commentaries on the Old Testament apocryphal books, the Acts, and the epistles to the Thessalonians and Galatians.

Zo'diac. The zodiac is a belt of the celestial sphere, extending 8° on each side of the ecliptic, or the path of the sun among the stars. "The name is derived from *zōon*, a living creature, because the constellations in it (except Libra), are all figures of animals. It was taken of that particular width by the ancients simply because the moon and the then known planets never go farther than 8° from the ecliptic" (Young's 'Astronomy'). The belt is divided into 12 parts, of 30° each, to which are given the following names: Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Pisces. This division into 12 parts was suggested by the 12 re-appearances of the moon in a year. The idea seems to have originated with the Chaldean astronomers.

Owing to the fact that the earth is not a perfect sphere, the pole of the earth's equator describes a circle around the pole of the ecliptic, which causes a constant retrograde motion in equator with the point of intersection of the plane of the zodiac. The rate of this motion is 1° in 70 years, and has amounted to 30°, or one entire sign, up to the present time. "The sign of Aries, therefore, is now in the position of the constellation Pisces; each sign having backed so to speak into the constellation west of it." The constellations themselves bear no resemblance to the signs designated by them.

During the Middle Ages the signs of the zodiac were supposed to influence human life, and hence were distributed to different parts of the human body. Disease was supposed to be cured by the aid of the zodiacal power presiding over that part of the body. The remnant of this superstition is still seen in some almanacs.

The Egyptians are supposed to have adopted the 12-fold division of the Zodiac from the Greeks, but they changed the symbols of living creatures to others of their own. The Chinese divided the course of the sun into 12 parts, which they designated as the Rat, the Ox, the Tiger, Hare, Dragon, Serpent, Horse, Sheep, Monkey, Hen, Dog, and Pig. This division is still found in some parts of Central Asia, and Japan. It has also been found among the remains of the Aztec race in America. The original zodiacal constellations occupied unequal spaces in the heavens. Hipparchus was the first to divide the zodiac into equal spaces of 30° each, and give to them the names of the older constellations. His method of reckoning positions in the ecliptic was used until this century. Astronomers have now abandoned it for the more accurate measurement of degrees, beginning at the vernal equinox.

The origin of the names of the animals assigned to the zodiac by the ancients is unknown. Some have supposed that the spring signs: Aries, the Ram, Taurus, the Bull, and Gemini, the Twins, mark the time of the bringing forth of young by flocks and herds. Cancer, the Crab, marks the time when the sun appears to move backward. Leo, the Lion, symbolizes the fierce heat of summer, and Virgo, the Virgin, gleaming corn, symbolizes the harvest. In Libra, the Balance, the day and night balance each other. Scorpius is supposed to have marked the presence of venomous reptiles in October; while Sagittarius symbolizes the season of hunting.

ZODIACAL LIGHT—ZOHAR

Capricornus marks the beginning of the return of the sun to the north, Aquarius symbolizes the winter rains, and Pisces the season of fishes. These are but fanciful representations, and have no foundation in fact.

Zodiacal Light. "The zodiacal light is a faint column of light rising from the western horizon after twilight in winter or spring evenings; and before daybreak in summer or autumn. It extends out on each side of the sun, and lies nearly in the plane of the ecliptic. Near the equator it can be seen all the year, and has been traced all the way across the heavens from east to west, forming a complete ring." In our latitudes it can seldom be traced more than 90° from the sun. Parts of the column near the sun are somewhat bright, but distant portions are extremely faint, and can only be seen on the very clearest nights. The cause of the zodiacal light is not definitely known. The theory most generally received is that it is sunlight reflected by myriads of small meteoric bodies revolving around the sun, nearly in the plane of the ecliptic. This theory would require a thin flat ring of these meteors to extend beyond the orbit of the earth. The theory is not established. The name zodiacal light was given to this phenomenon by Cassini in 1653, who described it as a flat luminous ring encircling the sun nearly in the plane of the ecliptic. Kepler supposed it to be the atmosphere of the sun; but Laplace showed that the atmosphere of the sun could not extend to anything like the distance from the sun which is reached by the zodiacal light. In 1853 an extended series of observations was made by Jones from different parts of the Pacific ocean. From these observations he deduced the theory that the zodiacal light was caused by a ring of matter surrounding the earth, and not the sun.

Professor Wright, of Yale University, has determined that the spectrum of the light is continuous, and therefore is essentially reflected sunlight. He has also determined that the light is partially polarized in a plane passing through the sun, and that the amount of the polarization is between 15 and 20 per cent. The origin of the minute particles which reflect the light has been accounted for in many ways. By some they are believed to have been thrown out from the corona of the sun; by others to be composed of dust thrown out from the equatorial regions of the sun; but by most they are believed to be an immense cloud of meteoroids filling the space between the earth and the sun. The meteoric theory of the sun's heat presupposes a multitude of these meteoric bodies constantly falling into the sun to supply the loss by radiation, as well as multitudes of others which never reach the surface. It is not probable, however, that these meteors if they exist play any part in the phenomena of the zodiacal light.

Zōē, zō'ē (Gr. Ζωή), empress of the East: b. about 978; d. 1050. She was the daughter of Constantine IX., and became the wife of Romanus III. in 1028. She became the murderess of her husband, in order to place Michael IV. on the throne. The latter dying, was succeeded by his nephew, Michael V., who was deposed by the people. Zōē and her sister Theodora were then proclaimed joint sovereigns. She displayed

great ability and firmness in the government, and in 1042 married Constantine IX., Monomachus. She reigned till her death.

Zo'trope, a modern mechanical toy, depending, for its interest on the constancy of visual impressions. It consists of a rotating drum, open at the top, in which around its inner periphery are placed strips of paper, having figures of men, animals, etc., in varying positions. By turning the cylinder the images are seen through slots in its upper side, giving the effect of action to the figures.

Zoffany, tsōf'fā-nī (properly Zaufelby), Johann, German painter: b. Ratisbon 1733; d. London 11 Nov. 1810. He was a pupil of Speer at Ratisbon, studied also for 12 years in Italy, in 1758 went to England, there first attracted attention by a portrait of Garrick, and soon won considerable reputation. He was sent by George III. to Italy, where he executed 'The Tribune of Florence,' one of his most celebrated works. In 1783 he went to India, where he was very successful in his art. Among his further paintings are: 'Earl of Barrymore'; 'Foote'; 'Weston'; 'Members of the Royal Academy'; 'Tiger Hunt'; and 'Embassy of Hyder Beg.'

Zogbaum, Rufus Fairchild, American artist: b. Charleston, S. C., 28 Aug. 1869. He studied at the Art Students' League (1878-9) and in Paris with Léon Bonnat (1880-2), made extensive study of European armies in field and garrison, and later became known as a leading delineator of military and naval subjects, which he renders with scrupulous fidelity to the various points of detail. His publications, written and illustrated by himself, are: 'Horse, Foot, and Dragoons' (1887); 'All Hands'; and 'Ships and Sailors.'

Zohar, zō'hār, the Bible of the Kabbalists, long revered by Jewish mystics and regarded by some as higher than the Bible and the Talmud, has, however, been proved a clever forgery. The secret science of the Kabbala received a marked development at the beginning of the 13th century, when a mystic, Ezra or Azriel, compiled a work called 'Brilliance' ('Bahir') (1240). In an atmosphere of reputed miracles and a new Messiah, there appeared some years later the most famous Kabbalistic book of the time—the 'Zohar,' or 'Splendor.' It was offered as the work of Simon ben Jochai, a sage of the 2d century, of whom many legends are told. He is said to have spent years in solitude, a hermit receiving special revelations. It was claimed that for over a thousand years the 'Zohar' had been concealed in a cave in Galilee and had been at last brought to light. The literary forger who "discovered" the 'Zohar' was Moses of Leon (born in Leon about 1250, died in Arevalo 1305), who employed an Aramaic idiom to give the book an air of antiquity, and with such skill that Jew and Christian alike were deceived and some even to-day attribute to it hoary age. Yet his widow admitted that it was a forgery.

The character of the 'Zohar' can hardly be dismissed as unique in literature, with its fantastic, imaginative, and emotional elements. It is a medley of spirituality and coarseness, a strange combination of intellectuality and grosse-

ness, whose influence has been far-reaching and whose adherents have numbered hundreds of thousands. It is a work without method, a kind of impressionist commentary on the Pentateuch, half homily, half meditation, dwelling largely on the "higher" sense of Scripture and allowing every opportunity for vague and mystic interpretation. Hence the moral perversions that abound, the blasphemy and absurdity. The pre-existence of the soul is assumed—paradise and hell are alike depicted, the varieties of sin described with painful minuteness, Messianic speculations indulged in, and views favorable to the dogma of the Trinity uttered, while communion with departed spirits, celestial hosts, and angels completes the farrago of nonsensical speculation. Such an aberration is rare in the history of Judaism and has been productive of much harm. Its soil has nourished gross superstitions and strengthened the belief in ghosts and evil spirits; its mode of interpretation has degraded the study of the Bible and spread the wildest fancies. At one time it was high in favor with the papacy when the Talmud was condemned to the flames, but it was later included in the Index Expurgatorius. Its occasional Christian tone was not overlooked by Christian scholars—Pico di Mirandola (1463-94) and Reuchlin (1455-1522) both made the 'Zohar' the basis of their vindication of Jewish literature. Its literary influence, however, was not long retained. It developed a few "saints" and "miracle workers," spurious Messiahs and the like, but it has had no successor. In absorbing the miasma of the earlier Kabbalistic literature, it left no germs for further development. See **Jews and Judaism**.

Bibliography—Graetz's 'History of the Jews,' Vols. III. and IV.; Abrahams' 'Jewish Literature,' pp. 172-5.

Zölma, zôl-lâs (Gr. *Zôlma*), Thracian rhetorician, chiefly remembered for the asperity of his criticisms on the poems of Homer. An account of his career is given by Vitruvius, which is not self-consistent, and the time at which he lived is uncertain. He is said to have been a pupil of Polycrates, to have been eminent before the rise of Socrates, and to have continued to write until the reign of Alexander. Vitruvius represents him as seeking the patronage of Ptolemy Philadelphus. Heracleides says he was originally a Thracian slave. He is reported to have died a violent death. The violence of his attacks on Homer procured him the title of *Homeromastix*. He also attacked Plato and Isocrates. It is said he found fault with Homer principally for introducing fabulous and incredible stories into his poems. He has acquired the reputation of having been a captious and unjust critic, but Dionysius of Halicarnassus places him in the highest rank. Consult Spindler, 'De Zöllo' (1888-9).

Zoïlîte, a mineral closely related to epidote. It is a basic ortho-silicate of calcium and aluminum, $\text{HCa}_2\text{Al}_2\text{Si}_2\text{O}_{10}$. The aluminum is sometimes partly replaced by iron, the mineral thus approaching epidote in composition. Though its crystals are orthorhombic, their form is very similar to the monoclinic epidote. Its hardness is 6 to 6.5 and specific gravity about 3.3. Its color is usually dull gray or

brown, but in the variety 'thulite,' found in Norway, it is a beautiful rose pink. It is found in many European localities, also abundantly in the New England States, Pennsylvania, and North Carolina, and in exceptionally good crystals at Ducktown, Tenn.

Zola, zô'la, Fr. zô-lâ, Emile, French novelist; b. Paris 2 April 1840; d. there 29 Sept. 1902. He was educated at the Collège of Aix, from which he went to the Lycée St. Louis at Paris with a scholarship in 1858. His career there was undistinguished, and he left in 1860 after failing to take his degree owing to insufficiency in literature. After a very brief experience as a clerk in a business house he was for more than a year compelled to sound the lowest depths of poverty in Paris, but in 1861 he obtained employment as a shopman with MM. Hachette, the publishers, at a salary of a pound a week. He devoted his spare time to literary work, contributing short stories to the 'Petit Journal' and 'La Vie Parisienne,' and critical articles to the 'Salut Public' of Lyons and afterwards to Villermessant's journals, the 'Evénement' and the 'Figaro.' Several of his stories were published separately in the volumes 'Contes à Ninon' (1864), which contains some of his best and purest work, and which was followed in 1874 by 'Nouveaux Contes à Ninon.' Some of his critical articles were collected under the title 'Mes Haines' (1866). In 'La Confession de Claude' (1865), a novel in which he utilized his early struggles, we find him already in full progress toward the characteristic work of his maturity, and this tendency became still more marked in the immediately succeeding novels: 'Le Vœu d'une Morte' (1866); 'Les Mystères de Marseille' (1867); 'Thérèse Raquin' (1867), a powerful study of the effects of remorse following on adultery and murder; and 'Madeleine Féral' (1868). Having by this time gained a secure footing in the world of letters, he conceived the plan of the series of novels known as 'Les Rougon-Macquart,' which includes his best-known work and occupied him for nearly a quarter of a century. It is described as an 'histoire naturelle et sociale d'une famille sous le second empire,' and consists of 20 works dealing with different phases of modern life, not always strictly that of the Second Empire, but rather that of the Third Republic. The particular departments of life treated in the volumes were studied by Zola in the spirit of a scientific observer, but of one with a decided bias toward the portrayal of moral filth and disease; and the bond of connection which constitutes them a series is the persistence under various forms in all the members of the Rougon family of a moral taint which is transmitted in accordance with Zola's views of heredity. The series consists of the following works: 'La Fortune des Rougon' (1871); 'La Curée' (1874); 'La Conquête de Plassans' (1874); 'Le Ventre de Paris' (1875), treating of the Paris markets; 'La Faute de l'Abbé Mouret' (1875), whose subject is clerical celibacy; 'Son Excellence Eugène Rougon' (1876); 'L'Assommoir' (1877), a powerful but revolting study of the effects of drunkenness and idleness, the first great success of the series; 'Nana' (1880), a coarse picture of courtesan life; 'Pot-Bouille' (1882);

'*An Bonheur des Dames*' (1883), dealing with the great shops of Paris; '*La Joie de Vivre*' (1883); '*Germinal*' (1885), treating of the life of French miners; '*L'Œuvre*' (1886), in which he dissects literary and artistic decadents; '*La Terre*' (1888), a study of the French peasantry in which purulent naturalism reaches the zenith of repulsiveness; '*Le Rêve*' (1888); '*La Bête Humaine*' (1890), treating of railways; '*L'Argent*' (1891), dealing with stockbrokers and company promoters; '*La Débâcle*' (1892), a powerfully realistic picture of military life in connection with the Franco-German war and the break-up of the Second Empire; and '*Le Docteur Pascal*' (1893), in which the whole is brought to a conclusion. Immediately after completing this huge undertaking he started the '*Trois Villes*' series, consisting of '*Lourdes*' (1894), '*Rome*' (1896), and '*Paris*' (1897), in which he portrays the spiritual development of a priest, Pierre Froment, out of miraculous Christianity through a sort of social Catholicism into a creed of justice and labor. In the incomplete tetralogy entitled '*Les Quatre Évangiles*' ('*The Four Gospels*') he proposed to formulate his social gospel. The first volume is '*Fécondité*' (1900), whose hero, Mathieu, is the son of the hero of the preceding series. The second volume, '*Travail*' ('*Labor*,' 1901), has a hero named Luc; and of the remaining two, '*Vérité*' (Truth) and '*Justice*,' whose heroes were to be named after the other two evangelists, the former was appearing at the time of his death. In the eyes of English readers Zola appears best in his short stories, of which, in addition to those already mentioned, collections entitled '*Le Capitaine Corle*' (1882), and '*Nais Micoulin*' (1883) have been published. His famous story of '*L'Attaque du Moulin*' forms part of the volume of '*Soirées de Médan*' (1880), to which Maupassant and other friends also contributed. He defended his view of the nature and function of literary art and collected many critical articles in several works. Several of his novels were dramatized by himself and others, and he also wrote for the stage '*Les Héritiers Rabourdin*' (1874), and '*Le Bouton de Rose*' (1878), but none of them except '*L'Assommoir*' (1881), known in Charles Reade's English version as '*Drink*' (1879), were at all successful. Zola's chivalrous defense of Captain Dreyfus (q.v.) in 1898 led to his trial and condemnation to imprisonment and fine. He was created a knight of the Legion of Honor in 1888 and an officer in 1893, but after his condemnation in 1898 his name was removed from the roll. He was president of the Société des Gens de Lettres in 1891-4, but he was repeatedly refused admission to the Academy. Zola was the recognized head of the naturalistic school in fiction, but his followers were latterly few in number. His novels belong rather to the domain of science than to that of art. They are studies, in the main faithful enough though not free from distortion and exaggeration, in moral and social pathology; but they are not true to life and nature in the fullest sense, in the only sense which would entitle them to rank as artistic creations. Translations of the most important have appeared, chiefly by Visetelly. Consult Brunetière, '*Le Roman Naturaliste*' (1883), and R. H. Sherard's highly

eclogistic biographical and critical study (1893).

Zollars, Ely Vaughan, American educator: b. near Lower Salem, Washington County, Ohio, 17 Sept. 1847. Graduated from Bethany College (W. Va.) in 1875, he was pastor of the church of the Disciples of Christ at Springfield, Ill., in 1885-8, and in 1888-1902 was president of Hiram College (Ohio). His writings include '*Holy Book and Sacred Day*' (1893); '*Bible Geography*' (1894); '*Great Salvation*' (1895); and '*Hebrew Prophecy*.'

Zollicoffer, zöll-kóf-er, Felix Kirk, American soldier: b. Maury County, Tenn., 19 May 1812; d. near Mill Springs, Ky., 19 Jan. 1862. He entered the printer's trade, published a weekly newspaper at Paris, Tenn., for about a year, and finally became editor of the '*Observer*' at Columbia, Tenn., his duties being temporarily interrupted by his service in the Seminole war, in which he rose to be a commissioned officer. At Columbia he also published and edited an agricultural weekly. He became editor of the Nashville '*Banner*,' the leading Whig organ of Tennessee, in 1841; in 1844-9 was State comptroller; and in 1853-9 was a representative in Congress. In 1861 he entered the Confederate army with brigadier's rank. He was in immediate command at the battle of Mill Springs, on the Cumberland, when Thomas drove the Confederates from the field, and achieved the first real victory for the National cause. Zollicoffer was killed within the enemy's lines, whither he had passed by mistake while on a tour of reconnaissance.

Zolling, tsöll'ing, Theophil, German editor and author: b. Scafati, near Naples, Italy, 30 Dec. 1849; d. Berlin 23 March 1901. He was educated at Vienna, Heidelberg, and Berlin, and from 1881 was editor of the Berlin weekly, '*Die Gegenwart*.' Unsuccessful with his dramas, he wrote some works of fiction that were well received,—among them '*Der Klatsch*' (1889); '*Couliassegeister*' (1891), and '*Bismarcks Nachfolger*' (1894). For Kürschner's '*Deutsche Nationalliteratur*' he prepared a four-volume critical edition of the works of Heinrich von Kleist (q.v.).

Zöllner, tsöll'nér, Karl Friedrich, German physicist and astronomer: b. Berlin 8 Nov. 1834; d. Leipsic 25 April 1882. Educated at Berlin and Basel, he became a lecturer in the University of Leipsic in 1865, in 1866 professor extraordinary of physical astronomy, and in 1872 professor ordinary. He made numerous contributions to astronomical science. These included the determination of the reflective capacity (albedo) of many planets and a study of their thermal conditions; photometric investigations of the Mercurian phases; and a study, through observation, of the intensity of solar radiations at their source, of the solar temperature. His '*Grundzüge einer allgemeinen Photometrie des Himmels*' (1861) contained the description of a new instrument, the astrophotometer, for the measurement of the light and color of stars. To the publications of the Royal Saxon Scientific Society he furnished many papers on the physical constitution of the sun and stars; and he constructed spectroscopic instruments. '*Ueber die Natur der Kometen*' (1872; 3d ed. 1883) expounded the theory that

the brightness of comets is due not to the fact that they are incandescent through heat but that they are glowing with electricity. Zollner was latterly interested in spiritualism. Among his further volumes are 'Photometrische Untersuchungen' (1865), and 'Ueber die universelle Bedeutung der mechanischen Principien' (1867). Consult the study by Körber (1899), and Clerke, 'Popular History of Astronomy in the 19th Century' (1893).

Zollverein, tsöl'fër-lîn ("customs-union"). The feeble German Confederation formed in 1815 failed in many respects to meet the desire for union among the German people, or even to satisfy their practical requirements. The trade of Germany in particular suffered much from the obstructions caused by the different customs systems of so many petty states. In 1818 Prussia took the initiative of abolishing internal customs, but this policy excited much opposition among the other German states, and even on the part of the Bund itself, which was indeed to some extent justified by the coercive measures used by Prussia to enforce the adoption of its policy on the smaller German states within its bounds. Prussia offered to admit the other German states within its union, but many of them preferred to set up rival and antagonistic associations. Thus Bavaria and Würtemberg formed a customs league in 1827, and Hohenzollern joined these states in 1828. In the same year was formed the Middle German Union, including Saxony, Hanover, Hesse, Brunswick, Nassau, Oldenburg, Bremen, Frankfurt-on-the-Main, etc., and in 1834 another union (Steuerverein) between Hanover, Brunswick, Schaumburg-Lippe, and which was joined by Oldenburg in 1836. But these hostile unions were not sufficiently extensive to have any great vitality, and they were gradually disintegrated by the desertion of their individual members to join the Prussian union. Electoral Hesse joined in 1831; Bavaria, Würtemberg, Saxony, and other states in 1833; Hesse-Homburg, Baden, and Nassau in 1835; Frankfurt in 1836; Luxemburg in 1842; Hanover, Oldenburg, etc., in 1851. During the treaty period of 1854-63 nearly all Germany, with the exception of Austria, the two Mecklenburgs, and the Hanse-towns, was included in the union. A difference of views between the various parties to the union began at this time to develop, which caused much tedious negotiation. In general the north of Germany was in favor of imposing import duties on foreign trade for purposes of revenue only, while the south favored protective duties. As each member of the Zollverein had an equal voice in the direction of a common policy it was impossible to adjust these differences so as to satisfy the more powerful states, particularly Prussia. Austria also wished either to be included in the union or to break it up. Matters continued substantially in the same state after the renewal of the treaty from 1 Jan. 1866 to 31 Dec. 1867; but the war of 1866 put an end to this agreement, and new arrangements were entered into according to the political combinations then formed, Prussia obtaining a preponderating influence in the union of 1867, which included the North German Bund, Bavaria, Würtemberg, Baden, Hesse (south of the Main), and Luxemburg. It was directed by a

Zollbundesrath and a Zoll parliament. The total number of votes in the Zollbundesrath was 58, of which Prussia had 17. This arrangement, formed for 12 years, was also brought to an end prematurely by the formation of the German Empire. By article 33 of the constitution of the empire the territory included in the Zollverein is to coincide with the territories of the empire, with a few exceptions noticed below. The powers of the Zollbundesrath and Zoll parliament are transferred to the legislative bodies of the empire, and the affairs of the central bureau of the Zollverein are transferred to committees formed by the Federal Council of the empire. The territories of the free ports of Hamburg and Bremen were for some time excluded from the Zollverein, and some communes of the grand duchy of Baden and a fragment of Hamburg are still excluded from it; while Luxemburg and the Austrian commune of Jungholz are included in it. See GERMANY.

Zol'nay, George Julian, American sculptor: b. Hungary 4 July 1863. He was for a time in the civil service, but subsequently studied at the Imperial Academy of Fine Arts, and in 1890 came to America, where he was connected with the staff of sculptors of the World's Columbian Exposition. His work at the Nashville, Tenn., exposition of 1897 attracted considerable attention. Among important examples of his art are a tympanum for the University of Virginia, a bust of E. A. Poe for the same, a statue of Jefferson Davis at Richmond, Va., and numerous portrait busts.

Zom'ba, capital of the British Central Africa Protectorate, situated in Nyassaland, on the southern slope of Mount Zoba, 10 miles west of Lake Shirwa, at the height of about 3,000 feet above the sea. Zomba is in telegraphic communication with the principal stations in Central Africa and Cape Town. A sanatorium has been built on a plateau 2,500 feet higher up. The population is as yet small.

Zombor, zóm'bör, or **Sombor**, Hungary, a town of the comitat of Bács-Bodrog, on the Baczor or Franzens Canal, which unites the Theiss with the Danube, 65 miles southwest of Szegedin. It has two Greek churches, a magnificent town-house, and a public library, and carries on manufactures of silk. There is a large trade in cattle and corn. Pop. about 31,000.

Zona Libre, sô'nâ lê'brâ, a strip of country extending along the whole northern frontier of Mexico, 20 kilometres wide, where imported goods are admitted at 10 per cent of the ordinary duties for use within the zone. This zone was first established on the frontier of the state of Tamaulipas alone, in 1858, and was not extended across the whole frontier until 1885. At one time after the Civil War, the United States authorities claimed that the privileges permitted within the zone encouraged smuggling; the Mexican government claims that the conditions of retail trade make the zone a necessity; opposition to the zone, however, exists among competing manufacturers in the interior of Mexico.

Zon'aras, Joannes, Byzantine historian of the first half of the 12th century A.D. He filled some distinguished offices about the imperial court, but gave himself up to a religious life as

ZONE—ZOOGEOGRAPHY

a monk of Saint Basil, employing his leisure hours in the compilation of a 'History of the World from the Earliest Periods to the Year 1118.' In this work (of which an edition appeared at Paris in 1686) he follows principally the narrative of Dio Cassius, of whose first 20 books nothing is extant save Zonaras' abstract; but as he approaches his own times he becomes more entitled to attention, as his mistakes arise evidently more from ignorance than design. There is also extant a commentary on the apostolic canons by him. There is an edition of the 'History' by Pinder (1841-4), with a third volume by Büttner-Wobst (1897).

Zone, the term applied to any portion of the earth's surface bounded by two parallels of latitude, but more particularly applied to five such zones, the position of which is marked by natural boundaries. These five zones are called the torrid, northern and southern temperate, and northern and southern frigid zones. The torrid zone extends $23\frac{1}{2}^{\circ}$ north and south of the equator; and twice a year the sun shines vertically on its inhabitants. This zone is bounded, on both sides of the equator, by the two tropics; that is, the circles in which the sun reaches its greatest distance from the equator. As the rays of the sun here are nearly vertical a perpetual summer reigns, and day and night under the equator are always equal; and even at the tropics the difference is scarcely an hour. Owing to the nature and situation, however, of the countries in this zone the heat is not everywhere the same. The warmest portions are the sandy deserts of Africa, in the regions nearer the equator where vegetation prevails the heat is less excessive, in the islands of the South Seas a milder climate prevails, and the highest mountains of Peru and equatorial Africa are covered with perpetual snow. The two temperate zones extend from the tropics to the polar circles. They contain the most populous countries, and the climate is various. As the distance from the tropics increases the heat under similar conditions diminishes, the difference of the seasons becomes greater, the days and nights become more unequal until we arrive at a point where once a year the sun does not appear above the horizon during the 24 hours, and once a year does not set for the same time. The circles passing through these points, parallel to the equator and the tropics, form the limits of the temperate zones, and are called the arctic and antarctic circles. The distance from the tropics to the polar circles, or the breadth of the temperate zones, both in the northern and southern hemispheres, is 43° . All beyond the polar circles to the poles is called the frigid zones. The distance from the polar circles to the poles is $23\frac{1}{2}^{\circ}$. The characteristic of the frigid zones is, that day and night are more and more unequal the nearer you approach the poles; and for days, weeks, and even months the sun is either constantly above or constantly below the horizon. At the poles the year consists of one day and one night each six months long.

Zoogeography, the science of mapping out the surface of the earth with reference to its faunas; the study of the distribution of animal life. It has always been obvious to travelers, and even the most superficial students of nature, that the various regions of the earth's surface were

characterized, among other differences, by local peculiarities in animals and plants. It is a commonplace of knowledge that the animal life of the tropics is different from that of the Arctic regions; that the birds and mammals and small creatures of Africa differ almost altogether from those of South America or Australia. Closer examination shows that such differences exist in a greater or less degree between lesser regions, as the east and west sides of a continent, groups of islands separated by a sea-space, and so forth. On the other hand, there may be found striking resemblances in the faunas of certain separate regions, or a sameness over an extensive area, as Europe and Asia.

The importance and significance of these facts impressed themselves upon scientific men only within recent times. As long as it was held that each species must have been created, as a general rule within the geographical area which it now occupies, the most curious facts of distribution could be regarded only with "sterile wonder." But when the idea came to be entertained that allied species have had a common origin, it was obviously implied that they or their ancestors must have had a common birth-place; and consequently, when we find members of a group severed from their nearest kindred, we feel bound to inquire how this came about. Thus, we have to explain how the tapirs are confined to the Malayan region and South America; the camels to the deserts of Asia and the Andes; marsupials to the Australian region and America; how the birds, mammals and reptiles of North America resemble those of Europe more than those of South America, and so on.

Means of Dispersal.—Accepting as a starting point the proposition that the various forms of life originated in some parent-stock or stocks at a particular place or places, the present distribution of their descendants as we know them, must depend mainly upon the powers of dispersion which each possessed, and the character of the physical influences and obstructions which acted as controlling factors or barriers in guiding their dispersal along certain lines and altogether prevented it elsewhere. Theoretically a new stock would spread equally in all directions from its point of origin; actually a very irregular and complicated kind of distribution has ensued in most or all cases. Hence an inquiry as to the means and limitations of dispersion possessed by animals and plants is of first importance.

It is scarcely necessary to draw attention to the facilities for diffusion possessed by animals endowed with great locomotive powers, and especially, among land animals, by those having the power of flight (q.v.); but it is important to note that some animals, which in the adult state have only feeble powers of locomotion, are better endowed in this respect when young. Such, for example, is the case with echinoderms, marine mollusks, and similar lowly aquatic forms, all of which develop from free-swimming and often far-drifting larvæ. (See **PLANKTON**.) But accidental modes of dispersal must also be taken into account. The carrying power of winds is known to be sufficient to bear along in the air fine dust across seas many hundreds of miles in width; and we have in that agency alone an adequate means of accounting for the dispersion of all plants propagated by minute spores.

ZOOGEOGRAPHY

For that reason the distribution of most cryptogamic plants hardly enters into the problem, since these mosses, fungi, seaweeds, and the like are almost universal. What part winds may have played in carrying the seeds of flowering plants is more doubtful; but observations show that even for such seeds, especially when provided with some kind of feathery appendage, winds may occasionally serve as a means of transport for very long distances. See PLANT GEOGRAPHY; PLANT LORE.

But in the case of animals also, winds are a more important means of transport than one might at first suppose. Birds and insects are often blown immense distances out of their course; and to this cause, for instance, is due the arrival every year of American birds on the coasts of Great Britain and France, while European birds almost never reach America—a fact plainly due to the prevalent easterly direction of the winds, and especially the gales in spring and autumn,

Further, marine currents often carry on their surface various kinds of natural rafts, which may transport both plants and animals. In the polar regions icebergs and icefloes may serve this purpose; and elsewhere trunks of trees, and even fragments torn from the land. Such fragments, forming small islands with erect trees upon them, have been seen at a distance of 100 miles from the mouth of the Ganges and other rivers. Wallace points out that ocean waifs of one kind or another are almost the only means we can imagine by which land-shells can have acquired the wide distribution for which they are remarkable. Again, locomotive animals are very frequently the means of dispersing both plants and other animals. Seeds may be attached to the fleece or fur of mammals or the plumage of birds, or may be enclosed in clumps of earth clinging to the feet or some other part of bird or beast, even of insects. It seems probable that aquatic birds and water-beetles have been the means of distributing aquatic plants and fresh-

when birds are migrating. Insects have been caught on ships upward of 300 miles from land. Further, there are well authenticated cases of even crabs, frogs, and fishes being carried long distances by storms, and in this way it is possible to account for the transference of fish, etc., from one river system to another. Still more frequently, in all probability, are the eggs of such creatures transported by this means.

Next, marine currents also form, beyond doubt, a highly important means of dispersal both for plants and animals, and that in various ways. First, seeds may float on the surface of the ocean, and be carried by currents for hundreds of miles, and become stranded on a distant shore still in a condition fit for germination. The experiments of Darwin to determine the vitality of seeds in sea-water first enabled us to appreciate the importance of this factor.

water mollusks, which are remarkable for their wide diffusion: and the spawn of amphibians and fresh-water fishes may be conveyed from one body of fresh water to another by the same means.

Lastly, man is often unintentionally the means of conveying both plants and animals from one region to another. The foreign plants found growing on ballast heaps near every civilized port, are instances of this, and so, also, are the plants which have sprung from seeds introduced with imported grain and merchandise. The whole coastal region of North America is overrun with European weeds. Wherever European ships have gone the rats and other vermin of the Old World have accompanied them, and hundreds of species of exotic injurious insects are known in all agricultural districts.

ZOOGEOGRAPHY

Obstacles to Diffusion of Animals.—For all land plants and land animals, the most obvious and effective barrier is a wide expanse of ocean; and where the expanse is very wide it is seldom passable except with the aid of man. For land mammals the ocean is an absolutely impassable barrier, and hence native mammals are always absent from oceanic islands (that is, islands that have never been connected with the mainland); and this barrier is almost equally effective for serpents and amphibians, which also are nearly always wanting where there are no native mammals. Lizards are more frequently found indigenous on oceanic islands, though their means of transit from the mainland is unknown. Arms of the sea and broad rivers are likewise generally impassable for the creatures mentioned, though some of them have greater powers of swimming than is generally supposed. The jaguar, the bear, and the bison are capable of swimming the widest rivers; pigs have been known to swim ashore when carried out to sea to a distance of several miles; and even a boa constructor, it is said, has swum to the island of St. Vincent from the South American coast—a distance of 200 miles.

Mountains, and especially high mountains, are also frequently effective barriers to the migration of land plants and animals; but in some cases they enable plants and animals of a cold climate to spread into latitudes where, in the plains, the climate is too hot for them. Again, deserts act as a barrier to the majority of plants and animals; forests are a barrier to the camel, hare, zebra, giraffe, etc.; treeless regions to apes, lemurs, and many monkeys; plains to wild goats and sheep. Broad rivers also act occasionally as barriers to distribution, and that, strange to say, even in the case of some species of birds.

Another important barrier is that of climate; but climate merely limits the range of a species or group within a continuous area, for example, through limiting the food supply by restricting vegetation. The range of insects is peculiarly liable to be limited in this way, certain insects being attached to particular species of plants, and others to genera or families; and for this reason insects, in spite of the exceptional facilities for dispersal which many of them enjoy, are remarkable, as a rule, rather for the restriction of their areas of distribution than for their wide diffusion. Various other minor factors might be mentioned.

But a more generally operative organic barrier consists in the fact of a region being already fully occupied by a native flora and fauna, so that there is no room for new-comers. Hence it happens that seeds may be wafted in plenty from one country to another without a single plant growing from these seeds being able to establish itself; and there may even be, as in South America, a free communication with another region while the fauna remains strikingly distinct, simply because that portion of the American continent is already completely stocked with a fauna perfectly adapted to the physical conditions there prevailing.

The barriers to the spread of marine creatures are not so numerous as in the case of terrestrial forms. The freedom of communication between one part of the ocean and another makes it impossible to mark out any marine zoogeographical regions, though many seas and

coasts are distinguished by characteristic fishes and other marine creatures. The principal barriers for fish are temperature and the intervention of land. Thus, the Isthmus of Panama is at present a complete barrier for fishes requiring warm seas. See FISH, GEOGRAPHICAL DISTRIBUTION OF.

Geological Evidence.—If all the barriers to migration had existed in all past time as they are now, it would be quite impossible to explain the present distribution of plants and animals on the supposition that kindred groups have had a common birthplace. But the solution of the problems of distribution is to be found in the fact that all the barriers are liable to change. Of changes of sea and land geology supplies us with abundant evidence. Portions of the mainland now continuous were at one time severed by arms of the sea; and islands have been formed by the severance of portions of land that once belonged to the mainland. Such islands are known as continental islands, and the study of their faunas and floras is one of peculiar interest in connection with geographical distribution. These faunas and floras show, as might be expected, a greater or less degree of correspondence with those of the mainland from which the islands have been cut off; and the resemblance is the closer the more recently the land connection has been destroyed. The relative date of the disunion is usually approximately indicated by the depth of the sea which now separates island and mainland, shallow seas dividing portions of land that have only recently been disconnected, and deeper seas separating those which have been longer apart.

The most remarkable case of isolation is presented by the Australian region, the fauna and flora of which are the most peculiar in the world. In the widest sense, this region includes not only the vast island of Australia itself, but also New Guinea and all the Malayan and Pacific islands to the east of a deep channel between the islands of Bali and Lombok—a channel the significance of which, as a boundary line for plants and animals, was first pointed out by A. R. Wallace, the great authority on animal distribution, and hence known as Wallace's Line. The great feature of this region (so far as animal distribution is concerned)

"the almost total absence of all the forms of mammalia which abound in the rest of the world, their place being taken by a great variety of marsupials." The family just mentioned, though now restricted in the manner stated at the beginning of this article, was at one time spread over the whole world, but has in most parts become extinguished by the competition of later types; thus presenting one of the best examples of what are known as discontinuous areas of distribution, and offering an illustration of the mode in which such discontinuity is usually brought about. The early severance of the Australian region from the Asiatic continent (in the Mesozoic Age) saved the Australian marsupials from the competition which almost extinguished the group elsewhere.

Turning now to marine distribution, we find evidence of the former absence of a land barrier at the Isthmus of Panama in the identity of many species of fish on both sides of the isthmus.

Changes in the climatic barrier have also had

ZOOGEOGRAPHY

an important influence on geographical distribution; and it is by such changes, combined with changes in the continuity of land in the north polar regions, that the affinities between the floras of Japan and eastern North America must be explained. When these affinities were first pointed out by Asa Gray, that distinguished botanist divined the true explanation—namely, that in former geological epochs, a genial climate must have prevailed even within the polar circle, so as to allow of the existence of a remarkably uniform flora, suitable to such a climate, all round the pole in very high latitudes; and that as the climate became colder in the North this flora was driven southward, and became differentiated according to the differences of climate in the more southerly latitudes to which it advanced. Hence the eastern parts of America and Asia, as they correspond pretty much in climate, came to correspond also more closely than other tracts in the same latitude in the character of their floras. The soundness of

mammals, the regions adopted by Wallace are nearly the same as those first suggested by Sclater as applicable to the distribution of birds; for, in spite of the exceptional facility which birds have for crossing barriers impassable by mammals, Wallace finds that the distribution of mammals (which afford the best means of marking off zoogeographical regions) corresponds with that of birds to an extent that one would not perhaps have previously anticipated. But with regard to these regions it must be remembered (1) that it is impossible in most cases to draw any very clearly marked boundary line between one region and another; (2) that the degree of divergence between different regions is different in different cases; and (3) that, when any two regions are compared, we have not the same degree of divergence between different groups of the animal kingdom, or between animals and plants belonging to the two regions. Obviously, the degree of correspondence depends largely on the facilities for dis-

The Zoogeographical Regions according to Sclater and Wallace:

Sub-regions of Palaearctic Region —	Sub-regions of Oriental Region —	Sub-regions of Neotropical Region —
1. European.	1. Indian.	1. Chilean.
2. Mediterranean.	2. Ceylonese.	2. Brazilian.
3. Siberian.	3. Indo-Chinese.	3. Mexican.
4. Manchurian.	4. Indo-Malayan.	4. Antilean.
Sub-regions of Ethiopian Region —	Sub-regions of Australian Region —	Sub-regions of Nearctic Region —
1. East African.	1. Austro-Malayan.	1. Californian.
2. West African.	2. Australian.	2. Rocky Mountain.
3. South African.	3. Polynesian.	3. Alleghanian.
4. Malagasy.	4. New Zealand.	4. Canadian.

this surmise was afterward confirmed by the discovery of abundant plant remains of the Miocene Age, indicating a warm climate in Greenland, Spitzbergen, and elsewhere. The effects on distribution of the changes of climate belonging to the Glacial Period or Ice Age may only be alluded to here.

Zoogeographical Regions.—As the result of all the processes of dispersal across the various barriers to migration, and of the changes in these barriers, we have the present distribution of plants and animals, which is such as to enable us to divide the terrestrial surface of the globe into more or less well-marked regions. For

persal, and largely also on the geological age of different groups; and both of these are varying factors. These considerations being premised, we may now state briefly the limits of the six zoological regions adopted by Wallace, as given in his 'Island Life.' In the space to which the present article is necessarily restricted it is impossible to give even the most fragmentary sketch of the characteristic life of the different regions, for which the reader must be referred to the works cited at the end of the article.

(1) Palaearctic Region, including Europe and north temperate Asia and Africa to the northern borders of the Sahara.

ZOOLATRY—ZOOLOGICAL GARDENS

(2) Ethiopian or Palearctic Region, consisting of all tropical and South Africa, together with Madagascar and the Mascarene Islands.

(3) Oriental Region, comprising all Asia south of the Palearctic limits, and the Malay Islands as far as the Philippines, Borneo, and Java.

(4) Australian Region, the Papuan Islands, Australia, New Zealand, and the islands of Oceania. Celebes might be referred almost with equal right to this or the previous region. New Zealand is treated by Wallace as a highly peculiar sub-region of this great region.

(5) Nearctic Region, comprising all temperate and arctic North America, including Greenland, and extending on the south to an irregular line running from the Rio Grande del Norte on the east to a point nearly opposite Cape Saint Lucas on the west.

(6) Neotropical Region, the American continent south of this line, together with the West Indian Islands, sometimes called Neogaea.

Heilprin and others advocate the union of the Nearctic and Palearctic regions under the name of Holarctic, and introduce three transitional tracts (the Mediterranean, embracing southern Europe, northern Africa, and western Asia, south of the Caspian and west of India, but exclusive of the southern half of Arabia; the Sonoran tract, embracing the northwest of Mexico; and the Austro-Malaysian tract, embracing Celebes and the smaller islands lying between it and New Guinea and Australia). Otherwise his major faunal divisions of the globe are similar to those of Wallace.

On plant distribution the most important recent works are those of Engler and Drude. Engler attempts to trace the history of the vegetable kingdom since the Tertiary period, and comes to the conclusion that already in the Tertiary period four "floral elements" (*Floraelemente*) could be distinguished, namely:

(1) The Arcto-tertiary element, characterized by an abundance of conifers and numerous genera of trees and shrubs now prevalent in North America, or in extratropical eastern Asia and in Europe.

(2) The Palearctic element, characterized by the presence of the families and subfamilies dominant in the tropics of the Old World; and still more by the absence of certain families, groups, and genera found in the territory of the Arcto-tertiary element.

(3) The Neotropical or South American element, which, according to Engler, must have had in Tertiary times much the same character as that now possessed by tropical Brazil and the West Indies.

(4) The old Oceanic element, consisting of forms which possessed the power of traversing considerable stretches of ocean and developing further on islands.

The modern provinces of the vegetable kingdom are subordinated by Engler to these great divisions. Drude, in the first place, distinguishes the oceanic (marine) flora from the terrestrial forms, and the latter he divides into three great groups, and these again into 14 floral domains. See PLANT GEOGRAPHY.

Zoöl'atry, the worship of animals. This seems to have passed through three stages: (1) The animal was revered and propitiated as possessing a power greater than that of man. (2) The animal was regarded as an incarnation of some deity or spirit. (3) It was raised to the position of a tribal ancestor. In the early history of the human race zoöl'atry of some kind was very prevalent. Traces of it appear in the Bible, as in the story of the Golden Calf made by the Israelites (Ex. xxxii.). Zoöl'atry took deep root in the religious life of the ancient Egyptians, and all three forms flourished among that people. Juvenal opens his 15th satire with a scathing invective of Egyptian zoöl'atry, and detailed accounts of it occur in Herodotus, Plutarch, Strabo, and Cicero. In classic times the chief form of zoöl'atry was serpent worship, though traces of other forms occur in the transformation myths of the poets. In the present day zoöl'atry survives chiefly in India and among the snake-worshippers of the west coast of Africa. See NATURE WORSHIP.

Zoological Gardens, or Parks, places for the keeping and attractive display of living animals, where they may live, as far as possible, in the open air and under natural conditions; a zoological garden thus differs from a menagerie, as that term is now understood, in that in the latter the animals are confined in narrow prison-cages, under cover, and are usually borne from place to place to be displayed for a fee. Collections of captive animals have always been kept by royal and eminent persons, and formed a large element in the sights and amusements of the populace in ancient and mediæval cities. The present conception of zoological collection, as a place where animals shall be maintained in the greatest practicable freedom for the sake of exhibiting their traits to the student, and shall be regarded only secondarily as objects of curiosity, is a modern idea, and one that has been developed to its highest degree in the United States. Many large cities of the Old World have "zoos," as they are popularly called, notably London, Dublin, Berlin, Paris, Vienna, Amsterdam, Rotterdam, Antwerp, Hamburg, Copenhagen, Hanover, Cologne, Bombay, Calcutta, Tokio, Melbourne, and several South American cities, especially Rio de Janeiro and Buenos Ayres. All of these are the property of a society or private ownership of some sort except the garden in Berlin, and that attached to the Museum of Natural History at the Jardin des Plantes, in Paris. They are sustained, therefore, partly by membership subscriptions, and partly by gate-receipts, but most or all of them give free days. The sale of animals born and reared within their precincts is a source of revenue with some, as, for instance, the Dublin garden which has supplied a large proportion of all the lions now held in captivity by circus and traveling menageries. The Berlin "zoo"

ZOOLOGICAL LABORATORIES—ZOOLOGY, HISTORY OF

stands first in the number of its animals and general excellence of arrangements; but that of London, founded in 1828, is nearly its equal; and the splendid series of volumes constituting the 'Proceedings' and 'Transactions' of the Zoological Society of London attest the admirable use which has been made of the collection by naturalists.

Zoological gardens have long existed in the United States, among the oldest being those at Cincinnati and Philadelphia, both privately sustained, and each highly creditable. To these were added collections of living animals in the parks of various cities, maintained by municipal appropriation, among which those in Central Park, New York; Schenley Park, Pittsburgh; Lincoln Park, Chicago; Belle Isle, Detroit; and Golden Gate Park, San Francisco, are important.

The National Zoological Park at Washington was established in 1889, in a large tract of hilly and forested land along Rock Creek in the outskirts of Washington. Its prime purpose was to gather a representative collection of American animals and possibly preserve from extinction species threatened with racial destruction. It has extensive and highly picturesque grounds, and its collection of animals have remarkably favorable surroundings and are kept in admirable condition. The support of this free park, one half of which comes from Congress and one half from the District of Columbia, has not been sufficiently liberal to make its development as rapid as its friends desire.

The latest and foremost American zoological park is that in the northern part of the city of New York, which is under the control of the New York Zoological Society, to which the city granted 261 acres of land in Bronx Park, police protection, and various aids and immunities. This is the largest and most suitable space devoted to the care and exhibition of animals anywhere in the world; and since its opening in 1897 it has developed into a most prominent and useful position among the world's institutions of this kind. The society had in 1904 about 1,500 members, and had begun the issue of a series of important periodical publications. This park has been developed and remains under the care of William T. Hornaday.

Zoological Laboratories and Stations. See LABORATORY.

Zoology, that branch of biology, or the science of living things, which treats of animals. The scope of the science may be gathered from the following enumeration of its main branches: (1) *Morphology*, which treats of the outer form and internal structure of animals, their anatomy, histology, physiology, etc.; (2) *Embryology*, or ontogeny, treating of the development of individual animals from their earliest discernible stage; (3) *Therematology*, treating of breeding or propagating animals and plants under domestication, of their congenital variations under these circumstances, and of the perpetuation of such variations; (4) *Paleozoology*, or animal paleontology, treating of fossil animals; (5) *Phylogeny*, which seeks to investigate the evolution of the various groups or types of animals; (6) *Taxonomy*, or *Systematic Zoology*, treating of the classification of animals,—their arrangement in

groups determined by genetic relationships; (7) *Bionomics*, or *Ecology*, which investigates the conditions of life as a whole, habits, instincts, etc.; (8) *Zoogeography*, dealing with the distribution of animals on the surface of the earth. So comprehensive a view of zoology is a modern conception and has resulted from the conviction of the unity of organic nature and the kinship of descent which pervades the whole realm of beings, past and present. In the earlier days of the study of nature each group of animals was considered by itself, and to each such study was naturally given a name, many of which survive as convenient terms in descriptive zoology. Such are *Conchology*, the study of shells (of mollusks), and hence the study of the *Mollusca*; *Entomology*, the study of insects; *Herpetology*, the study of reptiles (popularly including amphibians); *Ornithology*, the study of birds; and so on. For detailed information upon animals and the various aspects of their instigation consult articles under their names, as birds, horse, pompano, etc.; under the technical names of groups, as Carnivora, Camelidae; and under such terms as Ichthyology, Herpetology, and the like. See also ANATOMY; ANIMAL HEAT; BIOLOGY; BIONOMICS; BREEDING; CELL; COLORATION; PROTECTIVE; DARWINIAN THEORY; EMBRYOLOGY; EVOLUTION; GROWTH; HEREDITY; HYBRIDITY; INSTINCT; LAMARCKISM; LIFE; MIMICRY IN NATURE; MIGRATION; NATURAL SELECTION; ORGANS; PALEONTOLOGY; REPRODUCTION; WEISSMANISM; ZOOGEOGRAPHY, and related topics. In zoology. See SPORTS IN PLANTS.

Zoology, History of, the record of discovery in the science of zoology. The history of zoology may be regarded as beginning with Aristotle (384-322 B.C.), whose works reveal a classification of animals into the two main groups of Enema or blood-containing animals and Anama or bloodless animals, the former including the four classes of viviparous enema, equivalent to mammals, birds, four-footed, egg-laying enema, equivalent to reptiles and amphibians and fishes; and the last included the four classes of soft-bodied enema (cephalopods), soft-shelled enema (crabs and insects), and shell-bearing enema (mollusks and echinoderms). Among Aristotle's successors in zoological investigation in ancient times were Herophilus and Erasistratus (3d century B.C.), both physicians who contributed to the progress of anatomy (q.v.); the elder Pliny (23-79 A.D.), who wrote a most uncritical work on natural history; and Galen (131-200 A.D.), who is chiefly important as an anatomist and physician. The mediæval period witnessed no further progress in zoology, and the bestiaries (q.v.), and books severally known by the title 'Physiologus' are of no scientific value. The revival of the study of Aristotle effected a change for the better, but modern zoology does not begin till the era of the Renaissance.

Modern History to Linnaeus.—The discovery of new countries at the beginning of the modern period greatly increased the number of known animals, and it was accompanied by the growth of the scientific spirit. Extensive collections began to be formed, and in the 17th century academies and societies were founded for the promotion of scientific research. One of the oldest of these institutions was the Académie

ZOOLOGY, HISTORY OF

Nature Curiosorum, established at Schweinfurt in 1651, and it was soon followed by the Royal Society of London and the Academy of Sciences of Paris. In his work 'De Differentiis Animalium' (1552), Edward Wotton (1492-1555) presented Aristotle's zoological teaching without its mediæval accretions, and extended his master's classification by adding the group *Zoophyta*, in which he included holothurians, star-fishes, sea-anemones, sponges, etc. The work of the zoological revival was carried forward by, among others, Conrad Gesner (1516-65), whose 'Historia Animalium' (1551-8) may be regarded as an epoch-making work; Ulisse Aldrovandi (1522-1605); John Johnstone (1603-75), the last of the encyclopædists, who published a complete survey of the animal kingdom in four treatises (1649-53); Pierre Belon (1517-64), who wrote on fishes (1551), and birds (1555); Hippolyto Salviani (1514-72), author of a work on fishes; Guillaume Rondelet (1507-56), whose monograph on fishes is the chief of its time; Andreas Vesalius (1514-64), an anatomist; Hieronymus Fabricius (1537-1619), a pioneer in comparative anatomy; Thomas Willis (1621-75), who is of importance in the history of anatomy; Marco Aurelio Severino (1580-1656), an anatomist; Marcello Malpighi (1628-94), one of the pioneers in the application of the microscope to zoological investigation; Anton van Leeuwenhoek (1632-1723), another early microscopist of renown; Jan Swammerdam (1637-85), whose microscopic researches on insects, molluscs, and other animals were of the utmost value; Robert Hooke (1635-1703), of importance in the history of the microscope; William Harvey (1578-1657), who demonstrated the circulation of the blood and contributed in other ways to anatomical and physiological progress; Edward Browne (1644-1706), who made many dissections of animals; and Edward Tyson (1650-78), the first Englishman who published elaborate monographs of particular animals. John Ray (1627-1705), great as a botanist, is even greater as a zoologist. He did more for the science of animal life than any other man between Gesner and Linnæus, and he has been justly called the father of modern zoology. He made zoological classification more truly scientific by clearly fixing the meaning of the term "species" and by using anatomical characters in the determination of the larger groups. With his name we may associate that of his friends Francis Willughby (1635-72) and Martin Lister (1638-1712), and Lister's friend, Edward Lhwyd (1660-1709). Among other zoologists of note in the interval between Ray and Linnæus are Alexander Monro (1697-1767), a good comparative anatomist; Johann Philipp Breyn (1660-1764); Maria Sibylla Merian (1647-1717), who wrote on insects; Johann Leonhard Frisch (1666-1743), author of a description of the insects of Germany; René Réaumur (1683-1757), a distinguished entomologist; Johann Heinrich Linck (1674-1734); Jean Antoine Peyssonet (b. 1694), who established the animal nature of polyps; Jacob Theodor Klein (1685-1759), who proposed a purely artificial classification of animals, and John Woodward (1665-1728), an early paleontologist.

Linnæus to Cuvier—Karl von Linné (1707-78), usually called Linnæus (q.v.),

marked a new era in both botany and zoology. He introduced the binary nomenclature of species, and he gave the science a fixed terminology. In his 'Systema Naturæ' (1735) he gave the first entirely modern classification of animals, using in his scheme the descending series of terms, class, order, genus, species, and variety, which has ever since been used in the same way for the purposes of classification. His classes are: I. *Mammalia*, with the orders Primates, Bruta, Ferae, Glres, Pecora, Bellum, and Cete; II. *Aves*, with the orders Accipitres, Picæ, Anseres, Grallæ, Gallinæ, and Passeres; III. *Amphibia*, with the orders Reptilia, Serpentes, and Nantes; IV. *Pisces*, with the orders Apodes, Jugulares, Thoracici, and Abdominales; V. *Insecta*, with the orders Coleoptera, Hemiptera, Lepidoptera, Neuroptera, Hymenoptera, Diptera, and Aptera; VI. *Vermes*, with the orders Intestina, Mollusca, Testacea, Lithophyta, and Zoophyta. The principal zoologists of the period from Linnæus to Cuvier are the following: Johann Friedrich Gmelin (1748-1804), who edited the 13th edition of Linnæus' 'Systema'; George Louis L. Buffon (1707-88), author of a famous natural history (1749-88); Charles Bonnet (1720-93), known chiefly as an entomologist; O. F. Müller (1730-84), author of a fauna of Denmark; Thomas Pennant (1726-98), who wrote on the British zoology; Eberhard A. W. von Zimmermann (1743-1815), a pioneer in zoogeography; Peter Simon Pallas (1741-1811), who investigated and wrote on the fauna of Russia and Siberia; Mathurin J. Brisson (1733-1806), chiefly an ornithologist; Johann P. Eberhard (1727-79); Johann C. D. von Schreber (1739-1810); Johann C. Erxleben (1744-77); John Latham (1740-1837), and George Edwards (1694-1773), ornithologists; Bernard Lacépède (1756-1825), a student of reptiles, fishes, cetaceans, etc.; Johann G. Schneider (1750-1822), who wrote on the amphibians; Marcus E. Bloch (1723-99), an ichthyologist; Jean G. Brugnières (1750-98); Johann H. Chemnitz (1730-1800), a conchologist; Karl de Geer (1720-78), an entomologist; Johann C. Fabricius (1743-1808), a very eminent entomologist; Johann K. W. Illiger (1775-1813), another entomologist; P. Lyonnet (1707-89); Abraham Trembley (1700-84), who investigated fresh-water polyps; John Ellis (1710-76), who advanced our knowledge of corallines; Daniel C. Solander (1736-82), who assisted Ellis; Sir Joseph Banks (1743-1820); Jacques F. Dictionnaire (1733-89), a writer on sea-anemones; Filippo Cavolini (1756-1810), a student of marine polyps and fishes; Martin F. Ledermüller (1719-69), who introduced the term Infusoria; Albrecht von Haller (1708-77), an eminent anatomist and physiologist; John Hunter (1728-93), an eminent anatomist; Lazaro Spallanzani (1729-99), a physiologist; Marie F. X. Buchat (1771-1802), the founder of histology; Kaspar Friedrich Wolff (1733-94), whose dissertation entitled 'Theoria Generationis' (1759) is the starting-point of modern embryology; Jean Baptiste Lamarck (1744-1829), who fixed the two groups of *Vertebrata* and *Invertebrata*, and whose 'Philosophie Zoologique' (1809) is of the utmost importance in the history of the evolution theory; and the co-called nature-philosophers, including J. W. von Goethe

(1749-1832); Lorenz Oken (1779-1851), and others, who also contributed materially to the development of evolutionary conceptions.

Cuvier to Darwin.—George Cuvier (1769-1832) is the only name of supreme importance in zoology between Linnæus and Charles Darwin. He rejected the view, held by Lamarck, that a linear classification of the animal kingdom is possible, and in his great work, 'Le Règne Animal' (1817), he grouped his classes in four embranchements, representing four fundamentally distinct types of structure. These branches, with their contained classes, are as follows: *Vertebrata*, including Mammalia, Birds, Reptiles, Fishes; *Mollusca*, including Cephalopoda, Pteropoda, Gasteropoda, Acepala, Brachiopoda, Cirrhopoda; *Articulata*, including Annelides, Crustacea, Arachnides, Insects; and *Radiata*, including Echinoderma, Intestinal Worms, Acalephæ, Polypi, Infusoria. He raised comparative anatomy to the dignity of a true science, and he carried out researches of the utmost value in palæontology. In the restoration of extinct animals from remains of parts he used his law of the correlation of parts according to which animals are so constituted that single organs or parts can serve as an index to all other parts and to the general structure. Of the numerous workers who advanced the study of zoology from Cuvier's time down to that of Charles Darwin we can only name the following: Geoffroy Saint-Hilaire (1772-1844), who opposed Cuvier's view regarding types; Johann F. Blumenbach (1752-1840), a distinguished comparative anatomist and physiologist; Ignaz Döllinger (1770-1841), an eminent anatomist and physiologist; Friedrich Tiedemann (1781-1861), also distinguished in anatomy and physiology; Karl A. Rudolphi (1771-1832), who wrote on physiology and intestinal worms; Karl Ernst von Baer (1792-1876), a most distinguished embryologist; C. H. Pander (1794-1865), also an embryologist; Martin H. Rathke (1793-1860), another eminent embryologist; Theodor Schwann (1810-82), the founder of the cell-theory; Johannes Müller (1810-58), 'the greatest of all investigators of animal structure' in his century; Sir Richard Owen (1804-92), a great morphologist of the Cuvierian school, who introduced the conceptions of homology and analogy in regard to animal parts; Michael Sars (1805-69); Johannes J. S. Steenstrup (1813-97), who first emphasized the fact of alternate generation; Rudolf Leuckart (1822-98), who founded the sub-kingdom of Coelenterata and set forth the phenomena of polymorphism; Karl T. E. von Siebold (1804-85), who established the sub-kingdom Protozoa, Louis Agassiz (1807-73), a distinguished student of fossil fishes who held to Cuvierian traditions to his death; Christian G. Ehrenberg (1795-1876), who shed much fresh light on the Infusoria; Edward Forbes (1815-54), a distinguished investigator of the British marine fauna; Alcide D. D'Orbigny (1802-57), a palæontologist; Félix Dujardin (1801-60), who did valuable work on Infusoria, intestinal worms, and Medusæ; Antoine R. E. Claparède (1832-71), who wrote on Infusoria and Rhizopoda in collaboration with F. J. Lachmann (1832-61); William B. Carpenter (1813-85), an eminent physiologist and almost universal naturalist; Robert E. Grant (1793-

1874), a pioneer in the more exact study of sponges; Max J. S. Schultze (1825-74); James S. Bowerbank (1797-1877), who did splendid work on the sponges; Henri Milne-Edwards (1800-85), whose special work was done on crustaceans, corals, and mammals; Johann F. Eschscholtz (1793-1831), known by a treatise on the Acalephæ; Stefano della Chiaje (1794-1860), who described Sicilian invertebrates; Jean L. A. Quatrefages de Bréau (1810-92); Emile Blanchard (1820-1900), author of works on insects, Pierre A. Latreille (1762-1833), best known by his work on insects; William Kirby (1759-1850), an entomologist; Hermann Burmeister (1807-92), an entomologist and writer on the Brazilian fauna; Albany Hancock (1806-73), who studied the Mollusca, Tunicata, and Brachiopoda; Henri M. Ducrotay de Blainville (1776-1850); and John V. Thompson (1779-1847), who proved the crustacean character of Cirripedes and investigated the Polyzoa, the feather-star, etc.

Darwin and After.—The theory of the fixity of species was challenged at various times by different zoologists, notably by Lamarck, but it was not till the publication of 'The Origin of Species' (1859) by Charles Robert Darwin (1809-82) that the old view became generally abandoned and the evolution or development theory took its place. This has completely transformed the whole outlook of the zoologist and has brought new branches of the science into being, notably thremmatology. It makes the tree-like classification to which systematists have steadily advanced a truly genealogical tree, and it has contributed enormously to the progress of what may be called philosophical zoology. The natural-selection principle was independently discovered at practically the same time by Alfred R. Wallace (1823-), the eminent naturalist-traveler. Herbert Spencer had also formulated an evolution theory, extending to the whole of nature and life. Thomas Henry Huxley (1825-95), master of an admirably lucid and attractive method of exposition, and Ernst Hæckel (1834-), have done admirable work in embryology and other branches of zoology, and have contributed much to developing and popularizing the Darwinian views. August Weismann (1834-) is best known by his valuable contributions to the doctrine of heredity. The number of other zoologists who have done good work during the Darwinian period and under the influence of the Darwinian conceptions is so great that no attempt will be made to enumerate them.

Bibliography.—Lamarck, 'Philosophie Zoologique' (Paris 1809); Carus, 'Geschichte der Zoologie' (Leipzig 1872); Spencer, 'Principles of Biology' (London and New York 1898); Osborn, 'From the Greeks to Darwin' (New York 1894); 'Zoological Record' (London, annually).

Zoömorphie, a word meaning, pertaining to or exhibiting animal forms. In anthropology, representing a god or other supernatural being under the form of one of the lower animals. The zoömorphie element in classic mythology appears in such cases as that of the Sminthean Apollo, and the metamorphoses of Jupiter; it is very strongly marked in the religion of ancient Egypt, and traces of it may be found among the Jews and in the Apocalypse.

ZOOPHYTE—ZOROASTER

Zoöphyte, a term meaning literally animal plants, borrowed from Aristotle by Cuvier, and used by him as a synonym of *Radiata*. The term has no longer any specific value, but is often loosely applied as a designation for many plant-like animals, as sponges, corals, etc., more or less resembling plants in appearance.

Zöpfl, tsépfl, Heinrich, German legal scholar. b. Bamberg, Upper Franconia, Bavaria, 6 April 1807; d. Heidelberg 4 July 1877. Educated at Würzburg, he became a lecturer at Heidelberg in 1828, in 1839 professor extraordinary of constitutional law, and in 1842 professor ordinary. He was elected university representative in the first chamber of Baden in 1850, and sat in the Unionsparlament at Erfurt. Among his works are: 'Grundsätze des Gemeinen Deutschen Staatsrechts' (1841; 5th ed. 1863), and 'Deutsche Staats- und Rechtsgeschichte' (1833-6; 4th ed. as 'Deutsche Rechtsgeschichte', 1871-2).

Zoré's Islands, East Indies. See **XULLA ISLANDS**.

Zorgite, a mineral from Zorge and Tilkerode in the Harz. Massive; brittle; hardness, 2.5; specific gravity, 7 to 7.5; lustre, metallic; color, lead or sometimes yellowish gray. A sesquioxide of lead and copper in varying amounts.

Zorilla, thò-rèl'yà, Manuel Ruiz, Spanish statesman: b. Burgo de Osma, province of Soria, 1834; d. Burgo 13 June 1895. He studied law at Valladolid and became an advocate at Madrid, where in 1856 he was chosen to the Cortes, in which he identified himself with the Progressive party, and displayed a vigorous hostility against the Neo-Catholics. Banished in consequence of the insurrection of June 1866, he remained in France until the revolution of 1868, when Serrano appointed him minister of commerce, education, and public works. In 1869-70 he was minister of justice, and later president of the Cortes. He was a supporter of Duke Amadeus of Aosta for the Spanish throne; and when the latter became Amadeus I., was made minister of religious affairs. In 1872 he assumed the head of a radical ministry, but after Amadeus' abdication retired. On account of participation in the military revolt of March 1884, he was sentenced to death. He finally returned unharmed to Spain. Consult Villareal, 'Ruiz Zorilla desde la Expulsion de España hasta su Muerte 1875-95' (1903).

Zorn, tsörn, Anders Leonard, Swedish painter: b. Utmedal 18 Feb. 1860. He studied sculpture and painting at the Stockholm Academy. In 1882 he settled in London, where he attained special success as a portrait painter; and in 1889 went to Paris. He traveled widely in Sweden, Italy, Spain, England, the United States, and elsewhere; while in the United States he painted several portraits. His work includes landscape, genre, and portrait painting, as well as etchings of great merit. Among his paintings are 'Irish Maidens'; 'The Toast'; 'Italian Street Scene'; 'Summer in Sweden,' and portraits of Renan and of King Oscar; his etchings are mostly copies of his own paintings.

Zorn, Philipp, German jurist: b. Bai-reuth 13 Jan. 1850. After study at Munich and Leipzig, he became a lecturer at Munich in 1875, and in that year went as professor to

Bern. From 1877 he was at Königsberg, and in 1900 took a chair in the legal faculty at Bonn. In 1899 he participated as an expert in the Peace Conference at The Hague. Among his works are: 'Staat und Kirche in Norwegen bis zum Ende des 13ten Jahrhunderts' (1875); 'Staat und Kirche in der Schweiz' (with Gareis 1877-8); 'Staatsrecht des Deutschen Reichs' (2d ed. 1894-7); 'Deutsche Kolonialgesetzgebung (1901); and 'Die Deutsche Staatsprache' (1903).

Zorndorf, tsörn'dörf, Germany, a village of Brandenburg, Prussia, 53 miles northeast of Berlin. It is celebrated for the Prussian victory over the Russians 25 Aug. 1758, the Russians losing 21,539 men, and the Prussians about 11,000. See **SEVEN YEARS' WAR**.

Zoroaster, zò-rò-äs'tér (from Gr. *Zoroastros*; Avestan, *Zarathushtra*; Persian, *Zardusht*), the founder of the Parsee religion. The life of Zoroaster is completely enveloped in legend, and except from the work he has accomplished little or nothing can be discovered regarding it. In later times, when his religion was fully established, he was almost worshipped as a divine being, considered as above the archangels and next to God, and then the actions attributed to him are supernatural, and his history legendary; but even in the later accounts of the Zend-Avesta there is a manifest reference to a human original, and we may see in their exaggeration the gratitude inspired by the active benevolence of a good man and great reformer. 'He first thought good thoughts, first spoke good words, first performed good actions. He was the first priest, first warrior, and first cultivator of the soil. He first caused the wheel to turn among gods and among men.' This particularity may perhaps indicate that the date of Zoroaster was not so remote as it has sometimes been placed. His history was already legendary in the time of Aristotle, who placed him 6,000 years before Plato; others have supposed him to be contemporary or identical with Moses. The latest date generally assigned to him is the 6th century a.c. Modern researches place his period not later than 1000 a.c., or perhaps several centuries earlier. He lived in the reign of Vitaca or Gushtasp, a king of the Bactrian dynasty of Kávia, anterior to the time of the Median and Persian monarchies. This king was a zealous propagator of the religion of Zoroaster. Bactria was the scene of Zoroaster's labors, and thence his religion spread over Media and Persia. He appears to have been one of the Soshyantos or fire-priests of the early Iranian religion. According to the theory approved by scholars, the nomad Aryans first settled to agricultural life in Bactria. These settlers, the ancestors of the Iranian races, became alienated from their brethren who continued the nomad life, and, suffering from their depredations, at length came to regard even their religion with abhorrence, and placed their gods among the devils of their own creed. The new religion of the Iranians recognized a plurality of good spirits called Ahuras, which were opposed to the Devas of the Brahmanical creed. It was while the national religion was in this transitional stage that Zoroaster appeared and molded the discordant elements of the national faith into a new system, the fundamental principle of which was monotheism. He called the

ZOROASTRIANISM—ZOUCHE

supreme being, to whom he directed that worship should be exclusively paid, Ahurō Mazda, the Ahura who is the creator of the world. This name has been successively modified into Ahuramazda in the cuneiform inscriptions, and Ormuzd (q.v.) among the modern Parsees. Zoroaster is said to have called himself a reciter of manthras, a messenger of Ahuramazda, one who received sacred words from Ahuramazda through the flames. The descriptions he gives of the nature of God are full of the most exalted conceptions; he calls him the Creator of the earthly and spiritual life; he who taught the suns and stars their way. He is not only a Creator, but an intelligent and moral ruler. While the views of Zoroaster's teaching derived from the earlier Gāthas thus represent him as inculcating a pure and elevating religion, a speculative philosophy is ascribed to him which not unnaturally led to misconceptions of his theology, and speedily corrupted the religion he established. He imagined two principles which exist in all things, and are respectively the causes of all good and evil. These he called the Vohu Mano, or good mind, and the Ahem Mano, or naught mind; they are twins, and though opposed are inseparable, being apparently the necessary opposites of each other. The one creates day and the other night; the former produces life, and the latter extinguishes it. These two minds exist in Ahuramazda as well as in all created things. Such is Zoroaster's account of the origin of good and evil in the universe. Subsequent interpreters of his religion soon developed these two principles into two distinct and powerful beings, Ormuzd and Ahriman, the good and evil spirits, and gave to each of them a court of attendant ministers or councillors, six in number, so that a hierarchy of good and evil spirits, seven of each kind, was again established as an object of worship. The first of the angels of Ahuramazda is Vohu Mano, the good mind of Zoroaster, who is represented as the son of Ahuramazda; after him comes Ardibehst, who is represented as the blazing flame of fire. He is the preserver of life, and represents the omnipresence of Ahuramazda. Others preside over wealth, devotion, vegetation, etc. Besides the seven spirits there is an archangel Sraosha, who is possessed of great powers, and was the medium of revelation to the prophet. He first sang the five Gāthas of Zarathustra Spitama. He is the judge of men after death, and is worshipped for his power and purity. The dualism of the Persian creed is first developed in the Vendidad, which Haug dates partly as early as 1000 a.c., partly as late as 500 a.c. A small party continued to protest against the Zendic interpretation in favor of the ancient doctrine of Zoroaster as taught in the earlier Gāthas. They are said to have fallen into an opposite error of making the words Zervana Akarana, which simply mean time without bounds, into an independent being anterior to Ahuramazda. Among the doctrines of the Zend-Avesta are the distinction of a natural and a spiritual life, and a belief in immortality. Heaven is called the House of Hymns, and Hell the House of Destruction. Between heaven and hell is the Bridge of the Gatherer or Judge over which the good pass with safety, while the wicked are precipitated from it into hell. The resurrection of the body, the coming of a Messiah, Sosiosh,

son of Zarathushtra, and a final judgment, are foretold. Sosiosh is to be the last of three great prophets who are to precede the end of the world. The detailed description of the last judgment is contained in the Bundehesh. How far these doctrines are to be ascribed, as some hold, to Zoroaster, is doubtful. Consult Spiegel, 'Eranische Altertumskunde,' Vol. I. (1871); Haug, 'Essays' (2d ed. 1878); Brodbeck, 'Zoroaster' (1893). See also AVESTA.

Zoroastrianism. See ZOROASTER.

Zorrilla y Moral, José, hō-sā' thōr-rél'yā ē mō-rā'l, Spanish poet: b. Valladolid 21 Feb. 1817; d. Madrid 23 Jan. 1893. He studied for the law at Toledo and Valladolid, but turned to literature. His attempts in politics showed him to be unfitted for such a career. From 1855 to 1866 he was in Mexico, latterly at the court of Maximilian. His plays, of which 'Don Juan Tenorio' is probably the best, are without finish, but have continued effective through their distinctively native quality and their adaptability to theatrical requisites. His 'Leyenda de Alhama,' 'Granada,' and 'Leyenda del Cid' were picturesque presentations of national legends in the general manner of Scott, and very popular. Zorrilla was not a careful artist, but an improvisator of great readiness and skill, both lyrical and dramatic. A bronze memorial was erected to him in Madrid in 1900. An account of him may be found in the autobiographic 'Recuerdos del Tiempo Viejo' (Old-Time Memories, 1880-3). There is a three-volume collection of his works.

Zosimus, zōs'i-mūs (Gr. *Ζωσίμος*), Greek historian of the 5th century A.D. He wrote a history of the empire in six books, which is frequently referred to by Gibbon. He begins with the change of constitution introduced by Augustus, and his first book brings him to the reign of Diocletian, 305 A.D.; in the second, third, and fourth books the history of the 4th century is given with more detail; the fifth and sixth books are occupied with the period from 395 to 410. From internal evidence the work must have been partly written after 425. Zosimus was a pagan, and severely criticised the Christian emperors, making the change of religion largely responsible for the decline of the empire. The best editions are those of Bekker (1837) and Mendelssohn (1887).

Zostera, a genus of marine grasses. See EEL-GRASS.

Zotal. See MERCAL.

Zouave, zōo-āv, a soldier in the French army. Zouaves were originally mercenaries belonging to a Kabyle tribe. The Zouaves in the pay of the dey of Algiers were, when Algeria became a French possession, incorporated with the French army there, preserving their Arab dress. Ultimately the native element was eliminated, and the Zouaves became merely French soldiers in the picturesque Arab costume. As such they distinguished themselves in the Crimea and the Franco-Italian war of 1859. There were several regiments of zouaves among the Federal troops in the American Civil War.

Zouche, Richard, English legal scholar: b. Anstey, Wiltshire, 1590; d. London 1 March 1661. He was educated at New College, Oxford; in 1617 was admitted an advocate of Doctors' Commons; and in 1620 became regius

professor of civil law at Oxford. In addition to his university duties, he had a large practice in London. In 1641 he was made judge of the high court of admiralty. He was a royalist, though not a pronounced one, at the civil war; and although replaced in the judgeship in 1649, was nevertheless appointed by Cromwell to a special commission of oyer and terminer. He was restored to the bench in 1661. His writings include a descriptive poem, 'The Dove, or Passages of Cosmography' (1613); a comedy, 'The Sophister' (1639); and many works of a professional sort, most important of which are 'Elementa Jurisprudentiæ' (1629), a general system of legal science, and 'Juris et Judiciis Fecialis Explicatio' (1650), regarded by critics as the first treatise containing a systematized arrangement of what is now known as international law.

Zrinyi, zrén'yê, Niklas, Count, Hungarian soldier: b. 1508; d. Szigetvár 7 Sept. 1566. He distinguished himself in the siege of Vienna by Charles V., and in campaigns against John Zápolya and Sultan Suleiman. As ban of Croatia from 1542, he defended that territory against the Turks, and became famous for his defense of Szigetvár (or Sziget) in 1566. His garrison of scarcely 3,000 was reduced to 600, and on 5 September the enemy succeeded in firing the outer fortifications. Zrinyi retreated to the inner fortress, but this also was soon on fire. He thereupon ordered the gates to be opened, and after firing a mortar filled with broken iron into the midst of the Turks, who were urging along a narrow approach to the castle, led a sally of the garrison. He fell, mortally wounded, and the defenders were forced back; but a slow match ignited 3,000 pounds of gunpowder stored within, and great carnage among the Turks ensued. The catastrophe has been made by Theodor Körner the subject of his 'Zrinyi. Ein Trauerspiel.'

Zschokke, chök'kê, Johann Heinrich Daniel, German author: b. Magdeburg 22 March 1771; d. Biberstein 27 June 1848. He quitted his native place in 1788, and for some time wandered about the country as play-writer to a strolling company of actors; but afterward studied at the University of Frankfurt-on-the-Oder. In 1792 he commenced life there as a private teacher, and produced several pieces for the stage. He subsequently settled down in the canton of the Grisons and became director of an academy at Reichenau, where he wrote a history of the Grisons (1798). He then became head of the department of public instruction at Aarau, and was soon afterward sent by the Helvetic executive directory to Unterwalden as government commissioner, for the purpose of restoring tranquillity. He acquitted himself so satisfactorily that his powers as commissioner were extended to the cantons of Uri, Schwyz, and Zug. In 1800 he was appointed commissioner for the organization of the Italian territories of Switzerland. In 1804 he became a member of the board of mines and forests; and in the same year began the issue of his highly popular 'Schweizerbote' (Swiss Messenger). Through the greater part of his life Zschokke appeared as one of the most distinguished and energetic public men in Switzerland, but he found time to cultivate his favorite

literary pursuits, and it is chiefly by his numerous writings, historical and fictitious, that he is known to the world at large. Among his works may be mentioned: 'Ueberlieferungen zur Geschichte unserer Zeit' (1811-27) (Contributions to the History of Our Time); 'Des Schweizerlandes Geschichte für das Schweizer-volk' (1822); (History of Switzerland for the Swiss People), one of the best of his works; and 'Bilder aus der Schweiz' (1824-6) (Pictures from Switzerland). As a writer of tales he possesses a European reputation, and among them we may refer more especially to 'The Creole,' 'Alamontade,' 'Jonathan Frock,' 'Clementine,' 'Oswald or the Goldmakers' Village,' and 'Master Jordan.' The work, however, which has had the most extended circulation is his 'Stunden der Andacht' (Hours of Devotion) (1809-16; last ed. 1901-2), which, though rationalistic, has yet, from the pious feeling pervading it, found admirers among all classes of readers. Consult the studies by Münch (1831); Keller, 'Beiträge zur Politische, Thatigkeit Zschokkes' (1887); and Wernly (1894).

Zuazo, thoo-ä'thō, Alonso, Spanish jurist in the New World: b. Olmedo 1466; d. Santo Domingo 1527. A learned canon of Valladolid, he was appointed jurist of the commission which, at the request of Las Casas, was sent to the New World. He was given authority to organize justice in the West Indies, and to appoint judges. For his opposition to the complete abolition of enforced labor, he was denounced by Las Casas; although in Santo Domingo he emancipated the Indians who had been held in slavery by the officials. In 1518 he was despatched to Cuba to systematize the administration of justice in the island, and from 1525 until his death was auditor of the audiencia of Santo Domingo. Icazbalceta, in the 'Colección de Documentos para la Historia de México' (1858-66), gives an interesting narrative, written by Zuazo from Cuba in 1521, regarding the condition of the natives there and in Santo Domingo.

Zubly, John Joachim, American Independent Presbyterian clergyman: b. St. Gall, Switzerland, 1725; d. Savannah, Ga., 23 July 1781. The date of his arrival in America is unknown; but in 1760 he became the first regular pastor of the Independent Presbyterian Church in Savannah, coming thither, according to the Church record, from Wando Neck, S. C. In 1775, at the provincial congress of 4 July, he was one of five delegates elected to represent Georgia in the Continental Congress, and was selected to draft a petition to the king regarding the "unhappy situation of affairs." In a letter of 3 Sept. 1775 to the Earl of Dartmouth, he denounced the suggestions made in England of arming the slaves to bring the Southern provinces to obedience. He took part in the adjourned session of the Continental Congress assembled 13 Sept. 1775. When he discovered the intention of the Congress to declare the independence of the United States, he revealed to Sir James Wright, royal governor of Georgia, the plans being made. One of the letters was seized, and Samuel Chase, of Maryland, referred to the fact on the floor of Congress. Zubly hastily withdrew, and in Georgia

openly made common cause with the Tories. In 1777 he was banished, and half of his estate seized. He remained in South Carolina until the royal government was re-established in 1779. He was an eloquent and learned preacher. Consult C. C. Jones, 'History of Georgia,' Vol. II. (1883).

Zuccarelli, dzoo-kā-rē'lē, or **Zuccherelli**, Francesco, Italian painter: b. Pitigliano, Tuscany, 1702; d. Florence 30 Dec. 1788. He studied painting at Florence and Rome, and after gaining some success in decorative landscape, worked for five years in London decorating the Opera-House and executing views of the Thames. He again came to England in 1752 and became a fashionable painter, patronized by the royal family, especially the Prince of Wales, and the aristocracy. He was one of the original members of the Royal Academy in 1768. In 1773 he returned to his native country. Numerous examples of his art are in Venice, the Palazzo Reale containing 21. A large number, too, are in Windsor Castle, and he is also represented in Glasgow, Edinburgh, Paris (Louvre), St. Petersburg (Hermitage), Milan (Brera), and other cities.

Zuccaro, dzook-kā'rō, or **Zuccherò**, Federico, Italian painter: b. Sant' Agnolo in Vado (Urbino) 1543; d. Ancona 1609. He was employed by Gregory XIII. to paint the vault of the Cappella Paolina in the Vatican, but having quarreled with some papal officials and painted a scurrilous picture he fled to France, and ultimately he reached England in 1574. There he painted portraits of Queen Elizabeth, the Earl of Leicester, and other distinguished persons (21 were exhibited in 1866), and afterward worked in Venice until he returned to Rome to complete his work in the Cappella Paolina. On the invitation of Philip II. he went to Madrid in 1586 to paint for the Escorial, and on his return to Rome he founded the Accademia San Luca, of which he became the first president. Many portraits of English personages in the Elizabethan era are wrongly ascribed to him, but some genuine works from his brush are extant. He was also something of an architect and sculptor. Among his easel-works are 'Deposition from the Cross' (Palazzo Borghese, Rome); 'Descent of Christ into Limbo' (Brera, Milan); 'Sir Walter Raleigh' (Kensington Gallery); 'The Resurrection' (Borghese).

Zucchi, dzook-kē, Antonio Pietro, Italian painter: b. Venice 1726; d. Rome 25 Dec. 1795. In 1754 he accompanied the English architect Robert Adam on his journeys in Italy and Dalmatia, and on Adam's invitation he went to England in 1766. He decorated the interiors of several of the mansions built or altered by Adam, such as Caen Wood (Hampstead), Luton House (Bedfordshire), Osterley House (near Brentford), and Sion House (Middlesex). In 1770 he was elected an associate of the recently established Royal Academy. He married Angelica Kauffmann (q.v.).

Zuchetto, tsük-kēt'tō, the skull cap of a Roman Catholic ecclesiastic covering the tonsure. That of a priest is black, of a bishop or monsignor purple, of a cardinal red, and of the pope white.

Zueblin, Charles, American sociologist: b. Pendleton, Ind., 4 May 1866. He was educated at the University of Chicago, Northwestern, and Yale; became an instructor in sociology at Chicago in 1892; was assistant professor in 1895; and associate professor from 1895 to 1902. In 1902 he was made professor. Among his writings is 'American Municipal Progress' (1902).

Zug, tsoug or zoog, Switzerland; (1) The capital of the canton of the same name, on the northeast shore of Lake Zug, 12 miles by rail northeast of Lucerne. It has splendid old mansions and strong watch-towers; several interesting churches; a Capuchin monastery and a convent; a cantonal government building in Renaissance style; a fine town-house in late Gothic style, with a museum of antiquities; an arsenal; manufactures of cottons, enamel-ware, metal goods, tobacco, cigars, soap, etc. In 1435, 1594, and 1887 portions of the town sank into the lake. Pop. about 7,000. (2) A central and the smallest undivided canton of Switzerland, bounded by Zurich, Schwyz, Lucerne, and Aargau. The surface, which is generally mountainous in the southeast and south, where the Rossberg occupies the frontier, slopes more or less gradually north and west till it becomes comparatively flat. The only lakes deserving the name are those of Zug and Egeri. The climate, rigorous in the mountainous districts, is mild on the lower southern slopes. The chief exports are cattle, fruits, cider, and "kirschwasser." Area, 92 square miles; pop. about 28,000. (3) A lake chiefly in the canton of Zug, but partly also in Lucerne and Schwyz. It is 1,340 feet above sea-level; 12 miles long north to south, and varies in breadth from three miles to one mile at the centre. The shores are low in all directions except the south and southeast. In the former direction the Righi, with Mount Pilatus towering behind it, and in the latter the Rufiberg or Rossberg, rise in abrupt and lofty precipices, presenting scenery of the grandest description. At the foot of the Rossberg the depth of the lake is not less than 1,200 feet. Steamers ply upon it, and the fishing, principally of pike and carp, is very productive.

Zuider-Zee, zī'dér zē, Dutch, zoi'dér-zā, or **South Sea** (as opposed to the North Sea), Netherlands, a large gulf penetrating deeply between the provinces of Friesland, Overijssel, Gelderland, Utrecht, and North Holland; about 80 miles long, 45 miles greatest breadth, but only 10 miles broad between Enkhuizen and Stavoren. The islands Texel, Vlieland, Terschelling, Ameland, etc., separate it from the North Sea, with which it communicates by various channels, the principal being Marsdiep, between the Helder and Texel, and the Vlie Strom between Vlieland and Terschelling. It contains the islands of Wieringen, Marken, Urk, and Schokland, and numerous sandbanks, especially in its northern portion; has on its shores numerous towns, and receives the waters of the Yssel, Vecht, Eem, Kuinder, etc., but is generally shallow, and only navigable by vessels of small draught. Oysters and plaice are plentiful. A great part of it is to be reclaimed at the expense of the Dutch government, by enclosing tracts along the margin with dams and pump-

ZULIA — ZUMARRAGA

ing out the water. This great undertaking when carried out will add a large area to the kingdom. The Zuider-Zee is of modern origin, having been formed chiefly since the 12th century by successive irruptions of the sea. In earlier times there were here only a lake and marshes.

Zulia, thoo'lē-ā, Venezuela, the most northwestern state of the republic, surrounding Lake Maracaibo (q.v.), bounded on the west by Colombia and on the east by Falcón. It was formerly united with Falcón, but is now politically independent. Lake Maracaibo is surrounded by low lands, but a great part of the rest of the province is mountainous. Agriculture is the chief industry; coffee, sugar, and cacao are raised. Area, 24,969 square miles; pop. 100,000.

Zuloaga, thoo-lō-l'gā, Félix, Mexican politician; president of the republic: b. Alamos, Chihuahua, 1814; d. Mexico 1876. Having entered the national guard as a lieutenant, he fought against the Yucatan secessionists in 1842-3, in 1843 rose to be lieutenant-colonel, and in preparation for the war with the United States directed the fortification of Monterey and Saltillo and of the southerly approaches of the capital. From 1848 to 1853 he was not in active service, but in 1853 was promoted colonel, and subsequently variously employed. On 17 Dec. 1857 he conspired against the Liberal government, and finally on 11 Jan. 1858 the brigade of which he was the commander declared Comonfort (see COMONFORT, YGNACIO) deposed and Zuloaga president. Zuloaga entered on the office 23 January, and the "War of Reform" began, the Liberals being under the leadership of Juárez. In December the garrison deposed Zuloaga, who finally resigned, and appointed as a substitute Gen. Miramon (q.v.), who assumed office 2 February. In 1860 Zuloaga published a manifesto proclaiming himself constitutional president, but subsequently he came to an agreement with Miramon. When the French invaded Mexico in 1862, he withdrew, but in 1864 he returned and submitted to the empire, though he took no further part in political affairs.

Zululand, zoo'loo-länd, South Africa, a country lying on the southeast coast of Africa, now a province of Natal, extending westward to the Transvaal Colony, and northward to Tongaland. Area, about 10,450 square miles. The principal rivers are the Tugela, on the Natal boundary; the Buffalo, which joins the Tugela on the left, about midway up the Natal frontier, and forms the remaining portion of the boundary between Natal and Zululand; and the Umvolosi, which flows into St. Lucia Bay. From the coast at St. Lucia a range of mountains called the Libombo range runs northward nearly parallel to the coast, separating the country into two regions. The coast region is unhealthy. The inland region is comparatively healthful, fertile, and capable of cultivation. Rich gold reefs have been found, and excellent coal exists. The coal is being worked and a railway has been constructed to the Tugela. The country, which since 1897 has been attached to the colony of Natal, is mainly inhabited by the Zulus, who have long been distinguished as the most warlike of the Kafir tribes. The country inhabited by the Zulus was formerly much more extensive. In the beginning of 1879 the Zulu king, Cetewayo or Ketch-

wayo, with a large army of fairly disciplined troops armed with rifles, came into collision with the British in South Africa. This was partly due to a long-standing dispute as to the claims of the Zulus to the Utrecht district in the southeastern angle of the Transvaal, partly to other causes, which at last induced Sir Bartle Frere, the governor-general of the British provinces in South Africa, to send an ultimatum to Cetewayo. To this no reply was sent, and war ensued. On 22 January a portion of a British column was attacked at a place called Isandula or Isandhiwana, about 10 miles from Rorke's Drift on the Buffalo, by 20,000 Zulus, and completely destroyed. As soon as possible after the news of the disaster reached England, strong reinforcements were sent out, and on 4 July following the Zulu army was totally defeated at Ulundi. On 28 August Cetewayo was captured. Meanwhile Sir Garnet Wolseley had arrived with supreme military and civil authority in this part of Africa, and the Zulu territory was parceled out by him among several chieftains who were placed under the paramount supremacy of the British government, and were not to be allowed to keep up standing armies, or to import firearms or ammunition. British residents were appointed, one in North and one in South Zululand. In 1883 Cetewayo was restored to a portion of his dominions, but was opposed by some of the chiefs. After severe fighting he placed himself in the hands of the British at Ekowe or Eahowe, where he died in 1884. Subsequently the Boers of the Transvaal made themselves masters of a considerable portion of the territory and incorporated it with their own republic. In 1885 the British assumed a protectorate over the coast of the country, and in 1887 annexed all the rest. A strip between Tongaland (now a British protectorate) and Swaziland also belongs to Zululand. Pop. about 210,000.

Zumalacarregui, thoo-mā'lā-kā'rā-gē, Tomas, Spanish soldier and Carlist leader: b. Ormaiztegui, province of Guipuzcoa, 1788; d. Segama, Navarre, 23 June 1835. He distinguished himself in the war for independence, subsequently entered the regular army, became a lieutenant-colonel in 1825, and later colonel. Ferdinand VII. made him governor of Ferrol, but Cea Bermudez, the prime-minister, removed him. Soon after the death of Ferdinand, he became the head of the Carlist bands in the Basque provinces and Navarre. With great ability he organized these troops into a really formidable force, and wielded them with remarkable success against such generals as Valdeas, Quesada, and Rodil. Finally, when the constitutional army had been signally outfought, Don Carlos, against Zumalacarregui's advice, determined to attack Bilbao. Zumalacarregui's plan was to march upon Madrid by way of Victoria and Burgos, and he regarded the siege of Bilbao as a waste of time. It was during the operations there that he received the wound from which he eventually died. He was the most able figure of the first Carlist war. Consult Henningsen, 'Twelve Months of Campaign with Zumala-Carregui' (1836).

Zumarraga, Juan de, hoo-ān' dā thoo-mār'-rā-ga, Spanish prelate in America: b. Durango (Biscay) 1468; d. Mexico 3 June 1548. He was for many years guardian of the convent

ZUMBO—ZURBARAN

of Abrojo in Spain, and in December 1527 was appointed bishop of the newly established see of Mexico. He greatly developed the Mexican missions, but directed considerable misguided zeal against Aztec manuscripts, which he gathered together all over Mexico and publicly burned. Only comparatively few escaped this destruction. His see was elevated to an archbishopric in 1548.

Zumbo, South Africa, a town of Portuguese East Africa, near the confluence of the Loangwa with the Zambesi, and on the frontier line of North Rhodesia, 450 miles from the mouth of the Zambesi. It marks the western point of the Portuguese territories on the Zambesi, and was formerly the seat of an important trade, but its trade has declined greatly and the town itself has decayed. The active development of this region will probably restore its importance.

Zumpt, tsoompt, August Wilhelm, German classical philologist: b. Königsberg 4 Dec. 1815; d. Berlin 23 April 1877. He was nephew of Karl (q.v.). He was a professor in the Friedrich-Wilhelms gymnasium of Berlin from 1851. Among his publications were editions of Rutilius Namatianus (1840) and the 'Monumentum Ancyranum' (1845); 'Commentationes Epigraphicae ad Antiquitates Romanas Pertinentes' (1850-4); and 'Studia Romana' (1859). The larger part of the last two volumes of the German edition of Ihne's 'History of Rome' is the work of Zumpt.

Zumpt, Karl Gottlob, German philologist: b. Berlin 20 March 1792; d. Karlsbad 25 June 1849. Educated at Heidelberg and Berlin, and in 1827 appointed professor at the latter, he did much effective work toward the improvement of instruction in the Latin language. Among his writings were a Latin grammar (1818; 13th ed. 1874); editions of Quintilian (1831); Curtius (1826; 1846), Cicero's orations against Verres (1831), and the 'De Officiis' (1838); and several treatises, such as 'Die Religion der Römer' (1845). An abbreviation of the grammar (1824) reached a 9th edition in 1866.

Zúñi (zoo'ñē) Mountains, a detached range in Valencia County, New Mexico. The general trend is from southeast to northwest; length, 45 miles. The mountains do not rise more than 10,000 feet above sea-level, and this is only from 3,000 to 4,000 feet above the surrounding plateau. The range is heavily timbered. It is of geological interest on account of its isolation and the simplicity of the stratification.

Zúñiga, thoon-yē'gā, Alvaro Manrique de, Spanish viceroy of Mexico: b. Seville about 1530; d. Madrid about 1600. He entered Mexico in October 1585 as viceroy, and his administration was, according to the historian, Juan de Torquemada, one of prudence and wisdom. A dispute with the audiencia of Guadalajara, however, on a point of jurisdiction, nearly precipitated civil war upon the colony. Philip II., on the basis of reports circulated by his foes, finally removed him in 1589, and directed Pedro Romano, the bishop of Tlaxcala, to investigate Zúñiga's government. Romano persecuted Zúñiga with great cruelty until 1596, when the latter sailed for Spain, where he was successful

in getting revoked the sentence of confiscation pronounced against him.

Zúñiga, Dionisio de, Central American missionary: b. Guatemala about 1550; d. Chiapa about 1620. He became a Dominican in Chiapa province, and for the greater part of his life was a missionary among the Quiche Indians. He wrote a grammar of the Quiche dialect, and prepared also in Quiche a volume of sermons and several religious treatises, besides translating Francisco Viana's works, originally written in the dialect of Vera Paz.

Zúñiga y Azevedo, é i-thā-vā'fhō, Gaspar de, Count of Montreux, Spanish viceroy in America: b. Andalusia about 1540; d. Lima, Peru, 10 Feb. 1606. He took vice-royal charge of Mexico 5 Nov. 1595, and in 1596 sent an expedition in command of Sebastian Vizcaino (q.v.) for the exploration and occupation of Lower California. Vizcaino was hampered by lack of provisions, and returned after accomplishing little. By royal order, he was again sent out by Zúñiga in 1602, exploring the coast of Upper California. In 1597 Zúñiga drove out William Park, an English pirate who had taken possession of Campeche. Among other expeditions organized by him was one commanded by De Oñate (see OÑATE, JUAN DE) and Zaldivar to take New Mexico. During his administration in Mexico he was a benefactor of the natives. In 1603 he became viceroy of Peru, though he did not enter Lima until 1604.

Zuns, Leopold, German Jewish scholar: b. Detmold, Germany, 10 Aug. 1794; d. Berlin 17 March 1886. He studied at the University to 1839 he was in Prague as preacher at the synagogue of Berlin; and in 1824-32 was editor of the 'Spenerische Zeitung.' From 1835 to 1839 he was in Prague as preacher at the synagogue there, but in 1839 returned to Berlin to become director of the normal seminary, holding that position until 1850. In 1845 he was made a member of the board of commissioners for the promotion of the educational interests of the Jews. He was the first to take up the scientific study of the Jews' rabbinical literature in his 'Etwas über die rabbinische Literatur,' published in 1818; and his 'Die gottesdienstlichen Vorträge der Juden' (1832) is considered the authoritative work on the biblical exegesis and the homiletics of the rabbinical writings. Among his other works are 'Die Namen der Juden' (1836); 'Die synagogale Poesie des Mittelalters'; and 'Litteraturgeschichte der synagogalen Poesie' (1865).

Zurbaran, thoor-bā-rān', Francisco, Spanish painter: b. Fuente de Cantos, Estremadura, 7 Nov. 1598; d. Seville 1662. He was educated in the school of Juan de Roelas in Seville, and early formed his style on that of Caravaggio. He is thence frequently known as the Spanish Caravaggio. He first brought himself into notice by a series of pictures for the chapel of St. Peter in the cathedral of Seville, illustrating the life of the apostle; and about 1625 he executed his celebrated picture of 'The Glory of St. Thomas Aquinas' (Seville Museum), which is esteemed his masterpiece, and is one of the finest works in Spain. As early as 1633 he signed himself painter to the king. In 1650 he executed for the palace of Buen Retiro the 'Labors of Hercules' in 10 pictures, now in the

ZURICH—ZUTPHEN

Madrid Museum. Though he painted several large compositions, he preferred small and simple ones, generally religious in subject. He especially made studies of the Spanish friar. His works are to be seen in some private collections, and in the galleries of St. Petersburg, Pesth, Munich, Paris, and London. Consult: Bermudez, 'Diccionario de los Mas Ilustres Profesores' (1800); and Lefort, 'La Peinture Espagnole' (1894).

Zurich, zoo'rĭk, Switzerland; (1) a city, capital of the canton of the same name, situated at the northeast extremity of the lake of the same name. It is divided by the Limmat into unequal parts, forming an upper and lower town, connected with their suburbs by several bridges. The streets in the oldest quarters are narrow, crooked, and dark, but have undergone considerable improvement. The principal buildings are the cathedral or Grosse Münster, on a hill near the right bank of the Limmat, a heavy massive structure in the Byzantine style; the Fraumünster, on the left bank of the river; St. Peter's Church, with a fine tower and clock; the town-house; the town library, containing 100,000 volumes; the museum, with a collection of home and foreign periodicals, and a rich library; the university; the new Swiss polytechnic school; the arsenal; the music buildings; the railway station; the theatre and the post-office. Two public promenades add to the attractions of the city, besides a botanical garden and many smaller parks and walks connected with a variety of institutions public and private. Manufactures of silk and cotton, including dyeing and calico-printing, are extensive; those of candles, soap, tobacco, paper, leather, and machinery are also considerable. Besides the university, founded in 1832, and having a professorial staff of 124, and over 700 students in theology, law, medicine, and philosophy, there are a polytechnic school, schools of medicine and of arts, secondary and elementary schools of all kinds, deaf and dumb and blind asylums, orphan and several other hospitals. Learned and other societies of various descriptions abound. Zurich is of great antiquity, and early became a Roman station. In 1219 it was declared a free imperial city. The preaching of Zwingli in the cathedral made it the centre of the Swiss Reformation. Here, in 1443, the Swiss defeated the Austrians; and here also, in 1799, the Russians were defeated by the French. The Treaty of Zurich, signed here 10 Nov. 1859 by the plenipotentiaries of France and Austria, closed the Franco-Italian war by Austria's abandonment of her right to Lombardy. Pop., including suburbs, about 155,000. (2) A northern canton bounded north by Schaffhausen and grand duchy of Baden, west by Aargau, south by Zug and Schwyz, and east by Saint Gall and Thurgau; area, 665 square miles. Though not properly mountainous, it has on its south and southeast frontiers several lofty ridges, remarkable for their parallelism. Except the Lägern and adjoining heights, they have their longer axis from southeast to northwest, and form a succession of terraces lowering gradually toward the north. The culminating points are the summits of the Hornli and the Schauenberg, both in the east. The general slope is toward the left bank of the Rhine, which drains part of it directly, and part

indirectly, by the Thur, Töss, Glatt, and Limmat. Of the lakes, about 40 in all, the most important are those of Zurich, Greiffen, Pfeffikon, Türlar, and Katzen. The climate is on the whole temperate, but mists are prevalent, particularly on the lower grounds. In some parts the prevailing rock is the Jura limestone, but a more recent formation, consisting chiefly of marl and sandstone in almost horizontal strata, is still more largely developed. One remarkable feature is the immense number and magnitude of the granite boulders which cover the surface. The minerals are few and of little value. The soil, with the exception of a few favored spots, is far from fertile, and hence, though the arable land is comparatively large and carefully cultivated, the corn produced falls short of the consumption. In some districts a wine of tolerable quality is produced. Wood seldom forms forests, but occupies many scattered patches and hedgerows. Game is scarce; fish almost superabundant. In no canton have manufactures made more progress. The great staples are silk and cotton goods. The inhabitants are almost all Protestants, and education is very generally diffused. Zurich was admitted into the Swiss Confederation in 1351, and re-admitted in 1450, after a 10-years' alliance with Austria. The government, formerly somewhat aristocratic, became decidedly democratic in 1831. A new democratic constitution was adopted in 1869. Zurich holds the first place in the Swiss Confederation. Pop. about 450,000. (3) One of the principal lakes of Switzerland, chiefly in the canton of Zurich, but partly also in Schwyz. It forms a long irregular curve, bending round from southeast to northwest, convex on the south, and concave on the north side; greatest length, about 27 miles; greatest breadth, not exceeding three miles; greatest depth, 600 feet. Its scenery is distinguished not so much for grandeur as for beauty. The mountains around, nowhere exceeding 1,700 feet above the lake, commence in wooded heights, and descend to the water's edge in gentle slopes, covered with vineyards, orchards, gardens, cultivated fields, and verdant meadows, and studded over with country-seats and smiling villages. A considerable traffic is carried on upon the lake by means of sailing vessels, and numbers of steamers. It is well supplied with fish. Its chief feeder is the Linth Canal, communicating with the Wallenstätter-see. It discharges itself at the town of Zurich by the Limmat.

Zurita, thoo-rē'tā, Geronimo, Spanish historian: b. Saragossa 4 Dec. 1512; d. 3 Nov. 1580. He was educated at Alcalá, in 1543 was sent to Germany on a diplomatic mission to Charles V., and subsequently was made councillor of state and secretary to Philip II. Appointed chronicler of Aragon, he traveled in quest of data through Spain, Sicily, and Italy, and finally in 1562-80 published in six volumes his 'Anales de la Corona de Aragon,' continued by Argensola and Blasco-Lanuza (1622). He also made important corrections in, and additions to, Lopez de Ayala's (see AYALA, LOPEZ DE) 'Crónicas de los Reyes de Castilla.' For a biographical sketch and some correspondence, consult Dormer, 'Progresos de la Historia en Aragon' (1680).

Zütphen, züt'fēn, Netherlands, a former fortified town in the province of Gelderland, 27

miles northeast of Arnhem, on the right bank of the river Yssel, where it is joined by the Berkel. Its chief edifice is the 12th century church of Saint Walpurgis. The town was at one time a member of the Hanseatic League, and had a considerable foreign trade, which has ceased. It still has an active home trade, more especially in sending timber, both rough and prepared, down the Yssel. Pop. about 20,000.

Zuyder Zee. See *Zuider-Zee*.

Zweibrücken, tsvi'brük-én (Latin, *Bipontium*; French, *Deux-Ponts*, 'Two Bridges'), Germany, a town of Bavaria, on the Schwarzbach, 34 miles west by north of Landau. It was the capital of a mediæval duchy until the end of the 18th century. It is well built, and has Protestant and Roman Catholic churches and a synagogue; gymnasium, real-school, and several other schools; courts and public offices occupying the former ducal palace; an orphanage and hospitals; manufactures of silk plush, machinery, chicory, tacks, chains, leather, etc., and a trade in corn and cattle. The edition of the classics known by the name of 'Bipont' was published here in 1779 and subsequent years. Pop. about 15,000.

Zwickau, tsvik'ow, Germany, a town of Saxony, on the left bank of the Mulde, 60 miles by rail west-southwest of Dresden. It has several interesting churches, among them two ancient Gothic ones recently restored, one of them dating from the 12th century; a gymnasium with a library; and an old castle converted into a penitentiary. The chief source of its wealth is the rich coal beds in the vicinity, employing 8,000 miners, and yielding annually \$5,000,000 worth of coal. There are also manufactures of linen and cotton goods, dyes, and chemical products, numerous tanneries, dye-works, bleach-works, oil, saw, and other mills, and a considerable transit and general trade. See ANABAPTISTS for the "Prophets of Zwickau." Pop. about 58,000.

Zwinger, tsving'er, Theodor, Swiss scholar. b. Basel 2^d Aug. 1533; d. there 10 March 1588. He studied at Basel, and after a course in medicine at Padua, became a member of the Basel medical faculty. He lectured there on Greek in 1565-71 and subsequently on ethics, and from 1580 was professor of the theory of medicine. Zwinger was a type of the universal scholarship of that time; and wrote a 'Theatrum Viarum Humanarum,' a kind of general encyclopædia, then regarded as a marvel, but now having only a bibliographical interest. His 'Methodus Apodemica' contains material valuable for local history. Consult 'Athenæ Rauricæ' (1778), which contains a list of his writings.

Zwinger, The, a public building in Dresden, containing a valuable collection of works of art and scientific treasures. The word Zwinger is a general name for a prison, or any confined place.

Zwingli, zwing'le, Ger. tsving'le, or *Zwinglius Ulrich*, a celebrated Swiss reformer, was a contemporary of Luther (q.v.), and was born at Wildhaus, canton of Saint Gall, on 1 Jan. 1484. Ulrich was the third of eight sons of the bailiff of that place. He studied

at an early age in Basel and Bern, and continued his studies in Vienna, where he occupied himself with philosophy, and again in Basel, where he devoted his attention to theology, under the direction of Wyttenbach. In 1506 Zwingli became parish priest at Glarus, and here employed his time, as Luther had done in the Augustine monastery at Erfurt, in the diligent reading of the Holy Scriptures. He copied the epistles of Saint Paul in the original Greek, and even learned them by heart—an acquisition which afterward proved of great service to him in his public discussions. He accompanied the forces of Glarus during the campaigns of 1512, 1513, and 1515, in Lombardy, in the cause of the pope against the French, in the capacity of chaplain, and was rewarded for this service by the grant of a pension from the pope. In 1516 he became preacher in the convent of Einsiedeln, then a celebrated place of pilgrimage. Here he began to make known publicly his ideas of reform, preaching against the pilgrimage of Einsiedeln, which he termed an abuse and a corruption of the doctrine of the Christian Church, and calling upon the bishops of Sion and Constance to promote a reformation of religious doctrines, upon those points in which Zwingli considered that the Church had departed from the primitive teaching. Up to this time, however, his ideas of innovation excited no rebuke upon the part of the authorities, and he was, not long after, invited to Zurich, and entered on his office of preacher in the cathedral 1 Jan. 1519, with a discourse in which he declared himself for the use of the simple Scriptures without regard to the prescribed texts and lessons. At Zurich Zwingli delivered a series of sermons on the Holy Scriptures; and these discourses in which he inveighed against what he declared to be the errors and superstition of the times, laid the foundation for his future work of reformation. The occasion which launched him on his career was similar to that which had aroused Luther. In 1518 Bernadin Samson, a Franciscan monk of Milan, appeared in Switzerland to preach the indulgence proclaimed by Leo X. to all who should subscribe alms to the building of St. Peter's Church at Rome. Zwingli, who was then preaching at Einsiedeln, opposed him there, and afterward in Zurich, with all the power of his eloquence, and brought the indulgences into so much odium that Samson was not even permitted to enter Zurich; and the Council of Zurich finally obtained from the Papal Nuncio the recall of Samson to render an account of his mission at Rome. From this time Zwingli gradually went further in his plans, supported by the Zurichers. In Zurich his innovations were so far promoted by the government that in 1520 a decree was issued ordering that the Holy Scriptures should be taught "without human additions." In 1522 the reformation was extended to external ceremonies. In this year Zwingli was forbidden to preach by the bishop of Constance. In it also he wrote his first work against the fasts of the Church and began the study of Hebrew. In 1523 the government in Zurich invited all theologians to a public conference in Zurich, to convict, if possible, Zwingli of an error in doctrine. About 600 persons, clergy and laymen, were present at this disputation. Zwingli exhibited his opinions in the form of 67 propositions, which were to form

ZWOLLE—ZYMOTIC DISEASE

the subject of discussion. The celebrated John Faber, the vicar-general of the bishop of Constance, refused to discuss any of Zwingli's propositions save the last one, which denied the supreme authority of the Church, whereupon the Council of Zurich decreed that Zwingli had not been convicted of error or heresy, and "might continue to freely announce the holy gospel and the Word of God according to the new order." In a second dispute Zwingli urged his objections to images and the mass, and the former were soon afterward removed from the churches by order of the Council and the latter abolished. In 1524 Zwingli married Anna Reinhard, a widow, and the next year published his commentary on "True and False Religion." The Reformation in Switzerland was now fixed upon a firm base; and Zwingli continued the work with undiminished zeal, warmly supported by the cantons which espoused the Protestant cause. The religious orders were suppressed, and all questions of marriage were placed under the jurisdiction of the civil tribunals, as well as the administration of the Church revenues. In general, Zwingli agreed in his opinions with the German reformers; like them he assumed the Bible as the only rule of faith, rejected the Papacy, attacked the authority of the priesthood, and declared that his object was to restore the Church to the simplicity of primitive times. His views differed on some points from those of Luther, particularly in regard to the real presence, and on some less important matters relative to the liturgy. In order to remove this wall of partition from between the two parties which adopted the new doctrines, a meeting between the Saxon and Swiss reformers was held at Marburg (1-3 Oct. 1529) at the suggestion of Philip, the Landgrave of Hesse. The former were represented by Luther and Melancthon, the latter by Zwingli and Oecolampadius. Although a complete union was not effected, yet a convention was agreed upon, the first 13 articles of which, containing the most important matters of religious faith, were recognized by both parties; and the 14th declared that, though they could not agree as to the real presence of Christ in the eucharist, they would behave reciprocally in the spirit of Christian charity. In 1531 an open war broke out between Zurich on the one side and the Catholic cantons of Lucerne, Schwyz, Uri, Unterwalden, and Zug on the other; and Zwingli was commanded to take the field, bearing the banner of the canton, which it had been usual for an ecclesiastic to support. A battle ensued at Cappel, on the 11th of October. But the enemy were more than twice as strong as the Zürichers, and under better officers; the latter were therefore defeated, and Zwingli was among the slain. The Reformed Church in Switzerland afterward received from the hands of Calvin (q.v.) its present organization. The collected works of Zwingli were published at Zurich in 1545. A complete collection of Zwingli's writings was also published at Zu-

rich in eight volumes in 1828. E. Zeller has attempted to deduce Zwingli's doctrines from his writings, 'Das theologische System Zwinglis dargestellt' (Tübingen 1853). There are numerous biographies of this reformer, for example, 'Huldreich Zwingli, sein Leben und Wirken' (1895-7) by Stähelin. Consult also Janssen, 'History of the German People' (1903).

GEORGE E. RINES,

Editorial Staff, 'Encyclopedia Americana.'

Zwolle, zwöl'lē, Netherlands, capital of the province of Overijssel on the Zwart Water, 25 miles north of Zutphen. Formerly it was a member of the Hanseatic League and was a strong fortress with 11 bastions and three forts. It is a well-built city, with handsome boulevards on the site of its ancient ramparts, and three fine suburbs. Its corn market is one of the best in Holland. Its chief buildings are Saint Michael's Church, a large and splendid building with a famous organ, the government buildings with the provincial archives, the town-hall, and the courts of justice. The town has a Latin school, a school of navigation, an industrial school, a public library with rare works on geography and local history, a museum of natural history, a theatre, etc. Zwolle has communication with the sea by means of the Willemvaart Canal. It manufactures oil, spirits, iron goods, and linens, carries on shipbuilding, and a trade in corn and cattle. In a monastery in the neighborhood Thomas à Kempis lived and died.

Zylonite, **Xylonite**, same as celluloid. See CELLULOID.

Zylonite, a material made by treating cellulose or vegetable fibre with nitric and sulphuric acids, dissolving the resulting pulp in camphor, and then drying it. In its liquid state, collodion, it was used in surgical operations as early as 1848; in 1855 zylonite was manufactured by Alexander Parkes of Birmingham, England, and put on the market as parkesine. About the same time several factories for the manufacture of zylonite were established in France and Germany, England, and the United States. In 1869 celluloid (q.v.), a kind of zylonite, was first manufactured, and has entirely superseded all other forms of zylonite.

Zymotic Disease, any disease caused and continued by a living germ introduced from without into the body and there multiplied. The term was formerly applied to epidemic and endemic contagious diseases because they were supposed to be produced by some morbid principle acting on the system like a ferment (Greek ζῦμα). The chief of such diseases include measles, scarlet fever, smallpox, typhus, diphtheria, whooping-cough, croup, and erysipelas (q.v.). With the development of present theories and scientific knowledge of infectious disease, the term zymotic has been almost abandoned. See BACTERIOLOGY; DISEASES, General Theory of; MALARIA; NEBULOLOGY.
